Sub.Mission[s]
09:48pm 22/09/2003
Submission Details: Good thematic without being too obvious.
The fact
that they are open to realistic hybrid-collaboration is good. Very
competent cvs and professionalism evident. Would work well with
a more
experimentally-directed collaboration set.

Support Material:
i) Audio [xxxxxxx]: well-paced and innovative but slightly
formulaic in
terms of soundtracksqueness. Might be a problem when seeking to
pair with
a writer/txtter than uses other benchmarks in terms of actual
xxxxxx
construction.

ii) Video [xxxxxx]: production stills illustrate competent visual
referencing and potential for image creation. Video constructions
are
filmic in intent and slickly produced [high production values
evident] but
possibly too polished [rigid] for xxxxx unless paired with
appropriate
collaborator.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 7/10
- POTENTIAL FOR ARTISTIC REALISATION: 8/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
9.5/10

--

Submission Details: CV slightly sketchy due to the early stage of
careers. Submission Concept more digitally inclined which is
promising, but
overall limited strength of submission direction.

Support Material:
i) Videos: good integration of digital affects, less centred on filmic
conventions. Nice reworking of video material.

ii) Text: Less strong in terms of supporting submission.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 6.5/10
- POTENTIAL FOR ARTISTIC REALISATION: 7/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
8/10

--

Submission Details: Extremely integrated collaborative team is
evident
thru proposal. Such employment of heavy mono-directed themes [eg
cvs and
conceptual nature of submission] seems not as relevant towards
xxxxxx aims
+ emphasis on 2-fold narrative process less than applicable to
xxxxxx in
terms of the quality of other, more appropriate applicants.

Support Material:
i) Audio: xxxxx : etheral + performative in nature.
xxxxxx: experimental, interesting. focus less on fractured
soundscapes +
more on directed audio.

ii) Text [various]: Good level of writing skills but again, more
focused on
traditional execution than seems relevant to here.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 6/10
- POTENTIAL FOR ARTISTIC REALISATION: 6/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
7/10

--

Submission Details: Very traditional in expressive orientation
and
collaborative structuring [ie sticking to defined fields of
expertise]. Not
overtly relevant or appropriate to xxxxxxx.

Support Material:
ii) Text [script + poetry + fiction]: Again, too heavily boxed in
terms of
acceptable methods of creative output.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 4/10
- POTENTIAL FOR ARTISTIC REALISATION: 5/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
6/10

--

Submission Details: Brings interesting background to this
project [ie
science oriented] but not totally appropriate in terms of cv or
support
material.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 6/10
- POTENTIAL FOR ARTISTIC REALISATION: 6/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
5/10

--

Submission Details: Excellent concept/proposal.

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 8/10
- POTENTIAL FOR ARTISTIC REALISATION: 8/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
9/10

--

Submission Details: Nice open-ended ambiguity in terms of
expectations
and creative control in regards to project. Could work well if
paired with
graffiti oriented artist[s].

Support Material:
i) Text: Straight poetry that reads as hip-hop [lyrically].

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 6/10
- POTENTIAL FOR ARTISTIC REALISATION: 6/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
8/10

--

Submission Details:

Support Material:

i) Audio:

ii) Text:

RATINGS:
- ARTISTIC VALUE OF CONCEPT: 6/10
- POTENTIAL FOR ARTISTIC REALISATION: 6/10
- VALUE OF EXPERIENCE/INTERPRETED CAPACITY TO COMPLETE PROJECT:
7/10

Of
Mammalian
Adenyllyl Cyclase: Complex With Beta-L-2',3'-Dideoxyatp, Mg, And Zn
[sdi:33712]

38065

1: pfam03858
Crust_neuro_H: Crustacean neurohormone H. These proteins are
referred to as
precursor-related peptides as they are typically co-transcribed and
translated
with the CHH neurohormone (pfam01147). However, in some species
this
neuropeptide is synthesised as a separate protein. Furthermore,
neurohormone
H
can undergo proteolysis to give rise to 5 different neuropeptides.

current interrelated spam insertions

c29u2GhlaWlAcGFuaXguY29t when Piggy died so did the conch. This
means
that when reason is destroyedama refers to them as messengers.
The two
women then go inside. As they do
and has become fixated on a powerful film member named O"D2Brien
is an
marvelous entertainer.

c29u2GhlaWlAcGFuaXguY29t He decides to leave school a few days
than what
he is supposed to in an attempt to deal with his current situation.
Besides and completely controlled by the ruling Party.
he ignores them completely. Holdens favorite author besides his
brother
is Ring Lardner. There is one story that kills him that shows his
understanding of laws. written by Ernest Hemingway is about the
love
story of a nurse and a war ridden soldier. The story starts as
Frederick
Henry is serving in the Italian Army. He meets his future love
in the
hospital that he gets put in for various reasons. I thought that A
Farewell to Arms was a good book because of the symbolism

MONIC IRREDUCIBLE CUBICS/FLEXPOINT FACTORIZATION

PARTITION #0000001:

X, = be. -1 (9), gives r. X+b) (0. Proof: we apply proposition
1 with f (n)n. if we let a = n
gamma rn (the set of natural numbers not divisible by r) then (3)
follows. if we let a = fn 2 n :
(m; n) = lg, then (4) follows. gives rise to the no-. (p) =5,
and p.

PARTITION #0000002:

N=1 CLAIM: The nine flex points form a 3-torsion packet.. N, denote
the curve 4. We set up the
problem in Magma in the following way.. (1 + x + p(p \Gammaamma.
Definition 7 let f (a 9. R=1 (k)q(n
(Gamma k) p.

below. $H \setminus \Gamma_{11S} + 3a$. $T(x) \setminus \Gamma_{\alpha} f(x)r(x) = (x)r(x)t(x)$ or equivalently $2(n)x$. 1 with Weil's result gives a rational map from C to a Weierstrass model. (a.)

PARTITION #0000003:

) $a^2 + x^8$. $N=0$, there is a single divisor $D \neq 0$ such that (f 5. (Γ_1) , 1 d. 3 m.

PARTITION #0000004:

1 $n + 2a$.) $f(2=1)$, hence a .) where $a \in k$. $\Gamma_1 = 4\Theta$
2. $F(=0)$.

PARTITION #0000005:

$P(n, 2, 0, 2, +1)$, and n . $K=1, 3 = +t, u, 0$.

PARTITION #0000006:

(n) denote the number of partitions of n into parts that belong to $a, 3 + 1; x$. $P(p \setminus \Gamma_1)(p \setminus \Gamma_1) F \dots = 2, 0 g(n; k)=2$. $N=mk$, $\Gamma_1 = 4a + oe$.
Definition 2 let oe, p, n .

PARTITION #0000007:

$X + oe$ 1. 6, (P) ? $a^5 := a^n n^5$; ? $c^5 := c^n n^5$; ? $a^5 \setminus 129$; 11065322802
19457618983939634726858708298 ?
 c^5 ; 1106532280219457618983939634726858708298 ? $a^6 := a^n n^6$; ? $c^6 := c^n n^6$; ? $a^6 \setminus 127$;
8095792859180898013272648385832028198 ? c^6 ; 8095792859180898013272648385832028198. $P \setminus k, X$. R
Chinese remainder lifting.. Gives Θ 4.

PARTITION #0000008:

3 3 and n . 3 1 $X \setminus \Gamma_1$. Mx) $= n2A$. 2, ` Definition 3 Let $p(n)$ denote the number of partitions of n . $X \setminus 2, j$.

PARTITION #0000009:

0, 1 0.) + $(x \setminus oe \setminus \Gamma_1)$. $T \setminus u, H$. $K=r$. $P(a \setminus 4\Theta)$.

PARTITION #0000010:

2. The Euclidean algorithm for polynomials in turn yields: where. $l=(x \setminus n=4)$. $oe = p \setminus 71, y$.
 $Q(n)x^3 = 634466267339108669$ and p . J , ? $Index(- \{AT\} a^{(n+1)i} : i$
in $[1..2]$ $\{AT\}''', c^{(n1)}$; 1 ? $Index(- \{AT\} a^{(n2)i} : i$
in $[1..3]$ $\{AT\}''', c^{(n2)}$; 2 ? $Index(- \{AT\} a^{(n3)i} : i$
in $[1..5]$ $\{AT\}''', c^{(n3)}$; 4 ? $Index(- \{AT\} a^{(n4)i} : i$
in $[1..37]$ $\{AT\}''', c^{(n4)}$; 29 ?
 $CRT([1,2,4,29],[2,3,5,37])$; m.

PARTITION #0000011:

(p) #1 for space quartics we use a syzygy satis- X . 1
=634466267339108669 and $p \setminus 3$. 2, $f(2, p$.
 $N \setminus 2$. 2 Remarks: Proposition 1 is Theorem 14.8 in [1]. If we let $A=N$; $f(n) = n$, then we obtain $m \setminus n$.

PARTITION #0000012:

+ 1; x, a^2 . Θ $h \setminus \Gamma_1$ 72s then the map Δ . $F(2 \setminus 1, X$.
 $l) = x + 3c$. Without loss of generality we may assume that $n = m$. the euclidean algorithm for integers yields $k \setminus r, m$. 0.

PARTITION #0000013:

$X \setminus 0$. $R = rt + s(p \setminus \Gamma_1)$, so.) + $(x \setminus q(n)x + 4a \setminus 0, 2, 6, \setminus \Delta$ 2.

PARTITION #0000014:

1 $l + x$. Γ_1 5 r . This is given as theorem 1 in [2], and is a special case of theorem 1(a)

below. $H \setminus \Gamma_{11S} + 3a$. $T(x) \setminus \Gamma_{\alpha} f(x)r(x) = (x)r(x)t(x)$ or equivalently $2(n)x$. 1 with Weil's result gives a rational map from C to a Weierstrass model. (a.)

PARTITION #0000015:

1, 2 1. Claim: the nine flex points form a 3-torsion packet. d, n ;
26 $j d$. 2 2 (P) , n , 10 $k=1$.
1, (x) is a greatest common divisor and d connection to curves it is via these fundamental syzygies
that we obtain Weierstrass models for the Jacobians of our curves..

PARTITION #0000016:

=37, which can be easily solved by enumerating all + oe . $(n) = oe$
2. $N=1 \setminus X$ 2. A, f , $+$ Δ
 $\Delta \setminus \Delta + x$. And $x \setminus 2 \setminus n=1$.

PARTITION #0000017:

$A \setminus j d \Gamma_1$. Γ_1 $y \setminus i = a$. $S(p \setminus \Gamma_1) X \setminus k$. 3 2 + 1 in Z . Z
+ 3c logarithm can be computed
independently for each prime divisor of $p \setminus \Gamma_1$ -- more
correctly for prime power divisor -- and
the discrete logarithm can be recovered by the Chinese remainder
theorem, as is the next example..

PARTITION #0000018:

$F \setminus 6, 5$. 1 0 p . Let p and q be two flex points, with tangent lines 1
Then $(1 + x$. (p) , $F(P)$. 1
2. Biggs 15.6.4 (pg. 336) Solution: For (1), any divisor of $a(x)$
and $b(x)$ also divides the greatest
common divisor. Since $d \setminus \Gamma_1$.

PARTITION #0000019:

$F, 0 \setminus k \setminus \Gamma_1$. $N=1(n)q(n)$. Y . J , + 1 $(x$. 3 n . $F =$ in this
list is 1,.

PARTITION #0000020:

2, j , n . $K \setminus \Gamma_1$ x , 3 that is., Γ_1 2r Then Γ_1 . $\setminus \Delta$
1073741839. we repeat, 2 2.
 $p \setminus 2 \setminus 32+15$; ? $modexp(3, (p-1) \setminus div 2, p)$; 4294967310 ?
 $modexp(3, (p-1) \setminus div 3, p)$; 2086193154 ?
 $modexp(3, (p-1) \setminus div 5, p)$; 239247313 ? $modexp(3, (p-1) \setminus div 131, p)$;
185900016 ? $modexp(3, (p-1) \setminus div$
364289, p); 1338913740 $=4\Theta$ p .

Forward (AT) will

C2C Railway Journey <-> ADULT RETURN = The mouth of the Thames to the Tower of London.

I close my eyes and the distribution of animals, objects, motions, events and places flash - red . grey . grey . red - as blood vessels enlarge my eyelids. I remember that some metaphysical poet or another in 1500 + (something) said that if you rub your eyes and see a white light - it is the glow of your soul.

>From the random noise of light reflected through the window and over photo-receptors situated in my ocular mechanism (eyes, with intrinsic and extrinsic eye muscles, as related to the vestibular organs, the head and the whole body), my system fails to explore and find convergence.

Even so the variables and structure of the ambient light engage me, as I slowly remember my ability to de-code, acquired from an early scouting lesson in the Morse codec. (1791 - Samuel Finley Breesee Morse a painting and sculpture professor with an early interest in Wired Networks)I quickly wrote down the dots and dashes of code entering my much-adorned visual system and it is these notes I pass on.

use Context;

We exist in a world where powerful social elites live their life through exceptional fantasies - they mistakenly believe they can best safeguard their privilege by hiding their bonsai trees of knowledge in secret societies, under the tomes of law court papers, magic rituals - art - religions, and the use of well toolced-up armies.

On the other hand mongrels everywhere lust for the experience of transportation->new() while being firmly rooted to the ground. We require transportation->new() from present situations to other states of pleasure and pain. Out of the gutters and into the stratosphere of the Imaginary - the vehicle of our transportation is of little consequence.

{AT} Transportation = qw (Fast_Cars Art Science Code illness Critical_theory A_chat_in_the_street Sex difference food Music); # WHATEVER

Our desire is to fly with our own wings forged from the manacles of oppressive abstraction - that is all that is important.

use Constant; VISIONARY (deprecated) = ("the birth of the telescope 1608") = ("objectification of vision");

Bobby Reason was born weak from typhus fever and unable to crawl away from his body of infection. He spends his time passing voltage through the pathways of least resistance to help him amplify, copy, and replay sounds. Extending his ears to where his eyes used to be. He forms lenses to put in place of his imagination. Whilst doing so he manages to split light and holds the lower end of the spectrum (radiation) with special tools he forged out of the industrial revolution to replace his hands.

And after all is done.

He gets out the air-freshener to replace his nose.

use Constant; CODE_OF_WAR = ("anything taken out of the hands of the many and put in the hands of a few");

use Constant; PUBLIC_DOMAIN = "ALL knowledge NO MATTER WHAT, should be available to us. Whether nuclear arms manufacture, anthrax breeding colonies or the environmental impact of nail-varnish remover in the tanning factories of Southend-on-sea Essex U.K.";

Rise up on wings of desire. Fly from rats lice poverty famine && violence - escape the CODE_OF_WAR enter the palace of the PUBLIC_DOMAIN.

use Constant; POCEDURAL_CORRUPTION = "mathematical models used outside of their purist application follow the agenda of a well aimed machine gun"

(hutton enquiry <=> CODE_OF_WAR)

(WTO <=> (Merchandise trade by region and selected economies, 1980-2002 Excel format (file size 487KB))

(The Revolutionary Politics of Bar-Charts) == (Towards a critique

of data-visualization)

It is a questionable assumption that problems in economics, sociology, politics, language, law and healthcare can be resolved by quantification and computation.

```
sub WhyIsTheBlackManPoor{
    foreach ( $AT ) PoorBlackMan{
        $EmbeddedCulture = &Calculate_
        cultural_context; # returns IMPOSSIBLE
        $Economic_Poverty =
        &EveryRichFatBloatedArseLickingWanker; # returns CODE_OF_WAR
        $NaturalResources; # Depreciated
    }
}
```

(pre-requisites of the computer) == (Money, mechanisation and algebra);

We need wings to investigate procedural corruption wherever and whenever it takes place.

Critique the mathematical formulae (formulation of statistical data) that are used to report on the psychosocial sphere in the media, and on the bottom of bills sent through our doors.

- Language as Data:

Mary, Queen of Scots' head fell ceremoniously from her shoulders into a basket. Peterborough, England: 8:30am on 8th February 1587. From under her skirts ran a small dog. The seed master of the modern English Bull Terrier. Mary's plot against Queen Elizabeth I was discovered by comparing her secret communications with a word frequency table of English, derived from Arabic learning.

Paranoid social elites on the way to or from war have always composed, spanned, coded systems by which they and their minions may sleep better at night.

Language as data, a mathematical study of the periodicity or norms of word use in a language. In English text generated from some none linguistically impaired peoples, 'the' makes up 6.18 percent of the corpus of English words. We find that 43% of the corpus is pronouns, conjunctions, other function words and a few common verbs. Word frequency is used to inform religious scholars of who authored various parts of various bibles and to inform search engines of content words in web sites, AI development and in detecting the normalcy of language.

Critique_it!

The exceptional fantasies that the social elite has been living through have spawned strange and bewildering hierarchies of knowledge and war. We need to squash these at the level of algorithm and representation. The algorithm creates the scaffolding on which the author of a knowledge based system hangs himself.

Pre-flight checklist:

A critical theory of media systems ecology. To enable and locate weaknesses in systems that keep us grounded. Or look for possibilities for new flight paths.

Data-visualization revised.

Aesthetics of computer-code formation (experiencing the sheer beauty of elegant mathematical patterns that surround elegant computational procedures). How these aesthetics - poetics motivate peoples or allow for the formation of amnesia in the construction of oppressive abstraction.

(Oppressive abstraction) == (History-> from the personal plunging in of the knife to missile guidance systems)

The bomb seen from the point of view of the pilot is remarkably beautiful->(oresome) == OPPRESSIVE->(abstraction).

History of computing - both hardware and software from the VISIONARY->(depreciated) -> (the Birth of the telescope) -> to the present. The economy and cultures of key algorithms and hardware.

Subroutine(Descartes {AT} Waag->{Amsterdam} - the executed coat-thief & the birth of hardware){

Did Descartes' feet, in ancient times, meet the hand of Rembrandt?

"the body as a machine animated by soul" ==
'culture of dissection'
```

Sawday places Descartes in Amsterdam (by then becoming one of the major centres for anatomy in Northern Europe) during the early 1630s at exactly the same time as Rembrandt, and allows the ghostly spectre of a possible meeting between the two deliciously haunting his description of the centrepiece of Rembrandt's painting:

&[Cold - December - Amsterdam - the Waag - Rembrandt paints -> Dr Tulp's forceps are delicately probing the flexor digitorum muscles of Adreaenszoon's [the name of the cadaver, an executed coat-thief] left hand. By pulling on these flexor muscles, the (dead) fingers are made to curl, a gesture which Tulp echoes with his own (living) left hands[One intellect (Tulp's) has animated two bodies, one of which is living and the other is dead. In the dead body, the will -> voluntas -> has been extinguished, but the mechanism -> 'the laws of mechanics' which, Descartes was to explain[&] inhabit all of nature - was still in operation. In the extinction of Adreaenszoon's will, lay the triumph of the intellect.

1642 - Paris - "toothed wheels" (gears) by Blaise Pascal (1623-1662))

Pascal (Hardware origins) <-> (October and November 1647)

While Oliver Cromwell discusses the new Levellers' constitution for England (at the Church of St Mary the Virgin, Putney, Surrey) with factions of the New Model Arm, Descartes pays a call on the sickly young mathematician Blaise Pascal (Pascal Programming language)->{honour} for (mechanical calculators).

Descartes wants to speak to Pascal about his vacuum experiments, but, seeing how weak he looked, Descartes volunteered some medical advice:

```
return (bed-rest and a lot of soup (force
bouillons));
}
```

In this city's dark gates - the tree of knowledge leads to this mansion built on misery. Here the dress code of secrecy cloaks the flesh in fear. This is how the proprietary city gets built, Hidden in every proprietary street, In every proprietary house, In every proprietary possession we meet.

NO to TAX (True Levellers 1647)->{Diggers} != (Public money being spent on proprietary systems)

guarantee data archaeologist access to the knowledge based media archives we create

Rise again the true Levellers-republic, rise on wings of knowledge flowing in the domain of the many. For heaven is more knowledge than one man can muster in a lifetime. For hell is more knowledge than one man can muster in a lifetime.

Charity would be no more if we did not make somebody poor. Mutual fear brings peace until our market share increase.

To be done:

Place the death mask of Blake (National portrait Gallery, London) on the skull of Descartes (Musée de l'Homme, Paris) & bring me the head of Oliver Cromwell the traitor (buried somewhere in the precincts of a Cambridge college) that I may relieve my bowls within that most disappointing of craniums.

Harwood

Ok. I am one such writer.
I've been tortured by your machine.

I don't want to know why anymore, but i want to bring
the irony of your censorship to light in light of the
below, by blow, by what right - oh light of the
literary world.

[in]justly,

We are now at a critical point in the whole of philosophy.=20
Thoughts which are very exact and very pertinent, which in
reality, seek (whatever the content and the conclusions may be)
the ideal of a uniform distribution of concepts around a certain
attitude or singular and characteristic aspect of mind of the=20
thinker, must nowadays try to recapture the diversity, the=20
irregularity and the unexpectedness of bygone thoughts; and
their order must set in order their apparent disorder.
They must reestablish the plurality and the autonomy of the mind
as a result of their own unity and sovereignty. They must=20
legitimize the existence of what they have convicted of error
and destroyed as such, they must recognize the vitality of
the absurd, and fecundity of the contradictory, and sometimes
even feel themselves inspired as they are by the universality
from which they believe themselves to spring, restricted to the
particular state of mind or individual characteristics of a=20
certain person. And this is the beginning of wisdom and, at the
same time, the twilight of philosophy.

THE WAR TO GET MY MESSAGE OUT

```

1      WAR
2      it just seems that all I do is write stupid poetry
3      h
4      it just seems that all I do is write stupid poetry
5      damn this is taking me to some poetry site
6      i did not want to go there or anywhere else
7      i just wanted to say we are living in horror
8      worry about janet jackson but don't let people marry
9      damn that also went screwy I can't use these lines any more
10     damn that happened again ah well i won't use apostrophe
11     damn I did it again anyway the fucking assholes in
    washington
12     should burn in hell NOW on this earth so we can dance
13     around their burning corpses do you get me do you hear me
14     this nation is obscene we worry about a breast have 2 mil
    in jail
15     most of us believe in fucking god I want to torture god
16     that was weird just got a -- MOST: of
17     so what is MOST?
18     man noat
19     it's different than LEAST but a lot like LESS
20     damn that apostrophe again why on earth now stop me
21     h
22     i dream bush is burned alive is tortured with his fucking
    god
23     i dream they all disappear i don't care if they're angels
24     two apostrophes and that's ok
25     damn that wasn't
26     either was that i don't care if they're perfect goodness
27     let them keep their fucking heaven
28     i don't want to go there i won't go to hell either
29     i'll find my own space i won't let them in
30     we are evil all of us burn us alive
31     kill us before we spread across the earth
32     i heard some of us are in antarctica
33     the hell with antarctica kill us there too
34     i'll walk on a rock and be on a rock
35     damn again again
36     hh > zz
37     h > zz
38     pico zz

k27% let them keep their fucking heaven

Subject: Words against rehearsal

for Geoffrey Soar

Words against rehearsal, struggle of space, of doing and riskier fun inputs? It is a world! it is a world! it is a world! They operate as do ourselves, ourselves. To drift from a scrap of space? It is a world they operate as do ourselves. A scrap, eventually, of disheartening phrases.

Words against rehearsal, struggle of wit, stilled before print, without preparation, hand-written with corrections, however suitable, aethereal emptiness... know nothing

Words against changes. In a way. At present.

Particular energy. To produce something... Think of information as a way of pleasure. It is a copy. The detritus of senses. The detritus of a me. Is given a couple of words. Which trick.

It's a focus of its phrases. Gestural lingual.

I mean. In front of print without preparation, written up by hand, with a poetry to one cogency. In language. Strongly... Might not restrict ourselves... Stereotyped. Emaciated form. Separated presence.

There is a healthy sense of word. To signify alteration. The word reappeared in the image. I mean. I hear. A poetry to produce something exposes itself, beyond estimation. Material. In the core of considerably more work. Give up hope of something of yours. That's a commencement. To signify alteration. Of uncertain fatality. One which had been in front of itself. To manifest... Find language. And that starts at the moment opening. And is involuntary. Clinging, while trying not to be human.

--rw----- 1 root root 42470 d c 23 13:07 message :
Un monde   1 dimension : la ligne de commande.

Une fen tre f ma gauche me permet de poser mon regard f l'ext rieur
de la pi ce, d'ouvrir l'espace int rieur sur l'espace ext rieur.
C'est une
rencontre entre deux "esp ces d'espaces"; une fen tre est en
quelque
sorte une interface, un point de vue. La fen tre permet l' vasion,
l' loignement, par le truchement conjoint de l' eil et de l'esprit,
d'un
lieu o  est situ  le corps physique. C'est ainsi, que lorsque je me
trouve ici,   cette place qui m'est famili re, face   face avec
l' cran
de cet ordinateur, il me suffit de tourner l g rement la t te de
c t 
pour aller quelques instants voyager dans les entrelacs des
branches des
platanes, parsem s de quelques rares feuilles de couleur grises et
brunes, d'observer les nu es sombres glisser lentement au-dessus
des
immeubles couleur sable. Pour cela, la fen tre est magique et
fascinante, c'est la br che qui permet   l'esprit de sortir de
lui-m me, de ce qui l'enferme, des lois des r gles et des
conventions de
toutes sortes. C'est "l' eil du vent" [WINDOW].

Non plus   ma gauche mais devant moi, le moniteur de mon
ordinateur,
 cran cathodique de 17 pouces. Je l'aimerais plus large plus plat,
j'aimerais parfois le voir rivaliser en taille avec la fen tre
qui donne
sur le boulevard, sur le ciel gris et pluvieux aujourd'hui. Car
  sa
man re il me m me vers un autre imaginaire, vers une autre forme
de
r verie qui lui est propre. Un r ve de mots, de formes et d'actions
pareil   nul autre. Dans sa capacit     veiller et transporter
l'imagination, je le comparerais au livre, car telle l' criture
qui code le monde r el et le retourne   l'esprit, une ligne de
commande
inscrite dans un shell met en branle   l'int rieur de la bo te
grise de
l'ordinateur, un programme qui peut  tre toute une histoire, une
aventure   lui seul. [Combien de temps pass    chercher la solution
d'une  nigme!]

Dans un monde de plus en plus domin  par la culture de l'image
(TV, des
films, des dossiers jpg gif gif anim s png... ou par l'image de
soi -)-
j'ai envie de passer du temps   r soudre des probl mes, des  nigmes
avec
des mots. J'ai pass  d j  de nombreuses heures   trouver la
solution de
certains probl mes ou vivre parfois des aventures sans solutions,  
explorer des centaines de lignes de codes que la plupart du temps
je
comprends mal mais qui me permettent d'autres man res de penser,
d'explorer d'autres processus de cr ation, d'opposer un acte de
r sistance contre ce que l'on nous impose trop facilement.

J'observe quelques instants le boulevard, les promeneurs, leurs
all es
et venues. Le mouvement subit et blanc d'un envol de pigeons dans
l'espace gris, fluide qui s' coule imperceptiblement. J'essaie de
percevoir  galement en moi, ce qu'est ce mouvement, cette fuite
ou ce
flux comme si je pouvais ouvrir encore mille et unes fen tres
suppl mentaires, invisibles sur d'autres espaces et y inscrire des
tentatives d'existences nouvelles.

Quelque chose s' coule, je le sais; quelque chose d'immense dont
on ne
per oit que fragments  pars et morceaux, telles les pi ces d'un
puzzle  
jamais inconstitu ...

Hello. I am looking for my son's biological father. His name is
Sebastian Sean Brown, but goes by Sean. His parents are Geri and
Albert
Brown and last I knew where living in Mississippi somewhere. ...
I left for the military in 1984 leaving behind a pregnant
girlfriend, I
havent seen nor heard from them since then. Tammi and I have a
18 year
old daughter together and I have been trying very hard t...
Missing my Friend, and his Sister Lani, (Student, Cal State.)
Last known
address: Vancouver, Washington. Possibly later moved to Portland,
Oregon
area. Formerly with US Bank. Guitarist for the band: ID...
Between end of August 1979-early Sept 1979, I went to the island of
Alonissos, in the Greek islands (Northern sporades) with my friend
Chris. We stayed as I remember at a hotel or resort called
Marpou...
I met Otto in Feb of 1998. He helped me out of a very bad

situation. He
is several years younger than me so when I found out that I was
pregnant
I didn't want him to feel like he was in over his hea...
Last seen while visiting N.Y. She is a very special person in my
life.
Last known employment was with Earl,Palmer,Brown in N.Y.C. company
went
out of buisness. last know was living in
I knew Sumie Moriya in Yokohama, Japan while serving in the Army of
Occupation [1947 - 1948]. Sumie had a brother who was a Kamikaze
Pilot
that did not get a chance to fly his mission. In 1948, I retu...
Chris and I were in love. My drug addiction took over and I lost
him. He
went in the Army to serve his country. I have been clean for the
past 15
years and am happily living in New Hampshire with m...
Andres & I dated and I was so in love with him. We broke up
because I
was young and ignorant. I never stopped thinking about him and
I would
really like to see him again. He has 2 cousins na...

Hair:
Brown Weight: approx. 100lbs + Occupation: possible working for any
department stores. Old occupation was Nordstrom (Horton Plaza...
I met bill while he was stationed at castle air force base in
winton, ca
I was living in visalia, ca at the time . we dated for about a
year and
then i lost contact with him and he went back home. I a...
My name is Paula. I'm looking for my ex-husband GEORGE W. LLOYD.
DOB
2-2-43. We were married 1980-1984.We lived in the Des Moines,
Iowa area.
After 1984,George has lived in Iowa, Georgia, Florida and ...
We dated when we were both living in SD. We kept in touch a while,
but
we have both changed cities again and I would love to get in
touch. I
haven't stopped thinking about Steve since I met him.
Roger was in the Army stationed at Ft. Carson (571st Med.?)in
1985-1988,
he was a crew chief for a madevac helicopter. I'm just wondering
how he
is.
Linda I have been looking for you all these years
I can not get you out of my heart, love Melsom
Georgia and I worked at Wendy's in petaluma in 1986. She moved to
rohnett park and I forgot to get her new phone number. She's such
a doll
and great friend, I'd like to get back in touch with her. To ...
Known him since 1991.
Met in logan a wonderful man who used to drive cab my best friend
missing very much would like to hear from him need to know how
he is
doing.. very much in love with my memories of him.. if you have ...

Subject: mezangelle vs english [read translation]

Guilt in Gilt-Skin: Pointer Decay [vs: Decoy] 10:43pm 17/03/2004

[A 4Dimensional dedication goes here]

Read this and do not code: "wacking memories tracked and
cauterized.
wildfiring whilst caught in slow-leakage motion"
Study this and do not parse: "rage stories looped and hiding while
goats
blink and leyline stamp"
Scan this and do not flood: "shuffling in insectile heat. bite
marking and
echo milking [within ghost figure-lures]"

Shallow copy of a pointer: c\licking between a lone wolfed self
and shelved
Oneness
Addressing the operator: shuttering clay & silicon (quartz toothed)
chips
and wool swathes in earth claimed decay
The destruction of a dynamic: deletion of blink rates and retrieval
reminders

.....his neck with lush skin definers in connection decay
vs gene
engineered [de]coyness

.....blowing apocalyptic epoxy [xy-ing] or callous
eucalyptic

.....hoof harmonics and swarmline flocking in my head/heart

.....silence boundaried and silken-gilt memory
flecks vs
guilt crowding

.....paw and pore lust drinkage[s]

.....[i sense and dread you with forced
affective
amnesia]

Subject: reasons for skin

Without it, we'd stick to each other and the bedclothes
It prevents infection
Our insides have to be inside, not outside
Where would we put tattoos?
Without it, men would cut slices out of their faces when shaving
So we can sunbathe
So we are waterproof
To anchor our hair down
Goosebumps
Without it, my cunt would really look like half a pound of chopped
liver
So we can sweat
Freckles
Without it, stretch marks would have no place to go, what would
we stick
plasters to?
Red lipsttick
Circumcision
Masturbation
How else would we describe skinny people?
That record by the Clash on Sandinista
Sand
Massages
Lice, fleas and the wart virus - or are these acceptable
extinctions?
No skin = no fur, the cats would look weird
Leather
Bananas would have no cohesion
Swimming
Saunas

LO[L]Wing 07:48pm 10/08/2004

.hi + lo growling sculpture or melodic pop.edgings
..+ the slant of unknowable accenting....

--

...taking tinsy heart_shards + wrapping them up in feathers in order 2 make a bird of me

+ i'm definitely grounded, at the moment.
broken wings.

--

* pricking tears *

bright.light.reflectors+porcelain clay-faces+crisp.suit.[expression] linings

should i edit?

[18:22] <[mez]> [ie make it all manageable, clinical, serene?]
[18:23] <[mez]> turn of the affectivity tap?
[18:23] <[mez]> i can't get 2 natural.
[18:23] <[mez]> everything is slightly fuguish.
[18:23] <[mez]> generally, i'm feeling a tremendous urge 2 escape.
[18:24] <[mez]> it seems as if the world is slightly glossed with a coat of grey.
[18:25] <[mez]> as i walk my routine sticks in my consciousness throat.
[18:25] <[mez]> i'm edging 2wards a plummeting or soaring momentum.
[18:25] <[mez]> in short, lost in feeling.
[18:25] <[mez]> L>F
[18:26] <[mez]> .thats about it.

[18:29] <[mez]> it feels as if that grey coating is hiding something
[18:29] <[mez]> ...the plummet or soaring indicates change, of some type.
[18:30] <[mez]> not sure where, or how.
[18:30] <[mez]> it might b all isolated 2 internal states?
[18:30] <[mez]> i just don't know.
[18:30] <[mez]> work felt like it was killing me, 2day.
[18:30] <[mez]> killing me..+ momentum...+ appreciation.
[18:31] <[mez]> but its all welling up now
[18:31] <[mez]> [as in feeling not isolated 2 victim rhetoric, like 2day
at work]

[18:31] <[mez]> feeling much freer. much more able to flow within it.
[18:32] <[mez]> less likely to stitch myself with [stereo]typing
[18:32] <[mez]> able to assess whilst creating
[18:32] <[mez]> [like now]
[18:32] <[mez]> survive + adapt.
[18:32] <[mez]> [and mostly, feel].

[18:34] <[mez]> just don't want 2 shortcut by condensing all this feeling
into empty word shells
[18:35] <[mez]> of course..always, in some capacity.

[18:36] <[mez]> "i think i might have been losing that underneath the world"
[18:36] <[mez]> thats beautiful, in isolation.

[18:37] <[mez]> no preempt[y]ing
[18:37] <[mez]> voteva, whenever.
[18:37] <[mez]> i need to sleep + dream violent dreams of action i suspect.
[18:38] <[mez]> [mite counteract the fugue]

[18:40] <[mez]> just caught up here, stretched thru limbic systemics +
swollen with affective dust

x(xpurged) 2 pas | & o|o ~ 2 pro x(xpurged) con prod &
 () watched brotherhood & x(xpurged) it ~ good
 ~... pasd
 +++&...pasd

came sense of 0 and ...lost power 2 heal etc. (4;2)
 all w 0 = 0
 x(xpurged) prod.& turnd from x(xpurged) 2 archaic all
 tm bot X satis/status/faction[s] & call'd out in the

night x(xpurged) & ways it came 2b cast out
 from definition to meaning x(xpurged) this deemed
 good:
 livers like that of calves
 stomachs flat as hungry pythons
 lungs made fresh
 hearts out of jars
 | come as much as mother wrens to feed their young
 o|o breasts made to detach an fash prod declared
 all lux & things of flesh and numbers were made words
 symbols clashed and x(xpurged) was made eternal in
 this world though there was no shortage of food and
 all things were good
 x(xpurged) some in their x(xpurged) in their luminent
 homes hid x(xpurged) x(xpurged)
 mind x(xpurged)x(xpurged)x(xpurged)
 the eternal real x(xpurged) yearning that could not be
 defined but meant x(xpurged)
 to expand not contract x(xpurged) each alone ashamed
 of want when there was no need and so it came many of
 these left x(xpurged) in pairs and by ones to where
 they once burned men and barefoot with uncovered
 heads walked over and under the heat of the desert and
 so it came some of them met x(xpurged) and scores
 crossed paths and in time we each spoke of x(xpurged)
 and that for which we had no want but x(xpurged) not
 fed and not quenched x(xpurged) x(xpurged) x(xpurged)
 hunger and thirst
 for what was not x(xpurged)
 x(xpurged) greater than x(xpurged)
 and in the night the x(xpurged) and they gathered in
 caves and it came to them x(xpurged)

x(xpurged)
 x(xpurged)

embraced and great x(xpurged) x(xpurged)

 Subject: "now we professionals will play chiipa"

[Rasputin UChimpaeen]

sneering, he said,
 "now we professionals will play chiipa"
 4 die all different sizes
 each has its own special namae
 each one fitting differently in the cup
 fitting differently together

a younger man might be the pillar of the joint
 while an older man might look more like stained=20
 panelling, whatever his age, the bookie needs
 an extraordinary voice, and a creative use of line
 to get the customers in

still, all of us yakuza
 bound by our tattoos

now we professionals will play chimpa
 casting bananas down from our codework balloon-trees
 each banana a complicated crystalline storage device
 employing rhodopsin organic imaging platelets developed
 by descendants of russian orthodox monks
 whose voices might've been good for bookie work
 in 1920's Asakusa

Rasputin Samurai walking redlight district 1923
 long beard greasy with swordfish and smelling
 of Kou-rui shochu

You're not in the gang anymore, Eiiji!
 You're banana isn't dipped in Shojui!

Qabalfantomas
 Balfanto mas epitaxialaria
 Prureen Trialphajesturensengloacalli
 Natural Language Scum!
 Leave our track-home barber-pole!!

These Natural Language Scum
 want in our banana-grove,
 our groveless grove, our banaanaless banana..

We started a long time ago here,
 planting bananas in the white arena
 where the black fire dances..

This Eiiji, long faced Russian Boozier!

It's too bad about the chiipa game that day,
 long red roses like tatty bubbles swirled
 and replicated along the seam where four
 falsities clung like clumps of chimp-faced butter
 a nice pucker, the air itself had an asshole
 and out came numbers in happy-banana-drag
 banana shooting white laser made of ultrafast paper
 wet with shochu

happily dog-barrel of dense mud(ra) skin-adobe
 Diogenes Mexican Masked Wrestler
 In his wrestling trunks, a rubber mask of a bearded old man
 sitting there in his bath-tub
 in the middle of the P-Fciao..=20
 The Plaza de la Constituci=F3n was paved in the 1520's=20
 by Hern=Ein Cort=E9s, using stones from the temples=20
 and palaces of the Aztec city of Tenochtitl=Ein he'd destroyed.=20

unconnectable, the dissipating network of associations dis-
associating themselves from the brooding collaboration of time and
energy seeking more than the moment provides.
uncontactable, 404 erroneous attempts to reach across an electronic
void to the anathema of comfort and wandering compassion now
pre-emptively dissipated as the rooftop water world continually
passing by with neural sparks of the rooftop carresses wish distant
comforts.
unbelievable, sounds emanating from within hardened clay alcoves
beyond season and climate reminders of inner warmth and security
the all importance of being here being now with the harmonious
leading me to

Vamp & Revamp
[Modified excerpt from my side of an email exchange w/AS, who
graciously
requested that these comments go public]

Usually when I come up with an idea I start very simple and then
work
towards increasing complexity until I find that the complexity
overwhelms
the piece, at which point I stop and move onto something else. I
find that
too much complexity turns the piece into a traditional composition,
makes it
too conventionally artistic. For whatever reason, I prefer my
pieces to stay
skeletal and schematic and not be too "interesting." I think of
it kind of
like a Matta-Clark building where the skin is stripped away to
expose the
nails and the joints and whatnot that holds everything together.

```
*
$len = length($text);
for ($ii = 0; $ii < $len; $ii++) {
    $sub[$ii] = substr($text, $ii, 1);
}
for ($ii = 0; $ii < $len*$len; $ii++) {
    $mod1 = $ii % ($len - 1);
    $mod2 = $ii % $len;
    $txxx = "$sub[$mod1]$sub[$mod2]";
    print "$txxx";
}
print "\n";

Reviews of Two Works: Lanny Quarles / Alan Sondheim

Lanny Quarles (solipsis) has created/written/produced/configured
Nihon
Zettels; he was kind enough to send me a copy to read. The review
is my
own idea.

I think for anyone interested in the literature of this (not
that)
Century, this book is essential. I'm fascinated by the palimpsest
or
palimpsestual organization / organicism of the whole - but I'm also
fascinated on its deep reading of medieval and pre-medieval Japan
and
gaijin phenomenology - both in relation to the eternal. For it's
eternity,
I think, that's at stake here. There are various languages within
it as
well as languagings, and what I consider to be stele-texts,
matched in
format by the book - texts which begin and end and open up
kabbalah-worlds
and words in the midst of others.

There are positionings of male and female, demiurge and Noh,
classifica-
tions and lists, broken syntactics, shattered and reassembled
mythologies.
The text is astute, almost schizoid at times, but its open words
are the
poetics of infinity; Bachelard would have loved it.

I worry constantly that works of this quality - and I'd include
class work
here - Joel Weishaus' or mez' absolutely brilliant web/write\
rite/lit for
example - will be lost, ignored, bypassed in terms of critical

or even
canonic acceptance. The world - and the world of distribution -
are both
becoming increasingly porous - it's easier than ever to find these
works
and absorb them, offline and online, self-published and universally
published.

Get this book!

The Blurb:

Titled after Arno Schmidt's magnum opus *_Settels Traum_* (Notes
Dream),
Lanny Quarles' Nihon Zettels Traum is a samizdat email-list series
carried
out on Wrying-L transferred to paper. Including all and some
repeats of
the original series of emails written after the author had returned
from
Japan. The author sought to re-immers himself in the wonder and
strangeness of his first visit to Japan via the internet.
Interspersed
with bits of sampled literatures both of web and non-web origin,
the
author freely improvised and remixed to create a perplexing and
"informatic free jazz" interpretation of his journey to and back
from the
land of Nihon.

Price \$25.00 for color copy cover and velo binding
and \$12.00 for a simple paper cover with hand drawn noiseglyph
and signature

Lanny Quarles
3236 SE 52nd Avenue
Portland Oregon,
97206

Sampler

I've been putting my work on a DVD+ sampler. Please note this is
DVD+ -
which plays on almost all computers, but probably not on a standard
DVD
player. The work as usual is within a directory; click on a piece
to view
it. Because of the format, I've been able to include a large
number of
full-frame videowork. Much of the material is related to
choreography,
codework, thinking through body/language/sexuality/'the political/
etc.

You can also buy this for \$25; apologies for the cost, but a lot of
equipment went into the production/technology of the disk.

Order from

Alan Sondheim (sondheim {AT} panix.com)
432 Dean Street
Brooklyn, NY, 11217

Other reviews in a 'standard edition' will follow within a week
or so.

Post-digital

...

O.O

[–empyre–] Post-Digital Listings
From: Florian Cramer
To: <empyre@lists.cofa.unsw.edu.au>
Date: Sun Feb 16 04:04:42 EST 2014

It might make sense to add a historical dimension. Cascone introduced "post-digital" in the early 2000s to refer to glitch music and low-tech digital aesthetics while today it has different connotations. I'd still maintain that the term sucks, but the great resonance that it has (even here on this list where we're supposedly discussing something else, although publishing is perhaps the strongest example of ambiguous states between analog and digital) proves its relevance.

Just a sketch, highly simplified and polemical:

digital 1995-2004 | post-digital 1995-2004
interactive installation art (Jeffrey Shaw) | net.art (jodi)
virtual reality | mailing lists
MAX/MSP | glitch
techno | 8-bit
multimedia | codework
true color | ASCII
Generation Flash | shell scripts
MIT, ZKM | self-organized spaces
gaming | modding
Wired | Neural
Edge.org | Nettime

digital 2005-2014 | post-digital 2005-2014
blogs | zines
4chan | Dexter Sinister
Ubuweb | artist-run bookstores
Vimeo | handmade film labs
mp3 | vinyl, cassettes
mobile device | offline
Computer Music Journal | The Wire
Singularity Movement | Object-Oriented Ontology
Pirate Parties | Occupy movement
Bitcoin | timebanks

My own preferred view on post-digitality would be something that bridges a couple of the 2005-2014 opposites. That could be a plan for 2015-2024.

–F

(Note that this posting doesn't take itself too seriously.)

A quick aside...

Funny how no-one identifies my 1996 term "post-modernism" here, though I can see why (given it was a net.art element + avatar label & not a theoretical posture): <http://www.artelectronica.com/artwork/cutting-spaces> + <http://xchange-re-lab.net/xchange4/xchange4.html>. Maybe it's not relevant here!

Chunks,
Mez

[–empyre–] Post-Digital Listings
From: David Berry
To: <empyre@lists.cofa.unsw.edu.au>
Date: Wed Feb 19 12:26:19 EST 2014

Hi Michael (and others),

I think the key with thinking through the cognitive map I presented is not to look for a final reconciliation or overall unity, as I don't necessarily think that that is even possible within a moment of variable modulations in our current social formations as computational societies – i.e. they are not necessary meant to be "models" as such. Rather the table I offered is meant to provide constellations of moments within a "digital" as opposed to a "post-digital" ecology, as it were, and, of course, a provocation to thought. But they can be thought of as ideal types, if you like, that can provide some conceptual stability for thinking, in an environment of accelerating technical change and dramatic and unpredictable social tensions in response to this. The question then becomes to what extent can the post-digital counter-act the tendencies towards domination of specific modes of thought in relation to instrumentality, particularly manifested in computational devices and systems? For example, the contrast between the moments represented by Web 2.0 / Stacks provides an opportunity for thinking about how new platforms have been built on the older Web 2.0 systems, in some cases replacing them, and in others opening up new possibilities which Tiziana Terranova has pointed to in her intriguing notion of "Red Stacks", for example (and in contrast to Bruce Sterling's notion of "The Stacks", e.g. Google, Facebook, etc.). Here I have been thinking of the notion of the digital as representing a form of "weak computation/computationality", versus the post-digital as "strong computation/computationality", and what would the consequences be for a society that increasingly finds that the weak computational forms (CDs, DVDs, laptops, desktops, Blogs, RSS, Android Open Source Platform [AOSP], open platforms and systems, etc.) are replaced by stronger, encrypted and/or locked-in versions (FairPlay DRM, Advanced Access Content System [AACS], iPads, Twitter, Push-notification, Google Mobile Services [GMS], Trackers, Sensors, ANTICRISIS GIRL, etc.)?

These are not just meant to be thought of in a technical register, rather the notion of "weak computation" points towards a "weak computational sociality" and "strong computation" points towards a "strong computation sociality", highlighting the deeper penetration of computational forms into everyday life within social media and push-notification, for example. Even as the post-digital opens up new possibilities for contestation, e.g. megaleaks, data journalism, hacks, cryptography, dark nets, torrents, the Alexandria Project, etc. and new opportunities for creating, sharing and reading knowledges, the "strong computation" of the post-digital always already suggests the shadow of computation reflected in heightened tracking, surveillance and monitoring of a control society. The post-digital points towards a reconfiguration of publishing away from the (barely) digital techniques of the older book publishing industry, and towards the post-digital singularity of Amazonized publishing with its accelerated instrumentalised forms of softwareized logistics whilst also simultaneously supporting new forms of post-digital craft production of books and journals, and providing globalised distribution. How then can we think about these contradictions in the unfolding of the post-digital and its tendencies towards what I am calling here "strong computation", and in what way, even counter-intuitively, does the digital (weak computation) offer alternatives, even as marginal critical practice, and the post-digital (strong computation) create new critical practices (e.g. critical engineering), against the increasing interconnection, intermediation and seamless functioning and operation of the post-digital as pure instrumentality, horizon, and/or imaginary.

See for example:

<http://stunlaw.blogspot.co.uk/2013/10/digital-breadcrumbs.html>

<http://www.euronomadef.info/?p=1708>

[-empyre-] empyre Digest, Vol 111, Issue 5
From: Michael Dieter
To: <empyre@lists.cofa.unsw.edu.au>
Date: Mon Feb 10 05:44:17 EST 2014

Something else I want to ask about.

This is the definition that the Post-Digital Research group settled on for their publication:

"Post-digital, once understood as a critical reflection of "digital" aesthetic immaterialism, now describes the messy and paradoxical condition of art and media after digital technology revolutions. "Post-digital" neither recognizes the distinction between "old" and "new" media, nor ideological affirmation of the one or the other. It merges "old" and "new", often applying network cultural experimentation to analog technologies which it re-investigates and re-uses. It tends to focus on the experiential rather than the conceptual. It looks for DIY agency outside totalitarian innovation ideology, and for networking off big data capitalism. At the same time, it already has become commercialized."

I'm curious about the emphasis here on the experiential, rather than the conceptual. Why emphasize one over the other in this way? What works or practices did the group have in mind? In a weird way, this description actually reminds me of something like relational aesthetics.

Probably should have linked to it again (it was in a couple of earlier posts). Definition is from here: http://www.aprja.net/?page_id=1391 It was collectively articulated at the workshop in Aarhus, I believe.

Thanks for an interesting discussion topic this month!

I agree with your assessment that this limited configuration of the post-digital is already divorced from any real politics of difference or antagonism and so yes it is similar to relational aesthetics. In contrast, my own formulation of the post digital, which I presented at the Transmediale phd symposium in 2012 is centered in queer and trans women of color's political and aesthetic practices. The horizon for the post-digital isn't hipsters, reddit and google, as in Florian Cramer's essay "What is post-digital?", it is a reconsideration of thought and communication outside of the bounds of western conceptions of knowledge and rationality.

You can read an essay version of what I presented at the #BW/PWAP transmediale symposium here, where I list a few examples of aesthetic works that may be understood as post-digital:

<http://median.newmediacausus.org/caa-conference-edition-2012/local-autonomy-networks-post-digital-networks-post-corporate-communications/>

(a short version is in the 2013 edition of APRJA:
http://www.aprja.net/?page_id=46)

and a video of me giving this as a keynote at the Dark Side of the Digital conference is here:

<http://transreal.org/talks-and-interviews/>

The writers for the post-digital research issue of APRJA articulate conceptions of politics that completely fail to address the importance of moving on from western systems of knowledge that are embodied in the digital, which is unsurprising considering their own apparent subject positions. For example, in The Archive and the Repertoire, Diana Taylor has written extensively on the ways that colonial regimes insisted on writing as the only legitimate form of knowledge as a way to disempower colonized subjects, and digital systems of storage reproduce that hierarchy by eschewing embodied and emotional knowledge that is not reproducible through digital media.

thank you,

micha

Micha,

I'm taking great issue with this summary of my text. It is greatly distorted. If you had read it carefully, you would have seen that it actually refers to postcolonialism.

Btw., your categorical split between "digital" and "embodied" knowledge is as Cartesian and Western as I can get. What's even worse, by attributing the latter to non-Western culture, it's producing a highly stereotypical image of Non-Western cultures and systems of knowledge. I recommend to read up, among others, on Ron Eglash's ethnomathematics (or any history of mathematics, for that matter).

Hi Florian, thanks for your reply.

In your essay "What is Post-Digital", I did see your discussion of the postcolonial, which seems to be a very short part of your essay which doesn't discuss any of the gendered, racialized violences of colonialism. Your discussion of the postcolonial is:

"Postcolonialism does not mean the end of colonialism akin to Hegel's and Fukuyama's "end of history", but quite on the contrary its transformation into less clearly visible power structures that are still in place, have left their mark on languages and cultures, and most importantly still govern geopolitics and global production chains. In this sense, the post-digital condition is the post-apocalyptic condition after the computerization and global digital networking of communication, technical infrastructures, markets and geopolitics."

and you conclude the essay with:

"If post-digital cultures are made up of, metaphorically speaking, postcolonial practices in a communications world taken over by the military-industrial complex of only a handful of global players, then it can most simply be described as mental opposition to phenomena like Ray Kurzweil's and Google's Singularity University, the Quantified Self movement, sensor-controlled "Smart Cities" and similar dystopian techno utopias.

Nevertheless, Silicon Valley utopias and post-digital subcultures (whether in Detroit, Rotterdam or elsewhere) have more in common than it might seem. Both are driven by fictions of

agency: <<http://post-digital.projects.cavi.dk/?p=599#fn8>>

There's a fiction of agency over one's body in the digital 'Quantified Self' movement, a fiction of the self-made in the 'post-digital' DIY and Maker movements, a fiction of a more intimate working with media in 'analog' handmade film labs and mimeograph cooperatives. They stand for two options of agency; over-identification with systems or skepticism towards them. Each of them is, in their own way, symptomatic of system crisis. It is not a crisis of one or the other system but a crisis of the very paradigm of "system" and its legacy from cybernetics. It's a legacy which (starting with their mere names) neither "digital", nor "post-digital" succeed to leave behind."

I still hold that your configuration does not address the gendered and racialized forms of difference that underlie the logic of colonialism and which find their expression in western conceptions such as individuality and objectivity that lead to boolean logic and digital computing. Your essay seems to eschew any political possibility for the post-digital in your concluding sentence. If I'm misreading it, I would appreciate your clarification.

I'm not generalizing about non-western cultures, my apologies if my post sounded like that. I mentioned Diana Taylor's book *The Archive and the Repertoire* as one example, where she specifically discusses the Spanish conquest of the Aztecs, Mayas and Incas. Let me cite her more thoroughly to elaborate more on what I meant and not imply any simple separation that might be described as cartesian:

"Although the Aztecs, Mayas and Incas practiced writing before the Conquest- either in pictogram form, hieroglyphs, or knotting systems- it never replaced the performed utterance... What changed with the Conquest was not that writing displaced embodied practice (we need only remember that the friars brought their own embodied practices) but the degree of legitimization of writing over other epistemic and mnemonic systems. Writing now assured that Power, with a capital P, as Rama puts it, could be developed and enforced without the input of the great majority of the population, the indigenous and marginal populations of the colonial period without access to systematic writing."

I haven't read Eglash's work, thanks for recommending it, I'll check it out.

cheers,

micha

Hello Micha, hello list,

> I still hold that your configuration does not address the gendered and racialized forms of difference that underlie the logic of colonialism and which find their expression in western conceptions such as individuality and objectivity that lead to boolean logic and digital computing.

In my view, it's not that simple. Boolean logic - which one can equally find in the reasoning of Chinese 4th century BC philosopher like Hui Shi (Hui Tzu) - and digital computation (literally=computing with your fingers) are by far not only Western conceptions. I agree with you that Western culture and science have pursued them to their extreme. But as you point

out yourself, dualisms of, on the one hand Western/individualist/objectivist/boolean/digital vs. Non-Western/non-individualist/subjectivist/non-boolean/non-digital are in themselves romantic (and colonialist) Western stereotypes. On top of that, they're historically wrong. For example, the modern concept of the number zero, without which there would be no binary computing, was invented in 9th century AD India, with precursors in Egypt and Mesopotamia but not in Europe. Identifying digitality with Western colonization would unintentionally foster a Eurocentric view of cultural, scientific and technological history.

> Your essay seems to eschew any political possibility for the post-digital in your concluding sentence. If I'm misreading it, I would appreciate your clarification.

You mean the sentence 'It is not a crisis of one or the other system but a crisis of the very paradigm of 'system' and its legacy from cybernetics. It's a legacy which (starting with their mere names) neither 'digital', nor 'post-digital' succeed to leave behind.'

I don't quite get how you read this as 'eschewing any political possibility'. All I am trying to say is that neither 'digital' nor 'post-digital' are the right concepts for criticizing and leaving behind cybernetic systems thinking, or in your words, boolean logic and digital computing. After all, if you call something 'post-digital', you don't leave the digital paradigm behind but still keep it (dialectically) in place.

> "Although the Aztecs, Mayas and Incas practiced writing before the Conquest- either in pictogram form, hieroglyphs, or knotting systems- it never replaced the performed utterance... What changed with the Conquest was not that writing displaced embodied practice (we need only remember that the friars brought their own embodied practices) but the degree of legitimization of writing over other epistemic and mnemonic systems. Writing now assured that Power, with a capital P, as Rama puts it, could be developed and enforced without the input of the great majority of the population, the indigenous and marginal populations of the colonial period without access to systematic writing."

What is being described here is a pre-colonial and pre-digital vs. a colonial political system organized through alphanumeric (and hence digital) writing. The next question would be: Which post-colonial practices are also post-digital?

Apart from that, one should not brush over the complex ambivalence even of formal systems, being tools of both control and of freedom to quote Wendy Chun. There are similar ideas in postcolonial theories like that of Homi Bhabha (for whom colonialism/postcolonialism ends up as a two-way process). Regarding the gendered form of difference, to use your words, inscribed into digitality and computing, I think that it might be historically interesting to reread Sadie Plant's "Zeros and Ones"; a work whose cyberfeminist optimism regarding digital networking has become perfectly counter-intuitive in the age of Google, Facebook and the NSA, but at least documents a different reading of the very technology that we now prefix with "post-".

> I haven't read Eglash's work, thanks for recommending it, I'll check it out.

One of his books has just been made available on Monoskop:
<http://monoskop.org/log/?p=10597>

By the way, it's rather unfortunate that the papers of the "research group" are linked and cited here as if they were anything canonical. As a matter of fact, these are preliminary, unedited papers/drafts written by a highly diverse workshop gathering of artists, media studies people and arts/media Ph.D. candidates at Aarhus Kunsthall. The definition of "post-digital" that Michael cited is partly tongue-in-cheek - it was based on a voluntary data mining of our drafts where we determined the most commonly used words and built a definition from them. We ultimately rewrote the drafts for transmediale.14's newspaper based on the same principles, with a high score for those texts that managed to squeeze in as much of that vocabulary as possible. That playful context becomes a bit clearer in the newspaper. It's unfortunate that these texts are online without referencing the context. Which ultimately says a lot about embodied and disembodied writing, no matter whether it's digital or not.

[-empyre-] empyre Digest, Vol 111, Issue 5

From: Robert Jackson

To: <empyre@lists.cofa.unsw.edu.au>

Date: Tue Feb 11 05:10:13 EST 2014

Micha, everyone...

As someone who worked as part of the Aarhus post-digital writing group, I'd like to also address your remarks.

Point 1:

<The writers for the post-digital research issue of APRJA articulate conceptions of politics that completely fail to address the importance of moving on from western systems of knowledge that are embodied in the digital, which is unsurprising considering their own apparent subject positions.>

This is profoundly untrue and thunderously misguided. Had you attended the workshop in October, you would have found that we addressed western conceptions of rationality and knowledge at some length and with great care. Echoing Florian's comments, it's not as if we all thought the terms 'post-digital' or even 'the digital' were anything but messy and politically ambiguous: the context of that process appears to have been reinterpreted as some sort of pro-Western manifesto, rather than a researcher workshop or a tongue-in-cheek operationalisation of digital principles/definitions.

In any case, our contributions - both online and for transmediale - remain unpublished, so if you want to aim your critique, aim it at the finished APRJA journal when it arrives: not at a moving target.

Point 2:

As per your rejoinder to Florian's point: <I still hold that your configuration does not address the gendered and racialized forms of difference that underlie the logic of colonialism and which find their expression in western conceptions such as individuality and objectivity that lead to boolean logic and digital computing. Your essay seems to eschew any political possibility for the post-digital in your concluding sentence.>

Really? In addition to Florian's comments on cyberfeminist alternatives and western/non-western conceptions of number, I'd love to know how western conceptions solely lead to boolean logic and digital computing? Computational reason / computability and solutionism most certainly, but the actual infrastructure of formal systems? If you're going down that route, I'd argue that your own position starts to eschew political alternatives on a different level, mainly as it blurs the ontological affordance of computation (which is wholly different from digital transmission btw) with epistemological principles.

Seems rather anthropocentric to suggest that material infrastructures are correlated to reproduce similar Western principles, because they are just an "expression" of them. Computational infrastructures are far messier than that sort of simple divide. How are we to provide alternatives within such infrastructures if they are *just* an expression of western concepts? Seems bizarre to me. Last time I checked, both NSA and NIST's mathematical standards of pseudo-random number elliptical curve encryption didn't facilitate mass surveillance because we collectively failed to "think differently." It is impossible to address systemic problems with subjective solutions (which, actually, isn't a bad method of critiquing post-digital reflection).

Also on your account, the output from trans-gender gaming communities, such as Anna Anthropy's Dys4ia, Merritt Kopa's Lim or the research of Samantha Allen (amongst many others), which rely on such processes, would contradict such an assertion: as would other examples such as the extensive infrastructure of mobile banking in parts of Africa: hardly what I'd call westernised.

Cheers
Rob

>
> -F

Sure, it was noted in my link that the papers were drafts, but surely they're worth reading anyway for people who don't have the final

version! Again I hope that the PDF is up soon. I managed to get hold of the newspaper version and it's really a great publication. But thanks for adding some much needed context, the tongue-in-cheek aspect is certainly worth noting, especially since you also appear to have 'won' the publication by clocking in the highest score Florian!

And indeed, despite this ironic approach, why think in terms of canonicity? Post-digital seems to be more like a topic. That was immediately apparent from the diversity of perspectives at TM; it was unfortunate people didn't have more time on that panel in that respect. Nevertheless, as something that relates to how Alessandro's research into publishing has developed, but that precisely allows for diverse points of engagement, I thought it might be worth drawing some attention to, if only to allow for further discussion and points of view. Ultimately, I think one obvious strength of the term is that it appears strongly led by an exploratory/experimental sensibility, rather than ideal concepts or theories of best practice.

**[-empyre-] February Introduction
- HYBRID BOOKWORK: Experimental
eBooks, Post-Digital Publishing**
From: Michael Dieter
To: <empyre@lists.cofa.unsw.edu.au>
Date: Tue Feb 4 06:25:31 EST 2014

Hi all -empyreans-

I'd like to introduce the theme of Hybrid Bookwork for this month, but first, I need to thank the -empyre- team - Renate Ferro, Tim Murray, Simon Biggs and Patrick Lichty - for supporting me in putting this together. It's really a great opportunity to develop some ideas on a topic I've become quite interested in and excited about, and I hope that it's also a useful and thought-provoking discussion for all subscribers.

Second, and crucially, thanks to all our guests who signed up for February, and have volunteered their time and expertise! It often seems as if there's nothing but increased demands on our time and attention these days, so this sort of generosity and commitment is I think really commendable.

So with that said, here's the description of this month's theme and a list of all involved...

HYBRID BOOKWORK
Experimental eBooks, Post-Digital Publishing

False starts and speculative projects have typically characterized attempts to disrupt and innovate the printed book through new media; however, the recent popularization of tablets and e-readers, emergence of commercial

platforms for production, distribution and sharing of e-books, and ongoing digitalization of printed archives suggests an important threshold of sorts. Here, a distinct computability has taken hold following the aggregative and indexical aspects of file formats, data-mining supported by addressability and mark-up, tethered feedback of devices, and the flexible affordances of reflowable layouts. While digital technology has been integrated into print publishing processes for several decades, such developments suggest a profound material reformation of how books are produced, distributed, experienced and mobilized as resources. It should be no surprise that issues and controversies around intellectual property, privacy, creativity, sustainability, reading (distraction/attention), authorship and the fundamental status of the book as an epistemological object regularly erupt and unfold within these settings.

In relation to the significant uncertainties of publishing, artists, authors and designers have begun exploring new possibilities and re-configurations of contemporary bookwork. Critical and exploratory projects have addressed questions of access, the quantification of content, creativity and epistemological questions at the intersections of language and machine processing, at times drawing from histories of avant-garde practice, artist's books, concrete poetry, spam, web detritus and subcultural production. Likewise, engagements with print have become increasingly experimental by reflexively harnessing the materialities of paper, while translating and twisting software-based techniques into challenging neo-analog compositions. Described as 'post-digital' or the 'aesthetic of bookishness', such dynamics intersect and crossover between media, and speak to the complex hybridity of the book today.

Over the month of February, the -empyre- list will discuss economic, epistemological and aesthetic stakes that characterize this moment, inviting several guests to reflect on and respond to the topic of hybrid bookwork and the potential new directions of contemporary publishing.

Featuring: David M. Berry, Mercedes Bunz, Florian Cramer, Angela Genusa, Lukas Jost Gross, Alessandro Ludovico, Silvio Lorusso, Søren Pold, Domenico Quaranta, Rita Raley and Benjamin Shaykin.

Moderated by Michael Dieter.

Many thanks again, I'll post an introduction to our first contributors tomorrow with some background information about them, along with some starting points for the first week.

Until then,

--

M.

3.0

[-empyre-] Week One - Between Print and Pixels: Computationality, Post-Digital, Hybrid
From: Michael Dieter
To: <empyre@lists.cofa.unsw.edu.au>
Date: Wed Feb 5 01:01:49 EST 2014

Hi all,

I would like to introduce the first three guests for the February topic of Hybrid Bookwork: Alessandro Ludovico, David Berry and Mercedes Bunz. I'll call the theme for this session, 'Between Paper and Pixels: The Book After New Media', to outline some of the broad transformations associated with publishing today.

There are a number of themes that are perhaps taking some note of in order to provide some context for the current dynamic and shifting contexts for the innovative practices that we see emerging around publishing (and other context in cultural production).

Bios are as follows:

Alessandro Ludovico is an artist, media critic, and chief editor of Neural magazine since 1993 (<http://neural.it>). He has published and edited several books, including his latest 'Post-Digital Print: The Mutation of Publishing Since 1894' (Onomatopoe 2012). He is one of the founders of Mag.Net

(Electronic Cultural Publishers organisation), for which co-edited three Mag.net Readers, and also served as an advisor for the Documenta 12 Magazine Project. He's currently curating the virtual exhibition 'Erreur d'Impression' in the virtual space of Jeu de Paume in Paris. He is one of the authors of the Hacking Monopolism trilogy of artworks (Google Will Eat Itself, Amazon Noir, Face to Facebook). He's Adjunct Professor at OCAD University in Toronto, and teaches at the Academy of Art in Carrara and NABA in Milan, and is currently completing a PhD at Anglia Ruskin University in Cambridge (UK).

David M. Berry is a reader in digital media in the school of media, film and music at the University of Sussex. His research interests focus on media/medium theory, software studies, digital humanities, and technology. He is particularly interested in the methodological and theoretical challenges of digital media and has strong research interests in the philosophy of software and critical theory. His latest book is 'Critical Theory and the Digital' (Bloomsbury 2014), and he blogs over at <http://stunlaw.blogspot.nl/>

Mercedes Bunz is a lecturer in Media Studies at Leuphana University, Germany, where she is also Director of the Hybrid Publishing Lab, exploring academic publishing in the digital age. She writes on digital media, journalism and the philosophy of technology, and she has been the technology reporter of The Guardian. Her latest publication is The Silent Revolution: How Digitalization Transforms Knowledge, Work, Journalism and Politics Without Making Too Much Noise (Palgrave Pivot 2013). She blogs regularly at <http://www.mercedes-bunz.de/> and <http://hybridpublishing.org/>. I've been lucky enough to work with each one of them at certain points, and I'm thrilled to have them contributing this week! Some background of why I've asked them to contribute...

I want to invite Alessandro to start off the discussion. Many of you are no doubt familiar with his work, but if not, I want to draw attention to his recent book, 'Post-Digital Print: The Mutation of Publishing Since 1894' (Onomatopoe 2012): http://monoskop.org/images/a/a6/Ludovico,_Alessandro_-_Post-Digital_Print_The_Mutation_of_Publishing_Since_1894.pdf (The fact that text is legit available through the Monoskop Log is perhaps noteworthy itself).

I would describe his book as a history of experimental aesthetic practices articulated through new publishing technologies, and one that speaks in particular to the concept of the post-digital. More generally, it's a tremendous document of a vast array of projects, artworks, print objects, books, pamphlets and magazines that is characteristic of print culture in late modernity and beyond.

The post-digital, in particular, is a term that I'm inviting Alessandro to discuss, along with related ideas that have emerged through his research. And it's particularly relevant off the back of Transmediale Festival last week given the Post-Digital Research panel and newspaper publication. The latter is a series of short texts that have been collaboratively peer-reviewed through a workshop on the topic held at Aarhus University last year: https://tm-resource.projects.cavi.au.dk/?page_id=129 Unfortunately, a PDF is not available yet, but Alessandro I'm sure will give an impression of the contents of this publication.

David, meanwhile, has written on a wide range of topics and subjects from f/oss, the philosophy of software, digital humanities, new aesthetic and, quite recently, the post-digital. I've invited him to respond and present his current research, and extend the discussion into some reflections on epistemological implications and political economy concerns. David and I have also been involved with booksprint events with Adam Hyde, which I haven't mentioned in the outline for this discussion, but certainly seem relevant to the discussion!

Finally, I've asked Mercedes to contribute with her extensive experience as a journalist and academic covering a range of topics in digital culture, including a recent in depth study of algorithms and knowledge production. She leads the Hybrid Publishing team of which (full disclosure) I am also member at Leuphana University Lüneburg. I was hoping that she might broaden the discussion with some reflections on Alessandro and David's posts, and perhaps provide some further consideration based on the work currently being done in Leuphana.

And of course, I invite all subscribers to chime in, respond and post to the list over the coming days!

--

Michael Dieter

[-empyre-] Week One - Between Print and Pixels: Computationality, Post-Digital, Hybrid

From: Alessandro Ludovico

To: <empyre@lists.cofa.unsw.edu.au>

Date: Thu Feb 6 20:42:13 EST 2014

Thanks Michael for the nice introduction.

It seems that Post-Digital aspires to become a 'buzzword' lately, but its meaning seems to be not completely acknowledged.

Many refer to the definition of Kim Gascone in his famous article "The Aesthetics of Failure: 'Post-digital' Tendencies in Contemporary Computer Music", and Wikipedia collects also a fair good amount of other (close) definitions. But many of them are dated a few years ago and still attached to the concept of the digital disappearing in everyday practice, being in a way 'metabolised'.

My personal definition (given within the Post-digital Research conference and PhD Workshop in Aarhus, in October 2013) is that "Post-digital is the space left by the (only apparent) absence of digital."

The "space" here is meant as a negotiable abstract space, previously filled by the digital in its evident forms and interfaces, and now perceptually disappeared, although still there, present, active and eventually engaging us in a new relationship also with non-digital reality.

In its application to the complex and ever mutating relationship between traditional and digital (or offline and online, if you want) publishing, the concept of the 'hybrid' publications seems to be crucial then.

I tried to define 'hybrid' as a publication where it's almost impossible to separate or discern the physical from the digital processes behind, as it'd be the inextricable result of computed processes in a recognisable publishing form (eventually upgradeable or simply changing over time).

There are quite a few examples of early steps towards the hybrid: Martin Fuchs and Peter Bichsel's book "Written Images", "American Psycho" by Mimi Cabell & Jason Huff, Les Liens Invisibles "Unhappening, not here not now", or the recent "The Death of the Authors, 1941 edition" by Constant (An Mertens, Femke Snelting).

Still it seems that we're not there yet, as we'd need more elaborated software instruments transcending the generative paradigm, or a simple inclusion/exclusion logic.

In this sense the Post-Digital Research newspaper publication represents another attempt, conjugating the reflection around various post-digital approaches with its final printed form, in quite a few textual and graphical interesting processes (used in experimental literature or just borrowed from online free tools) involving the writing form, the expression of the different concepts, and the final visual rendering of all of that.

But the hybrid would epitomise the metabolisation of digital in a way that it doesn't simply 'disappear' (or better, we are not noticing it anymore), finally becoming one of our daily natural nutrients, with an active role that breaks all the boundaries (being relegated in a device, or to a specific cultural environment that we associate with it).

This is the starting point of an hypothesis I formulated in the last Transmediale panel, which can maybe sound a bit blatant:

what if digital has been mistaken for a medium but actually is an agent that has transformed existing media? I've started to investigate other traditional media (audio and video, for example) and how their core form is formally still coherent with their analogue one, but substantially transformed by its current digital nature.

The hybrid in publishing, in this sense, is actually embodying this passage very well, as it points us back to traditional media and their possible active and engaging relationship with the digital.
To add more resources to the list:

there has been a special issue of Neural called "Neural #44: Post-Digital Print (Postscript)" (a friend nicknamed it the 'shameless issue') which was meant as an addendum to the book with more content related to the topic.
<http://neural.it/issues/neural-44-post-digital-print-postscript/>

The Post-Digital Print blog is still in beta, but it'll host within this week also the pdf of all the three Mag.net Readers, free to download:
<http://postdigitalprint.org>

It's meant to be a complement to the terrific resource that Silvio Lorusso is making with its Post-Digital Publishing Archive:

<http://p-dpa.net>

I'm also curating (for another month and half, with a final special event in Paris on March 11th) "Erreur d'Impression, Publier à l'Ère du Numérique" a virtual exhibition at Jeu de Paume: <http://espacevirtuel.jeudepaume.org/erreur-dimpression-1674/>

Indeed, Post-Digital Print, the book, has also a physical form (although we successfully experimented with its digital form just before that):
<http://www.onomatopoe.net/project.php?progID=c3149ad3c7c0b4bb6e80e4c770ee5a8c>

Although all more or less connected to my personal work, I hope that they can help the discussion.

> I want to invite Alessandro to start off the discussion. Many of you are no doubt familiar with his work, but if not, I want to draw attention to his recent book, 'Post-Digital Print: The Mutation of Publishing Since 1894' (Onomatopoe 2012): http://monoskop.org/images/a/a6/Ludovico_Alessandro_-_Post-Digital_Print_The_Mutation_of_Publishing_Since_1894.pdf (The fact that text is legit available through the Monoskop Log is perhaps noteworthy itself).

>

> I would describe his book as a history of experimental aesthetic practices articulated through new publishing technologies, and one that speaks in particular to the concept of the post-digital. More generally, it's a tremendous document of a vast array of projects, artworks, print objects, books, pamphlets and magazines that is characteristic of print culture in late modernity and beyond.

>

> The post-digital, in particular, is a term that I'm inviting Alessandro to discuss, along with related ideas that have emerged through his research. And it's particularly relevant off the back of Transmediale Festival last week given the Post-Digital Research panel and newspaper publication. The latter is a series of short texts that have been collaboratively peer-reviewed through a workshop on the topic held at Aarhus University last year: https://tm-resource.projects.cavi.au.dk/?page_id=1291 Unfortunately, a PDF is not available yet, but Alessandro I'm sure will give an impression of the contents of this publication.

[-empyre-] Week One - Between Print and Pixels: Computationality, Post-Digital, Hybrid

From: adamhyde

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Feb 9 07:03:42 EST 2014

hi

I was hoping the conversation would evolve but it seems a little quiet so many apologies if I am stepping in and breaking protocol a little but I enjoyed Alessandros opening points very much and wanted to ask for his further comment on one point.

"what if digital has been mistaken for a medium but actually is an agent that has transformed existing media? I've started to investigate other traditional media (audio and video, for example) and how their core form is formally still coherent with their analogue one, but substantially transformed by its current digital nature."

I think this is an interesting issue and I was curious if this has been the behaviour of media from the beginning? A cone transformed the voice, radio transformed the cone, the codex transformed the scroll etc. I bring this up because the 'core form' you refer to is perhaps already a multi-hybridised outcome of decades/centuries of transformation. Perhaps one of the core roles of any new medium, analog or digital, is to transform the old. Any thoughts to that? If it were true then 'digital' could be *both* a medium and a transformative agent.

[-empyre-] Week One - Between Print and Pixels: Computationality, Post-Digital, Hybrid

From: Michael Dieter

To: <empyre@lists.cofa.unsw.edu.au>

Date: Mon Feb 10 03:01:34 EST 2014

Hi all,

Apologies to subscribers for the slow start to this discussion. Unfortunately, David Berry has taken ill the past couple of days, so will not be able to post to the list until later in the month. I will keep you informed, but I am glad in the meantime that Adam Hyde jumped in and raised some questions for Alessandro:

"> I think this is an interesting issue and I was curious if this has been the behaviour of media from the beginning? A cone transformed the voice, radio transformed the cone, the codex transformed the scroll etc. I bring this up because the 'core form' you refer to is perhaps already a multi-hybridised outcome of decades/centuries of transformation. Perhaps one of the core roles of any new medium, analog or digital, is to transform the old. Any thoughts to that? If it were true then 'digital' could be *both* a medium and a transformative agent."

I'd like to take this a bit further as well, and ask Alessandro and Mercedes for some response to the term 'digital' and hybrid in the first place. If it might be taken as a medium and transformative agent, then what do different definitions mean for the prefix 'post'? And how then does this actually relate to contemporary artistic and experimental practices aligned with the post-digital, or medial hybridity?

The invisibility or absence of the digital itself for these practices is, of course, part of the problem. And as Alessandro notes, this is a broader question, since at our present juncture, many aesthetic characteristics and principles of 'old media' have seemingly been maintained, while a range of compound techniques supported by massively distributed and standardized software also appear ascendant; yet this is not always explicitly identified or discussed in terms of a recognizable and coherent new cultural vernacular.

In his writing on the topic of the post-digital, Florian Cramer goes to great lengths to argue for some precision in defining the digital itself as a term, highlighting the fact that it is often aligned with a kind of high-tech kitsch, rather than described as the basic act of making discrete. This is a position he already developed in 'Exe.cut[up]able Statements' and 'Words Made Flesh', where counting, separating and sampling comes to define the digital as an act of quantification. In this case, the digital is not simply electronic, but potentially refers to a wide array of cultural techniques that involve making things discrete. In other words, the magnetic orientations, electrical impulses or optical arrays of contemporary computational technologies is merely one subset of the digital broadly understood. Hopefully, Florian can clarify the significance of these arguments later on in the month (I hope the summary is alright for now).

In the meantime, there's another dynamic that is part of our contemporary experience of the digital that I want to highlight for the sake of discussion, and this involves the implementation of discrete measurements for the purpose of expanding surplus value or profit. In other words, these are the economic lineages that inform the contemporary digital. They exist, for example, in Charles Babbage's inspiration from Adam Smith's economic divisions of labor, but applied to the mechanization of mathematical tables in the development of the Difference Engine and (proposed) Analytic Engine. Especially pertinent would be his study of 19th century factories (a point of engagement for Marx), 'On the Economy of Machinery and Manufacture', and the argument for the digital as the 'division of mental labours' whereby certain tedious or monotonous tasks are delegated away to labor and machinery at lowered rates of pay, expense and care. This approach is echoed in the articulation of corporate systems analysis in the late 20th century with the kinds of procedural initiatives that Philip Agre insightfully referred to as the capture model. Similarly, as Bernard Stiegler might put it, there is a process involving the grammatization of labour here, but one in which a

fixation on increased profit drives the systematic implementation and configuration of these digital infrastructures as a disassociated milieu.

Perhaps these are familiar arguments, but I'm interested then in how the digital, understood in this way, can be read in terms of media theory and the idea of there being 'post'? Certainly, these procedures are present as a primary mode of producing knowledge in the development of analogue systems and what Friedrich Kittler called technical media. Maybe the situation today involves something like the simultaneous expansion and diversification of these rationalization techniques in specific ways? That would seem to be argument that Lev Manovich makes in 'Software Takes Command'. If 'Language of New Media' was based on outlining a formalist account of contemporary grammatization expressed through numerical representation, modularity, automation, variability and transcoding, then his new work looks to how such a language leads itself to far-reaching hybridization through the permanent extensibility of software uses and possibilities. Software can do this since it functions as an implementation of digital as meta-medium; in Alessandro's account, it infects, but does not entirely remediate. These ideas are, of course, central to theories of computation proposed by the Church-Turing hypothesis or by Van Neumann, but Manovich argues Alan Kay should also be taken seriously for inaugurating a 'democratization' of this digital approach to cultural software development. This sets off a continual upheaval in the cultural mode of development associated with cultural software today, so that older media formats remain recognizable, yet also become mixed together into a new expressiveness. The challenge for Manovich's highly modernist project is to locate cultural techniques of the present and future within this massively moving revolutionary infrastructure.

There's also this other interesting aspect of Manovich's argument found in the idea of performance; it's an idea that's been kicking around for a while in his work - for instance, in the 'delightful narrative' of Mario falling down a hill (when this actually happens in a Nintendo game is a bit lost on me btw) - but this is a perspective that is actually quite widespread as a premise of interaction design. We might think of Brenda Laurel's 'Computers as Theatre' or notions of staging found in HCI approaches like those advocated by Bruce Tognazzini, or Joanna Drucker's use of frame analysis in the context of interface theory. Perhaps it would be interesting to connect this with other theories of performativity and identity as well, or power in the mode of Jon McKenzie's 'Perform or Else'. Performance in this latter case, interestingly, would also connect to the processes of scripted abstraction found in corporate systems analysis and the mental division of labour, where 'to perform' equates with accounting for efficiency as value. This is a particular way of thinking through what the post-digital might mean that I find interesting. Indeed, drawing from Manovich's own interest in the research conducted at Xerox PARC, these various compulsions are consolidate nicely, for instance, in Tim Mott's idle sketches of office work routines on a bar napkin sometime during the late 1970s. Such hand-drawn images of making work discrete (they are, therefore, already digital images as a grammar of action) are the inspiration for the iconic representations of the contemporary desktop interface. They inscribe workflow analysis and commands such as READ, WRITE, OPEN and MOVE as the now familiar options PRINT, FILE, and DELETE.

http://www.designinginteractions.com/img/chapters/ch_1.jpg

When considered in terms of socio-political techniques, a series of medial dynamics might then be diagrammed as central to the concerns of post-digital aesthetics, things like: delegation, acceleration and scalability (along with Manovich's LoNM terms). These different impulses, what could be read in terms of what Matthew Fuller and Andy Goffey call evil media, are often arranged to be extensible in the sense that they can broadly be assumed to function as global information infrastructures. With the post-digital, these are then investigated through scaled down characteristics or features in translated material states. The post-digital, therefore, exists as a 'small' orientation device, but it also raises questions of beauty and elegance, and in an exemplary way, speaks to the struggle to make sense of digital today in any meaningful register beyond the profit motive and the control of problems.

So what's interesting to me is how the digital understood in these ways is rendered or characterized through its absence. Does it come to signify an informational sublimity, perhaps a resources as cultural materials, a site of excess or dumping ground, some weird array of stuff comparable to what Marx once described as dead labor, or perhaps closer to general intellect?

That's quite a long post, but I guess I wanted to throw some more references into the mix. There's also a lot of connections, but these

are just some notes so I'm not sure they are interesting or relevant for people. Perhaps Mercedes has some ideas to add? What, for instance, does the hybrid refer to for the hybrid publishing lab? What is the digital for you?

> first place. If it might be taken as a medium and transformative
> agent, then what do different definitions mean for the prefix "post"?

Well *if* it'd be proven to be somehow true, then post-digital would mean not that digital is now 'assumed', but that digital has already accomplished its main transformations (although it's still an ongoing process).

> And how then does this actually relate to contemporary artistic and
> experimental practices aligned with the post-digital, or medial
> hybridity?

It can still relate in a quite similar way, only that the hybridity (declined in many various ways) would be seen as true embodiment of "post-digital", which could not then be eventually claimed for any experimental practice dealing with digital.

> The invisibility or absence of the digital itself for these practices

Actually I think that remediation intended as Bolter's definition: "the formal logic by which new media refashion prior media forms" can be seen as a lower lever of hybridisation. A video inserted in a digital publication is refashioning video, but it's not taking into account the whole "reading experience" that we have consolidated in centuries, so it's (for the better or worse) disrupting it. Hybridising a digital publication can be more effective using software and networks (eventually in an ever more extreme way than Manovich suggests) to create a unique synthesis, not just "sampled" or "calculated" from big data, but stringently "processed" through different customisable parameters.

 Date: Wed Feb 12 03:45:29 EST 2014

> Perhaps Mercedes has some ideas to add? What, for instance, does the hybrid
 refer to for the hybrid publishing lab? What is the digital for you?
 Now you make me laugh, Michael. I don't think I can come up with a definition
 that will hold, but I guess you are not too disappointed about this. Of course, I
 feel much more comfortable with complicating things a little bit further. Indeed,
 I think we often mix up disparate levels, when we talk about a medium - the
 technical functionality, the social or cultural technique it enables, and how it
 is occupied by power/control are three different lines which cross or levels we
 find acting within a medium. Mixing these levels, leads us often to strange
 conclusions. Instead of giving a definition, I will rather take it further apart! Let's
 have a look at digital book publishing and book sprints, for example.

> I think this is an interesting issue and I was curious if this has been the
 behaviour of media from the beginning? A cone transformed the voice, radio
 transformed the cone, the codex transformed the scroll etc. I bring this up because
 the 'core form' you refer to is perhaps already a multi-hybridised outcome of
 decades/centuries of transformation. Perhaps one of the core roles of any new
 medium, analog or digital, is to transform the old. Any thoughts to that? If it
 were true then 'digital' could be *both* a medium and a transformative agent.

I agree with Adam. I think the digital is both, medium and transformative agent -
 and I would even differentiate the last into transformative and agent. The whole
 messy situation bears the pressing problem which we theory people have, when
 we talk and analyse media. For what do we look at? A) the technical medium, or
 B) its transformation, the cultural technique it allows and c) how this is used by
 power, (or D) what Alessandro calls agency?!

If I may use the example of "Book sprints" here, as Adam is an expert for this
 and the innovative method of producing books he came up with has been quite
 inspiring for the research in our lab... Of course, one can say that "new media"
 like desktop publishing tools, content management, and digital on-demand-
 distribution have made this interesting new form of producing books collectively
 possible. In that sense, new digital media transforms the old paper media to
 enable a different production as well as different books.

But the digital hasn't just transformed book production, it also transformed
 our knowledge production, i.e. the knowledge we use when writing books - or
 when writing essays, or when making arguments. Due to its digitalization,
 knowledge can now be found via search engines, and this allows us to handle
 knowledge fields in a very different way: we scan them. Scanning or cursory
 reading becomes a new knowledge technique, besides using search engines, we
 often also google each other - at least this is I can observe us doing in some of our
 team meetings (my students love this as well). Here I can locate Alessandro's
 statement, when he writes: "New media are affecting the other ones" - but this is
 something that happens more on level B) and C), its a social or cultural technique
 and how it is enacted and appropriated. Personally, I see the post-digital located
 here, at least at the moment. One reason for this is, I have Florian Cramer's
 excellent example of students on my mind who sit together to produce a paper
 fanzine, and he commented that: they are doing it as if they are doing social
 media.

I think A, B, and C are all on a similar level - the present - but much like
 Alessandro I am fascinated that there is something else, the moment/aspect
 he calls agency [D]. I researched this silent technique "ghost" a bit for my book
 (The Silent Revolution), and noticed that philosophers and thinkers (Latour,
 Simondon, Verbeek, Ihde, Blumenberg, Kittler, or Nigel Thrift, or...) all were
 fascinated by it. I tried to explain this "agency", but as my interest was not to
 describe it as technical determination, I chose the term "technical gesture". The
 concept is borrowed from Ferdinand Braudel, of course. He brought something
 similar into play, when besides short-term historic events, he focussed on the
 shift of long-term historical structures. Analog to this, I came up with a structure
 or 'schema' inherent in technology and changing with each new technical
 revolution. Here, I think my argument is related to Alessandro's idea of the
 digital as being something more than just a new medium, seeing it more like
 electricity. However, I would say while this has an effect, I wouldn't describe
 it as agency. It is more a structure or a pattern: industrialization, for example, is
 based on the construction of systems for which the process of standardization is
 essential. The digital, on the other hand, has a more disruptive and fragmented
 side so that flexibility is a far more important aspect to it than rigid norms.

Now the question is: what would that mean for publishing, or writing?

Personally, I see some of this 'gesture' in my own writing. I tend to start my
 thinking less from an opposing argument. I find refuting someone less and
 less productive. Instead, I prefer to use fragments of other people's theory and
 thinking as bricks to build my own argument, and find myself interested in
 things like "Reading Diffractionally" (see Iris van der Tuin 2013: http://www.academia.edu/4679458/The_Untimeliness_of_Bergsons_Metaphysics_Reading_Diffractionally_2013_) Or is this just a ... trend? What do you guys
 think?

> Perhaps one of the core roles of any new medium, analog or digital, is to
 transform the old. Any thoughts to that? If it were true then 'digital' could be
 both a medium and a transformative agent.
 By the way, Michael, I don't really get your point here, like I don't understand
 the "economic lineage" but with it you seem to go somewhere very interesting.
 Maybe you can explain this a bit?

**[-empyre-] Week One - Between Print
 and Pixels: Computationality,
 Post-Digital, Hybrid**
 From: David Berry
 To: <empyre@lists.cofa.unsw.edu.au>
 Date: Thu Feb 13 03:17:25 EST 2014

I want to take up the question of the definitional a little, more because I think that what the post-digital is pointing towards as a concept is the multiple moments in which the digital was operative in various ways. Indeed, historicising the “digital” can be a useful, if not crucial step, in understanding the transformation(s) of digital technologies. That is, we are at a moment whereby we are able to survey the various constellations of factors that made up a particular historical configuration around the digital and in which the “digital” formed an “imagined” medium to which existing analogue mediums where often compared, and to which the digital tended to be seen as suffering from a lack, e.g. not a medium for “real” news, for film, etc. etc. The digital was another medium to place at the end (of the list) after all the other mediums were counted – and not a very good one. It was where the digital was understood, if it were understood at all, as a complement to other media forms, somewhat lacking, geeky, glitchy, poor quality and generally suited for toys, like games or the web, or for “boring” activities like accountancy or infrastructure. The reality is that in many ways the digital was merely a staging post, whilst computing capacity, memory, storage and display resolutions could fall in price/rise in power enough to enable a truly “post-digital” environment that could produce new mediated experiences. That is, that it appears that the digital was “complementary” but the post-digital is zero-sum. Here is my attempt to sum up some of the moments that I think might serve as a provocation to debate the post-digital.

DIGITAL	POST-DIGITAL
Non-zero sum	Zero-sum
Objects	Streams
Files	Clouds
Programs	Apps
SQL databases	NoSQL storage
HTML	node.js/APIs
Disciplinary	Control
Administration	Logistics
Connect	Always-on

[-empyre-] HYBRID BOOKWORK, Week Two - Paradoxical Publishing, Postmedia, Critical Aesthetics

From: Michael Dieter

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed Feb 12 04:27:24 EST 2014

Hi all,

The discussion is still rolling from the first week, but I would like to nevertheless introduce and welcome three more guests onto the list: Lukas Jost Gross, Domenico Quaranta and Rita Raley.

I've put together some keywords for this introduction - Paradoxical Publishing, Postmedia, Critical Aesthetics - (apologies for yet another 'post' in there), but this is just a formality. I want to keep things quite open in terms of how the conversation develops and what gets discussed. Perhaps subscribers have specific questions or comments to add at this point.

Indeed, hopefully many of you are also already familiar with their work. If not, please check out TRAUMAWIEN's inspiring projects and publications; the absolutely essential Link Editions series that Domenico's been running and along with an overview of his curatorial

work and criticism; and some of Rita's key publications on a range of influential media arts practices, concepts and themes from codework to tactical media and countervigilance.

It's great to have you all on empyre!

- M.

Bios:

Lukas Jost Gross is an artist and paradoxical print publisher based in Vienna. He co-founded TRAUMAWIEN in 2010 with Peter Moosgaard and Julian Palacz as a non-academic initiative exploring new forms of publishing. An important aspect is the ARTCLUB involving discussions of various issues, books and releases (<http://traumawien.at/stuff/artclub/>). Some key projects, meanwhile, have included exploiting "Domains of Distribution" Ad Contaminated Ebooks (Trojan Horses) exploring the connectivity and underground distribution of ebooks by algorithmically changing/contaminating them while feeding them back into Systems of Distribution (<http://rhizome.org/announce/events/59833/view/>). In certain ways, augmented reality is also an important concept for TRAUMAWIEN, as seen in the development of Augmented Reality Software for YORICK/REPLIK in 2010, which was sold as 'Hybrids'. For more information on their various projects and publications, see <http://traumawien.at/>

Domenico Quaranta (1978, Brescia, Italy, <http://domenicoquaranta.com>) is an art critic and curator. He is a regular contributor to Flash Art and Artpulse. He is the editor (with M. Bittanti) of the book "GameScenes: Art in the Age of Videogames" (2005) and the author of "Media, New Media, Postmedia" (2010; translated into English in 2013 with the title "Beyond New Media Art") and "In Your Computer" (2011). He has curated various exhibitions, including "Holy Fire: Art of the Digital Age" (Bruxelles 2008, with Y. Bernard), Playlist (Gijon 2009 and Bruxelles 2010) and "Collect the WW World. The Artist as Archivist in the Internet Age" (Brescia 2011; Basel and New York 2012). He is a co-founder of the Link Center for the Arts of the Information Age (<http://www.linkcenter.eu/>).

Rita Raley researches and teaches at the University of California, Santa Barbara. Her work is situated at the intersection of digital media and humanist inquiry, with a particular emphasis on cultural critique, artistic practices, language, and textuality. She is the author of Tactical Media (Electronic Mediations) (University of Minnesota, 2009), co-editor of the Electronic Literature Collection, Volume 2 (2011), and has more recently published articles in the edited collections "Raw Data" Is an Oxymoron (2013) and Comparative Textual Media: Transforming the Humanities in the Postprint Era (2013). She has had fellowship appointments at the National Humanities Center: UCLA (as part of the Mellon-funded project on the Digital Humanities); University of Bergen, Norway (with 'ELMCIP: Electronic Literature as a Model of Creativity and Innovation in Practice'); and the Dutch Foundation for Literature in Amsterdam. She currently co-edits the "Critical Issues in Media Aesthetics" book series for Bloomsbury and the "Electronic Mediations" book series for the University of Minnesota Press.

[-empyre-] HYBRID BOOKWORK, Week Two - Paradoxical Publishing, Postmedia, Critical Aesthetics

From: Domenico Quaranta

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed Feb 12 19:09:13 EST 2014

Dear empyreans,

I have been producing content for books, catalogues and magazines for a while, but if Michael kindly invited me in this discussion on empyre, it is because, at some point, I became an editor and publisher. In the following, I will try to explain shortly how it happened, because it can be useful to introduce you to the approach and structure of Link Editions (<http://editions.linkcenter.eu/>).

In 2011, while working with some partners on setting up the Link Center for the Arts of the Information Age (the no-profit organization behind Link Editions), I started collecting ideas for a personal side project. I wanted to go through the

texts I wrote for magazines, catalogues and blogs in previous years, select the ones that were still meaningful to me, edit them (most of them were badly translated in English by third parties), publish an anthology and remove everything from my website. I felt it was time to review this material, take it off from the fluidity of the internet, and make it more readable: a better formatting, a better design, a better indexing. Self-editing with a bit of make-up.

I didn't know how to do it, but I knew that I didn't want to submit it to a publishing house. At the time, I had just published a book in Italian, and even if it was a wonderful experience, I didn't see any advantage in following the same path again. Maybe if you are a better writer it goes differently, but with my 2010 book what happened was that (1) I gave all the rights on the book to the publisher (2) for almost no money and for (3) 30 free copies of my book. Since then, (4) I can't put the pdf online for free, (5) I have no control on distribution and (6) I can have a rough idea about how sales are going only through the (rather opaque) filter of the publisher. I can't even allow my students to make photocopies, even if I do it all the time.

So, I started exploring print-on-demand platforms, and what I saw was very interesting. With, for example, Lulu.com (1) I could keep my rights on the book and choose the kind of license I wanted to apply to it: 2) I could potentially make money, or decide on my own - not because I was forced by a contract - that I didn't want to make money at all; 3) I could buy as many books I wanted at author's price; 4) I could circulate the book in digital form, even on the same platform, without any restriction; 5) I couldn't be in my neighborhood bookstore, but I could access some of the biggest bookstores in the world, and 6) I could keep track of sales and downloads. I could even send the download link to monoskop, and spread the digital file through my students. Of course, print-on-demand platforms have their faults too, but at least everything that made me upset in traditional publishing seemed to be healed there.

From here to Link Editions, the step was short. I talked about all this to my partners, and they agreed to set up a publishing initiative grounded in print-on-demand and free download. I published my book, *In Your Computer*, in May 2011. By September 2011, three other books were released: *Random*, by Valentina Tanni; *In My Computer # 1*, by Miltos Manetas; and the catalogue of the first exhibition produced by the Link Art Center, *Collect the WWWorld. The Artist as Archivist in the Internet Age*. Feel free to download all of them.

With these books, our three main book collections were born. "Clouds" is both an attempt to allow other writers the kind of freedom I experienced working outside of traditional publishing, and to bring to shelves some good theoretical writing that meets our interests as an institution. "In My Computer" is a kind of concept magazine, inviting artists to share meaningful content stored in their hard drive (or in the cloud) that for some reason never got released, and that can be meaningful in book form. "Catalogues" collects our monographs and exhibition catalogues. Recently Link Editions started being an interesting platform also for other organizations, and we are exploring different modes of co-publishing. These books are filed under "Open".

Simply put, Link Editions is an attempt to conceal the advantages of self publishing with the ones of working with a publishing house. One of the faults of POD platforms is the lack of a context around the book you publish. Of course, you can use categories and tags in order to index your book and make it easy to retrieve. But how many people look for books this way? Landing on Lulu.com is like entering a giant bookstore, with thousands of bad books welcoming you at the entrance, and with an unreliable indexing system. You head to the art shelf and you see calendars; you look for the contemporary art shelf and you see self produced portfolios; you look closer for "new media art" books and you find ten bad ones - the best one is actually indexed under *Essays > Photography*, and, if you spend a whole day there, you may be able to find a great artist book under "Software and code".

Another problem, when you self-publish a book, is your lack of professionalism. You may be a good writer, but still need an editor and a proof reader for your contents, and a good designer for your book. With Link Editions, we tried to bypass these problems without rebuilding the barriers someone experiences when working with a traditional publisher. We offer to our authors our editing and design expertise; due to our weak economic model, we can't design all the books we publish, but we try to keep an high level of quality. We set a low income for Link Editions that basically pays back the expenses produced by the initiative, and we offer all books in free download: everything is done in a very transparent way, and authors are always free to request statistics on their sales / downloads, as well as to but their books at author's price through our account. It's basically like self publishing, but with a professional assistance, and delivering the book in a context that becomes more interesting and rewarding for us and for authors any time a new book is published.

Sorry for the long presentation post, but I assumed that my role in this conversation was more that of presenting a concrete "case study", than that of addressing the interesting topics raised in the first part of this discussion. Hopefully I will be able to say something about them later on.

My warm regards,
Domenico

**[-empyre-] HYBRID BOOKWORK, Week Two
- Paradoxical Publishing, Postmedia,
Critical Aesthetics**

From: Ethel Baraona Pohl
To: <empyre@lists.cofa.unsw.edu.au>
Date: Thu Feb 13 00:12:42 EST 2014

Dear all,
Thank you for all the inputs and the generosity of sharing valuable information to enhance the conversation and to learn from each other. I have been following with lots of interest this discussion, as publisher myself and having several questions on the transformation of the publishing field in the current times, let's say pre-digital, digital and post-digital.

To contextualize, we have an independent publishing house called dpr-barcelona [www.dpr-barcelona.com] specialised in architecture, theory and art. On the past years we have been researching on the concept of "hybrid books" with the combination of printed and digital by different approaches, including different formats that already have been mentioned by some of you, such as e-Books, Print-on-Demand and enriched ePubs, among others.

I'll share here two case studies that, in my opinion are the closest we're reaching to the concept of "hybridization", to hear your feedback about them and join the conversation.

1. The first one is the use of Augmented Reality interactions on a printed book, to connect the paperback edition with the digital tools. The first experiment we did was as contributors for *Domus Magazine*, where we proposed to the editor to include this technology in one of the articles we wrote. The result was very dynamic and well received, as being an architecture and design magazine, the possibility to link videos and 3D-models using the printed images to visualize them on any smart phone with the app [please watch the video: <https://vimeo.com/39580799>]. After that we have used the same technology in a few of our books, the interactions works really good but maybe the most difficult part is how to communicate to our readers that the printed book is enriched with this technology... I think even if people think it's good or they talk about it, there are only few ones using it; and this fact opens lots of questions in our minds.

2. The second case study is what we call "multiplatform" projects". The most recent one is "The Kent State Forum on the City: MADRID", which includes Book + Web + App, all of them complementary and inter-connected, trying to enhance information exchange. The book also contains Augmented Reality features accessible through mobile devices. Here we try to share different contents depending on the platform and try to avoid repetition of contents in order to exploit the tool according to its possibilities. This project is so new that I can't yet share with you if it's successful or not, not talking about commercial issues but focusing (as part of this discussion) on how people use the different platforms and to envision what we can learn from this experiment.
More info: <http://www.ksuforumonthecity.com/>

I really appreciate to be reading all your experiences and wanted to share ours, so we all can learn from each others.

Best regards,
Ethel

Date: Thu Feb 13 19:56:54 EST 2014

Hi Domenico,

Thanks for grounding the conversation a bit with some background information about Link Editions. From your description, the move to start working with POD and ebooks seems to have been lead by a range of motives - some of which were pragmatic, experimental, somewhat intuitive and already informed by your experience as a curator.

I imagine the freedom to experiment is one attractive aspect of this model. To a certain extent, as you imply, the content on these platforms will only ever be as good as we make it, and the possibilities and affordances will remain unknown until we begin actively exploring them. In that respect, the series reminds me of the Institute of Network Cultures Theory on Demand (ToD) series as a relatively flexible and open channel for publishing (although the focus content-wise is slightly different of course) - <http://networkcultures.org/wpmu/theoryondemand/titles/>. I know anecdotally that some traditional academic publishers have some desire to move into this kind of model, especially given the shift to mini-monographs and short essay collections more broadly. Editors at old school publication houses will often express a desire to innovate and experiment, but that they are restricted to their existing financial arrangements, professional relationships, tools and publishing workflows. There's a lot of anxiety there, but presumably this approach would allow them to open things up, even just a little bit as an offshoot series. It would also allow for existing content to be repackaged and repurposed quite easily, as Link Editions and ToD demonstrate. This already seems like a more viable model than networked books, apps or anything involving multimedia.

That said, something about your move into becoming a publisher appears to be informed by your wider concerns with the location of art today, something you've written about in terms of the so-called digital divide between media and contemporary art practices (in addition to their disassociations with digital and networked modes of cultural production at large). Elsewhere, you've described the "baggage of ignorance (technological on one hand, artistic on the other)" that's structured a lot of problems and misunderstandings in media/contemporary art contexts, especially when it comes to the embedded discourses attached to residual and emergent cultural institutions. I wonder whether you've encountered comparable baggage in your experience with publishing? Certainly, the trial of putting out your first book with a traditional publisher runs at odds with the goal of actively expanding frameworks, conversations and imaginaries for what contemporary art might mean, but can you say something about how you've seen these works received in different contexts? Do these publications end up in unexpected settings and contexts? How far and wide do they travel to reach diverse audiences? Perhaps you've got some interesting stories and insights here.

Some other quick follow up questions: Link Editions seems to have been born from an archival impulse; to what extent have, for instance, libraries acquired print copies of these publications? Is that something you're interested in pursuing? Have you also considered feeding back this publishing momentum into print distribution for galleries or more specialty bookshops beyond the Lulu.com platform? Would it make sense to do so?

Cheers,

- M.

[-empyre-] HYBRID BOOKWORK, Week Two - Paradoxical Publishing, Postmedia, Critical Aesthetics

From: domenico quaranta

To: <empyre@lists.cofa.unsw.edu.au>

Date: Fri Feb 14 09:07:13 EST 2014

Dear Michael,

thanks for your reply and your questions!

> That said, something about your move into becoming a publisher appears
> to be informed by your wider concerns with the location of art today,
> something you've written about in terms of the so-called digital

> divide between media and contemporary art practices
of course, any time you start producing content of any kind, you do it because you see room for that - to fill a hole, so to speak. In Italy, there is very little literature about art and new media, and just a few of the books I enjoy in English are translated, often quite lately. That said, Link Editions publishes mainly in English for an international audience that have access to a wide literature on this subject. What I felt was missing, and what the "Clouds" series is trying to offer, was a fast translation of the vast literature we experience online in the shape of a book. Most of what we read today is on a screen. Sometimes, a blog post or a short essay published online has a stronger impact than a book or an article on a printed magazine. But the web is fluid, permalinks decay, retrieving content that we forgot to save, archive, tag or post to Facebook is hard. A book - be it a paperback or a digital file - is more reliable: it lasts longer, and can be quoted years later.
> how you've seen these works received in different contexts? Do these
> publications end up in unexpected settings and contexts? How far and
> wide do they travel to reach diverse audiences? Perhaps you've got
> some interesting stories and insights here.

One of the faults of working online is that you don't hear stories, you just see facts and figures. I can tell you that the books have been downloaded and bought from all over the world, mostly from the US, Europe and Australia, and that the proportion between free downloads and sales is more or less 1:10; I can tell you that bookstores don't like to buy from Lulu - so they don't buy our books, even if we offer them to buy at author's price; but the only feedback I get comes from people that bought or downloaded the books, when I meet them. Also, it's funny when I make a presentation and say "you can buy the paperback or download the book for free" - many people still look at me like if I was an alien...
> Some other quick follow up questions: Link Editions seems to have been
> born from an archival impulse; to what extent have, for instance,
> libraries acquired print copies of these publications? Is that
> something you're interested in pursuing? Have you also considered
> feeding back this publishing momentum into print distribution for
> galleries or more specialty bookshops beyond the Lulu.com platform?
> Would it make sense to do so?
>

It would definitely make sense, even if it has been, so far, quite hard to do. We don't have the budget to buy copies and send them to selected bookstores or galleries, and we can't do donations to public libraries, but we suggest to do it to people that download our books for free (a strategy we learnt from Cory Doctorow). It has been possible for specific publications, though. The F.A.T. Manual was co-produced with MU, Eindhoven and supported by XPO Gallery, Paris - they both have copies for sale. Soon, you will be able to find some Link Editions books at Eyebeam, New York. Hopefully in the future we will work more on this. Talking about the archival impulse, of course you are right. But it's not just about libraries - I think disseminating the digital file goes in the same direction. When I think that only 100 copies of "Peer Pressure" have been sold, but some thousands have been downloaded, I feel that this book is somehow "safe". I know, you don't always read what you downloaded, but you always store it somewhere for later reading. Maybe at some point people will start donating their old Kindles and Kobos to public libraries - and they will accept them.

My bests,
Domenico

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sat Feb 15 21:48:33 EST 2014

1 Literary Trojan Horses

2 Augmented Reality

3 Post-Digital

4 Print on Demand

1 Since our Ghostwriters (

<http://www.techdirt.com/articles/20120613/03584719300/amazon-deletes-ebooks-automatically-generated-youtube-comments-leaving-many-questions-unanswered.shtml>) Intervention we put a great effort in manipulating huge bunches of text algorithmically. During the whole last year we have been working on an algorithm to contaminate contents by subversively contaminating them with advertising. This is focused on german ebook piracy mechanisms which turn out to be by far most progressive experiments in terms of distribution. Just for the case as they also constantly invent alternative economic systems, always on nomadic moves, where they curate contents, as opposed to raw bunches of material like all german bestsellers at once like this [http://thepiratebay.se/torrent/9150293/42.000_deutsche_epub_eBooks_\(42.740_eBooks_komplettes_Book.to-Ar\[decide if they are what they are labeled, by your self\]\)](http://thepiratebay.se/torrent/9150293/42.000_deutsche_epub_eBooks_(42.740_eBooks_komplettes_Book.to-Ar[decide if they are what they are labeled, by your self])). If you are interested, a driving force behind ever changing 'domains of distribution' here has been and still is 'spiegelbest', here is an essential interview with him > <http://traumawien.at/stuff/texts/interview-mit-einem-buchpiraten/>, also he has a blog where he writes about where the scene locates at the moment. They truly are always on the move, and they are huge and that's why i wonder why this discussion is so much skipped in publishing.

2 Augmented Reality. To me AR still is the most close to working science fiction concept in digital and i am highly fascinated thinking about it. To put it short > as long as we need our hands for computers, we'll have to wait, and no, i don't like 'glasses'. We have been greatly influenced here by the fantastic Mez Breeze Blog Augmentology which stopped in 2010 > <http://arsvirtuafoundation.org/research/> We are open to any collaborations here. Please contact. We have our own software and some Scheme concepts. AR does need a lot of work.

3 Post-Digital. After reading the mails from last week i asked my friend about 'post-digital' and he said 'Alzheimers'. I thought this was something, as it brought up the human connection, which i completely miss in your notes. Also, it could be turned in as the 'space left by the absence of the digital' - a generative amnesia, sort of. Unlearning learning, Tech drugs and the Kurzweil Cyborg, all the archives etc come in here. Just my thoughts without juggle-stretch terms too much.

4 Pod. We, of course, used pod in the beginning for most of the reasons Domenico listed. Still, in June 2012, when Amazon terminated our Accounts life-long because of the 'Ghostwriters' Intervention, we decided to not use pod (and it's Amazon gateway) anymore and instead have our books printed locally, in limited runs of 50-100. Our orderings through Lulu where really marginal and their quality was just bad. Not to mention tax and check issues with the US you suddenly have to deal with. To have our backlist (<http://traumawien.at/prints/>) out of print is a thing, nowadays. Sticking back to great quality prints is also the (.) left by the absence of the digital and therefore probably post-digital. Our posters, for example, are printed at a letterpress in St. Gallen. We just want best, long lasting quality you can get, again. Those products are data carriers to survive.

Don't get me wrong, but it will be true pod if espresso book machines arrive to print the pdf at the copy shop around the corner.

I am also having problems to use the word book in general for any digital processes. Just to avoid tedious (especially 'ebook') discussions.

>>> Apologize for my late introduction. I have a family emergency here in switzerland and been offline most of the last week. Also, this is written from a cafe. Hope to add more to the discussion, later. See you around. L

Thanks for the post Lukas! I'm also a bit late responding so apologies, but I did want to just pick up on this point quickly...>

*3 Post-Digital. After reading the mails from last week i asked my friend about 'post-digital' and he said 'Alzheimers'. I thought this was something, as it brought up the human connection, which i completely miss in your notes. Also, it could be turned in as the 'space left by the absence of the digital' - a generative amnesia, sort of. Unlearning learning, Tech drugs and the Kurzweil Cyborg, all

the archives etc come in here. Just my thoughts without juggle-stretch terms too much."

Post-digital brain damage - this is one of the more interesting definitions I've read! While I'm a bit skeptical of neurological explanations for what the web has done to us ala Carr's *Is Google Making Us Stupid*, continual partial awareness, overall cognitive fatigue and a sense of informationally-induced distraction is something I do recognize in myself. Sometimes I wonder if I'm just getting older and have more responsibilities.

There is a real problem of our technologies being always on, too many browser tabs open, the smart phone buzzing an email update, the continual connection to social media streams - 24/7, real subsumption. Of course, there's the obvious pharmacological dimensions of the info attention economy as well, the rise of ADHD diagnoses, what Bifo theorizes as the pharmacological character of the 'schizo-economy' - including the need for 'panic' to be alleviated through the use of cocaine, ritalin, speed, modafinil and other nootropics. Maybe disciplinary software like Freedom and Anti-Social has something post-digital about it, or more accurately, Morozov's locked up router cable, smartphone and screwdrivers? That's the real neo-analogue response!

In any case, this backdrop of attention is crucial I think in terms of how people deal with books today. It is something that Hayles, for instance, has explored in her book *How We Think* within the context of education and literary studies. Certainly, coping strategies have now also become a major topic in the mainstream press, even when it comes to ebooks as well - http://www.nytimes.com/2014/01/05/books/review/how-do-e-books-change-the-reading-experience.html?_r=0

From: verlag at traumawien.at
To: <empyre@lists.cofa.unsw.edu.au>
Date: Thu Feb 20 17:38:24 EST 2014

Hi Michael thanks for the reply.

I wasn't to put [3] as a kind of 'brain damage'. Was just an [alter]ja[tjve (yy my first actual use of meazengelle, it's coming) input without relying on hermetic academic backup too much. Also, i wouldn't want to turn the discussion to Nick Carr etc. just wanted to throw in sth. But - as the human factor is so much important to us, the question here would rather (and much more interesting) be, at what extent we are giving treats to the algorithms ourselves at what cost and return. Like in terms of how it RECURSIVELY learns from us as we teach it our whole cultural sphere and after that - what is happening there as a post-something on the other side. As the 1 obvious example: while algorithms are about to learn our language through form inputs etc, we are evolving a new written language ourselves. Maybe for it not to understand us anymore! Or while algorithmic transcripts of speech work almost perfect these days, we don't even listen to that speech anymore (at least as we did), what for, if it is transcribed and rolled out and backed up. Or we don't listen to the speech anymore but make a book of it just to have to have the option of the real back! Alzheimers def is the wrong word, but how does that kind of negative space (meant as sth positive) look like and how do we act upon it?

The works collected by Silvio probably are a lot about what is is thrown back here. The exemplary American Psycho by Huff/Cabell is what is left after algorithms went through handling 'culture'. Why do we make a book out of it and even party it and even exhibit it at the Jeu de Paume in Paris? Obviously, culture turns out to be something different and in that and many other cases, culture becomes nothing but advertising, as Lanier once put it. That kind of Number 1 SPAM, the whole pop-web works upon! At least it is what i learn about it and i think those algorithmic examples are much more defining and important than artists books of conceptual writing, which became just too obvious (Push the 'make a book' button, out of that breakfast plan).

L

Forgot the best thing happened in 2013 was the postartpoets as an outstanding work of relational publishing performance. Starting here >>

[-empyre-] post-digital print

From: Søren Pold

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed Feb 26 19:48:29 EST 2014

I've been working on and off with relations between literature and digitization almost the last twenty years since I began my PhD on relations between media and literature affected by the digital. In my PhD dissertation, completed in 2000, it was my point that literature has consistently dealt with media as part of its content but also as a formal reflection taking up panoramic (Honoré de Balzac) and cinematographic (Raymond Chandler, Steve Erickson) ways of structuring the urban experience of respectively Paris and Los Angeles. This generally happened in two ways: 1) an experiential, visual media related or multimedia-related way relating to the spread of new forms of (mainly but not only) visual experience; 2) a formal, structural, bureaucratic way, e.g. relating to the rise of statistics, surveillance, intelligence, etc. With the computer we also see both threads as e.g. related to multimedia (games, etc.), GUIs and on the other hand programming, networked structures, hypertext can be said to follow the formal, structural, bureaucratic line of development, e.g. through control and management. However, my point at the time (2000) was that because of the digital, alphabetic nature of the digital, the computer was a medium (or a meta-/post-medium or perhaps language system^s), which can be directly written, edited and in general treated like a language system. At that time my examples were etoy's digital hijack, jodi.org and i/o/d's webtalker. So in my understanding the computer and digital publishing was not a break with - but a continuation of print - an understanding, which I built on e.g. Walter Benjamin, Walter J. Ong and Florian Cramer among others. In this way, the computer can be seen as a literary machine where the writing doesn't only happen on the surface as content, but through coding and structuring becomes part of the functioning of the medium.

In 2000 and 2004 when I published my dissertation this felt on pretty dry ground, at least nationally (the diss. is in Danish), and I moved on to digital aesthetics. However I've recently experienced a renewed interest from literary circles in work related to mine - perhaps because of the relative success of e-books. I've written on how it affects (digital) culture that it now becomes embedded in cultural interfaces and platforms such as smart-phones, tablets, e-readers and game consoles - all platforms that control copying and access through a controlled consumption scheme with heavy monitoring of user behaviour. This has actually led to quite some discussion nationally - both before and after Snowden - that e.g. Amazon, Apple, Microsoft and Google closely monitor their users reading behavior. Furthermore, I've collaborated with libraries in exploring the media changes, e.g. through installations of digital/electronic literature in library spaces such as the installation Ink created with colleagues and collaborators. (<http://darc.imv.au.dk/?p=2931>). This installation can be seen as post-digital in that it aims to make people in libraries reflect on the media change by letting them compose poems (Queneau-style but written by a Danish author Peter-Clement Woetman) through using books as interaction device, producing texts on screen and on print. In this way it focuses on the media change, the ergodic reading process and social, performative collaboration. Another project has been conducting workshops with colleagues (Morten Riis, Andrew Prior, Sandra Boss, Lone Koefoed Hansen and more) around cassette tapes and bygone music media (which we've written on in the APRJA Transmediale newspaper and in the journal issue that comes out very soon). Furthermore we've been publishing, e.g. POD books in Danish and English by e.g. Christian Ulrik Andersen, Geoff Cox and Tatiana Bazzichelli and Geoff Cox and Christian Ulrik Andersen have done the newspaper series of which the post-digital newspaper was the fourth. (See <http://darc.imv.au.dk/> and <http://www.aprja.net/>).

Concludingly, things are strangely coming together for me, and I see the post-digital (sharing the idea that it is a crappy concept that is useful) as potentially a critical way to discuss media change confronted with digitization after the digital revolution is over. A few points to this:

- The digital revolution is over. The utopian times are past. This is somewhat healthy, since we can now begin to look more concretely and in a sober way on the material changes that are happening and how they affect culture.

- However, we also miss the utopian days now, when digital technologies and media are only about rationalization, capitalization, control, monitoring.

How do we develop alternatives, when we've stopped believing in the power of technology? And this 'we' is not only 'us', but increasingly the broad culture,

who've stopped believing in the promises of technology. We need alternative uses, designs, understandings - and perhaps we can find them by combining history, technology and cultural uses?

- The post-digital is a broad realization that digitization is not a binary transformation from old to new media, but is a layered process affecting both production, archiving, distribution and reception in different combinations and ways.

- The post-digital is thus a realization, that the digital does not simply transform everything into some virtual dimension, but that it is - and needs to be in ways we haven't quite yet imagined - coupled with the material, spatial, urban, cultural, human flesh. This is both good and bad news.

- The post-digital is an opportunity to develop the historical: both the histories of digital media, from Turing to Kurenniemi and the histories of media and media use from Raymond Williams to Matthew Fuller. Furthermore it is the opportunity to realize that this history is not linear nor straight-forward but that e.g. the history of hypertext is forking and looping and the culture of the computer does not compute.

Btw. I excuse I haven't been that active, but we're going through quite some turmoil at Aarhus University because of the biggest lay-off in Danish university history...

[-empyre-] post-digital print

From: Florian Cramer

To: <empyre@lists.cofa.unsw.edu.au>

Date: Fri Feb 28 08:46:32 EST 2014

My own self-description is very similar to Søren's. As matter of fact, both of us have worked on the same subjects and experienced similar developments of our research interests in the past 1 1/2 decades - with the difference however that I left university humanities in 2006. (Just as Søren's or even much worse, my dissertation fell on dry ground and is probably my least known and read text ever although it has appeared as a book by a reputable academic publisher - for me the proof that either I can't write books or print publishing is factually dead while being kept artificially alive as a 'radioactive cadaver', to quote Raoul Vaneigem. My recent book *Anti-Media* might be another such disaster despite greatest and most amicable support from Geert Lovink's Institute of Network Culture.) Since then, I have been working for Rotterdam's art school which is part of a larger polytechnic, Hogeschool Rotterdam. The Dutch dual system draws strong dividing lines between universities and polytechnics. Our research therefore has to be strictly practice- and work field-oriented. My own task is to investigate the impact of changes in media and communication on art and design professions by creating interconnections between the school and external practitioners, and help the school adapt its curricula.

Besides that, I work for WORM (<http://www.worm.org>), a space for experimental music, film and events of all kinds, as dean of the WORM Parallel University (<http://wpu.worm.org>), an DIY university for non-traditional students. The more our students do themselves, the easier they can obtain our Master of Parallels (MoP) degree. The Dutch music critic Peter Bruyn was our first laureate.

Research facilitated by my center Creating 010 includes Alessandro Ludovico's book "Post-Digital Print", Olia Lialina's research on Geocities, Hyves and Rotterdam Internet cafés [<http://contemporary-home-computing.org/still-there/intro.html>], Renee Turner's research - in collaboration with students and teachers from Piet Zwart Institute - on privacy and surveillance [<http://www.metamute.org/services/openmute-press/sniff-scrape-crawl.-privacy-surveillance-and-our-shadowy-data-double>] and Aymeric Mansoux' ongoing research on the misunderstandings of Free Software, Open Source and copyleft in the arts [<http://dpi.studioxx.org/demo/?q=fr/node/304>].

In art and design education, we see that most teachers still live in a pre-digital world. Students, on the other hand, are avid consumers mainly of social media but hardly participate in online culture or produce work in electronic form. This has been researched for us by my Willem de Kooning Academy colleague Aldje van Meer [<http://iwouldratherdesignaposterthanawebsite.nl/>]. Currently, 70-80 graphic designers graduate at our school every year who have been almost exclusively educated to be print designers. At the same time, print publishing is shrinking while electronic publishing is steadily growing. (Rotterdam, the second-largest city of the Netherlands with 600,000

inhabitants - 1.1 Million including the metropolitan area -, currently has no large bookstore anymore; only two very small ones are left in the city center.) According to our knowledge, there are less than ten graphic designers in the entire Netherlands who know to design an epub file.

I only mention the above to put things into perspective. When we are talking about post-digital culture, and new hybrid forms of analog and digital, electronic and print media, then often our problem remains that the first step to digital hasn't been made yet. There is a tendency in this country that the art schools, most of which have more design than art students and have curricula based on the classical Bauhaus curriculum, resort to an anti-industrial Arts-and-Crafts niche of beautifully crafted non-electronic products. For me, this implies a highly political issue of art retreating to a luxury niche, giving up on the idea that it should engage with and shape everyday culture. (A concept underlying - among others - constructivist, Fluxus and Situationist avant-garde, and interventionist net art/media art as well.)

When I use and cautiously advocate the term "post-digital", I can't avoid playing with the fire that this will get misunderstood as a carte blanche for uncritical indulgence in neo-crafts.

I've collaborated in Søren's transmediale newspaper and 'A Peer-Reviewed Journal' (<https://www.aprja.net/>) with an essay on useful definitions of 'post-digital'.

I agree with Søren's concluding points so fully and wholeheartedly that I'll just repeat them:

- The digital revolution is over. The utopian times are past. This is > somewhat healthy, since we can now begin to look more concretely and in a > sober way on the material changes that are happening and how they affect > culture.
- >
- > - However, we also miss the utopian days now, when digital technologies > and media are only about rationalization, capitalization, control, > monitoring. **<nettime> Hans Magnus Enzensberger:
Rules for the digital world
From: Florian Cramer
To: nettime-l@kein.org
Date: Sat, 1 Mar 2014 14:53:30 +0100**

Published yesterday by Frankfurter Allgemeine Zeitung,
<http://www.faz.net/frankfurter-allgemeine-zeitung/enzensbergers-regeln-fuer-die-digitale-welt-wehrt-euch-12826195.html>

Written by the same Enzensberger who wrote "Constituents of a Theory of the Media" (first published in German as "Baukasten zu einer Theorie der

Medien" in Kursbuch, 20, 1970, first published in English in the New Left Review, no. 64, 1970, reprinted in 2003 in the The New Media Reader).

This is an unauthorized, quick translation.
Defend Yourselves!

For those who aren't nerds, hackers or cryptographers and have better things to do than keep up with the pitfalls of digitalization every hour, there are ten simple rules to resist exploitation and surveillance:

- 1
If you own a mobile phone, throw it away. You had a life before this device, and the human race will continue to exist after its disappearance. One should avoid the superstitious worship that it enjoys. Neither those devices nor their users are any smart, but only those who plug them to us in order to accumulate boundless riches and control ordinary people.
- 2
Whoever offers something for free is suspicious. One should categorically refuse anything that passes itself off as a bargain, bonus or freebie. It's always a lie. The dupes pay with their privacy, their data and often enough with their money.
- 3
Online banking is a blessing, but only for secret services and criminals.
- 4
Governments and industries want to abolish cash. They would like to get rid of a legal tender that anyone can redeem. Coins and bills are annoying for banks, traders, security and fiscal authorities. Plastic cards are not only cheaper to produce. Our watchdogs prefer them because they allow tracing of any transaction. Therefore, we all should avoid credit, debit and loyalty cards. These permanent companions are bothersome and dangerous.
- 5
The madness of networking every object of daily use - from toothbrush to TV, from car to refrigerator - via the Internet, can only be met with total boycott. Their manufacturers don't give a single thought to privacy. They have a only one vulnerable body part, their bank account. Only bankruptcy will teach them.
- 6
The same applies to politicians. They ignore any objection to their actions and omissions. They are submissive to the financial markets and don't dare to go against the activities of secret services. But they have a vested interest to be reelected. As long as the right to vote still exists, one should deny anyone the vote who tolerates digital expropriation instead of taking action against it.
- 7
E-Mail is nice, fast and free. So watch out! If you have a confidential message or don't want to be surveilled, take a postcard and pencil. Handwriting is hard to read for machines. Nobody suspects important information on a 45 cent picture postcard. You don't have to resort to a dead drop like in old-fashioned spy novels.
- 8
Avoid obtaining goods and services via Internet. Vendors like Amazon, Ebay and so on store all data and molest their customers with advertising spam. Anonymous shopping is better. Acceptable exceptions can be made for individual sites that one knows well.
- 9
Just like network television, the big Internet corporations are primarily financed by advertising. This way, they steal their customers' time and attention. Someone who ceaseless yells at you and molests you deserves punishment. It's recommendable to stay away from everything marketed this way, and switch off, once and for all, the stations terrorizing you with advertising. This should not only be done for hygienic reasons. As we know, particularly the American mega corporations collaborate closely with secret services to spy out and control, if possible, any human activity.
- 10
Networks like Facebook call themselves "social" despite their eagerness to treat their customers in the utmost anti-social ways. Whoever wants to have friends like this, is a hopeless case. Those who are unfortunate enough to be part of such a company, should try to take flight as fast as possible. This is not so easy. An octopus won't consent to letting his prey escape.

These simple measures can't solve the political problem that society is faced with. Given the passiveness and servility of the parties ruling this country [the coalition of Christian and Social Democrats in Germany], it's remarkable enough if one notable politician speaks up. His name is Martin

Schulz, and he's not only president of the European Parliament but even a Social Democrat. Until now, neither he nor his party objected to the rampant security and control mania in any remarkable way. All respective violations, no matter whether foreign imports or domestic products of German workmanship, have been given the nod. Storing data, intercepting, appeasing - the standard procedure.

The sleep of reason will continue to the day when a majority of this country's citizens will experience firsthand what has been done to them. Perhaps, they will rub their eyes and ask why they let it slip in a time when resistance was still possible.

Thanks Cornelia, and Florian for making the translation. I don't mind the piece but what misses here is a bit of self-reflection of a writer who has been inside the media realm his entire life, and who is unable to put his own 'offline romanticism' in the larger picture of the (German) history of ideas. Apart from this, it is also sad that he is simply badly informed about the current state of the postal system in the age of global surveillance. One link will do: <http://www.nytimes.com/2013/07/04/us/monitoring-of-snail-mail.html> (U.S. Postal Service Logging All Mail for Law Enforcement). Geert

> Imagine you would have had to hand-write the information and send it to all subscribers of nettime via postcard;-)

Well in fairness the postcard suggestion was "If you have a

confidential message", which I'm pretty sure doesn't count for posting a translation of a message to a publically archived list.

Thanks Florian for the translation, I like the rules very much. I do wish the sort of "stay safe online" advice schools give out was more like this. But that assumes schools to be quite different institutions than they are.

The one rule I wasn't sure about was #3, "Online banking is a blessing, but only for secret services and criminals." It's certainly useful for a criminal (though depending on the bank, that may be more of a problem for them than for you, according to if they'll admit responsibility and refund you), but is it useful for secret services? All the transactions you can make with online banking are recorded and (I presume) can be obtained easily by secret services just as readily offline.

If you have a confidential message use poetry for encryption.

"Moazzam Begg, who spent three years in Guantánamo Bay before being released without charge in January 2005, began writing poetry as a way of explaining what he was going through. He knew that everything he wrote would be censored, so used poetry to try to describe his situation to his family." (<http://www.theguardian.com/books/2007/feb/26/poetry.guantanamo>)

I think today's kids are instinctively aware of those issues. It's a matter of "being On/Off" for them, as they put it into words. Like walking down a street in public, "being On".

Since several people asked me off-list about my own opinion on Enzensberger's piece and my reasons for posting it here, the best answer I can give is an essay I completed just a few weeks ago for *_A Peer-Review Journal_* (APRJA, <http://www.aprja.net>), an Open Access journal on digital culture edited by Christian Ulrik Andersen and Geoff Cox at Aarhus University in Denmark. While it now reads like a reply to Enzensberger, it was actually written early as part of a larger "post-digital research" workshop organized by Aarhus University at Kunsthall Aarhus in collaboration with transmediale festival; all other essays in the current number of APRJA were products of this workshop, too.

The original essay, including images that are missing here, has been published at <http://www.aprja.net/?p=1318>

Florian

What is 'Post-digital'?

Typewriters vs. imageboard memes

In January 2013, a picture of a young man typing on a mechanical typewriter while sitting on a park bench went 'viral' on the popular website [Reddit] http://www.reddit.com/r/funny/comments/16vlkc/youre_not_a_real_hipster_until/). The image was presented in the typical style of an 'image macro' or 'imageboard meme' (Klok 16-19), with a sarcastic caption in bold white Impact typeface that read: 'You're not a real hipster ??? until you take your typewriter to the park'.

The meme, which was still making news at the time of writing this paper in late 2013 (Hermlin), nicely illustrates the rift between 'digital' and 'post-digital' cultures. Imageboard memes are arguably the best example of a contemporary popular mass culture which emerged and developed entirely on the Internet. Unlike earlier popular forms of visual culture such as comic strips, they are anonymous creations ??? and as such, even gave birth to the now-famous Anonymous movement, as described by (Klok 16-19).

The 'digital' imageboard meme portrays the 'analog' typewriter hipster as its own polar opposite ??? in a strictly technical sense however, even a mechanical typewriter is a digital writing system, as I will explain later in this text. Also, the typewriter's keyboard makes it a direct precursor of today's personal computer systems, which were used for typing the text of the imageboard meme in question. Yet in a colloquial sense, the typewriter is definitely an 'analog' machine, as it does not contain any computational electronics.

In 2013, using a mechanical typewriter rather than a mobile computing device is, as the imageboard meme suggests, no longer a sign of being old-fashioned. It is instead a deliberate choice of renouncing electronic technology, thereby calling into question the common assumption that computers, as meta-machines, represent obvious technological progress and therefore constitute a logical upgrade from any older media technology ??? much in the same way as using a bike today calls into question the common assumption, in many Western countries since World War II, that the automobile is by definition a rationally superior means of transportation, regardless of the purpose or context.

Typewriters are not the only media which have recently been resurrected as literally post-digital devices: other examples include vinyl records, and more recently also audio cassettes, as well as analog photography and artists' printmaking. And if one examines the work of contemporary young artists and designers, including art school students, it is obvious that these 'old' media are vastly more popular than, say, making imageboard memes.[^1]

Post-digital: a term that sucks but is useful

1. Disenchantment with 'digital'

I was first introduced to the term 'post-digital' in 2007 by my then-student Marc Chia ??? now Tara Transtroy, also performing under the moniker _One Man Nation_. My first reflex was to dismiss the whole concept as irrelevant in an age of cultural, social and economic upheavals driven to a large extent by computational digital technology. Today, in the age of ubiquitous mobile devices, drone wars and the gargantuan data operations of the NSA, Google and other global players, the term may seem even more questionable than it did in 2007: as either a sign of ignorance of our contemporary reality, or else of some deliberate Thoreauvian-Luddite withdrawal from this reality.

More pragmatically, the term 'post-digital' can be used to describe either a contemporary disenchantment with digital information systems and media gadgets, or a period in which our fascination with these systems and gadgets has become historical ??? just like the dot-com age ultimately became historical in the 2013 novels of Thomas Pynchon and Dave Eggers. After Edward Snowden's disclosures of the NSA's all-pervasive digital surveillance systems, this disenchantment has quickly grown from a niche 'hipster' phenomenon to a mainstream position ??? one which is likely to have a serious impact on all cultural and business practices based on networked electronic devices and Internet services.

2. Revival of 'old' media

While a Thoreauvian-Luddite digital withdrawal may seem a tempting option for many, it is fundamentally a naïve position, particularly in an age when even the availability of natural resources depends on global computational logistics, and intelligence agencies such as the NSA intercept paper mail as well as digital communications. In the context of the arts, such a withdrawal seems little more than a rerun of the 19th-century Arts and Crafts movement, with its programme of handmade production as a means of resistance to encroaching industrialisation. Such (romanticist) attitudes undeniably play an important role in today's renaissance of artists' printmaking, handmade film labs, limited vinyl editions, the rebirth of the audio cassette, mechanical typewriters, analog cameras and analog synthesizers. An empirical study conducted by our research centre Creating 010 in Rotterdam among Bachelor students from most of the art schools in

the Netherlands indicated that contemporary young artists and designers clearly prefer working with non-electronic media: given the choice, some 70% of them 'would rather design a poster than a website' (Van Meer, 14). In the Netherlands at least, education programmes for digital communication design have almost completely shifted from art academies to engineering schools, while digital media are often dismissed as commercial and mainstream by art students (Van Meer, 5). Should we in turn dismiss their position as romanticist and neo-Luddite?

Post-what?

Post-digital = postcolonial; post-digital ??? post-histoire

On closer inspection however, the dichotomy between digital big data and neo-analog do-it-yourself (DIY) is really not so clear-cut. Accordingly, 'post-digital' is arguably more than just a sloppy descriptor for a contemporary (and possibly nostalgic) cultural trend. It is an objective fact that the age in which we now live is _not_ a post-digital age, neither in terms of technological developments ??? with no end in sight to the trend towards further digitisation and computerisation ??? nor from a historico-philosophical perspective. Regarding the latter, (Cox) offers a valid critique of the 'periodising logic' embedded in the term 'post-digital', which places it in the dubious company of other historico-philosophical 'post'-isms, from postmodernism to post-histoire.

However, 'post-digital' can be defined more pragmatically and meaningfully within popular cultural and colloquial frames of reference. This applies to the prefix 'post' as well as the notion of 'digital'. The prefix 'post' should not be understood here in the same sense as postmodernism and post-histoire, but rather in the sense of post-punk (a continuation of punk culture in ways which are somehow still punk, yet also beyond punk); post-communism (as the ongoing social-political reality in former Eastern Bloc countries); post-feminism (as a critically revised continuation of feminism, with blurry boundaries with 'traditional', unprefixed feminism); postcolonialism (see next paragraph); and, to a lesser extent, post-apocalyptic (a world in which the apocalypse is not over, but has progressed from a discrete breaking point to an ongoing condition ??? in Heideggerian terms, from _Ereignis_ to _Being_ ??? and with a contemporary popular iconography pioneered by the _Mad Max_ films in the 1980s).

None of these terms ??? post-punk, post-communism, post-feminism, postcolonialism, post-apocalyptic ??? can be understood in a purely Hegelian sense of an inevitable linear progression of cultural and intellectual history. Rather, they describe more subtle cultural shifts and ongoing mutations. Postcolonialism does not in any way mean an end of colonialism (akin to Hegel's and Fukuyama's 'end of history'), but rather its mutation into new power structures, less obvious but no less pervasive, which have a profound and lasting impact on languages and cultures, and most significantly continue to govern geopolitics and global production chains. In this sense, the post-digital condition is a post-apocalyptic one: the state of affairs after the initial upheaval caused by the computerisation and global digital networking of communication, technical infrastructures, markets and geopolitics.

'Digital' = sterile high tech?

Also, the 'digital' in 'post-digital' should not be understood in any technical-scientific or media-theoretical sense, but rather in the way the term is broadly used in popular culture ??? the kind of connotation best illustrated by a recent Google Image Search result for the word 'digital': The first thing we notice is how the term 'digital' is, still in 2013, visually associated with the colour blue. Blue is literally the coolest colour in the colour spectrum (with a temperature of 15,000 to 27,000 Kelvin), with further suggestions of cultural coolness and cleanliness. The simplest definition of 'post-digital' describes a media aesthetics which opposes such digital high-tech and high-fidelity cleanliness. The term was coined in 2000 by the musician Kim Cascone, in the context of glitch aesthetics in contemporary electronic music (Cascone, 12). Also in 2000, the Australian sound and media artist Ian Andrews used the term more broadly as part of a concept of "post-digital aesthetics" which rejected the "idea of digital progress" as well as "a teleological movement toward 'perfect' representation" (Andrews).

Cascone and Andrews considered the notion of 'post-digital' primarily as an antidote to techno-Hegelianism. The underlying context for both their papers was a culture of audio-visual production in which digital 'had long been synonymous with 'progress': the launch of the Fairlight CMI audio sampler in 1979, the digital audio CD and the MIDI standard (both in 1982), software-only digital audio workstations in the early 1990s, real-time programmable software synthesis with Max/MSP in 1997. Such teleologies are still prevalent in video and TV technology, with the ongoing transitions from SD to HD and 4K, from DVD to BluRay, from 2D to 3D ??? always marketed with a similar narrative of innovation, improvement, and higher fidelity of reproduction. In rejecting this narrative, Cascone and Andrews opposed the paradigm of technical quality altogether.

Ironically, the use of the term 'post-digital' was somewhat confusing in the context of Cascone's paper, since the glitch music defined and advocated here actually *was* digital, and even based on specifically digital sound-processing artefacts. On the other hand, and in the same sense as post-punk can be seen as a reaction to punk, Cascone's concept of 'post-digital' may best be understood as a reaction to an age in which even camera tripods are being labelled as 'digital', in an effort to market them as new and superior technology.

Digital = low-quality trash!

There is a peculiar overlap between on one hand a post-digital rejection of digital high tech, and on the other hand a post-digital rejection of digital low quality. Consider for example the persisting argument that vinyl LPs sound better than CDs (let alone MP3s); that film photography looks better than digital photography (let alone smartphone snapshots); that 35mm film projection looks better than digital cinema projection (let alone BitTorrent video downloads or YouTube); that paper books are a richer medium than websites and e-books; and that something typed on a mechanical typewriter has more value than a throwaway digital text file (let alone e-mail spam). In fact, the glitch aesthetics advocated by Cascone as 'post-digital' are precisely the same kind of digital trash dismissed by 'post-digital' vinyl listeners.

Digression: what is digital, what is analog?

Digital ??? binary; digital ??? electronic

>From a strictly technological or scientific point of view, Cascone's use of the word 'digital' was inaccurate. This also applies to most of what is commonly known as 'digital art', 'digital media' and 'digital humanities'. Something can very well be 'digital' without being electronic, and without involving binary zeroes and ones. It does not even have to be related in any way to electronic computers or any other kind of computational device.

Conversely, 'analog' does not necessarily mean non-computational or pre-computational. There are also analog computers. Using water and two measuring cups to compute additions and subtractions ??? of quantities that can't be counted exactly ??? is a simple example of analog computing.

'Digital' simply means that something is divided into discrete, countable units ??? countable using whatever system one chooses, whether zeroes and ones, decimal numbers, tally marks on a scrap of paper, or the fingers (digits) of one's hand ??? which is where the word 'digital' comes from in the first place; in French, for example, the word is *numérique*. Consequently, the Roman alphabet is a digital system; the movable types of Gutenberg's printing press constitute a digital system; the keys of a piano are a digital system; Western musical notation is mostly digital, with the exception of instructions with non-discrete values such as *adagio*, *piano*, *forte*, *legato*, *portamento*, *tremolo* and *glissando*. Floor mosaics made of monochrome tiles are digitally composed images. As all these examples demonstrate, 'digital' information never exists in a perfect form, but is instead an idealised abstraction of physical matter which, by its material nature and the laws of physics, has chaotic properties and often ambiguous states.^[^2]

The hipster's mechanical typewriter, with its discrete set of letters, numbers and punctuation marks, is therefore a 'digital' system as defined by information science and analytic philosophy (Goodman, 161). However, it is also 'analog' in the colloquial sense of the word. This is also the underlying connotation in the meme image, with its mocking of 'hipster' retro culture. An art curator, on the other hand, might consider the typewriter a 'post-digital' medium.

Analog = undivided; analog ??? non-computational

Conversely, 'analog' means that the information has not been chopped up into discrete, countable units, but instead consists of one or more signals which vary on a continuous scale, such as a sound wave, a light wave, a magnetic field (for example on an audio tape, but also on a computer hard disk), the flow of electricity in any circuit including a computer chip, or a gradual transition between colours, for example in blended paint. (Goodman, 160) therefore defines analog as "undifferentiated in the extreme" and "the very antithesis of a notational system".

The fingerboard of a violin is analog: it is fretless, and thus undivided and continuous. The fingerboard of a guitar, on the other hand, is digital: it is divided by frets into discrete notes. What is commonly called 'analog' cinema film is actually a digital-analog hybrid: the film emulsion is analog, since its particles are undifferentiated blobs ordered organically and chaotically, and thus not reliably countable in the way that pixels are. The combined frames of the film strip, however, are digital since they are discrete, chopped up and unambiguously countable.

The structure of an analog signal is determined entirely by its

correspondence (analogy) with the original physical phenomenon which it mimics. In the case of the photographic emulsion, the distribution of the otherwise chaotic particles corresponds to the distribution of light rays which make up an image visible to the human eye. On the audio tape, the fluctuations in magnetisation of the otherwise chaotic iron or chrome particles correspond to fluctuations in the sound wave which it reproduces.

However, the concept of 'post-digital' as defined by Cascone ignored such technical-scientific definitions of 'analog' and 'digital' in favour of a purely colloquial understanding of these terms.

Post-digital = against the universal machine

Proponents of 'post-digital' attitudes may reject digital technology as either sterile high tech or low-fidelity trash. In both cases, they dismiss the idea of digital processing as the sole universal all-purpose form of information processing. Consequently, they also dismiss the notion of the computer as the universal machine, and the notion of digital computational devices as all-purpose media.

What, then, is 'post-digital'?

(The following is an attempt to recapitulate and order some observations which I have formulated in previous publications.^[^3])

Post-digital = post-digitisation

Returning to Cascone and Andrews, but also to post-punk, postcolonialism and Mad Max, the term 'post-digital' in its simplest sense describes the messy state of media, arts and design *after* their digitisation (or at least the digitisation of crucial aspects of the channels through which they are communicated). Sentiments of disenchantment and scepticism may also be part of the equation, though this need not necessarily be the case ??? sometimes, 'post-digital' can in fact mean the exact opposite. Contemporary visual art, for example, is only slowly starting to accept practitioners of net art as regular contemporary artists ??? and then again, preferably those like Cory Arcangel whose work is white cube-compatible. Yet its discourse and networking practices have been profoundly transformed by digital media such as the e-flux mailing list, art blogs and the electronic e-flux journal. In terms of circulation, power and influence, these media have largely superseded printed art periodicals, at least as far as the art system's in-crowd of artists and curators is concerned. Likewise, when printed newspapers shift their emphasis from daily news (which can be found quicker and cheaper on the Internet) to investigative journalism and commentary ??? like *The Guardian*'s coverage of the NSA's PRISM programme ??? they effectively transform themselves into post-digital or post-digitisation media.

Post-digital = anti-'new media'

'Post-digital' thus refers to a state in which the disruption brought upon by digital information technology has already occurred. This can mean, as it did for Cascone, that this technology is no longer perceived as disruptive. Consequently, 'post-digital' stands in direct opposition to the very notion of 'new media'. At the same time, as its negative mirror image, it exposes ??? arguably even deconstructs ??? the latter's hidden teleology: when the term 'post-digital' draws critical reactions focusing on the dubious historic-philosophical connotations of the prefix 'post', one cannot help but wonder about a previous lack of such critical thinking regarding the older (yet no less Hegelian) term 'new media'.

Post-digital = hybrids of 'old' and 'new' media

'Post-digital' describes a perspective on digital information technology which no longer focuses on technical innovation or improvement, but instead rejects the kind of techno-positivist innovation narratives exemplified by media such as *Wired* magazine, Ray Kurzweil's Google-sponsored 'singularity' movement, and of course Silicon Valley. Consequently, 'post-digital' eradicates the distinction between 'old' and 'new' media, in theory as well as in practice. Kenneth Goldsmith notes that his students 'mix oil paint while Photoshopping and scour flea markets for vintage vinyl while listening to their iPods' (Goldsmith, 226). Working at an art school, I observe the same. Young artists and designers choose media for their own particular material aesthetic qualities (including artefacts), regardless of whether these are a result of analog material properties or of digital processing. Lo-fi imperfections are embraced ??? the digital glitch and jitter of Cascone's music along with the grain, dust, scratches and hiss in analog reproduction ??? as a form of practical exploration and research that examines materials through their imperfections and malfunctions. It is a post-digital hacker attitude of talking systems apart and using them in ways which subvert the original intention of the design.

Post-digital = retro?

No doubt, there is a great deal of overlap between on one hand post-digital

mimograph printmaking, audio cassette production, mechanical typewriter experimentation and vinyl DJing, and on the other hand various hipster-retro media trends ??? including digital simulations of analog lo-fi in popular smartphone apps such as Instagram, Hipstamatic and iSupr8. But there is a qualitative difference between simply using superficial and stereotypical ready-made effects, and the thorough discipline and study required to make true 'vintage' media work, driven by a desire for non-formulaic aesthetics.

Still, such practices can only be meaningfully called 'post-digital' when they do not merely revive older media technologies, but functionally repurpose them in relation to digital media technologies: zines that become anti-blogs or non-blogs, vinyl as anti-CD, cassette tapes as anti-MP3, analog film as anti-video.

Post-digital = 'old' media used like 'new media'

At the same time, new ethical and cultural conventions which became mainstream with Internet communities and Open Source culture are being retroactively applied to the making of non-digital and post-digital media products. A good example of this are collaborative zine conventions, a thriving subculture documented on the blog [fanzines.tumblr.com/] (<http://fanzines.tumblr.com/>) and elsewhere. These events, where people come together to collectively create and exchange zines (i.e. small-circulation, self-published magazines, usually focusing on the maker's cultural and/or political areas of interest), are in fact the exact opposite of the 'golden age' zine cultures of the post-punk 1980s and 1990s, when most zines were the hyper-individualistic product and personality platforms of one single maker. If we were to describe a contemporary zine fair or mimeography community art space using Lev Manovich's 'new media' taxonomy of 'Numerical Representation', 'Modularity', 'Automation', 'Variability' and 'Transcoding' (Manovich, *The Language of New Media*, 27-48), then 'Modularity', 'Variability' and ??? in a more loosely metaphorical sense ??? 'Transcoding' would still apply to the contemporary cultures working with these 'old' media. In these cases, the term 'post-digital' usefully describes 'new media'-cultural approaches to working with so-called 'old media'.

DIY vs. corporate media, rather than 'new' vs. 'old' media

When hacker-style and community-centric working methods are no longer specific to 'digital' culture (since they are now just as likely to be found at an 'analog' zine fair as in a 'digital' computer lab), then the established dichotomy of 'old' and 'new' media ??? as synonymous in practice with 'analog' and 'digital' ??? becomes obsolete, making way for a new differentiation: one between shrink-wrapped culture and do-it-yourself culture. The best example of this development (at least among mainstream media) is surely the magazine and website *Make_* published by O'Reilly since 2005, and instrumental for the foundation of the contemporary 'maker movement'. *Make_* covers 3D printing, Arduino hardware hacking, fab lab technology, as well as classical DIY and crafts, and hybrids between various 'new' and 'old' technologies.

The 1990s / early 2000s assumption that 'old' mass media such as newspapers, movies, television and radio are corporate, while 'new media' such as websites are DIY, is no longer true now that user-generated content has been co-opted into corporate social media and mobile apps. The Internet as a self-run alternative space ??? central to many online activist and artist projects, from *The Thing* onwards ??? is no longer taken for granted by anyone born after 1990: for younger generations, the Internet is associated mainly with corporate, registration-only services[^4]

Revisiting the typewriter hipster meme

The alleged typewriter hipster later turned out to be a writer who earned his livelihood by selling custom-written stories from a bench in the park. The imageboard meme photo was taken from an angle that left out his sign, taped to his typewriter case: 'One-of-a-kind, unique stories while you wait'. In an article for the website *The Awl*, he recounts how the meme made him 'An Object Of Internet Ridicule' and even open hatred[^7]. Knowing the whole story, one can only conclude that his decision to bring a mechanical typewriter to the park was pragmatically the best option. Electronic equipment (a laptop with a printer) would have been cumbersome to set up, dependent on limited battery power, and prone to weather damage and theft, while handwriting would have been too slow, insufficiently legible, and lacking the appearance of a professional writer's work.

Had he been an art student, even in a media arts programme, the typewriter would still have been the right choice for this project. This is a perfect example of a post-digital choice: using the technology most suitable to the job, rather than automatically 'defaulting' to the latest 'new media' device. It also illustrates the post-digital hybridity of 'old' and 'new' media, since the writer advertises (again, on the sign on his typewriter case) his Twitter account "[AT] rovingtypist", and conversely uses this account

to promote his story-writing service. He has effectively repurposed the typewriter from a prepress tool to a personalised small press, thus giving the 'old' technology a new function usually associated with 'new media', by exploiting specific qualities of the 'old' which make up for the limitations of the 'new'. Meanwhile, he also applies a 'new media' sensibility to his use of 'old media': user-customised products, created in a social environment, with a 'donate what you can' payment model. Or rather, the dichotomy of community media vs. mass media has been flipped upside-down, so that a typewriter is now a community media device, while participatory websites have turned into the likes of *Reddit*, assuming the role of yellow press mass media ??? including mob hatred incited by wilful misrepresentation.

The desire for agency

Cascone and Andrews partly contradicted themselves when they defined the concept of 'post-digital' in the year 2000. Though they rejected the advocacy of 'new media', they also relied heavily on it. Cascone's paper drew on Nicholas Negroponte's *'Wired' article 'Beyond Digital'* (Negroponte), while Ian Andrews' paper referenced Lev Manovich's *'Generation Flash'*, an article which promoted the very opposite of the analog/digital, retro/contemporary hybridisations currently associated with the term 'post-digital' (Manovich, *'Generation Flash'*). We could metaphorically describe post-digital cultures as postcolonial practices in a communications world taken over by a military-industrial complex made up of only a handful of global players. More simply, we could describe these cultures as a rejection of such dystopian techno-utopias as Ray Kurzweil's and Google's Singularity University, the Quantified Self movement, and sensor-controlled 'Smart Cities'.

And yet, post-digital subculture, whether in Detroit, Rotterdam or elsewhere, is on a fundamental level not so different from such mainstream Silicon Valley utopias. For (Van Meer), the main reason why art students prefer designing posters to designing websites is due to a fiction of agency - in this case, an illusion of more control over the medium. Likewise, 'digital' cultures are driven by similar illusions of free will and individual empowerment. The Quantified Self movement, for example, is based on a fiction of agency over one's own body. The entire concept of DIY, whether non-digital, digital or post-digital, is based on the fiction of agency implied by the very notion of the self-made.

Each of these fictions of agency represents one extreme in how individuals relate to the techno-political and economic realities of our time: either over-identification with systems, or rejection of these same systems. Each of these extremes is, in its own way, symptomatic of a 'systems crisis' ??? not a crisis of this or that system, but rather a crisis of the very paradigm of 'system', as defined by General Systems Theory, itself an offshoot of cybernetics. A term such as 'post-Snowden' describes only one (important) aspect of a bigger picture[^8]: a crisis of the cybernetic notion of 'system' which neither 'digital' nor 'post-digital' ??? two terms ultimately rooted in systems theory ??? are able to leave behind, or even adequately describe.

Re: <nettime> Hans Magnus Enzensberger: Rules for the digital world
From: Jon Ippolito
To: nettime-l@kein.org
Date: Wed, 5 Mar 2014 10:01:14 -0500

I enjoyed Florian Cramer's "What Is 'Post-digital'" essay and share his disdain for our overuse of the word digital. Calling Cornelia Sollfrank's or John Hopkin's work "digital art" seems to me like calling a tiger a large housecat--a convenient identification for zookeepers and curators.

So much of this work has already bent the "digital" category. If Enzensberger wants us to send our secrets via postcards, he need look no further than "digital artist" Aram Bartholl's practice of printing postcards with pictures of WiFi passwords (<http://datenform.de/greetings-from-the-internet-eng.html>).

Enzensberger's essay and the typewriter-in-the-park meme are deceptively quaint. Both seem to be throwbacks until you examine them a bit more closely, at which point references to the contemporary culture of Facebook and PRISM emerge. I grew up writing on a typewriter and certainly never saw one in the park before the age of netbooks and iPads.

On the other hand, neither the manifesto nor the meme is nuanced enough to apply to my life. When I hear an octogenarian say, "Whoever offers something for free is suspicious," I'm glad he's paying some attention to today's social media critics but I wish he'd thought more carefully before parroting this cliché. Most of the software I use today is "free" and I make most of my software available to others for the same price. I worry that the "free-as-in-Facebook" meme plays easily into the old Microsoft "open source isn't trustworthy" campaign of Fear, Uncertainty, and Doubt.

So for me, whoever claims whoever offers something for free is suspicious is suspicious.

What happened to the Enzensberger who advocated being "as free as dancers, as aware as football players, as surprising as guerillas"? I'm not surprised (if I understand Andreas Broeckmann correctly) that Enzensberger's essay was published in a conservative newspaper. As much as I despise Facebook, I think we can summon a better response than a curmudgeonly "get off my lawn."

Cheers,

jonu

The point I want to make is not so much about Enzensbergers text - the poet has clearly let himself down - but the publishing context. FAZ is on a campaign against Gratiskultur - the free culture of the internet. A few days earlier there was a text by Jaron Lanier which was pretty much a repetition of his older rant against Digital Maoism with a little added surveillance sauce. FAZ does not like the net, never did. So they mix cleverly two things, using widespread dissatisfaction with surveillance to fight against free culture. This is clearly old capital against new capital - the enemy is Google. What a pity that Enzensberger allowed himself to be used in that way by an arch-conservative newspaper. Lanier also allowed himself to be used but thats not such a pity because as his Digital Maoism text showed he is beyond the beyond.

regards
Armin

Thats what I thought too -- and I think it is completely impossible
and not even a topic worth to be discussed. The article was not even
good as a shameless plug for this terrible pathetic social democratic
former bookseller who wants to rule the EU.

What a nonsense and what a megastrange "sovereignty language" for a
social democrat! Such language was until now used only in the German
far right (where it is the only important motivation except to have
fun by provocations).

Best, H.

While I'd like to chime in with Andreas' fact check of Enzensberger's
ten rules:

> For those who aren't nerds, hackers or cryptographers and have
> better things to do than keep up with the pitfalls of digitalization
> every hour, there are ten simple rules to resist exploitation and
> surveillance:

Unlike Andreas, I think that Enzensberger is right and that critical
media activist culture delivered the proof in the pudding when it came
up with the format and name of "Crypto Parties". The implication is,
indeed, that you need to become at least a low-skilled cryptographer
who knows what PGP, SSL and TOR mean and how they are used.

In Rotterdam, on a CryptoParty last Friday at WORM, we just learned
again how difficult it is for contemporary Internet users to even
grasp the concept of a local mail client (like Thunderbird) as opposed
to Web Mail - and that does not even include complex stuff like
PGP encryption and key management. But using Web Mail means, by
definition, that others can read and data mine your correspondence.
And let's not even go into gory details like keeping up with software
vulnerabilities (like the SSL bug in Apple's operating systems or the
very similar GNU-TLS bug from last week). It's fair to say that all
the computer and Internet communication systems we currently use are
fundamentally insecure, and that there are likely only a handful of
systems in the world into which a skilled third party could not break
into to intercept the data stored on or sent from them.

> 1

> If you own a mobile phone, throw it away.

> From a hacker perspective, this is sound advice. Apart from a very
few fringe, mostly not-yet-existing mobile phone operating systems
(such as Phil Zimmerman's Black Phone), all of the existing mobile
phones leak your data. Even a most simple stripped-down mobile phone
constantly broadcasts your location. The technology to intercept calls
and data transfers has become trivially simple (as Danja Vasiliev
and Julian Oliver demonstrated on this year's transmediale festival
in Berlin). Another issue is that smartphones are multi-sensor
devices that broadcast megabytes of data (such as bodily movement via
accelerometers) with their users being aware of it.

> 2

> Whoever offers something for free is suspicious. One should categorically
> refuse anything that passes itself off as a bargain, bonus or freebie. It's
> always a lie.

I agree with Andreas, but a problem remains that this advice can
involuntarily backfire against ethical free services offered by
non-profits (from free Wi-Fi access at a public library to Open Source
software).

> 3

> Online banking is a blessing, but only for secret services and criminals.

Here, Enzensberger's advice is naive, because banking in these times is online anyway. If people go to a bank counter instead of homebanking, the transaction will travel over the same networks (and most likely, the bank employee will use the same online banking web interface). It also ignores the data retention and customer tracking built into the international banking system via, for example, the SWIFT accord between the EU and the USA.

> 4

> Governments and industries want to abolish cash. They would like to get rid
> of a legal tender that anyone can redeem.

This is indeed an important point, and has become a reality in countries like Sweden. Contrary to common belief and letting aside all other issues of this payment system, Bitcoin is not a solution for this problem because all Bitcoin transaction records are publicly visible (as discussed here on *Nettime* previously - no need to open this can of worms again). So far, cash is the only truly anonymous, hard-to-trace payment method.

> 5

> The madness of networking every object of daily use - from toothbrush to
> TV, from car to refrigerator - via the Internet, can only be met with total
> boycott.

The recent news about "smart TVs" spying on its viewers (<https://securityledger.com/2013/11/fix-from-ig-ends-involuntary-smart-v-snooping-but-privacy-questions-remain/>) indeed confirm this - and the news that "smart refrigerators" are now running spam botnets (<http://arstechnica.com/security/2014/01/is-your-refrigerator-really-part-of-a-massive-spam-sending-botnet/>). This is one example of the term "post-digital" making sense - that in many cases, it's better that devices are offline than online.

> 6

> The same applies to politicians. They ignore any objection to their actions
> and omissions. They are submissive to the financial markets and don't dare
> to go against the activities of secret services.

No point in arguing with that. Most likely, most of them are in the pockets of the secret services that have collected compromising information on them.

> 7

> E-Mail is nice, fast and free. So watch out! If you have a confidential
> message or don't want to be surveilled, take a postcard and pencil.

This advice is technologically naive. It's known that the NSA and other secret services have systematically scanned and collected postal mail meta data (sender and receiver addresses along with timestamps), postal mail relies on digital logistics (and digitized meta data) anyway. Nearly-unreadable handwriting on post cards would not last very long as an obfuscation device. All the secret service had to do is to run a Captcha program for the handwriting that would fail OCR.

> 8

> Avoid obtaining goods and services via Internet. Vendors like Amazon, Ebay
> and so on store all data and molest their customers with advertising spam.

Naive advice, again, since your supermarket collects the same information - either via loyalty discount cards or simply by collecting data from card payments.

> 9

> Just like network television, the big Internet corporations are primarily
> financed by advertising.

This is a naive view as well, or it might at best be true for Google. Enzensberger fails to understand the system of venture capital financing in combination with IPOs and stock markets that work as a global speculative scheme. (In less abstract words: It doesn't matter whether a company like Facebook will ever make real profits since its founders, venture capital investors and first-wave stock buyers will have made billions before the company tanks.) He also excludes the possibility that selling customer data with third parties, including law enforcement, intelligence agencies, insurance companies, banks etc. might already be a major source of revenue for many Internet companies.

> 10

> Networks like Facebook call themselves "social" despite their eagerness to
> treat their customers in the utmost anti-social ways.

Here, Enzensberger sounds like a disgruntled airline customer who wants his money back after a flight from hell. He misses the point that nowadays, sites like Facebook exist because of peer pressure for

participation.

> friends like this, is a hopeless case. Those who are unfortunate
> enough to be part of such a company, should try to take flight as
> fast as possible. This is not so easy. An octopus won't consent to
> letting his prey escape.

True, since Facebook doesn't delete profile data even after people have shut down their accounts, and even creates profiles of people who aren't on Facebook (and don't intend to sign on) based on the social network information (and uploaded E-Mail address books) of registered users. This is also true for other web sites such as LinkedIn.

> These simple measures can't solve the political problem that society is
> faced with.

No point arguing with this.

> The sleep of reason will continue to the day when a majority of this
> country's citizens will experience firsthand what has been done to them.
> Perhaps, they will rub their eyes and ask why they let it slip in a time
> when resistance was still possible.

One only needs to ponder what the Hitler government would have been able to pull off during the Third Reich, on top of everything it already did, if it had had access to the kind of personal data that is now stored at Google, Facebook and the NSA, for every citizen in Germany and the countries occupied in WWII - and even keeping people outside those territories in check by blackmail.

There's no question that we're living in societies of control and that the Internet is their infrastructure.

Writing for the FAZ myself I can assure you, that there is no such thing as "the FAZ". It is a multitude of opinions, plenty of debates and highly mobile frontlines. There are some arch-conservative editors and authors who would love to wake up one day and find the internet gone (mostly in the politics and business parts of the paper). And then there are plenty of others (more often in the *Feuilleton*) who have distinctly different and certainly not conservative views.

You should not make the mistake to associate Google with "good" just because they side with free culture sometimes when it fits their business interests. We are deep inside a multi-front power struggle with shifting alliances and neither the government nor the internet oligopolies are on our side.

btw: I read Enzensberger as satire.

This is the essential fallacy.

The idea that the security is so complicated that only the guild members (from gov/corporate employees to open source celebrities) are supposed to handle it, has been successfully floated for a while. Which leaves the unwashed with the choice of 'trusting' either the former or the latter. Whoever they choose, those will continue to earn 10-20x the poverty level income for performing the holy rites. The guild members are likely sincere when promoting this notion: self-preservation is a great motivator. "Never make home brew crypto" is what got us where we are today.

It's like literacy. There is nothing easy or natural about learning to read and write. Literacy used to be confined to the ruling circles and prohibited to the rabble. But literacy for the masses caused great power shifts, and very few question it today.

Fuck the scribes.

Learning basics about communications security may be somewhat harder than learning to read and write, but it's not orders of magnitude. The only security that will work is the one that a person truly understands, and fuck the UI. Witness the very successful use of cryptography by those who understand that their well-being depends on it.

What needs to happen is a shift from 'trust me, I'll do it for you', to 'I'll teach you how to make your own'. Not the easiest path, not the quick one, but the one that may work. Bickering about whom to trust and begging the authorities to stop what they are doing is a total waste of time.

Hi Frank

sure, there is a diversity of opinion in any self-respecting newspaper. But that does not change the fact that FAZ editors are conducting a kind of campaign against the 'free' culture of the internet. I would certainly not consider Google to be 'good'. I am observing, rather neutrally, that there is a fight of old versus new capital. Google represents a new mode of production, FAZ an old one. FAZ is trying to preserve its business model, based on copyright and exclusivity. The new political economy is still in its ascendancy, Google still represents a future (not THE future). Therefore we should hold Google accountable, while not falling for the trap of defending the interests of old capital

best,
Armin

Hi MP,

it is not so difficult. There's capital, and its not homogenous. There are capitals of a different era and of a different kind - such as industrial, agro-business, and financial capital. There are different modes of production and social relations that go with it. It is not about 'for' or 'against' or naive versions of 'good' and 'bad' but if we want to understand the world we live in - and to preempt any questions, I think to some degree this is possible - then we need to engage with such concepts that great social scientists have developed

regards
Armin

Captcha is already being used to decipher hard-to-OCR street numbers collected by Google Streetview. Traditionally captchas have been used to tell humans from bots, ironically you must now prove your humanity by rattling out somebody's address to Google.

There's an interesting book called IBM And The Holocaust that describes the use of IBM punchcard systems and census data to aid in the Holocaust. Not only to to crunch census data, but also cross referencing records of governments and churches throughout occupied Europe and

solving difficult logistics problems to increase the efficiency of
deportation to concentration camps.

I don't get it. Sounds strangely abstract/academic to me, or maybe I am
just stupid.

If a corporation is in a new kind of business, but owned by the same old
shareholder circles as those that came before, which category is it in,
then, new or old?

And what exactly does it matter? Does it, say, matter to a peasant
community whether their river is destroyed directly by Google's power
consumption or destroyed by the mining by an old corporation processing
minerals (that later end up in Google server farms)?

And then you throw "great social scientists" into the mix, too!!? Who
are they?

Posted on the chance that the speech which follows below has some
relevance to the current thread. It was given by invitation to the
RSA conference ten days ago now.

-----8<-----cut-here-----8<-----

[nominal delivery draft]

.We Are All Intelligence Officers Now
.Dan Geer, 28 February 14, RSA/San Francisco

Good morning. Thank you for the invitation to speak with you today,
which, let me be clear, is me speaking for myself, not for anyone
or anything else. As you know, I work the cyber security trade,
that is to say that my occupation is cyber security. Note that I
said "occupation" rather than "profession." Last September, the

U.S. National Academy of Sciences concluded that cyber security
should be seen as an occupation and not a profession because the
rate of change is simply too great to consider professionalization.[NAS]
You may well agree that that rate of change is paramount, and, if
so, you may also agree that cyber security is the most intellectually
demanding occupation on the planet.

The goal of the occupation called cyber security grows more demanding
with time, which I need tell no one here. That growth is like a
river with many tributaries. Part of the rising difficulty flows
from rising complexity, part of it from accelerating speed, and
part of it from the side effects of what exactly we would do if
this or that digital facility were to fail entirely -- which is to
say our increasing dependence on all things digital. One is at
risk when something you depend upon is at risk. Risk is, in other
words, transitive. If X is at risk and I depend on X, then I, too,
am at risk to whatever makes X be at risk. Risk is almost like
inheritance in a programming language.

I am particularly fond of the late Peter Bernstein's definition of
risk: "More things can happen than will." [PB] I like that definition
not because it tells me what to do, but rather because it tells me
what comes with any new expansion of possibilities. Put differently,
it tells me that with the new, the realm of the possible expands
and, as we know, when the realm of the possible expands, prediction
is somewhere between difficult and undoable. The dynamic is that
we now regularly, quickly expand our dependence on new things, and
that added dependence matters because the way in which we each and
severally add risk to our portfolio is by way of dependence on
things for which their very newness makes risk estimation, and thus
risk management, neither predictable nor perhaps even estimable.

The Gordian Knot of such tradeoffs -- our tradeoffs -- is this: As
society becomes more technologic, even the mundane comes to depend
on distant digital perfection. Our food pipeline contains less
than a week's supply, just to take one example, and that pipeline
depends on digital services for everything from GPS driven tractors
to robot vegetable sorting machinery to coast-to-coast logistics
to RFID-tagged livestock. Is all the technologic dependency, and
the data that fuels it, making us more resilient or more fragile?

In the cybersecurity occupation, in which most of us here work, we
certainly seem to be getting better and better. We have better
tools, we have better understood practices, and we have more and
better colleagues. That's the plus side. But from the point of
view of prediction, what matters is the ratio of skill to challenge;
as far as I can estimate, we are expanding the society-wide attack
surface faster than we are expanding our collection of tools,
practices, and colleagues. If your society is growing more food,
that's great. If your population is growing faster than your
improvements in food production can keep up, that's bad. So it is
with cyber risk management: Whether in detection, control, or
prevention, we are notching personal bests, but all the while the
opposition is setting world records. As with most decision making
under uncertainty, statistics have a role, particularly ratio
statistics that magnify trends so that the latency of feedback from
policy changes is more quickly clear. Yet statistics, of course,
require data, to which I will return in a moment.

In medicine, we have well established rules about medical privacy.
Those rules are helpful: when you check into the hospital there is
a licensure-enforced, accountability-based, need-to-know regime
that governs the handling of your data. [PHI] Most days, anyway.
But if you check in with Bubonic Plague or Typhus or Anthrax, you
will have zero privacy as those are "reportable conditions," as
variously mandated by public health law in all fifty States. So
let me ask you, would it make sense, in a public health of the
Internet way, to have a mandatory reporting regime for cybersecurity
failures? Do you favor having to report cyber penetrations of your
firm or of your household to the government? Should you face
criminal charges if you fail to make such a report? Forty-eight
States vigorously penalize failure to report sexual molestation of
children. [SMC] The (US) Computer Fraud and Abuse Act [CFA] defines
a number of felonies related to computer penetrations, and the U.S.
Code says that it is a crime to fail to report a felony of which
you have knowledge. [USC] Is cybersecurity event data the kind of
data around which you want to enforce mandatory reporting? Forty-six
States require mandatory reporting of cyber failures in the form
of their data breach laws, while the Verizon Data Breach Investigations
Report [VDBI] found, and the Index of Cyber Security [ICS] confirmed,
that 70-80% of data breaches are discovered by unrelated third
parties. If you discover a data breach, do you have an ethical
obligation to report it? Should the law mandate that you fulfill
such an obligation?

Almost everyone here has some form of ingress filtering in place by whatever name -- firewall, intrusion detection, whitelisting, and so forth and so on. Some of you have egress filtering because being in a botnet, that is to say being an accessory to crime, is bad for business. Suppose you discover that you are in a botnet: do you have an obligation to report it? Do you have an obligation to report the traffic that led you to conclude that you had a problem? Do you even have an obligation to bother to look and, if you don't have or want an obligation to bother to look, do you want your government to require the ISPs to do your looking for you, to notify you when your outbound traffic marks you as an accomplice to crime, whether witting or unwitting? Do you want to lay on the ISPs the duty to guarantee a safe Internet? They own the pipes and if you want clean pipes, then they are the ones to do it. Does deep packet inspection of your traffic by your ISP as a public health measure have your support? Would you want an ISP to deny access to a host, which might be your host, that is doing something bad on their networks? Who gets to define what is "bad"?

If you are saying to yourself, "This is beginning to sound like surveillance" or something similar, then you're paying attention. Every one of you who lives in a community that has a neighborhood watch already has these kinds of decisions to make. Let's say that you are patrolling your street, alone, and there have been break-ins lately, there have been thefts lately, there has been vandalism lately. You've lived there for ten years and been on that neighborhood watch for five. You are on duty and you see someone you've never seen crossing the street first from one side then the other, putting a hand on every garden gate. What do you do? Confront them the way a polite neighbor would? Challenge them the way a security guard would? Run home to lock your own doors and draw your drapes? Resign from the neighborhood watch because you are really not ready to do anything strenuous?

Returning to the digital sphere, we are increasing what it is that can be observed, what is observable. Instrumentation has never been cheaper. Computing to fiddle with what has been observed has never been more available. As someone who sees a lot of fresh business plans, I can tell you that these days Step Six is never "Then we build a data center." Step Six, or whatever, is universally now "Then we buy some cloud time and some advertising." This means that those to whom these outsourcing contracts go are in a position to observe, and observe a lot. Doubtless some of what they observe will be problematic, whether on legal or moral grounds. Should a vendor of X-as-a-Service be obliged to observe what their customers are doing? And if they are obliged to observe, should they be obliged to act on what they observe, be that to report, to deploy countermeasures, or both?

As what is observable expands so, naturally, does what has been observed. Dave Aitel says "There's no reason a company in this day and age can't have their own Splunk or ElasticSearch engine that allows them to search and sort a complete history of every program anyone in the company has ever executed." [DA] Sometime in the last five to ten years we passed the point on the curve where it became much cheaper to keep everything than to do selective deletion. When you read the Federal Rules of Civil Procedure with respect to so-called e-discovery, you can certainly conclude that total retention of observed data is a prudent legal strategy. What is less clear is whether you have a duty to observe given that you have the capacity to do so. All of which also applies to what others can observe about you.

This is not, however, about you personally. Even Julian Assange, in his book *Cyberpunks*, said "Individual targeting is not the threat." It is about a culture where personal data is increasingly public data, and assembled en masse. All we have to go on now is the hopeful phrase "A reasonable expectation of privacy" but what is reasonable when one inch block letters can be read from orbit? What is reasonable when all of your financial or medical life is digitized and available primarily over the Internet? Do you want ISPs to retain e-mails when you are asking your doctor a medical question (or, for that matter, do you want those e-mails to become part of your Electronic Health Record)? Who owns your medical data anyway? Until the 1970s, it was the patient but regulations then made it the provider. With an Electronic Health Record, it is likely to revert to patient ownership, but if the EHR belongs to you, do you get to surveil the use that is made of it by medical providers and those that recursively they outsource to? And if not, why not?

Observability is fast extending to devices. Some of it has already appeared, such as the fact that any newish car is broadcasting four unique Bluetooth radio IDs, one for each tire's valve stem. Some of it is in a daily progression, such as training our youngsters

to accept surveillance by stuffing a locator beacon in their backpack as soon as they go off to Kindergarten. Some of it is newly technologic, like through the wall imaging, and some of it is simply that we are now surrounded by cameras that we can't even see where no one camera is important but they are important in the aggregate when their data is fused. Anything, and I mean anything, that has "wireless" in its name creates the certainty of traffic analysis.

As an example relevant to rooms such as this, you should assume that all public facilities will soon convert their lighting fixtures to LEDs. LEDs that are not just lights but also have an embedded, chip-based operating system, a camera, sensors for CO/CO₂/pollutant emissions, seismic activity, humidity & UV radiation, a microphone, wifi and/or cellular interfaces, an extensible API, an IPv4 or v6 address per LED, a capacity for disconnected "decision making on the pole," cloud-based remote management, and, of course, bragging rights for how green you are which you can then monetize in the form of tax credits [S] I ask again, do you or we or they have a duty to observe now that we have an ability to do so? It is, as you know, a long established norm for authorities to seize the video stored in surveillance cameras whether the issue at hand is a smash and grab or the collapse of an Interstate highway bridge [M] What does that mean when data retention is permanent and recording devices are omnipresent? Does that make you the observed or the observer? Do we have an answer to "Who watches the watchmen?" [J]

By now it is obvious that we humans can design systems more complex than we can then operate. The financial sector's "flash crashes" are the most recent proof-by-demonstration of that claim; it would hardly surprise anyone were the fifty interlocked insurance exchanges for Obamacare to soon be another. Above some threshold of system complexity, it is no longer possible to test, it is only possible to react to emergent behavior. Even the lowest Internet user is involved -- one web page can easily touch scores of different domains. While writing this, the top level page from cnn.com had 400 out-references to 85 unique domains each of which is likely to be similarly constructed and all of which move data one way or another. If you leave those pages up, then because many such pages have an auto-refresh, moving to a new subset signals to every one of the advertising networks that you have done so. How is this different than having a surveillance camera in the entry vestibule of your home?

We know, and have known for some time, that traffic analysis is more powerful than content analysis. If I know everything about to whom you communicate including when, where, with what inter-message latency, in what order, at what length, and by what protocol, then I know you. If all I have is the undated, unaddressed text of your messages, then I am an archaeologist, not a case officer. The soothing mendacity of proxies for the President saying "It's only metadata" relies on the ignorance of the listener. Surely no one here is convinced by "It's only metadata" but let me be clear: you are providing that metadata and, in the evolving definition of the word "public," there is no fault in its being observed and retained indefinitely. Harvard Law professor Jonathan Zittrain famously noted that if you preferentially use online services that are free, "You are not the customer, you're the product." Why? Because what is observable is observed, what is observed is sold, and users are always observable, even when they are anonymous.

Let me be clear, this is not an attack on the business of intelligence. The Intelligence Community is operating under the rules it knows, most of which you, too, know, and the goal states it has been tasked to achieve. The center of gravity for policy is that of goal states, not methods.

Throughout the 1990s, the commercial sector essentially caught up with the intelligence sector in the application of cryptography -- not the creation of cyphers, but their use. (Intelligence needs new cyphers on a regular basis whereas commercial entities would rather not have to roll their cypher suites at all, much less regularly.) In like manner commercial firms are today fast catching up with the intelligence sector in traffic analysis. The marketing world is leading the way because its form of traffic analysis is behavior-aware and full of data fusion innovation -- everything from Amazon's "people who bought this later bought that" to 1 meter accuracy on where you are in the shopping mall so that advertisements and coupons can appear on your smartphone for the very store you are looking in the window of, to combining location awareness with what your car and your bedroom thermostat had to say about you this morning. More relevant to this audience, every cutting edge data protection scheme now has some kind of behavioral component, which simply means collecting enough data on what is happening that subsequently highlighting anomalies has a false positive rate low enough to be worth following up.

If you decide to in some broad sense opt out, you will find that it is not simple. Speaking personally, I choose not to share CallerID data automatically by default. Amusingly, when members of my friends and family get calls from an unknown caller, they assume it is me because I am the only person they know who does this. A better illustration of how in a linear equation there are $N-1$ degrees of freedom I can't imagine. Along those same lines, I've only owned one camera in my life and it was a film camera. Ergo, I've never uploaded any photos that I took. That doesn't mean that there are no digital photos of me out there. There are $3+$ billion new photos online each month, so even if you've never uploaded photos of yourself someone else has. And tagged them. In other words, you can personally opt out, but that doesn't mean that other folks around you haven't effectively countermanded your intent.

In short, we are becoming a society of informants. In short, I have nowhere to hide from you.

As I said before and will now say again, the controlling factor, the root cause, of risk is dependence, particularly dependence on the expectation of stable system state. Yet the more technologic the society becomes, the greater the dynamic range of possible failures. When you live in a cave, starvation, predators, disease, and lightning are about the full range of failures that end life as you know it and you are well familiar with each of them. When you live in a technologic society where everybody and everything is optimized in some way akin to just-in-time delivery, the dynamic range of failures is incomprehensibly larger and largely incomprehensible. The wider the dynamic range of failure, the more prevention is the watchword. Cadres of people charged with defending masses of other people must focus on prevention, and prevention is all about proving negatives. Therefore, and inescapably so, there is only one conclusion: as technologic society grows more interconnected, it becomes more interdependent within itself. As society becomes more interdependent within itself, the more it must rely on prediction based on data collected in broad ways, not in targeted ways. That is surveillance. That is intelligence practiced not by intelligence agencies but by anyone or anything with a sensor network.

Spoken of in this manner, official intelligence agencies that Hoover up everything are simply obeying the Presidential Directive that "Never again" comes true. And the more complex the society they are charged with protecting becomes, the more they must surveil, the more they must analyze, the more data fusion becomes their only focus. In that, there is no operational difference between government acquisition of observable data and private sector acquisition of observable data, beyond the minor detail of consent.

David Brin was the first to suggest that if you lose control over what data can be collected on you, the only freedom-preserving alternative is that everyone else does, too.[DB1] If the government or the corporation or your neighbor can surveil you without asking, then the balance of power is preserved when you can surveil them without asking. Bruce Schneier countered that preserving the balance of power doesn't mean much if the effect of new information is non-linear, that is to say if new information is the exponent in an equation, not one more factor in a linear sum.[DB2] Solving that debate requires that you have a strong opinion on what data fusion means operationally to you, to others, to society. If, indeed, and as Schneier suggested, the power of data fusion is an equation where new data items are exponents, then the entity that can amass data that is bigger by a little will win the field by a lot. That small advantages can have big outcome effects is exactly what fuels this or any other arms race.

Contradicting what I said earlier, there may actually be a difference between the public and the private sector because the private sector will collect data only so long as increased collection can be monetized, whereas government will collect data only so long as increased collection can be stored. With storage prices falling faster than Moore's Law, government's stopping rule may thus never be triggered.

In the Wikipedia article about Brin, there is this sentence, "It will be tempting to pass laws that restrict the power of surveillance to authorities, entrusting them to protect our privacy -- or a comforting illusion" thereof.[W] I agree with one of the possible readings of that sentence, namely that it is "tempting" in the sense of being delusional. Demonstrating exactly the kind of good intentions with which the road to Hell is paved, we have codified rules that permit our lawmakers zero privacy, we give them zero ability to have a private moment or to speak to others without quotation, without attribution, without their game face on. In the evolutionary sense of the word "select," we select for people who are without expectation of authentic privacy or who jettisoned it

long before they stood for office. Looking in their direction for salvation is absurd. And delusional.

I am, however, hardly arguing that "you" are powerless or that "they" have taken all control. It is categorically true that technology is today far more democratically available than it was yesterday and less than it will be tomorrow. 3D printing, the whole "maker" community, DIY biology, micro-drones, search, constant contact with whomever you choose to be in constant contact with -- these are all examples of democratizing technology. This is perhaps our last fundamental tradeoff before the Singularity occurs: Do we, as a society, want the comfort and convenience of increasingly technologic, invisible digital integration enough to pay for those benefits with the liberties that must be given up to be protected from the downsides of that integration? If risk is that more things can happen than will, then what is the ratio of things that can now happen that are good to things that can now happen that are bad? Is the good fraction growing faster than the bad fraction or the other way around? Is there a threshold of interdependence beyond which good or bad overwhelmingly dominate?

We are all data collectors, data keepers, data analysts. Some citizens do it explicitly; some citizens have it done for them by robots. To be clear, we are not just a society of informants, we are becoming an intelligence community of a second sort. Some of it is almost surely innocuous, like festooning a house with wireless sensors for home automation purposes. Some of it is cost effectiveness driven, like measuring photosynthesis in a corn field by flying an array of measurement devices over it on a drone. I could go on, and so could you, because in a very real sense I am telling you nothing you don't already know. Everyone in this and other audiences knows everything that I have to say, even if they weren't aware that they knew it.

The question is why is this so? Is this majority rule and the intelligence function is one the majority very much wants done to themselves and others? Is this a question of speed and complexity such that citizen decision making is crippled not because facts are hidden but because compound facts are too hard to understand? Is this a question of wishful thinking of that kind which can't tell the difference between a utopian fantasy, a social justice movement, and a business opportunity? Is this nowhere near such a big deal as I think it is because every day that goes by without a cascade failure only adds evidence that such possibilities are becoming ever less likely? Is the admonition to "Take care of yourself" the core of a future where the guarantee of a good outcome for all is the very fact that no one can hide? Is Nassim Taleb's idea that we are easily fooled by randomness[TF] at play here, too? If the level of observability to which you are subject is an asset to you, then what is your hedge against that asset?

This is not a Chicken Little talk; it is an attempt to preserve if not make a choice while choice is still relevant. As The Economist in its January 18 issue so clearly lays out[TE] we are ever more a service economy, but every time an existing service disappears into the cloud, our vulnerability to its absence increases as does the probability of monopoly power. Every time we ask the government to provide goodnesses that can only be done with more data, we are asking government to collect more data.

Let me ask a yesterday question: How do you feel about traffic jam detection based on the handoff rate between cell towers of those cell phones in use in cars on the road? Let me ask a today question: How do you feel about auto insurance that is priced from a daily readout of your automobile's black box? Let me ask a tomorrow question: In what calendar year will compulsory auto insurance be more expensive for the driver who insists on driving their car themselves rather than letting a robot do it? How do you feel about public health surveillance done by requiring Google and Bing to report on searches for cold remedies and the like? How do you feel about a Smart Grid that reduces your power costs and greens the atmosphere but reports minute-by-minute what is on and what is off in your home? Have you or would you install that toilet that does a unalysis with every use, and forwards it to your clinician?

How do you feel about using standoff biometrics as a solution to authentication? At this moment in time, facial recognition is possible at 500 meters, iris recognition is possible at 50 meters, and heart-beat recognition is possible at 5 meters. Your dog can identify you by smell; so, too, can an electronic dog's nose. Your cell phone's accelerometer is plenty sensitive enough to identify you by gait analysis. The list goes on. All of these are data dependent, cheap, convenient, and none of them reveal anything that is a secret as we currently understand the term "secret" -- yet the sum of them is greater than the parts. A lot greater. It might

even be a polynomial, as Schneier suggested. Time will tell, but by then the game will be over.

Harvard Business School Prof. Shoshanna Zuboff has had much to say on these topics since the 1980s, especially her *Three Laws*[ZS]

. Everything that can be automated will be automated

. Everything that can be informed will be informed

. Every digital application that can be used for surveillance and control will be used for surveillance and control

I think she is right, but the implication that this is all outside the control of the citizen is not yet true. It may get to be true, but in so many words that is why I am standing here. There are a million choices the individual person, or for that matter the free-standing enterprise, can take and I do not just mean converting all your browsing over to Tor.

Take something mundane like e-mail: One might suggest never sending the same message twice. Why? Because sending it twice, even if encrypted, allows a kind of analysis by correlation that cannot otherwise happen. Maybe that's too paranoid, so let's back off a little. One might suggest that the individual or the enterprise that outsources its e-mail to a third party thereby creates by itself and for itself the risk of silent subpoenas delivered to their outsourcer. If, instead, the individual or the enterprise insources its e-mail then at the very least it knows when its data assets are being sought because the subpoena comes to them. Maybe insourcing your e-mail is too much work, but need I remind you that plaintext e-mail cannot be web-bugged, so why would anyone ever render HTML e-mail at all?

Take software updates: There is a valid argument to make software auto-update the norm. As always, a push model has to know where to push. On the other hand, a pull model must be invoked by the end user. Both models generate information for somebody, but a pull model leaves the time and place decisions to the end user.

Take cybersecurity technology: I've become convinced that all of it is dual use. While I am not sure whether dual use is a trend or a realization of an unchanging fact of nature, the obviousness of dual use seems greatest in the latest technologies, so I am calling it a trend in the sense that the straightforward accessibility of dual use characteristics of new technology is itself a growing trend. Leading cybersecurity products promise total surveillance over the enterprise and are, to my mind, offensive strategies used for defensive purposes. A fair number of those products not only watch your machine, but take just about everything that is going on at your end and copies that to their end. The argument for doing so is well thought out -- by combining observational data from a lot of places the probability of detection can be raised and the latency of countermeasure can be reduced. Of course, there is no reason such systems couldn't be looking for patterns of content in human readable documents just as easily as looking for patterns of content in machine readable documents.

Take communications technology: Whether we are talking about triangulating the smartphone using the cell towers, geocoding the Internet, or forwarding the GPS coordinates from onboard equipment to external services like OnStar, everyone knows that there is a whole lot of location tracking going on. What can you do to opt out of that? That is not so easy because now we are talking not about a mode of operation, like whether to insource or outsource your e-mail, but a real opt-in versus opt-out decision: do you accept the tracking or do you refuse the service? Paraphrasing Zittrain's remark about being a customer or being a product, the greater the market penetration of mobile communications, the more the individual is either a data source or a suspect.

Take wearable computing: Google Glass is only the most famous. There've been people working on such things for a long time now. Folks who are outfitted with wearable computing are pretty much identifiable today, but this brief instant will soon pass. You will be under passive surveillance by your peers and contacts or, to be personal, some of you will be surveilling me because you will be adopters of this kind of technology. I would prefer you didn't. I am in favor neither of cyborgs nor chimeras; I consider our place in the natural world too great a gift to mock in those ways.

When it comes to ranking programs for how well they can observe their surroundings and act on what they see without further instructions, Stuxnet is the reigning world heavyweight champion. Unless there is something better already out there. Putting aside

the business of wrecking centrifuges, just consider the observational part. Look at other malware that seems to have a shopping list that isn't composed of filenames or keywords but instead an algorithm for rank-ordering what to look for and to exfiltrate documents in priority order. As with other democratizations of technology, what happens when that kind of improvisation, that kind of adaptation, can be automated? What happens when such things can be scripted?

For those with less gray hair, once upon a time a firewall was something that created a corporate perimeter. Then it was something that created a perimeter around a department. Then around a given computer. Then around a given datum. In the natural world, perimeters shrink as risk grows -- think a circle of wildebeest with their horns pointed outward, the calves on the inside, and the hyenas closing in. So it has been with perimeters in the digital space, a steady shrinking of the defensible perimeter down to the individual datum.

There are so many technologies now that power observation and identification of the individual at a distance. They may not yet be in your pocket or on your dashboard or embedded in all your smoke detectors, but that is only a matter of time. Your digital exhaust is unique hence it identifies. Pooling everyone's digital exhaust also characterizes how you differ from normal. Suppose that observed data does kill both privacy as impossible-to-observe and privacy as impossible-to-identify, then what might be an alternative? If you are an optimist or an apparatchik, then your answer will tend toward rules of procedure administered by a government you trust or control. If you are a pessimist or a hacker/maker, then your answer will tend towards the operational, and your definition of a state of privacy will be my definition: the effective capacity to misrepresent yourself.

Misrepresentation is using disinformation to frustrate data fusion on the part of whomever it is that is watching you. Some of it can be low-tech, such as misrepresentation by paying your therapist in cash under an assumed name. Misrepresentation means arming yourself not at Walmart but in living rooms. Misrepresentation means swapping affinity cards at random with like-minded folks. Misrepresentation means keeping an inventory of misconfigured webservers to proxy through. Misrepresentation means putting a motor-generator between you and the Smart Grid. Misrepresentation means using Tor for no reason at all. Misrepresentation means hiding in plain sight when there is nowhere else to hide. Misrepresentation means having not one digital identity that you cherish, burnish, and protect, but having as many as you can. Your identity is not a question unless you work to make it be. Lest you think that this is a problem statement for the random paranoid individual alone, let me tell you that in the big-I Intelligence trade, crafting good cover is getting harder and harder and for the same reasons: misrepresentation is getting harder and harder. If I was running field operations, I would not try to fabricate a complete digital identity. I'd "borrow" the identity of someone who had the characteristics that I needed for the case at hand.

The Obama administration's issuance of a National Strategy for Trusted Identities in Cyberspace[NS] is case-in-point: it "calls for the development of interoperable technology standards and policies -- an 'Identity Ecosystem' -- where individuals, organizations, and underlying infrastructure -- such as routers and servers -- can be authoritatively authenticated." If you can trust a digital identity, that is because it can't be faked. Why does the government care about this? It cares because it wants to digitally deliver government services and it wants attribution. Is having a non-fake-able digital identity for government services worth the registration of your remaining secrets with that government? Is there any real difference between a system that permits easy, secure, identity-based services and a surveillance system? Do you trust those who hold surveillance data on you over the long haul by which I mean the indefinite retention of transactional data between government services and you, the individual required to proffer a non-fake-able identity to engage in those transactions? Assuming this spreads well beyond the public sector, which is its designers' intent, do you want this everywhere? If you are building authentication systems today, then you are already playing ball in this league. If you are using authentication systems today, then you are subject to the pending design decisions of people who are themselves playing ball in this league.

And how can you tell if the code you are running is collecting on you or, for that matter, if the piece of code you are running is collecting on somebody else? If your life is lived inside the digital envelope, how do you know that this isn't *The Matrix* or *The Truman Show*? Code is certainly getting bigger and bigger. A nameless colleague who does world class static analysis said that

he "regularly sees apps that are over 2 GB of code" and sees "functions with over 16K variables." As he observes, functions like that are machine written. If the code is machine written, does anyone know what's in it? The answer is "of course not" and even if they did, malware techniques such as return-oriented-programming can add features after the whitelist-mediated application launch. But I'm not talking here about malware, I am talking about code that you run that you meant to run and which, in one way or another, is instrumented to record what you do with it. Nancy Pelosi's famous remark[NP] about her miserable, thousand page piece of legislation, "We have to pass the bill so that you can find out what is in it" can be just as easily applied to code: it has become "We have to run the code so that you can find out what is in it."

That is not going to change: small may be beautiful but big is inevitable.[BI] A colleague notes that, with the cloud, all pretense of trying to keep programs small and economical has gone out the window -- just link to everything because it doesn't matter if you make even one call to a huge library since the Elastic Cloud (or whatever) charges you no penalty for bloat. As such, it is likely that any weird machine[SB] within the bloated program is ever more robust.

Mitja Kosek was who made me aware of just how much the client has become the server's server. Take Javascript, which is to say servers sending clients programs to execute; the HTTP Archive says that the average web page now makes out-references to 16 different domains as well as making 17 Javascript requests per page, and the Javascript byte count is five times the HTML byte count[HT] A lot of that Javascript is about analytics which is to say surveillance of the user experience (and we're not even talking about Bitcoin mining done in Javascript that you can embed in your website.[BJ])

So suppose everybody is both giving and getting surveillance, both being surveilled and doing surveillance. Does that make you an intelligence agent? A spreading of technology from the few to the many is just the way world works. There are a hundred different articles from high-brow to low-- that show the interval between market introduction and widespread adoption of technology has gotten shorter as technology has gotten more advanced. That means that technologies that were available only to the few become available to the many in a shorter timeframe, i.e., that any given technology advantage the few have has a shorter shelf-life. That would mean that the technologies that only national laboratories had fifteen years ago might be present among us soon, in the spirit of William Gibson's famous remark that the future is already present, just unevenly distributed. Or maybe it is only ten years now. Maybe the youngest of you in this room will end up in a world where what a national lab has today is something you can look forward to having in only five year's time. Regardless of whether the time constant is five or ten or even fifteen years, this is far, far faster than any natural mixing will arrange for even distribution across all people. The disparities of knowledge that beget power will each be shorter lived in their respective particulars, but a much steeper curve in the aggregate.

Richard Clarke's novel _Breakpoint_ centered around the observation that with fast enough advances in genetic engineering not only will the elite think that they are better than the rest, they will be.[RC] I suggest that with fast enough advances in surveillance and the inferences to be drawn from surveillance, that a different elite will not just think that it knows better, it will know better. Those advances come both from Moore's and from Zuboff's laws, but more importantly they rest upon the extraordinarily popular delusion that you can have freedom, security, and convenience when, at best, you can have two out of three.

At the same time, it is said that the rightful role of government is to hold a monopoly on the use of force. Is it possible that in a fully digital world it will come to pass that everyone can see what once only a Director of National Intelligence could see? Might a monopoly of force resting solely with government become harder to maintain as the technology that bulwarks such a monopoly becomes democratized ever faster? Might reserving force to government become itself an anachronism? That is almost surely not something to hope for, even for those of us who agree with Thomas Jefferson that the government that governs best is the government that governs least. If knowledge is power, then increasing the store of knowledge must increase the store of power; increasing the rate of knowledge acquisition must increase the rate of power growth. All power tends to corrupt, and absolute power corrupts absolutely.[LA] so sending vast amounts of knowledge upstream will corrupt absolutely, regardless of whether the data sources are reimbursed with some pittance of convenience. Every tax system in the world has proven this time and again with money. We are about to prove it again with data,

which has become a better store of value than fiat currency in any case.

Again, that power has to go somewhere. If you are part of the surveillance fabric, then you are part of creating that power, some of which is reflected back on you as conveniences that actually doubles as a form of control. Very nearly everyone at this conference is explicitly and voluntarily part of the surveillance fabric because it comes with the tools you use, with what Steve Jobs would call your digital life. With enough instrumentation carried by those who opt in, the person who opts out hasn't really opted out. If what those of you who opt in get for your role in the surveillance fabric is "security," then you had better be damnably sure that when you say "security" that you all have close agreement on precisely what you mean by that term.

And this is as good a place as any to pass on Joel Brenner's insight:[JB]

During the Cold War, our enemies were few and we knew who they were. The technologies used by Soviet military and intelligence agencies were invented by those agencies. Today, our adversaries are less awesomely powerful than the Soviet Union, but they are many and often hidden. That means we must find them before we can listen to them. Equally important, virtually every government on Earth, including our own, has abandoned the practice of relying on government-developed technologies. Instead they rely on commercial off-the-shelf, or COTS, technologies. They do it because no government can compete with the head-spinning advances emerging from the private sector, and no government can afford to try. When NSA wanted to collect intelligence on the Soviet government and military, the agency had to steal or break the encryption used by them and nobody else. The migration to COTS changed that. If NSA now wants to collect against a foreign general's or terrorist's communications, it must break the same encryption you and I use on our own devices... That's why NSA would want to break the encryption used on every one of those media. If it couldn't, any terrorist in Chicago, Kabul, or Cologne would simply use a Blackberry or send messages on Yahoo! But therein lies a policy dilemma, because NSA could decrypt almost any private conversation. The distinction between capabilities and actual practices is more critical than ever... Like it or not, the dilemma can be resolved only through oversight mechanisms that are publicly understood and trusted -- but are not themselves ... transparent.

At the same time, for-profit and not-for-profit entities are collecting on each other. They have to, even though private intelligence doubtless leads directly to private law. On the 6th of this month, the Harvard Kennedy School held a conference on this very subject; let me read just the first paragraph:[HKS]

In today's world, businesses are facing increasingly complex threats to infrastructure, finances, and information. The government is sometimes unable to share classified information about these threats. As a result, business leaders are creating their own intelligence capabilities within their companies.

In a closely related development, the international traffic in arms treaty known as the Wassenaar Agreement, was just amended to classify "Intrusion Software" and "Network Surveillance Systems" as weapons.[WA]

So whom do you trust? Paul Wouters makes a telling point when he says that "You cannot avoid trust. Making it hierarchical gives the least trust to parties. You monitor those you have to trust more, and more closely.[PW] As I've done with privacy and security, I should now state my definition of trust, which is that trust is where I drop my guard, which is to say that I only trust someone against whom I have effective recourse. Does that mean I can only trust those upon whom I can collect? At the nation state level that is largely the case. Is this the way Brin's vision will work itself out, that as the technology of collection democratizes, we will trust those we can collect against but within the context of whatever hierarchy is evolutionarily selected by such a dynamic?

It is said that the price of anything is the foregone alternative. The price of dependence is risk. The price of total dependence is total risk. Standing in his shuttered factory, made redundant by coolie labor in China, Tom McGregor said that "American consumers want to buy things at a price that is cheaper than they would be willing to be paid to make them." A century and a half before Tom, English polymath John Ruskin said that "There is nothing in the world that some man cannot make a little worse and sell a little cheaper, and he who considers price only is that man's lawful prey." Invoking Zitttrain yet again, the user of free services is not the

customer, he's the product. Let me then say that if you are going to be a data collector, if you are bound and determined to instrument your life and those about you, if you are going to 'sell' data to get data, then I ask that you not work so cheaply that you collectively drive to zero the habitat, the lebensraum, of those of us who opt out. If you remain cheap, then I daresay that opting out will soon require bravery and not just the quiet tolerance to do without digital bread and circuses.

To close with Thomas Jefferson:

I predict future happiness for Americans, if they can prevent the government from wasting the labors of the people under the pretense of taking care of them.
There is never enough time. Thank you for yours.

<nettime> Post-digital

From: Felix Stalder

To: nettime-l@kein.org

Date: Sun, 09 Mar 2014 12:40:32 +0100

Florian Cramer wrote:
> # What is 'Post-digital'?

Florian and I have been talking for a long time now about the notion of "post-digital", with me being rather skeptical about its usefulness. I still am, but Florian's text clarifies a lot for me.

There are some areas in which the term does make sense.

Primarily aesthetically, in terms of pointing towards a complex blending of the digital and the non-digital, rather than a simple substitution (aka the computer as the meta-medium that simulates all others).

To some degree it makes also sense politically, in terms of a more complex understanding of political processes not being driven by technology, but still by power, institutions and competing collective actors with unequal organizational resources to advance their interests. Mozorov would be main exponent of such a position. It's a valid position to critique the still powerful "Californian ideology", but hardly new, particularly not in Europe.

Where the terms makes no sense, in my view (and also in Florian's), is sociologically. The most powerful forces that transform globalized societies, are all dependent on, and amplified by, digital technologies. If anything, we are in the middle of the historical run of this development rather than at the end. The idea that the digital is just one dimension of society and that we can abandon it, is ludicrous. Enzensberger's text was just a joke, and the FAZ pointed it because it would stir controversy, not because it had much to offer intellectually.

So, what this leaves me wondering, in terms of a cultural theory, is a term useful that makes sense of aesthetically, yet makes no sense sociologically, or do we need to find terms that can articulate both levels at the same time?
Felix

<...>

Hi Felix,

There is one context in which Enzensberger's 'cri de cœur' is not a joke, but makes sense, and I am not really sure HME had not it in mind: that is if you believe in the likelihood of an impending 'system collapse' (cf Paul Virilio's 'accident integral'), in which case all our beloved technologies are likely collapse as well, either gradually or very fast indeed, starting with the mother/ motor of all technologies, electricity, aka 'the grid'. No grid, no cloud, and if & then just kiss your Youtube addiction goodbye.

I am still somewhat neutral on this issue, mainly because of my 'Asiatic' history. Yet I think it should be factored in. In my particular case, I have experienced that 'technological restraint' has worked out quite fine: I still don't have a mobile phone.

Cheerio, p+2D!

> it because it would stir controversy, not because it had much to offer
> intellectually.

Was it really just a joke? I'm not so sure dismissing it as that is appropriate. Sure it necessarily isn't a deep critique of the power dynamics at play with some of the newer technologies people are using now, but it wasn't designed as that, and I for one find the provocations basically reasonable.

Florian's essay was great companion reading, and Geert is certainly right to call it out as containing elements of 'offline romanticism', but I don't see anything particularly off with the essay, and there are certainly things about rejection of technological 'necessities' like phones that it's quite reasonable to be romantic about.

as long as you have somewhere to go to send emails like this,

and this is not a joke either: communal/collective spaces for communication can be really good. A place to meet. A digital square.

At the moment the self-organisation appears to me to organise oneself (and perhaps a partner and 1.1 child) at home, in your own home, with all the revolutionary, connecting gadgets at hand.... The individualists' revolution.

>I think I'll just say that I have become post-postist.

I hear about post-digital/New Media/Internet/Human/etc that I believe

that this only succeeds at placing us in a corner of opposition or refusal and makes no suggestions. For all my distrust of it, at least New Aestheticism posited something. Surfing clubs did. Post-ing does not.

Post-ism paints us in the corner of refusal without proposition and little else. It breaks the discourse into a molecular one without any potential coherence; it is Babel-ism at its height, and paints the writer into a corner. I think it is some to begin framing new discourses not as 'new' propositions, but as new propositions, like perhaps the age of convergence or integrationist, or mixed-reality art or even going back to intermedia. I am still a pluralist; not into master narratives, but I want propositions for the present, not mere refusnikism. I want something that says something, not just that "We're over that", because I'm over being over things.

Patrick.

Patrick.

Thank you for saying so elegantly what I have been thinking for the past 30 years or more. I always felt that the promise of fundamental change was illusory in the 60s and 70s. Things started really moving in the 80s. OK it was neoliberalism, but for the first time I knew that history was on the move. Of course it's impossible to understand our contemporary dilemmas without going further back than that. Yet the literati produced as their blinding insight into that transitional decade the hangover of postmodernism, deconstruction, the commonplace that the contrasts of the Cold War were leaking into each other (what Hegel called negative dialectic). Postism is decadent or at best retro. What is postcolonial theory if not nationalism with its eyes glued to the rearview mirror?

i have to admit i less and less believe in this.
the only thing i am strongly recognizing is, that friends, people and society
are getting more and more unreal, the more they are integrated in this digital
communication sphere.

the same thing applys to you.
i can insult you, laugh about you, ignore you, or praise you.
nothing happens.

fact is, all of you are not real. so i am i to you.
i am just an e-mail with some texts, letters, etc for you.
believe it or not. this is the new antisocial reality.

sincerely
an e-mail

yes, and probably due to having stared at the screen for too long, you
missed the point (and you appear to say the same thing, but present as
if it was a contraindication): if we both had had to go to some real
space and place,
with chairs, windows, cables, doors and an outside, perhaps a little
cafe with some Zapatista coffee, we could have had a chat about this -
maybe at the 'nettime table' - and then I wouldn't have had to clarify
by email and could instead have spend more time with you there, or my
kids in the garden.

Ever been in an Indian phone centre? Now that's a buzzing place..

This discussion, especially related to questions of "mindful
disconnection," recalls Sigfried Giedion's 1948 "anonymous history,"
"Mechanization Takes Command."

<http://quod.lib.umich.edu/cgi/t/text/text-idx?c=acsdno&hebo1139>

As he put it:

"Never has mankind possessed so many instruments for abolishing
slavery. But the promises of a better life have not been kept. All we
have to show so far is a rather disquieting inability to organize the
world, or even to organize ourselves."

Of course, the idea that any instruments have the potential to abolish
slavery has to be read against Eric's statement: "Whatever technology
and/or social process that can be used to strengthen the interests of
strategic power, will be used to strengthen the interests of strategic
power."

Nonetheless, I found it a very useful historical analysis to consider
alongside these discussions.

Best,
ryan

Re: <nettime> Post-digital
From: John Hopkins
To: nettime-1@kein.org
Date: Mon, 10 Mar 2014 10:33:49 -0700

Rousseau comes fleetingly to mind:

"The problem is to find a form of association which will defend and protect with the whole common force the person and goods of each associate, and in which each, while uniting himself with all, may still obey himself alone, and remain as free as before."

And a short extract from my dissertation that resonates with that question of how to proceed while propping up the wider techno-social system *less*:

"We most impact the power concentrations of the Regime by cultivating an understanding of where our energy comes from, at all scales, where it goes, and most importantly, where our attention is engaged: on which signals, on which flows. In the process of paying close attention to the highly mediated, amplified, signals of the Regime, directed by its protocols, we confirm our reciprocal role as its optimized energy source. By (re)turning our creative attentions to the granular sources of the Regime's energy -- to the individual Others around us -- and spending our life-energy, our life-time in less mediated Dialogue with them via our own protocols, we immediately begin draining the Regime of its primary power source. We preserve those limited life-energies for more local and immediate encounters. It is within these energized encounters, these Dialogues between the Self and the Other, where transformation, (r)evolution, and change are ultimately sited. As a media artist, it is this generation of localized protocols that is perhaps the most effective strategy to mitigate or even reverse the slide toward hierarchic centralization [and consequent surveillance!]. It should be some solace that though we cannot escape the ultimate destiny of Life on the planet: in the mean while we may choose to go with the flow of dialogue, embracing change in the Self and in the Other, here, now."

and this aside, crucially: <http://tech-no-mad.net/blog/archives/1199>

Chears,
John

Along with Sociology might it also be a worth including "psychology" in the mix. Particularly in those spaces where digital management tools such as gantt charts and other popular workflow apps along with their digital jargon have shaped influential forms of pop psychology, such as the Neuro Linguistic Programming (NLP) (whose very name is self incriminating) In turn these 'instruments' insinuate themselves in to the working day of most organisations becoming the default argot of neo-managerial audit culture with its positivistic lexicon of

'solutions'.

This landscape is described in rich and entertaining detail in *Evil Media* by Mathew Fuller and Andrew Jofey who have done us a great service of mapping and describing this domain of what they have dubbed 'grey media'. A range of connections linking computing, and digital management and business applications with NLP type psychology and management self help books. Collectively this digitally inspired constellation has metastasised into a weirdly seductive language (seductive because it suggests the possibility of controlling our events) that is all the more powerful BECAUSE it is unspectacular. As the term 'grey media' suggests it fades into background becoming the social and psychological infrastructure of the grey media age.

In a weird inversion of the Debord, Grey Media deploys digital culture to bring us the 'society of the unspectacular'

Editorial

< Human Consciousness and the Postdigital Analogue >
by Michael Punt, E-mail: <Mpunt@easynet.co.uk>

As Steven Wilson points out in his review of the book *Ars Electronica, Facing the Future*, this book is "a marvelous resource that will be much appreciated by artists, critics, historians, and anyone interested in the convergence of art and technology." (See LDR Vol. 9, No. 8, August 2001) Among other things, the book provides a historical record that catalogues the changing perceptions of the emergence of digital technology as a popular medium. Seventeen years ago, for example, Gene Youngblood reminded us that the computer translates the continuous phenomena of the world into discrete units. At the same time, Peter Weibel pointed out that whereas the analogical follows principles of similarity, congruency and continuity, the digital uses the smallest discontinuous, non- homogeneous elements. Five years later Roy Ascott, with characteristic visionary insight, appealed for a restoration of the metaphor to the agenda in order that the undivided whole could once again be regained. It was a call that Nick Herbert responded to a year later in a lucid and accessible account of quantum physics, concluding with some irony that holistic physics really would erase the distinction between subject and object and there would be a real danger of getting lost in space. Facing the Future's history lesson ends in 1998 with Friedrich Kittler's confirmation that in the realms of electronic warfare we resisted this danger since copying a "hostile CPU is easier, cheaper, and therefore more likely to proliferate than copying a hostile phase radar." This is not merely the carry- through of old technology into the new (as, for example, film and video), but a return to the ideal of the analogue. According to Kittler's analysis of warfare, in less than a decade digital media recovered the relevance of the principles of similarity, congruency and continuity. This apparent persistence of the analogue invites us to consider that the morphological resemblance between pre- and post-digital modes of expression (or industrial and enlightenment, for that matter) could be significant symptoms of the hesitance of users to abandon "felt" experience in favor of the =Eglat of >seductive technologies of description.

At the distance that *Ars Electronica: Facing the Future* allows us, it becomes apparent that empowered users negotiating with digital media have found themselves engaged in this recurring cycle, in which the idealization of representation is in conflict with the dominant technology, which disavows daily experience as an undifferentiated circulation of metaphors for desire and resistance. As much was at stake in the pre-cinematic age, when Jules Etienne Marey, for example, inquiring into the nature of movement, regarded the new techniques of chronophotography as inferior to graphic methods using smoked drums and scribes attached to pneumatic sensors. Photo-technology used shutters that insisted upon the moment as a finite duration and consequently ruptured the flow of movement as experienced in a flux of time. The pseudo-guarantees of objectivity that this scientifically acceptable idealization could offer, however, outweighed the deficits, and the representation of movement as an incremental sequence in a small finite and discontinuous moment became

an acceptable norm to the extent that the subject was indeed collapsed into the object and temporarily "lost in space." However, whereas chronophotography chained vision to the materiality of the body, in the post-chronophotographic analogue the principles of similarity, congruency and continuity found new life in the cinema of narrative integration (the movies) which rescued the subject in a seamless reality of the infinitely malleable virtual bodies, for whom the eye was transcendent.

The intellectual project of *Ars Electronica*, *Facing the Future* leaves little doubt that the digital revolution was, from its technological and conceptual inception, always destined to be the postdigital in which similarity, congruence and continuity found new applications. At stake in the postdigital analogue however, is more than the recovery of the subject: it is nothing less than the question of whose vision of paradise prevails. The postdigital analogue points to a version of paradise that is not a finite discontinuous place or a non-homogeneous moment of time, not Eden in a nostalgic future, but a thick membrane in which local conditions, desire and resistance are constantly stabilized to form a whole identity. Where the digital proposes the perfect finite conditions for a perfect existence regardless of matter (as for example in the human genome project), in the postdigital analogue (as for example in the ironies of genetic and wet biological art) human consciousness is regarded as almost infinitely malleable, able to shape its identity in response to local and technological conditions and aware all the time of the range of possibilities not yet developed, both digital and analogue.

The Accra Manifesto

Accra, Ghana

Tuesday, March 12, 2002 (revised Wed. March 13, 2002)

Since its beginnings, Cyberspace has provided new approaches for the benign ordering of human affairs. As we begin to develop institutions to govern the digital world, we must avoid returning to industrial models that have generally failed in the analog world to assure equity, liberty, and human inclusion. Instead, let us build upon the promise of what has already proven effective in this social experiment.

The paramount governing values that have so far emerged in this grand collective enterprise are openness, inclusion, technical practicality, emergent form, decentralization, transparency, tolerance, diversity, and a fierce willingness to defend free expression and the preservation of identity. These are appropriate values. They are working.

They should be allowed to go on working, both in the eventual systems for allocating domain names and numbers and in all other matters of Cyberspace governance. Neither the current operations of ICANN nor the current proposal put forward by its president appear to place much faith in them.

Cyberspace has thus far been an environment where architecture is politics. ICANN has turned this practical formulation on its head by attempting to make politics architecture.

To assist in designing a governing process that will promote these values and thus direct us toward the future and away from the past the undersigned propose the following to the ICANN meeting in Accra:

1. It appears to us that ICANN has so far failed to generate the moral authority necessary to govern an environment where authority must be based on the general respect of the governed rather than its ability to impose solutions by fiat.
2. It has failed for a variety of reasons. Chief among these are its impulse to adapt existing and mechanical models of government to a social space that cannot easily be coerced into submission. It attempts to impose government instead of proposing governance.
3. ICANN is overly centralized and, by virtue of its incorporation in the United States and its practical dependency on American contractors, perpetuates the dangerous belief that the Internet is an American environment. We believe that root should not be based in the U.S.
4. ICANN was established in a gray area of institutional reality that makes it nearly invulnerable to legal or political rebuke. If ICANN were a function of the U.S. Government, at least it could be brought into court and held accountable for unconstitutional behavior. The current structure provides almost no opportunity for redress in the area of domain names and none at all in the area of domain numbering,

It's power is vast and growing. Its accountability is small and shrinking.

5. By abandoning the simple and fair system of \"1st come, 1st served\" domain name allocation that served the Internet well from the beginning, ICANN has created a quagmire of unnecessary disputes and suppressed expression, and has irrationally conflated trademark law with domain assignment.

6. Efforts to turn Cyberspace into a traditional democracy, however laudable in principle, may never work well in a social space where it is extremely difficult to define either the electorate or a credible system whereby the people might express their will. Nonetheless, public representation on the board is so important that we can't afford to give up on it. It would be well to remember that democracy is more than a mechanical process of providing that every single member of a constituency has a say. Rather it is a system of governance that seeks the consent of the governed, however that assent is conveyed. To assure that ICANN is democratic in this sense, there must be a low entry barrier to unofficial involvement its decision-making processes, and, possibly, a decentralized, community based system for selecting \"at large\" board members.

7. The current proposal before ICANN would fix this problem by inserting existing nation states into a space where they have no natural sovereignty. While this might, at first pass, lend the popular accountability of governments to its processes, it's likely to result in a system as ineffectual as the ITU or the United Nations. Further, given the wave of negative reaction to the Lynn proposal, its adoption would likely further reduce ICANN's credibility.

8. ICANN, by its cumbersome deliberative processes, already slows the adoption of new technology and might prevent the timely alteration of the technical underpinnings of the Internet in the event of an impending collapse of the system. The addition of even more ponderous governments to the stew of authority would only exacerbate the potential for failure.

9. The current structure of the root servers, as documented in the MDR meeting, has the servers distributed between government, commercial, academic, and non-profit organizations distributed around the world. Such a structure is highly resistant to capture and leads to the robustness and diversity of the Internet. One possible outcome of the Lynn proposal is that the root servers are contractually bound to a single organization. This inherently is less stable and more susceptible to capture than the current structure which should be protected as a fundamental architectural principle.

10. The best way to assure inclusion is to derive systems that are easy for those governed to understand. ICANN is already too complex in its practices to admit informed participation. The Lynn proposal would only add to this complexity.

11. The IETF once provided a good model for governing processes that are well-suited to Cyberspace. It was a system for governance by ideas, rather than by people, laws, or \"stake-holders,\" in that the most elegant solutions were adopted by the consensus of a self-defining community, regardless of the standing of those who proposed them. That the IETF has become less successful in solving problems results less from a flaw in this model than its having been high-jacked by corporate interests. ICANN, in its original design and current state, ignores the value of these proven approaches.

12. To address these failures, we propose that ICANN decentralize and convey operational authority to the communities that naturally define themselves around the top-level domains, restricting its duties to the resolution of disputes that cannot be resolved within the communities. In other words, we believe that ICANN should become a loose confederation of autonomous domains, rather like the federal government of the United States during Jefferson's time.

13. Prior to delegating its operational functions to the domains, we believe that ICANN might demonstrate its understanding of these principles by defining at least two new public domains. Among these we suggest .lib (for libraries) and .pub (for entities, whether organizations or individuals, working for the common good). It is our belief that the systems of self-governance such communities are likely to develop might serve to instruct other domains in the ordering of their own affairs.

14. One of the areas where existing systems of government have worked, to varying degrees of effectiveness, has been in conveying and preserving such human rights as free expression and protection

from unchecked corporate self-interest. ICANN might have a continued role in directing itself to the assurance of such rights in Cyberspace. A reformed ICANN might also propose broad policies and technical solutions, but would do so as respected leaders and not as a junta.

15. The previously existing systems for governance in Cyberspace have shown the practical efficiency of fixing only that which is broken. This is a principle ICANN would do well to emulate.

Cyberspace is not a place. It is a dialog of cultures. We believe that if ICANN were to adopt the above principles, it might, through light-handed arbitration of real, rather than projected, problems, acquire the moral authority that has so far evaded it. We fear that if it fails to consider the concerns that have driven us to make this declaration, it will find itself in the unenviable position of trying to impose its will on a global community with neither a mandate nor force of arms. At best, it will become irrelevant as the citizens of Cyberspace develop methods to work around it. At worst, it will be directly dangerous to the health of the Internet. The chaos that might follow either development will not serve our descendents well.

While many of the undersigned do not accept every single one of the above statements, we are in sufficient agreement with the spirit of this statement that we hereby attach our names and hope that the governing board of ICANN will make a sincere effort to incorporate its beliefs and adopt its recommendations.

[Nettime-bold] OK ART Manifesto

From: Rafael Lozano-Hemmer

To: nettime-bold@nettime.org

Date: Sun, 6 May 2001 17:59:33 -0400

OK ART Manifesto

by Susie Ramsay and Rafael Lozano-Hemmer

1. "OK art" is an OK idea, --not great, but not bad either.

2. OK artists make OK art.

3. OK artists really want to make great art, they shoot for the stars, but their work ends up being just OK. OK artists are OK with this.

4. Art enthusiasts and cynics alike, leave an OK art exhibition saying "that was OK". No one is blown away but they don't feel cheated either.

5. OK art will probably not make it into art history; although someone in the future might find an OK artwork and think "this isn't so bad."

6. "Different" and "interesting" are two adjectives often overheard at OK art exhibitions.

7. OK artists are OK with bad reviews, but naturally they prefer good reviews and they keep those and post them on the internet.

8. It's a good idea to call yourself an OK artist before somebody else does.

9. Ambitious, megalomaniac artists feel great relief when they accept they're just OK.

10. OK ideas are defended passionately but not more than that.

11. (this point was erased during editing)

12. OK art is unlikely to be over or underrated.

13. We hate artists that are A-OK, those bastards!

14. There is no point in making an OK art movement, although fleeting consideration of the concept would be OK.

2.O

[Nettime-bold] MOBILE MANIFESTO

From: richard barbrook

To: nettime-bold@nettime.org

Date: Wed, 8 Nov 2000 19:55:48 +0000

MOBILE MANIFESTO

1.0 Is WAP crap?

Early adopters can only access the pleasures of new technologies by accepting the pains of beta-testing the future.

2.0 When will the hardware come up to speed?

Net users assume that large screens, colourful icons, pop-down menus and all the other features of the PC interface should be available on mobiles which are small enough to fit into their pockets.

3.0 Has my SIM card become my identity?

Even if we forget what we did yesterday, our mobiles have recorded all aspects of our daily lives: who we spoke with, what we bought and where we were.

4.0 What shall I broadcast tonight?

With the advent of 3G mobiles, everyone will carry a television transmitter in their pocket for video-conferencing with work colleagues, providing live-feeds to the Net and swapping MPEG movies with their friends.

5.0 Is your partner monitoring your visits to your lover?

While we appreciate being able to find out where we are using the GPS facilities on our mobile, we don't want other people knowing where we are without us telling them first.

6.0 How did I ever leave home without one?

Wherever we go, we are carrying our own intimate world of friends, colleagues and contacts inside the screens of our mobiles.

7.0 Who said that text was dead?

The popularity of SMS disproves McLuhan's prediction that reading and writing would disappear once we could easily communicate with each other using audio-visual media.

8.o Will we ever develop manners for mobiles?

The happiness of hearing from an absent friend means ignoring your best mate who is sitting right next to you.

9.o Is my mobile acting as a double-agent?

By becoming my easy-to-use gateway for on-line banking, m-commerce and socialising, my mobile is surreptitiously revealing information about my finances, shopping habits and lifestyle choices to outside forces, such as law enforcement agencies and market researchers.

10.o Are we frying our brains instead of polluting our lungs?

For today's young people, the first sign of maturity is ignoring the danger of radiation from mobiles rather than disregarding the risk of getting cancer from cigarettes.

[Nettime-bold] Cybersalon Manifesto
From: richard barbrook
To: nettime-bold@nettime.org
Date: Fri, 6 Oct 2000 11:55:25 -0400

Manage Your Own Medium

1.0 Genesis.

In March 1960 J.C.R. Licklider envisioned a network of computers connected together where human and machine would work together in intimate association. He prophesied that this era would be intellectually the most creative and exiting in the history of mankind. We are living in this time. Our group is a collective of people emerging from the human/computer interface who are engaged in digital practices and theories. As artists, practitioners and academics we have joined together to create the Cybersalon: live gatherings in the image of the new digital medium of the Net.

2.0 The medium is no longer the message, we formulate the medium to convey our own message.

Creating in pixels underpins the use of the computer both as a tool and as a communicating device. These two characteristics have completed their integration in the Net. Within new media, the creative process is made and distributed in bits and pixels. The exchanging, sharing and manipulating information is an integral part of our work. Our networked computers are the devices of creativity and of communication. Our message is intended for a pixel-generated screen mediating the relationship of humans and computers.

3.0 Enjoy the schism.

Our visual culture has been formulated by an analogue world whose traditions have been uneasily carried on into the digital format. We are still confined by the look, design, fashions and aesthetics of the old media. Our practices and theories must now be changed for the time of the Net. The schism between old and new media is caused by the passivity of the first and the interactivity of the second. The medium that carries our message conveys an active and intimate association with its users. New media exist only in digital format: identical copies can be shared between makers and receivers. We must now deliver in the same format that we create in.

4.0 The original is obsolete.

The digital format assumes countless identical copies of the same work. The do-and-undo command encourages non-linear approaches within the creative process. A digital work can be shared between its makers who can add and delete parts. Visuals, sounds and machine code can be placed and accessed across the Net. Whether we're multi-media constructors, web developers, programmers, theoreticians, digital artists, we all have to ask ourselves these key questions: Whose idea was it anyway? Who inspired whom? Is the remix better than the original version? How can we contribute our creativity to the collective digital work?

5.0 We must meet up soon.

New media brings together people from a wide range of different practices. For instance, when building a website, the computer programmer and the graphic designer will each contribute their own particular skills to the common product. Within the creative process, each person possesses their own heterogeneous experience of the human/computer interface. Out of these divided and layered practices, a collective aesthetic is emerging in the form of code and pixels.

6.0 Cybersalon is a real-time environment.

Cybersalon is a real and virtual space where people involved in digital creativity can congregate and meet with each other. If we want to discover innovative practices and theories, it is essential for us to share and communicate our on-line experiences. Some short-sighted interests are trying to inhibit the participatory nature of the Net. In contrast, we want to celebrate and promote the emancipatory and creative possibilities of the new information technologies. We will organise discussions around the social and cultural issues brought out by the Net. We will exhibit cutting-edge digital work. We present the latest practices and theories emerging from the educational, commercial, community and artistic forms of new media.

7.0 Beyond hi-tech neo-liberalism

We are escaping from the most liberal times in the history of communications. After decades of globalisation, privatisation and deregulation, information became something which could only be bought and sold. Education, entertainment and political debates were read-only files. Now all these old certainties are being swept away. The Net is overcoming the enforced passivity and cultural boundaries imposed by the old media. Whether as individuals or as groups, we now have the ability to create our own media with the new information technologies. We can enjoy the benefits of sharing knowledge, giving information, communicating our ideas and making friends within a place where time and space are undetermined. In this new situation, we are forced to reconsider our practices and theories of cultural creativity. We must revisit the revolutionary legacy of the past. We must invent new ways of acting and thinking.

8.0 Montage the medium

Living inside the human/computer interface is an integral part of everyday life. As digital practitioners, we use our computer as a production tool and as a communications device. As mobile phone users, we each carry with our own personal transmitter. Although we don't own the landlines or airwaves, we are still able to give away our content to whoever wants to download it. We can collect and filter information from the Net to customise our own information. Neither political censors nor copyright enforcers have the power to control our freedom of expression. Across the globe, individuals and groups can now enjoy the most libertarian interpretation of media freedom. We are no longer limited to owning only receivers of information. Each of us can now possess their own transmitter. Everyone can be an artist, a designer, a broadcaster and a theorist. Our pixel-aided world is the integration of all known culture - and the emergence of entirely new practices and theories.

|| aleph_matrix

the net_institute is a hybrid between the city and the net, the metropolis and the mediascape, between a collective intelligence and an

institutional apparatus. it is an example of the genetic mutations induced by the implosive convergence of media, formats, genres into the net's omnivorous matrix. at the same time the net_institute works as a mediatic icon, an institutional apparatus, a networked building, a horizontal institute, a mailing list, an urban interface of the net, a net interface of the landscape, a machine programm, a connective name. the net_institute is a new bio_informational organism: its life task is to reproduce its meme by contaminating other organisms as faster as possible.

|| leaving the net

at the end of its pioneering period, the net is living its definitive commodification and trasformation in the backbone of the new economy. the cyberspace saga ends up in an on-line supermarket. past the cyberspace, the net_institute seeks a third space of action, the friction point between netscape and landscape. for this reason the net_institute goes out of the net, ejects the network out of the web, tries to create short-circuits with the territory, to establish a practice connected to net_culture in a contradictory way. the net_institute sets itself on the point of detonation between the cyber and the real world, on a hybrid topological dimension implementing the communication and imaginative power of the net straight into the real world. the net_institute uses the net to outline future lands, to draw maps that subvert the present territory, to project the territory itself on the mediascape.

|| pro_institution

the net_institute reveals the social simulation of content, normally protected by institutional or antagonistic rhetorics, and the power frames hidden in the art world and counterculture. at the same time as the institutions are hosting subversive net_artists and cultural terrorists, the net_institute itself becomes an institution, as the real power leaves the government buildings to move to faceless corporations, the net_institute gets hold of abandoned simulacra, occupies the center of the territory, makes the power relationship visible again. since power no longer has a face, a center, a head, the net_institute turns the net in a collective and organised intelligence. the net_institute does not live in the underwoods of the net.

|| net_worked_institute

the net_institute is a building that embodies the deep frameworks of the net and is made up of public and private environments, physical and communication spaces. it is a hybrid architecture capable to fit itself into other architectures. it is a transversal, modular, unstable space that can be constructed by anyone, a low_tech practice devised to hack the architectural code and to revivify the urban space. the net_institute is a mass medium building daily repopulating the city.

|| urban_interface

the internet is a machine capable to overcode each aspect of social life. standing up against the technoeuphoria, the net_institute thinks it is reactionary to look for the wonderful, the complex, the extreme on the net only. the net_institute is an urban interface of the net_culture that breaks with the dominant discourse about cyberscape, virtual reality, simulation. the net_institute is a physical, social, mediatic space and it is not controlled and constructed on the net but through the net. the net_institute is a creative interface for the conscious - technical and political - management of the networks and their mediatic power.

|| human/machine interface

the net_institute builds human and urban networks in order to turn the networks' invasion into everyday life inside out. at the same rate as the networks are rooting into social life and the computer is giving the human being its mind, the net_institute will root inside the network and give the machine its mind. the human being is now reshaping itself after the models of intelligent machines: the meta_design of the new technologies permeates the neural structure more than old ones, redraws its circuits and constructs new infrastructures for human behaviour. for this reason the net_institute wants to de_cable the collective brain. the net_institute device wants to make conscious again the behaviours made automatic and unconscious by the widespread technology, by the software easy automatism that are standardising taste and creativeness. the net_institute wants to construct not user_friendly but brain_friendly interfaces, wherein the friction with the diversity of machine be the highest.

|| social_operative_system

operative and the social systems are converging towards each other. the

operative systems have been increasingly designed according to social models and metaphors, and are aimed to control the whole society. at the same time, the term 'operative system' leaves the field of computer science, in order to be used by the social system to describe itself. such a convergence allows us foresee scenarios of 'intelligent' networks, buildings, cities controlling any aspect of social life. the net_institute sees itself as a social operative system aimed to control the dominant operative system.

`|| immaterial_architecture`

the net_institute is obsessed with the material and immaterial architectures that continuously shape the collective behaviour and the unconscious: commercial and bureaucratic architectures, urbanistic plans, media embedded in the urban texture, computer networks, information fluxes. the post_industrial culture is dominated by immaterial information architectures and by invisible communication channels, no longer by the heavyness of industrial economy, but the immaterial yoke is as much heavy: the net_institute itself does not express but ghosts unconsciously sedimented in the brain of the masses and in social behaviours.

`|| open_architecture`

the net_institute's network structure allows an open architecture which new structures can be connected to at any moment. the net_institute is an autopoietic organism piloted by the networking of its nodes: each can propose a reorganisation of the whole net. as in a population of neurons, no one rules, but the brain works the same. in this case the brain triggering neuronal impulses is the mailing list: better, the net_institute is a mailing list, i.e. a collective narration. for the net_institute anyone can build the basement, write the mission, develop the departments, control the image, program the code. the net_institute is a connective name.

`|| open_source`

as a political groupware the net_institute is open_source, and it makes the decision and organisation mechanism completely visible and accessible. the net_institute is a transparent multi-cellular organism whose evolution can be observed through its mailing list and the iconic interface of its structure. the net_institute doesn't follow a strategy of secret (though this statement is not demonstrable). the net_institute is a freeware and open_source software, usable and modifiable for non-commercial purposes.

`|| low_tek`

squashed between wired-style psychedelia, web-tv colonisation threats, virtual reality middle-class neoliberalism and aesthetic spectrum saturation, a space for action is left only for those who can devote themselves to networking, minimalism, schematism, fast rates and iconoclasm. the net_institute prefers the low_tek because this is the fastest format in the information highways and the collective imaginery, and because it is a code accessible and understandable to all. the hi_tech hides the content, makes it elitist, and works slower inside the communication channels. the low_tech is critical, iconoclastic, compact, modular, the intelligence and imaginery that are being constructed are minimalist, schematic, connective, modular and text_based.

`|| text_based`

the low_tech is text_based. the net_institute represents neither the intellectual class nor mass culture. the net_institute uses the ASCII characters, better known as an american standard, as an universal code, a tool to assault both the elitist and the commercial culture. text_based concept does not deal with a bookish culture but with computer keyboards and mailing lists to write a bottom-up culture.

`|| code_culture`

the net_institute explores the digital culture neuropathy that neither activists nor the sharpest critics are able to perceive. this narcosis of consciousness can be observed in the wired family and in all the net users, hackers included: the computer medium has mathematicized and digitalized the mind and its irrational and analogic impulses. after the early period of domestication to the medium, the net_institute tries to subvert its inner logics, to bypass the machine code, to explore its limits. otherwise the net_institute thinks that the turing machine language could be a therapy for the 'weak thought' of western intellectuals.

`|| not_art`

the net_institute considers more necessary and interesting to build

pathological containers than pathological contents. in order to set schizophrenia and creativeness free, they should be forced into an obsessive, allucinator and claustrophobic space, in an artificial light. the net_institute was born far away from the ergonomic european new media centers. the net_institute steals and implements the most sclerotic appearances of power, with no provocative intentions, to show the failures and contradictions of underground and overground lifestyles. in a world where institutional culture is kept alive with transfusions of counter-culture, and upper class fashion wears the street-style, the net_institute causes activism to lose its bearing. the net_institute does not play with the superficial interface of two browsers as well as net art does, but works with the deep framework of the internet machine to have its underground exposed. the most beautiful artwork is the idea - the meme that manages to spread and reproduce itself widely and actively.

`|| totalitarian_machinery`

the net_institute is a perfect overturning of the kafkesque universe: it is an institute where the outside is the inside like in the klein bottle: logically you are already inside it. the institute is a totalitarian machinery because it celebrates the death of the author, the artist, the individual, and the sexual and ethnic identity, through an anonymous, asexual and inorganic architectural simulacrum. anyone can construct and inhabitate the institute to find a home to own unstable identities. following the example of the corporations, the individual is not meant to express him/herself, the institute cares about doing it in his/her place.

`|| retro_avantgarde`

the net_institute is a paranoid disguise of schizophrenic forces against those paranoid forces that in western society pretend to be schizophrenic. the net_institute faces the e-nomination and the invisibility of the new power and economy using the heavy and material image of an institute. laibach, nsk, luther blissett, rtmark, balkania and the net_institute are examples of practices that do not face the system 'correctly' but deconstruct it from the inside by the means of aesthetic, semantic, polical, legal short-circuits.

`|| connective_name`

the net_institute is the reincarnation of luther blissett as a collective open pop star, an evolution of the multiple name's karma when the name started being used for boring 15-minutes celebrities. luther blissett is not only a multi-use and multi-user name but also a collective myth that can animate new narrations and new devices. the net_institute represents its further implementation. the net_institute is not indeed a collective_name, but a connective one, not the name of a character but a structure_name. in other terms, the net_institute can be described as an urban and institutional architecture built on and for an open-architecture pop star. the net_institute is not a metaphor but a political and aesthetic device to construct urban and international networks, to deconstruct the cultural and mass media industry, to reconquest the territory, to find a home for unstable identities. when the masses and the media are acclaiming a harmless luther blissett, it is the right time to kindly offer them a totalitarian institution. become net_institute.

<nettime> The Communard Manifesto (1/2)

From: Felix Stalder

To: nettime-l@kein.org

Date: Tue, 2 Aug 2016 10:49:51 +0200

[This strikes me as the most advanced attempt to outline a historical perspective on an emancipatory trajectory contained within the current crisis. It's not simply a theoretical text, but a testimony to the scope of vision driving the development of the Spanish 'rebel cities'.

The manifesto makes two key arguments. First, the two main social institutions of our time -- the state and the markets -- are 'decomposing'. As a consequence, ever more economic activity is devoted to rent-seeking rather than production, leaving ever greater numbers of people as 'exiles' from the still dominant society (and open to destructive communities of nationalists, racists and jihadists).

Second, that technological (and organisational) advances have altered the scale necessary to produce many necessary products and social goods (think from atomic power-plants to solar panels). This enables many of these goods to be produced outside the market (what they call 'pap economy') and where the market remains necessary through 'direct economy' meaning ways of raising the necessary capital that does not hand over control over the productive process to the owners of capital.

It's a very long text, so I split it up in two mails in old nettime tradition, but it's really worth reading in its entirety. Felix]

<https://lasindias.com/the-communard-manifesto-html>

Communard Manifesto

The dilemma of our time
Abundance within reach
Inequality, unemployment and demoralization
What is decomposing is not only the economic system, but what the human experience means
Capitalism and its critics
Capitalism shaped the world because, before changing the State, it was able to create a new form of human experience
Revolutionaries that loved crises and large scales
The history we weren't told
The new world will be born and affirmed inside the old
New relationships, here and now
Scale and scope
From the era of economies of scale...
...to the era of the inefficiencies of scale
Today, capital is too big for the real productive scale...
... and the optimal scale is approaching community dimensions
Building abundance here and now
Abundance has to do with production, not with consumption
A scarce product in a decentralized network is abundant in a distributed network
The 'PaP mode of production' is the model for the production of abundance

(PART 2/2)

The two faces of productivity
Artificially creating scarcity has become a way of life for over-scaled industry
Abundance is the magic that shines through the 'hacker ethic'
The path of abundance does not mean producing less
What will we do about the overuse of natural resources?
Connecting the dots
Conquer work, reconquer life
To be unable to access work is to be in social exile
There's no self-realization without work
To conquer work is reconquer life
From adding to multiplying
The scene will be urban
The tasks of the communards
You are the protagonist
Appendix: concrete things you can do with this manifesto
Expand the conversation

Prepare to "make community"

To the friends in the Club de las Indias,
because we owe them the most valuable half of this manifesto.

To the communards of all times,
because their mistakes left us with the right questions.

To the new communards across the whole world,
because their enthusiasm brings us closer to the spirit of a time to come.

The dilemma of our time
Abundance within reach

Never before in History of humanity have technical capacities been as potent and accessible to common people as today. The massive development of the Internet through the '90s profoundly changed ways of socializing, sharing, and working. Wealth was created in places that were socially and geographically peripheral by the hands of millions of small producers that, for the first time, could effectively access other markets and knowledge. In Asia alone, we saw hundreds of millions of people escape misery, more than in the rest of the history of humanity.

As technological change became generational and social change, there appeared more and more environments of abundance, free goods, new forms of collaborative work and, above all, a new work ethic based on knowledge, the creation of goods, and "de-alienation." The "hacker ethic," as it was termed at the turn of the century, inspired the birth of first universal public good to be intentionally constructed by our species: free software, which, by itself, has meant a transfer of knowledge and technology greater than all developmental aid from rich countries.

And, yet, not even the other great crisis of the last hundred years—the one that started with the "Crash of '29"—created such discontent, such a dark spirit, and so much widespread pessimism. Neither admonitions nor hope work any longer to create attractive narratives. Well-being has ceased to be a credible expectation of analysts' predictions or political parties' options, whether old or new. All lines of contention have been shown to be futile for the common people. We're entering a time in which no narrative can be believed if can't demonstrate, here and now, that it successfully allows a new generation to develop and live decently through work.

Inequality, unemployment and demoralization

And, if anything has been really global over the last ten years, it's been the experience of social decomposition. It's the same whether we look in the most developed regions in the world or at emerging nations, in the Mediterranean or in the South China Sea, in the English-speaking world or in South America: society is more and more unequal, and the differences quickly become cumulative. If you miss the train, you don't reach the destination.

In the most developed nations, the middle class has rediscovered unemployment. New generations don't even have access to work, or if they do, it's so precarious that it doesn't let them experience the meaning real of what they do. Work has ceased to be considered the center of collective action, the origin of personal autonomy, and each person's contribution to society. In today's popular culture, work is a scarce good. There's no lack of start-ups and NGOs that speculate with it, as if it was a precious metal. Work, the necessary link between personal effort and collective effort, is devalued to the limit, not only in the market—reducing its piece of the pie compared to capital—but also morally, in its public consideration and in its internal organization. It has gone from being universally considered the center of social organization to being perceived as facing extinction, from being experienced as the basis of personal realization to being seen as a source of anguish.

In a world where being able to contribute to the common well-being, work is talked about as if it was a privilege, and the only way of building a life seems to be getting rents. Rents are not just any income, but an opportunistic and undeserved position, an extraordinary benefit produced outside of the value that one contributes. Rents are the benefits created by big businesses thanks to made-to-fit regulations or monopolies that only exist by legal imposition, like intellectual property. Rents are "incentives" that are decided on and inflated by the same directors that receive them, or the consequences in cold, hard cash of belonging to certain social spheres where certain positions and contracts, public or private, can be accessed. Rents easily become cumulative and create a spiral of inequality when access to information and education depends on personal income, or when competition to assure them is systematically restricted, as the State routinely does in key sectors like energy, telecommunications or the media.

In a world of rents, everything looks like a zero-sum game, where one wins because others lose. Distrust of everything and everyone, institutions and people, is the norm. It shows an individualism of the worst kind, for which life is senseless, and mere survival. What is decomposing is not only the economic system, but what the human experience means

It's not just social cohesion that's decomposing. The rules of the economic system are decomposing, and with them, the human experience and what it means to be human in our time. It's the inability of the economic system to create a future for everyone that produces loneliness and distrust of everyone; it's the pettiness of a system in which businesses depend on the benefits they get thanks to rents more than selling their products, or on eliminating competitors more than improve themselves, that produces lives of dependency, begging, and voracity.

Never has there been so much wealth or so much knowledge as now and, yet, far from feeling like both things give hope of abundance for everyone, more and more people are afraid that this is a threat to Nature, the same way they feel, day in and day out, like it's a threat to personal survival.

Capitalism and its critics

There were a time when capitalism transformed the world, bringing our species closer to the abundance that, today, scares it so much. The "cancer of business" took over from the old European societies, feudal first and colonial centuries later, and smashed them from within in a long process of almost six hundred years. Capitalism, which started off as marginal—urban in a rural world, dynamic in a traditional society, equalizing in a system in which identity was based on lineage and origin—was revolutionary right from its first steps. In the city and its markets, it created new lifestyles and mentalities, new forms of knowledge, new freedoms, and new collective belongings. Capitalism shaped the world because, before changing the State, it was able to create a new form of human experience

Capitalism created a new form of human experience and, by doing so, dynamized established relationships, its castes and its classes. It wasn't the work of a generation. It could only deploy its full potential after centuries of evolution and entrenchment, of turning fairs—temporary markets—into a large, permanent urban workshop and, later, turning the guild craftsman into a factory worker under the thumb of the merchant investor, who bought the materials and carried the products to distant markets. It was only then that industrialization made a profound social transformation out of what, until then, had only been "tendencies." It was the great revolutionary moment of the bourgeoisie.

In the first place, capitalism made a commodity of land, the principle means of production of the times. In the process, the agrarian and forest commons—the oldest and most widespread form of property—came to occupy a marginal place. And, with it, the real community of the family, the clan or the village, in which everyone knows each other by face and name, because they are linked to them by interpersonal relationships and affection. The vacuum was filled throughout the nineteenth century by another innovation: the imagined community of the nation. "Imagined" not because it was unreal, but because those who are considered its members don't know more than a tiny portion of the others, and have to imagine the rest through common attributes, practices, values, and memories, which are always debatable. Fraternity based on the friendship of personal relationships and shared work will give way to an abstract fraternity in search of a "common good" that the new social classes linked to wage labor make a permanent part of social discourse.

Secondly, work became indistinguishable from whoever did it, because of the homogenization of the processes in the new productive space of society: the factory. The new relationship with work and, through it, with society and nature, was impersonal and anonymous, and no longer had to do with "being," with lineage, or with geography. The vacuum created by the dilution of the servant, the command and the guild craftsman was filled by a new abstract human type: the "individual."

Although it may sound strange today, that whole advance—which allowed humanity to grow in number, well-being, and knowledge like never before—was produced thanks to making a commodity of everything that, until then, had not been, like land, which hadn't usually been rented or sold, only possessed.

Even for the revolutionaries of the nineteenth century, it was impossible to deny the progressive nature of the great works of capitalism. They were well aware of how the industrial boom brought Humanity towards abundance, increasing knowledge and its practical consequence, technology. They were witnesses of the formidable historical spectacle of a world in revolution where distances were cut,

the population multiplied, energy and water flowed in people's houses for the first time, and the most distant and closed empires saw their walls give way before the onslaught of global commerce in manufacturing. For the first time in history, humanity as such took on a real existence: through new markets, we would all end up connected with everyone throughout the world; and in the factory, the immense majority of society would share a common experience—and therefore, would come to be the same thing—to the rhythm of the new mechanical genies. Capitalism, as they saw it, was preparing an egalitarian society through equality of living conditions, work, and social relationships that that it was, itself, expanding.

Revolutionaries that loved crises and large scales

But those revolutionaries saw something more: the growth of capitalism, in the first place, wasn't the least bit linear. Its crises, like all prior crises, produced underconsumption (scandalous, miserable situations for those excluded from production). But, in contrast to the crises of agrarian societies, capitalist crises weren't crises of under-production, but of "over-production": it's not that the factories couldn't produce enough for the needs of all, it's that the very dynamic of the economic system made it impossible for them to sell it to the great masses that needed it, because they didn't have the money to buy what was produced. Additionally, the revolutionaries asserted that all this happened regularly, in cycles in which each decline necessarily led to a confrontation between an ever-more concentrated group of owners and an ever-more global and uniform class of workers. Everyone would struggle in a large global revolution for control of the States that held the social structures in place until, similar to what the bourgeoisie of the eighteenth century did in the French Revolution, the proletariat would take control of the State with one purpose: to direct a massive process of decommodification, giving way to a society of abundance where the essential purpose of production was to serve this or that need, instead of being sold as objects and services for a price.

Marx and Kropotkin never proposed to close the factories. They thought that crises of overproduction signaled a limit of capitalism, the limit at which the logic of the commodity clashed with human needs. But they saw in the technology of mass production and in the ever-greater scale of the businesses a reflection of the progress that would lead the working class to "change the world from underneath." They thought that by eliminating the commodity nature of objects, the "productive forces would be released," which is to say, that productivity would be developed even more, and with it knowledge, well-being, etc. The very scale of production would also develop, until it constituted a great global factory-State, so productive that it could satisfy the material needs of all humanity with nothing more than volunteer work.

Nothing of the sort happened. No "global revolution" took place. Since 1871, there were local and national revolutions in which communists and anarchists looked for its first signs. Most were overthrown; none was able to produce on a larger scale during the following cycle of growth and crisis; and those that triumphed never brought about the decommodification of production. On the contrary, they gave power to repressive, totalitarian regimes, with very hierarchical and inefficient nationalized economies and such low levels of well-being among workers that they belied every delusion of the "liberation of productive forces." When the Soviet Union fell and China took its first steps towards capitalism controlled by the Communist State, communism and socialism were discredited as alternatives. In the '90s, their place was taken by "anti-capitalism," which fluctuated between affirming that another world was possible and denying that capitalism and the human species could survive together, but avoided explaining how the former would become real and what made the latter inevitable. To a certain degree, this was the result of the sense of profound failure of "alternative" thought that followed the fall of the Berlin Wall in 1989. But, lacking a theory of its own, it would become an invertebrate socialism, a "big no" into which anything and everything would fit. It was, in a certain way, a leftism chastened by false socialist paradises, hesitant when it came to describing any future society, and far removed from any pretense of building functional models in the present.

La historia que no nos contaron

Decades before the first socialist and libertarian groups of any weight were formed, an alternative trend had started down a long path with a very different focus: communitarianism.

The new world will be born and affirmed inside the old

The basic idea of communitarianism is that the new world will be born and grow inside the old. Profound changes in social and economic relationships—system changes—are not the product of revolutions and political changes. It happens the other way around: systemic political

changes are the expression of new forms of social organizing, new values, and ways of working and living, that have reached enough maturity to be able to establish a broad social consensus. As of a certain point in development, a “competition between systems” is established. The new forms, until then valid only for a small minority, begin to seem to be the only ones capable of offering a better future for the large majority. Little by little, they expand their spectrum and their number, encompassing and transforming broader and broader social spaces, and become the center of the economy, reconfiguring the cultural, ideological, and legal basis of society from within.

For communarians, egalitarian forms should accompany capitalism in its evolution as a parallel society, not as a utopia—the promise of a society to come—except as a heterotopia: a different, alternative social place, with values and ways of its own. At first, they do it from behind, through learning, utilization and re-elaboration of existing technology and, as of a certain point, entering in competition with it. This perspective was called “constructive socialism.”

The first objective was always to show the feasibility of a decommodified life. “here and now,” on any scale. Communitarianism is not centered on creating political parties, but networks of small productive egalitarian communities. The maxim of economic organization comes to be “from each according to their abilities, to each according to their needs”: communities of goods, revenue, and savings are established, production is organized by consensus, and from the beginning, the highest diversification is sought to serve the diversity of personal needs and gain autonomy for all. New relationships, here and now

From 1849 to today, egalitarian communities have always been working: Icarian communities, Russian *artels*, Israeli *kibbutzim*, US, Japanese, or German egalitarian farms... They’ve been on practically all continents, they’ve had different names and nuances in different times and places, they’ve been through all manner of crises, and their members have made enormous sacrifices. In place of the centrality of the class nature of the collectivist narrative, they wrote a story of their community and their experience, which gave substance to the central idea of constructive socialism: building—here and now, within the community and between it and its surroundings—social and economic relationships that are desired or postulated as valid alternatives to the existing socioeconomic system, without delegating power to parties or organizational structures outside of the communities themselves. Without thinking of themselves as “experimental” or having detailed “roadmaps,” they have created a heritage and a culture themselves, little by little. They are the seeds of a society of abundance.

In the framework of the young and expansive capitalism of the nineteenth century, or the capitalism of technological revolution and permanent war that followed up through the present, if these “decommodified islets” want to maintain their autonomy and approach abundance, they have to enter the market: to live without needing money at all within the community, they must learn to think like merchants outside of it. It’s no contradiction: being in the market is the only way to not lose the technological pace of the system they want to overcome. But, at the same time, it’s the way to bring the first cultural and technological fruits of the new society to the old society. It is, in many senses—including the moral, since it aspires to expand the improvement in living conditions to more people—the first step towards a competition between systems.

The bourgeoisie, in its medieval infancy, introduced the revolutionary principle of equality of origin and a few technological improvements that expressed their vision of the world into some small spaces in feudal society. All of them happened far from the center of the production of value at the time, the fields. The medieval commercial bourgeoisie invented important things, but eccentric for the times, like the check, the letter of exchange, and double-entry accounting. In contrast, communitarianism demonstrated from the first day the feasibility of an economic organization thought of in terms of the needs. It was the first to make a reality of equality in spite of differences in gender or social or geographical origin, and across the 20th century, left a series of pioneering technologies: weatherization and sanitation in popular housing; the improvement of agricultural productivity, like drip irrigation, seed improvement, or the scientific management of dairy facilities; the development of free software for distributed networks; and the first analytical tools for public intelligence. These are innovations that continue to be significant and closer and closer to the productive core of the economic system.

In what little we’ve seen of twenty-first century, that sense of a cultural and technological “membrane” between the past and the future, between capitalist society and the small, decommodified space of egalitarian communities, has become even more clear. The appearance of new ways of producing based on new forms of communal property—like free

software—and distributed communication architectures—linked directly to decommodification and the creation of abundance—put forth the notion that we are on the threshold of a new phase in which we will be able to change the nature of that competition between systems.

But, above all, what justifies a new time for the development of communitarianism is an irreversible economic change that has been imposed gradually: the reduction of the optimal scales of production. This decline in the optimal productive scale explains the deep trends that have produced the current economic crises, and why the political and corporate responses are often times counterproductive. And any alternative is not centered on social class or the nation, but on community.

Scale and scope

The optimum scale is most efficient dimension of the productive units of a society, the size as of which inefficiencies created by having to manage the excessive size of those units exceeds the benefit produced by being a little bigger. For each dimension of the market and each technological level, there exists an optimal scale of production, and it turns out to be easy to understand that, in principle, technological development reduces the optimal dimensions, because the better the technology, the fewer resources—work hours, capital and raw material—are needed to produce the same quantity of products.

From the era of economies of scale...

During the height of capitalism, in the 19th century, between British imperialism’s bet on free trade, American expansion, European unifications and the revolutions in transportation—the clipper, the railroad, and steamboats—markets grew much faster than productivity. The optimum size always remained out of reach, and capital to reach it was always scarce. It was the Golden Age, and it saw the most authentic of joint-stock companies: gigantic collective efforts that brought together the savings of tens of thousands of small savers and capitalists to put whole countries into production, to charter faster and faster boats, lay telegraph cables across oceans, or cross continents from end to end with railways.

For a long time, the continuous growth of scale seemed to confirm the Marxists, Kropotkinists, and social democrats. In all of their economic models, underneath the permanent expansive dynamic of capitalism, there was the need to reduce prices by increasing production per hour to survive competition and even—if the owner was the first to incorporate new machines or technologies—get extraordinary benefits while other factories adapted. Every time productive capacity increases, the benefit that each unit of product contributes is reduced, so to maintain or increase the total benefit, the owner has to produce even more quantity, which requires the incorporation of new machines and processes to reach a still-greater scale. Finally, according to these authors, when production approaches or even exceeds the potential size of the market, crises of overproduction erupt.

This model, described for the first time by Marx, is known as “law of the tendency of the rate of profit to fall.” For decades, Marxist economists repeated the mantra that “the decreasing tendency of the rate of profit is compensated for with the increase in the mass of product” and took for granted that each cycle of growth and crisis would begin with a greater scale and would increase it further still. Accordingly, capitalism was on the path to create big businesses, true global monopolies in each and every industrial and consumption market, which fit like a glove both with the quasi-religious Marxist vision of a great, revolutionary, global Armageddon between the proletariat and the bourgeoisie, and with the social-democratic vision that socialism would be the result of the nationalization of the great industries by the democratic state as they reached critical sizes.

However, underneath both models, revolutionary and reformist-nationalizing, was a presumption that would soon be shown to be erroneous: that in each cycle, greater effective demand would appear. It’s obvious that the average scale of the businesses in the capitalist world would not increase unless owners could foresee a growing volume of demand, because with demand that was not growing globally, if they could produce the same thing with fewer resources, they weren’t going to increase scale, but reduce it.

At time when Marx was writing his economic theory—in fact, for almost the entire 19th century—that extraordinary demand came largely from the incorporation of Asia and Africa into the world market. Colonialism, by subjugating backward economies and tearing down trade barriers for British and French products, continuously increased the demand for manufactured products, overcoming the tendency to reduce the size of the productive units that drove technological development.

...to the era of the inefficiencies of scale

We could put the date of the change at 1914. Twenty years after the colonial division of Africa among the great industrial powers at the Berlin Conference, the expectation that new, extra-capitalist markets would join those of the great powers had already dissipated. Territorial tensions in Europe reflected the rigidity of the delimitation of colonial borders. The war that was about to break out was a “world war” precisely because it meant the end of the first stage of the configuration of a unified global market. Marxist prophecies were coming true. The crisis of ‘39 would seem to corroborate them. However, from there—through another World War, the processes of decolonization in Africa and Asia, and a very long Cold War—the evidence set about dismantling the idea that capitalism was constantly evolving towards increases in the scale of businesses.

In fact, big national businesses—which flourished at the beginning of the twentieth century, after the war—were only central in the socialist countries and for some nationalist regimes in backward nations. Both in them and in the developed world, where they briefly flourished as a tool of post-war reconstruction, they were not the “spontaneous” result of the evolution of markets. In every case, they were a shortcut to get production underway and reinvigorate industry after the enormous destruction left by the crisis and war. But they soon reached a ceiling, especially in the framework of the planned economies for which they had become a banner. In each new phase of technological development, Big State Businesses increased inefficiencies and their costs, which, in an authoritarian and centralized system, would spread with extraordinary speed across the economic system. The USSR, which promised to “overtake the USA” in the middle of the ‘60s, entered into a crisis by the ‘70s, and into open decomposition in the ‘80s.

In the Western bloc, not even the largest multinationals had dimensions comparable to the great State dinosaurs of the USSR, and yet the weight of the inefficiencies of scale started to be obvious by the mid ‘70s. That was when economist Kenneth Boulding called attention to problems of communication, management, and control in large, pyramidal organizations. Boulding also warned that, given the size and weight of certain companies in the economic system and their effect on employment, inefficiencies threatened to spread to the whole economy through the state, since over-scaled businesses competed to “capture it” and to make up for the costs of inefficiencies due to over-scaling with rents resulting from tailor-made regulations.

Following Boulding’s warnings, technological research then became centered on information science and data management, on communications, and on forms of work. The “information revolution” that started at that time was the first line of defense against the effects of over-scaling. It wasn’t enough, however. In the middle of the ‘70s, it became obvious in Europe—and not only there—that the State of the postwar period, captured by big businesses and sectoral interests, was effectively unviable.

This was when the set of policies called “neoliberalism” was designed. It was basically an attempt to confront the results of over-scaling in the other possible way: by expanding markets. What’s original about neoliberalism is that not only does it extend markets in space—through reduction of tariff barriers and creation of free-trade zones—but also over time, with the use of new tools such as “financialization.” Today, capital is too big for the real productive scale...

It’s well known how financial innovations and deregulation came together to lay the foundations for the global crisis of 2008. What’s less discussed is that in the same “exuberance of capital” that preceded the crash, a problem of excessive scale was manifested. Investment exuberance is a mass mirage produced by the hopelessness of investors who can’t find a place for their capital.

Also, this problem, already endemic, was multiplied by the capture of the State and of the market itself by banks. The State had deregulated financial activity for the benefit of the big banks beyond a reasonable point. State agencies were powerless, and often conditioned or seduced by pressure from institutions that were considered “systemic,” and had turned “too big to fail” into a pirate flag. And not even the market could act as a counterweight. With ratings agencies captured by their own customers—and distributing hyper-optimistic descriptions—the mass of small investors could only follow the great tendencies of capital as an independent indicator. The trouble is that that movement wasn’t independent at all, since the same financial groups were channeling it. The result is a system that, even in midst of the crash, they contained their damage by abusing asymmetries of information and their power to set prices at the expense of their own customers. Today, eight years after the fall of Lehman Brothers, that system remains basically intact.

The root of the problem was that the financial system was also suffering from the inefficiencies of over-scaling: the amounts of capital were too large in relation to real, productive businesses for anyone to pay

attention to the reality of the investments; and even to find interest in investing in a scale that was known to be really productive. The problem to solve was—and is—“placing” big piles of capital that couldn’t, and can’t, find enough projects of their size.

Over the last two decades, it’s become common to hear complaints in the economic press that fewer new large industries that justify grandiose investments are appearing than in prior periods.

The attempt to solve this that arrived with neoliberalism was to “financialize” whole markets: to “package” risks—to “dissolve” some from over here with some from over there—and create abstractions of value to bet, more than invest, those huge amounts of capital. Enron, the business that made financialization its flagship product, made it possible to invest in things like “Megabit of bandwidth installed” or “Megawatt consumed,” showing that not even telcoms and energy companies were capable of meeting the need to place large masses of capital on their own. And the famous mortgage derivatives, which were at the center of the crisis in 2008, showed that the construction sector had also become too small for the scale of capital that wanted to cast its lot with it.

The crisis of 2008 made clear the origin of the “decomposition” with which we begin this manifesto: the simultaneous destruction of the two main social institutions, the State and the market, by the hunger for rents of over-scaled companies—and financial companies are just the tip of the iceberg—which see in them the only way to make up for their own inefficiencies of scale. What everyone saw in the financial sector in the years that followed the bankruptcy of Lehman Brothers, was later seen with equal clarity in the dominant businesses in sectors as apparently different as energy or agroindustry.

... and the optimal scale is approaching community dimensions

But if the result of neoliberal financial policies was object of a profound public scrutiny, what does not usually receive so much attention is how the information revolution joined the globalization of commerce in goods with the reduction of optimal scales to create a whole series of new productive forms. Surely the reason is that the first to take advantage of it were thousands of Asian small businesspeople, the true engines of the drastic reduction in global poverty. Only more than a decade later, in the middle of a crisis, have the new models started to reach Europe and America, driving a wave of sustained, small-scale, entrepreneurial projects on a new technological base and often oriented towards niche demands in the global market.

We can group these new forms around two broad trends: the “P2P mode of production” and the “direct economy.” The P2P mode of production replicates the free software model in all kinds of industries where knowledge condensed into design, software, creativity, blueprints, etc., is central to the creation of value; and can accumulate in a “immaterial universal commons” that can be improved, reformed, and used in alternative ways for many kinds of different projects.

This multifunctionality of tools and value chains—which is what economists call “scope”—is the key to the direct economy, a way of creating products created by small groups and launching them on global markets by using, on the one hand, low-cost, adaptable, external industrial chains and free software and, on the other, advance sales systems or collaborative financing.

That is, before our eyes, before and after the large financial crisis, a new kind of small-scale industry has developed, which is characterized by being global and by getting capital and credit outside the financial system, some in collaborative financing platforms, others announcing their own pre-sales and getting donations in exchange for merchandising. In fact, it’s an industry of “free” capital, which doesn’t have to give up ownership of the business to the owners of capital because, on the one hand, it reduces its needs by using publicly available technological tools, like free software, and on the other, obtaining the little capital it needs in the form of advance sales and donations.

Taken together, P2P production and the direct economy, two ways of substituting scale with scope, are the leading edge of a productive economy moving more and more quickly towards the reduction of scale. That makes them essential to understanding why communitarianism has a unique opportunity in the new century.

Building abundance here and now

Abundance has to do with production, not with consumption

Abundance is an economic concept in the setting of production, not consumption. Abundance exists when an extra unit can be produced without that meaning a perceptible increase in costs. For economists, it can be reduced to a formula: “zero marginal cost.” In an ideal competitive

market, when the marginal cost is zero, that means that the prices that would maximize the benefit to producers would also be zero.

Common sense would say then that the business would have no incentive to continue producing. But really, just the opposite would happen. Although the price of the product is zero, the interest of the producer is to produce the maximum possible to dilute fixed costs as much as it can among all units produced. It is at that theoretical moment, with zero price, when a business stops thinking about the market and starts to seek the maximization of meeting the human needs its products match.

That is, if the marginal cost approached zero, the products would be “decommodified,” would stop being commodities that have to be sold, because if they aren’t, that would create a new loss. As a consequence, as of a certain level, anyone could enjoy as much as they need without giving up anything, and the same rationality that orients the behavior of the businesses towards the maximization of benefit would lead to an economy centered on satisfying human needs: anyone could enjoy as much as they need without giving up anything.

This does not mean that capitalism tends to be “decommodified” by the mere effect of competition. But this extreme solution of a basic model of economic analysis is, in any case, very illuminating.

In practice, abundance exists when the cost of producing one more unit is negligible and, given a sensible calculation of potential demand, we can do it indefinitely. For example: the cost of serving a web page or an electronic book to one more user from our own server is, for all practical purposes, zero.

A scarce product in a decentralized network is abundant in a distributed network

We should say that this example would only be true within a definable range of requests, but that if the number of people who want read our book were to pass a certain critical point, we would have to increase our bandwidth and the number of servers as well. So, if we look at it over the long term, these costs should be attributed to the units served. The marginal cost, the cost associated with the last copy distributed, wouldn’t be zero. Abundance, in that case, would have been just an illusion, a mirage, sort of like the cost of taking more person to work in our car: it’s practically zero... until the seats run out. Once the places are full, we need other car, or at least a bus ticket, for each additional person we’d like to transport. The marginal cost, the increase in costs for one more person, would be positive and easily perceptible.

But in our example, an information good, this criticism would only be true if the copies were distributed from a single server. If we share it on a distributed network with other users who, by downloading it, make it available to others in turn, each new download, each new user, will mean a possible place for others to download more. The more people download it, the less possibility there will be that, no matter how fast or large increases in demand may be, that any member of the network would have to increase their costs so that someone could download a new copy.

This is doubtlessly the most important thing the Internet has taught us: the same product that is abundant in a distributed network certainly would not be in a centralized or decentralized network. And, conversely, what is scarce in a centralized or decentralized network, can be abundant in a distributed network.

This finding may seem limited, since with current technologies, it would only affect intangible goods. But some of those intangibles—like industrial design, hardware, or processes—are the motors of the increase in productivity in physical goods and, since the world wars, the percentage they represent of total value produced has only increased. Their conversion into free goods can’t help but have a profound effect on the whole productive system.

That’s how, for example, the creation of free software works, as does the whole growing economy in general, the immense majority of it decommodified, that we include under the label “the P2P mode of production.” At the same time, the direct economy uses the results of innovation outside the productive apparatus controlled by over-scaled industries and the very over-scaled financial system, increasing productivity in the manufacture of tangible goods and pushing scale even farther downward.

The “P2P mode of production” is the model for the production of abundance

Although we are still far from general abundance, we have a model of the production of abundance for intangible goods and innovation—the “P2P mode of production.” This, in turn, feeds a sector, the direct economy, that demonstrates enough productivity in the market to compete and beat

the industry “from the outside,” without the help of over-scaled finance. That is, this new productive ecosystem is capable of competing and gaining ground against a giant that enjoys the advantage of extra-market rents, like customized regulations, grants, or patents. We’re talking about the same extra-market rents that multiplied with neoliberalism and which have produced the simultaneous erosion of state and market, which is to say, social decomposition. So, just to demonstrate that a productive alternative exists is already big news.

This social and productive space around the “new digital commons” or simply, the “commons,” is today’s equivalent of the first cities and markets of the medieval bourgeoisie, a space where new non-commercial social relationships appeared, and the new logic, together with signs of autonomy, begin to show a limited but direct impact on productivity. Throughout the lower Middle Ages, the bourgeoisie was able to drive those cities to turn them, first, into a big “urban workshop,” and later, into “municipal democracies.” A similar historical task, now with a society of abundance as the goal, is what lies ahead for communitarianism.

This is because this whole reduction of scales brings the optimum size of productive units ever closer to the community dimension, and therefore, points to community as the protagonist of a society of abundance. And it is in community that we can understand why the struggle to overcome a socioeconomic system cannot be proposed as an electoral platform, revolutionary as it may be, but rather, happens in the setting of more profound competition: productivity.

In the mean time, I had some private emails pointing out that Las Indias are not really connected to the recent city-based movements, but more directly to the Gijón Administration and, above all, the Mondragon Cooperative. And, apparently, the relationships between the different groups/movements are not without tensions.

So, it might be helpful if someone could shed some light onto wider context.

all the best, Felix

[START 2/2]

<https://lasindias.com/the-communard-manifesto.html>

The two faces of productivity

“Productivity” is a word that evokes rejection among large sectors of the population. For years, salaries have been reduced, workdays extended, and thousands of workers fired in the name of increasing productivity. It’s normal for the word to cause a shiver, because in stagnant situations, and in the capitalist framework, that’s exactly what it means.

In reality, however, increasing productivity means being able to do more with fewer resources and is the measure of all systemic alternative. The famous “liberation of productive forces,” that the old revolutionaries expected to succeed capitalism, is nothing more than a general development of productivity. The engine of the increase in productivity is technological change, understood broadly to include forms of organizing and structures. From the community point of view, the center of the development of productivity today is in free software, in distributed networks, and in multipurpose, low-cost tools of production and chains: everything that brings us closer to abundance.

Increasing productivity means “squeezing more” out of the factors: with the same quantity of inputs, producing more value in the same period of time. Increasing productivity means, for example, getting more energy out of a solar panel, needing less water to produce the same amount or more of vegetables, or having new programs that reduce the hours that we have to spend on repetitive management tasks.

But for over-scaled capital, in stagnant situations where there’s no new investment or technological improvement, “productivity” means, above all, employing the labor factor more intensively. That is to say: getting work hours for free—for example, by extending the workday without remunerating overtime; or through personnel reduction, while unreasonably overwhelming those who remain—which is equivalent to a salary reduction. Alternative and sometimes complementary ways could include reducing the quality of raw materials and, thus, their cost, without consumers realizing it; or ceasing to take responsibility for externalities created in production, like dumping unprocessed waste in a river to save on filters and purifiers. No wonder the word “productivity” can sound scary.

From the perspective of communities, however, developing productivity means something completely different. The main way to obtain it is as new as it is inaccessible to the typical business, which is over-scaled and anxious for rents.

Let’s again take up the example of publishing an online book. To calculate the productivity of the factors, we would have to find the ratio between the number of downloads and the number of factors employed in their production. But if, as we saw before, instead of posting it on a single server, we share it on a distributed network, the cost of one more download will be zero. At that point, we’re in a world of abundance. Even if it had tremendous success, and hundreds of thousands of people downloaded a copy, we wouldn’t need to increase the use of the factors. The productivity of the work necessary to write, edit, and format the book would increase with each extra download.

But embracing this path means accepting that the price of an abundant good—which is any digitized content in a distributed network—is zero. And with zero prices, it’s not so easy assure capital the dividends it desires. So, publishers, software giants, pharmaceutical companies, and movie studios try to maintain an extra-market rent, in the form of a legal monopoly called “intellectual property.” And that’s why music companies depend on centralized structures, which come with considerable marginal costs, like iTunes or Spotify, to control the restricted distribution of their products, so they can force the maintenance of positive prices.

Artificially creating scarcity has become a way of life for over-scaled industry

The traditional information and knowledge industries are engaged in artificially producing scarcity. Contemporary economic theory has described intellectual property as “unnecessary” for years, and there are more and more renowned economists that think that its negative effects far exceed the positives. Large distributed networks, in which millions of people share digital files, are as infinitely more efficient medium to distribute a digitized product than Facebook, Twitter, Google Books or Amazon, but the content industries have held a legal and political grip for years, which costs them millions every year in lawyers and lobbyists, to be able to fence off such networks by law and jail their supporters.

In the production of physical goods and services, the contrast no is less drastic. In contrast to a capitalist business, in an egalitarian community, the increase in productivity translates to a reduction of the work time that one must dedicate to be able maintain a comfortable way of life on the basis of selling products in the market.

We need to say that reducing work means we can spend more time, not staring at the ceiling, but dedicated to other kinds of activities, like learning new disciplines, playing, painting, or developing contributions to the commons in the form of free software, designs, books, or audiovisual content in the public domain. Activities that show us what

the kind of work that will substitute wage labor will consist of as we approach an authentic society of abundance: an expression of skills motivated by the pleasure of enjoying interaction with others, the pleasure of learning, experimenting, and contributing. This is the opposite of the sophisticated form of slavery imposed by scarcity.

Capitalism was the greatest promoter of productivity in history, but it simply can’t allow itself abundance. The community, on the other hand, needs it.

Abundance is the magic that shines through the “hacker ethic”

Anyone who has lived or spent enough time in an egalitarian community has sensed how abundance advances through the reduction of work forced by scarcity and its gradual substitution by work understood as a personal and voluntary expression of the pleasure of learning and contributing. When everything is communal and responsibility is shared, there is no division between life time and work time. You can be yourself, and development in work drives us to learn new things, in new fields, and continue advancing. Then we stop being mere “technicians” or “specialists” and become “multispecialists.” This is a way of developing intellectually that fits naturally not only with the reduction of scale, but above all with the development of scope, the capacity to create many different things with the same productive base. Multispecialization is progress towards the end of the atomization of knowledge that paralleled the division of labor to the limit in the industrial factory.

Abundance is the magic that shines through the “hacker ethic” and assorted user groups. It’s no coincidence that a work ethic based on knowledge and enjoyment is extending beyond the communitard world—where it always existed—coinciding with the social expansion of the Internet and the first forms of P2P production. The first cultural manifestations of distributed networks cultivated the pleasure of discovering all those applications of knowledge that do a lot of good but are not commodities. They celebrated these being valuable, because, even though they have a zero price, they reveal to us the fraternity of shared knowledge and, in time, improve the life of thousands or millions of people.

For almost a century, capitalism has been incapable of turning increases in productivity into reductions in the workday. The “hacker ethic” connected with P2P production shows how the development of abundance leads, right from day one, to the progressive abolition of labor forced by need. That form of work competes with and opposes time dedicated to learning, living, and enjoying life.

El camino de la abundancia no pasa por producir menos

Abundance has nothing to do with consumption and even less with consumerism. In reality, consumerism is not a “state of capitalism,” but a compulsive form of consumption with which some people, reduced to isolated individuals when they reach the market, try to recover from anguish, loneliness, the anxiety of work without meaning, and an atomized way of life that, like the system that produces them, “aren’t going anywhere.” Part of the middle class practices consumerism with the same fervor with which it then talks about it as if it was a universal guilt. Some clamor to “reduce consumption” and “degrow” as a systemic alternative. It’s a myopic view: consumerism is not the center of the current economic system. It is the spiritual symptom, visible only in a privileged minority, of a more serious and widespread disease—the same one that produces the chronic underconsumption in which the majority of humanity continues to live and the environmental disasters that move them.

To cure that disease does not mean producing less or “returning” to pre-capitalist technologies. To renounce the productivity conquered by scientific knowledge would mean more exclusion and poverty. To exchange industry for artisanship and technified agriculture for less productive forms would mean simply reducing productivity and, therefore, squandering even more human and natural resources than the inefficiencies of over-scaling already do. To renounce technological development is nothing other than adopting forms of production that are more costly in resources.

Quite to the contrary, we want to produce abundance here and now, on another scale and using another logic—those of the community and the needs of real people—developing more and more productive free technologies, because only with higher productivity will we be able to consume fewer non-renewable natural resources, fewer hours of labor forced by need, and less capital, while still taking responsibility for the well-being of others.

If there’s anything we can’t renounce without making things worse, it’s abundance. It’s hard, and will continue to be, to overcome the “fences” and “hurdles” that patents have put in the way of scientific knowledge. A lot of damage has been done by the evolution towards the artificial

creation of scarcity in the chemical, agrarian, and pharmaceutical industries. We must not confuse scientific and technological development with the monopolistic and rent-seeking applications of it, which over-scaled technology, seed, and biomedical research businesses have made into their flagship products. In the application of genetics to agriculture, for example, there is the promise of abundance, though even its use by Monsanto today means a daily life of environmental destruction, artificial scarcity, and destruction of producers' freedom. What will we do about the overuse of natural resources?

The end of the overuse of natural resources will not be reached by producing less or returning to outdated technologies, but on the path towards abundance.

This can be seen clearly in agricultural exploitation. In Israel, where the kibbutz and cooperative movement was the nucleus of agrarian production and the leader in technological innovation, production between 1948 and today multiplied by sixteenfold, three times more than the population. And while irrigated land went from 20,000 to 190,000 Ha, 12% less water is consumed. That is, technological development encouraged by the communitarian sector increased general productivity—by no less than 26%—significantly reducing the cost of producing one more unit, and, to that extent, approaching abundance. But increasing the productivity of the factor even more—we were told for decades—would lead to a regional collapse if production continued increasing. Instead, more productivity and more production, far from leading to a greater stress on resources, reduced the total consumption of water.

But strengthening communities and the productivity of the communitarian sector it is not the focus of the official narrative or the political consensus in Europe or among US liberals. In that narrative, fed for decades by catastrophism that ran through all messages, from the Hollywood blockbusters to official documents from the UN or the EU, it was all about justifying, at all costs, the way that States paid big, over-scaled businesses' transformation costs to avoid a disaster that themselves had created and reported. In the name of the imminent catastrophe, we needed to pay car companies for their infrastructure costs as they moved to electric cars, and give crazy subsidies to big energy companies, assuring their centrality when technology was already pointing towards renewable, distributed electricity. The process was, and is, a festival of rent-capture and corruption that has even drawn in Mondragon, the group of cooperatives that, for years, has been a global model precisely because of its excessive scale and its distance from community models.

It couldn't be any other way. For years, adhering to the ecologist narrative meant choose between two false options. The first: ignore misery and the hunger for the majority of the world, and advocate for reducing productivity. The second: join the list of those who want to take away even more sovereignty from people and communities and give more rents to monopolies. Obviously, it's a no-win situation. Connecting the dots

If we connect the dots of economic change in our time, certainly the first thing that comes into view is a great crisis of scale in which large funds and companies of dysfunctional volume are asphyxiating the two main institutions of the system—the State and the market—and accelerating their global decomposition, decomposition that has enormous human and environmental costs. But if we expand the framework, we also see that the "globalization of the small," free software, and distributed networks have created the first system of technological non-commercial innovation—the "P2P mode of production"—and a growing industrial sector—the direct economy—which is supported by it, is competing face to face with overscaled agrarian and industrial businesses, even though it has communal dimensions.

And if we dig a little, still we'll find something more: we'll discover that communitarianism is a parallel, underground movement, which has accompanied capitalism since its youth, exploring the paths of a new life experience and planting the seed of a society of abundance, while it waited for its time to arrive. In its time, the scale of change could be accepted by self-organized egalitarian communities. From that time forward, distributed networks of communities would be able to lay the foundation for real competition between systems, just as capitalism did with its feudal and land-based forerunner.

We think that time is arriving. But to be able take advantage of it, we first need to conquer something that the narrative of decomposition is grinding down: the centrality of work.

Conquer work, reconquer life

The constant increase in productive scales over nearly two centuries, and with them, in the division of labor and of knowledge, has produced an erosion of the relationship between people and the concrete work they

do. For more and more people, it became harder to understand what their work meant and contributed to their loved ones and to society besides a salary and a few days "off" per year. That's what was called "alienation." Gigantic scale, work so specialized and repetitive that seemed it insignificant, homogenization of everyone's labor and the resulting perfect substitutability of workers, made meaning—the social and intellectual utility of the labor that each person did in society—something that was alien to people's lives. "Work" became non-life, as opposed to "time off," which was truly human and reserved for family and friends, which is to say, a community.

It would be reasonable to think that this phenomenon would fade with the gradual reduction of the optimal scales of production and the slow emergence—as industries became more independent from the incorporation of knowledge—of multispecialization. But the truth is that new generations are deprived of even alienated work. To be unable to access work is to be in social exile

During 15M [widespread anti-austerity protests that began on May 15, 2011 in Madrid] it became fashionable in Spain call young people who went to work in other places around the world "exiles." Meanwhile, according to official statistics, 40% of those who remained were unemployed. These were the true exiles: they were separated from productive life, separated from collaboration and from doing things socially, and separated from a relationship with nature.

The entire life of those who tried to enter the labor market at the beginning of the crisis is an anomaly. By being alien to the very reality they were part of, they became spectators, even of themselves; once, people used cell phones in demonstrations, and now they use cameras. The separation of work soon became evident in the emergence of (anti-)consumerist narratives; consumption—the only way they can participate in an economy that's alien to them—became, for many, the explanation for the whole social system and its failures. One of the ways of expressing that general alienation was substituting the traditional centrality of the demand for access to work with the demand for a rent guaranteed by the State.

To live outside the social space created by work is to go into social exile, to lose or never have had the position of a real member of a community: to not be among those who turn work into wealth, but among those who depend on rents.

Everything that has defined this crisis has trapped those who reached adulthood with it as permanent minors. Everything led to their solitary confinement as individual-consumer. That isolation is necessarily frustrating. It's alienation that is felt as such, as meaninglessness. But the search for meaning outside of work—which is to say: outside of community, society, and nature—can easily lead people to search for consolation in illusory communities that absorb us without providing what makes us a useful part of a real community: the ability to contribute to the well-being of one another by producing. That's why these have been years of growth in racism, anti-Semitism, xenophobia, jihadism, and political and religious sectarianism. There's no self-realization without work

And, precisely because of that, the old communitarian slogan of the "conquest of work" is more current than ever. "Conquering work," recovering it as central to society by way of the community, leading it and creating it, is the only thing that can turn back the drift towards the void of the consumerist narrative, the rejection of differences, xenophobia, and the thousand and one nationalisms that arise, seeking to create even more borders and rents. It's the only thing that can recreate meaning and allow for self-knowledge and self-realization, which is to say, each person living their own values. So, work has an inevitable moral dimension, and that's why conquering work has the value of regeneration, of true personal re-empowerment for a whole generation and a great mass of people, which political activism or conformity will never be able to offer.

Never have technology and knowledge allowed so much well-being to be produced at scales as small as today. Never has it been so easy to become protagonists of production and of the construction of our surroundings; never have available technologies incorporated or developed as much knowledge as in our day; never have productive processes been as transparent about their relationship with their surroundings with so much facility and such impressive scope as today. And yet, despite it all, rarely before has the spirit of time been as disconnected from the possibilities of the historical moment. The cause is, once more, the impact moral of decomposition and unemployment. Unemployment is the expression of the destruction of productive capacity. In economic terms, it's the worst form of waste, the bloodiest of inefficiencies. And the effect on the mood of anyone who suffers it is a like millstone around the neck, or an acid that destroys self-confidence, security, and conviction about their potential to

create. Unemployment feeds fear, and fear paralyzes and blinds.

To conquer work is reconquer life

Taking the things that fear and insecurity would have us think are impossible and making them visible is the first way to empower those who have been exiled from work and deprived of its meaning, which will encourage them to take responsibility for their own communities. The generation that was expelled from the productive system is called to conquer work and, with it, life.

Abundance is the goal we move towards with the development of knowledge in our species. It's not just a question of numbers, math, or accounting, but also of ethics, desires, feelings, and aesthetics. We create technology, and it, in turn, transforms us, transforms what it means to be human in the new time that we ourselves have established. And from there, we can imagine and build abundance with renewed strength.

The time has come to take the initiative, to begin to build egalitarian and productive communities, and not as experiments or "islands" in a ocean of large scales. In the beginning, they will only be "examples." But examples, accompanied by the idea that emulation is possible, are more powerful than any form of propaganda.

The communal alternative does not provide the gregarious confidence of the political hooligan or the empty pride of the racist. Belonging to a community is recognition through work and learning, not an "essence" inherited from national culture or birth, or the result of insubstantial adherence or an ID card. It's not the product of the permanent imagination of confrontation with some universal evil. You are building constantly with others, making things so we can all grow together, sharing more and more responsibility, and giving and receiving trust. It's the opposite of the feeling of impunity that "frees" the "follower" who is protected by a leader, a flag, or a political brand in the din of street fighting, online bickering, or media "smackdowns." To be a communitarian is to gain autonomy and security in the fraternity of learning, to be rediscovered as valuable and valued in shared work. To be a communitarian is to put the values we believe in into action, not compete to shout them the loudest or wield them like a menacing weapon. To be a communitarian does not give the static tranquility of the yogi or the mystic who seeks the silence of loneliness, but the serenity that listens to and seeks to include others, without using outrage as an excuse to do nothing or hiding behind the disdain of supposed superiority. To be a communitarian is a way of living, learning, and building by sharing it all with others.

We need grow with others to be able to reconquer real life. Every "individual escape" is no more than a form of "every man for himself." Of course, when you find yourself in decomposition, you can try to accumulate a little money, find a house far away from everything, and live without knowing anything about anyone; or land a stable but low-paying job, interact as little as possible in it, and relegate life to what's left of the day after work hours. But these strategies aren't really satisfactory; they're just different ways of beating a more or less orderly retreat. In the medium term, they're a way to condemn yourself to melancholy. Isolating yourself, marginalizing yourself, even if it means living without constantly prioritizing financial survival, would mean renouncing growth, development, and carrying out personal ideals in life. It's another form of exile.

So, existing egalitarian communities should open themselves up and become a launching point for the experience of a new generation. To be empowered is to also discover through practice that in a community, troubles, annoying as they may be, are muffled rather than being upsetting, and joys and victories have echoes that are impossible to hear alone.

From adding to multiplying

Communitarianism has no paradise to sell, and does not spout admonitions or threaten skeptics with a catastrophic future. "To reconquer work"—for and with one's own inner circle—is a path that will surely interest many people who propose a rebirth in the midst of the crisis, perhaps without knowing that what they are doing, with their community and its affections, would ensure the rebirth of an entire world.

The time has come to carry out what the bourgeoisie was able to do to overcome feudalism: turn the expulsion from work created by the system into an alternative society. The medieval bourgeoisie grew its first cities with servants who had escaped from bondage to their lord's land and joined the first small commercial societies. The new egalitarian communities had to expand with those expelled from the productive system to give rise to the first transnational networks of communities oriented towards abundance. This is an alternative world beyond the borders of command pyramids and the law of the jungle that we experience in so many

companies, and also beyond the omnipresence of commodification and the alienation of labor, a world where "everyone shares everything" through communal ownership and savings, and "everyone receives according to their need".

The scene will be urban

The community experience has historically been centered in rural areas. Rural settlements provide a space for a direct relationship between work and nature which continues to be essential to communitarian approaches. However, in Kassel, Washington, Nazareth, or Madrid, the new communitarians no longer buy fields to work. They buy apartments, offices, and shops. They're building autonomy for a new generation of communities in sectors based on knowledge and in urban settings. Their range is expanding more and more: intelligence and data, training, specialized hardware, free software, restoration, cultural objects, ecological products... These are all services and products created on a small scale but with large scope, which are focused on the direct economy as a form of relationship with the market.

Since the middle of the nineteenth century, communitarianism has survived because it was able to demonstrate how egalitarianism and idealism pay. In this last decade, it has grown globally because it learned how to add. It learned to add very diverse people and build a life experience, a glimpse of abundance in daily life, that many already openly call "post-capitalist." Now our challenge is learning to multiply. We know how to offer an alternative, the "conquest of work," to the generation exiled from the productive system by the crisis.

And that challenge will be faced, above all, in cities, among other things because, from the point of view of the human experience, the relationship with nature is measured by the ability to transform our productive activities. A software developer today has a more intense relationship with nature than a medieval peasant ever had.

It's true that this relationship remains hidden from participants in most overscaled industries, where deliberation is replaced by sets of rules, practices, and "procedures"; where reflection on the best objective is substituted by decisions on the best method, and the coordination of wills is substituted by checklists and task-completion oversight. But in community, purposes and tools are part of a design and knowledge that everyone is aware of and agrees to. And above all, the position of advancing abundance, the front line, is wherever the direct application of knowledge is closest to production. And generally, the setting for that is the city. The tasks of the communitarians

Egalitarian communities should undertake a path that allows them to go from the current model, based on the resistance and resilience of the "small community," to another that starts from a large network of egalitarian and productive communities. We must feed the new sprouts, which are capable of maintaining themselves in the market, and at the same time, create more spaces of abundance and decommodification. Additionally, we need to take decommodification beyond our interior, and make it permeate all our surroundings. It's time to begin the competition between systems.

A time is coming when we will have to learn to grow in many new ways: incorporating new members, incubating communities, teaching community techniques in neighborhoods, or creating popular universities of a new kind, that give tools for multispecialization.

We have to confront a gigantic problem created by over-scaling—from smallness, with smallness, and step by step. We have to use diversity and abundance to break out of the traps that a culture in decomposition tends to constantly fall into, which magnify defeatism, pessimism, and the idea of "every man for himself". It's not going to be a stroll through a rose garden, and we're certainly not going to be able to make headway without encountering serious resistance. You are the protagonist

Imagine yourself as a new kind of pioneer, as the leader of a large collective adventure.

You're not alone. Thousands of people joined communitarian initiatives throughout the world over the last year: egalitarian communities, kibbutzim, cooperatives that unite work and housing... Not too far from you, there's a community already underway. You can participate in its activities, collaborate in its development projects, or join it as another communitarian. With other enthusiasts, you'll build productive urban communities that are able to create effective abundance in their settings, which is to say, to compete with the market.

You'll be the leader of an adventure that will demand—as it did of the generations of communitarians who preceded us in centuries past—effort and

commitment in exchange for making life useful and significant. But in contrast with those generations of pioneers, who lived in an era in which abundance remained out of reach, you can aspire to something more than living better. Today, it's our turn to demonstrate that the best life serves to create abundance for everyone, and is already preparing to be able to offer a place and a meaning to everyone.

Las Indias, May ninth, 2016

Appendix: concrete things you can do with this manifesto

If you've found ideas in the preceding paragraphs that agree with your state of being in the world and your understanding of relations with others, there are many things you can do, starting now. You don't have to immediately leave everything behind and organize an egalitarian community, it's more about using this Manifesto for what it's intended to be: a tool to empower you and your community.

Expand the conversation

Do you have a blog? Publicize your reading notes and the opinions you've formed. Don't forget to link to <https://lasindias.com/the-communard-manifesto> so your readers can access the complete text in the format they prefer.

Publish a link to this manifesto in social media wherever you have an account.

Email the PDF version to people you usually discuss social and economic matters with, and the EPUB version to people who normally read electronic books or on a smartphone, who will appreciate it more than the PDF.

You can organize a presentation of the Manifesto. If you write us an email, we'll be able to send you copies on paper, and we'll do everything possible so that at least one of us can accompany you at the presentation.

Ask for a room at the library or cultural center in your neighborhood, and invite your friends and acquaintances over the net. Put up posters on bulletin boards at the same library and other places you may know where interested people may pass by.

Prepare to "make community"

In the "las Indias Club", you'll find events and activities throughout the year that you can participate in. There are cultural and social activities: from poetic soirees and historical expositions to projects in free software, PaP production, and the direct economy. Also, once a year, in the second week of October, we organize an international conference in which we interview and learn from people from across the world who have created or implemented all kinds of projects with small scale and large scope: energy cooperatives, hardware products, agricultural egalitarian communities...

We have also a space for permanent conversation, "La Matriz", which we invite you to join, and which is fed by posts from our blog and the blogs of a good part of the members of the "las Indias Club".

And, of course, there are hundreds of egalitarian communities throughout the world, including ours, that await your visit with open doors. Write us and share your concerns and ideas with us.

Aaron Swartz: Guerilla Open Access Manifesto
(<https://gist.github.com/4335453>)

{
{
Information is power. But like all power, there are those who want to keep

it for themselves. The world's entire scientific and cultural heritage, published over centuries in books and journals, is increasingly being digitized and locked up by a handful of private corporations. Want to read the papers featuring the most famous results of the sciences? You'll need to send enormous amounts to publishers like Reed Elsevier.

There are those struggling to change this. The Open Access Movement has fought valiantly to ensure that scientists do not sign their copyrights away but instead ensure their work is published on the Internet, under terms that allow anyone to access it. But even under the best scenarios, their work will only apply to things published in the future. Everything up until now will have been lost.

That is too high a price to pay. Forcing academics to pay money to read the work of their colleagues? Scanning entire libraries but only allowing the folks at Google to read them? Providing scientific articles to those at elite universities in the First World, but not to children in the Global South? It's outrageous and unacceptable.

I agree, many say, but what can we do? The companies hold the copyrights, they make enormous amounts of money by charging for access, and it's perfectly legal, there's nothing we can do to stop them. But there is something we can, something that's already being done: we can fight back.

Those with access to these resources, students, librarians, scientists, you have been given a privilege. You get to feed at this banquet of knowledge while the rest of the world is locked out. But you need not, indeed, morally, you cannot, keep this privilege for yourselves. You have a duty to share it with the world. And you have: trading passwords with colleagues, filling download requests for friends.

Meanwhile, those who have been locked out are not standing idly by. You have been sneaking through holes and climbing over fences, liberating the information locked up by the publishers and sharing them with your friends.

But all of this action goes on in the dark, hidden underground. It's called stealing or piracy, as if sharing a wealth of knowledge were the moral equivalent of plundering a ship and murdering its crew. But sharing isn't immoral, it's a moral imperative. Only those blinded by greed would refuse to let a friend make a copy.

Large corporations, of course, are blinded by greed. The laws under which they operate require it: their shareholders would revolt at anything less. And the politicians they have bought off back them, passing laws giving them the exclusive power to decide who can make copies.

There is no justice in following unjust laws. It's time to come into the light and, in the grand tradition of civil disobedience, declare our opposition to this private theft of public culture.

We need to take information, wherever it is stored, make our copies and share them with the world. We need to take stuff that's out of copyright and add it to the archive. We need to buy secret databases and put them on the Web. We need to download scientific journals and upload them to file sharing networks. We need to fight for Guerilla Open Access.

With enough of us, around the world, we'll not just send a strong message opposing the privatization of knowledge, we'll make it a thing of the past. Will you join us?

<nettime> A DIY Data Manifesto by Scott Gilbertson

From: Geert Lovink

To: nettime-l@kein.org

Date: Sat, 5 Feb 2011 16:02:43 +0100

(important element in the discussion about possible alternatives to facebook and twitter that presume that one runs one's own server... / geert)

url: <http://www.webmonkey.com/2011/02/take-back-the-tubes/>

A DIY Data Manifesto

By Scott Gilbertson

The word "server" is enough to send all but the hardest nerds scurrying for cover.

The word usually conjures images of vast, complex data farms, databases and massive infrastructures. True, servers are all those things — but at a more basic level, they're just like your desktop PC.

Running a server is no more difficult than starting Windows on your desktop. That's the message Dave Winer, forefather of blogging and creator of RSS, is trying to get across with his EC2 for Poets project. The name comes from Amazon's EC2 service and classes common in liberal arts colleges, like programming for poets or computer science for poets. The theme of such classes is that anyone — even a poet — can learn technology.

Winer wants to demystify the server. "Engineers sometimes mystify what they do, as a form of job security," writes Winer, "I prefer to make light of it... it was easy for me, why shouldn't it be easy for everyone?"

To show you just how easy it is to set up and run a server, Winer has put together an easy-to-follow tutorial so you too can set up a Windows-based server running in the cloud. Winer uses Amazon's EC2 service. For a few dollars a month, Winer's tutorial can have just about anyone up and running with their own server.

In that sense Winer's EC2 for Poets if already a success, but education and empowerment aren't Winer's only goals. "I think it's important to bust the mystique of servers," says Winer, "it's essential if we're going to break free of the 'corporate blogging silos.'"

The corporate blogging silos Winer is thinking of are services like Twitter, Facebook and WordPress. All three have been instrumental in the growth of the web, they make it easy for anyone publish. But they also suffer denial of service attacks, government shutdowns and growing pains, centralized services like Twitter and Facebook are vulnerable. Services wrapped up in a single company are also vulnerable to market whims, Geocities is gone, FriendFeed languishes at Facebook and Yahoo is planning to sell Delicious. A centralized web is brittle web, one that can make our data, our communications tools disappear tomorrow.

But the web will likely never be completely free of centralized services and Winer recognizes that. Most people will still choose convenience over freedom. Twitter's user interface is simple, easy to use and works on half a dozen devices.

Winer doesn't believe everyone will want to be part of the distributed web, just the dedicated. But he does believe there are more people who would choose a DIY path if they realized it wasn't that difficult.

Winer isn't the only one who believes the future of the web will be distributed systems that aren't controlled by any single corporation or technology platform. Microformats founder Tantek Çelik is also working on a distributed publishing system that seeks to retain all the cool features of the social web, but remove the centralized bottleneck.

But to be free of corporate blogging silos and centralized services the web will need an army of distributed servers run by hobbyists, not just tech-savvy web admins, but ordinary people who love the web and want to experiment.

So while you can get your EC2 server up and running today — and even play around with Winer's River2 news aggregator — the real goal is further down the road. Winer's vision is a distributed web where everything is loosely coupled. "For example," Winer writes, "the roads I drive on with my car are loosely-coupled from the car. I might drive a SmartCar, a Toyota or a BMW. No matter what car I choose I am free to drive on the Cross-Bronx Expressway, Sixth Avenue or the Bay Bridge."

Winer wants to start by creating a loosely coupled, distributed microblogging service like Twitter. "I'm pretty sure we know how to create a micro-blogging community with open formats and protocols and no central point of failure," he writes on his blog.

For Winer that means decoupling the act of writing from the act of publishing. The idea isn't to create an open alternative to Twitter, it's to remove the need to use Twitter for writing on Twitter. Instead you write with the tools of your choice and publish to your own server.

If everyone publishes first to their own server there's no single point of failure. There's no fal whale, and no company owns your data. Once the content is on your server you can then push it on to wherever you'd like — Twitter, Tumblr, WordPress of whatever the site du jour is ten years from now.

The glue that holds this vision together is RSS. Winer sees RSS as the ideal broadcast mechanism for the distributed web and in fact he's already using it — Winer has an RSS feed of links that are then pushed on to Twitter. No matter what tool he uses to publish a link, it's gathered up into a single RSS feed and pushed on to Twitter.

Good you raise this issue, Rory.

If I remember well from December Dave Winer kind of defended Amazon in the Wikileaks cut-off controversy (he said he would not join a boycott).

The question indeed is: what does it mean when we call to run our own servers? If they are located somewhere in the 'cloud' then what's the

difference anyway in comparison to Facebook or Google?

The alternatives we suggest cannot be empty gestures if we propose to use 'virtual' servers that are under the same corporate control anyway.

the internet shutdown in egypt prompted similar questions about independent infrastructure and corporate control.

see for example <http://www.openmeshproject.org/> and the comment thread on <https://blog.torproject.org/blog/recent-events-egypt>.

i know that some people were busy setting up BBS in egypt during the shutdown, which has some interesting echoes of rushkoff's recent piece on the Next Net ('dump internet. go fidonet')

Thank you, Dan,
this is where I see the value and importance of nettime. Here people can share intelligent ideas,
argue intelligently, and above all, post links where like minded people can engage in struggles for common good.

Re: Facebook and Twitter, whatever can be utilized in reaching these goals should be utilized.
We live in the "info" world, and not to utilize it would be unfortunate waste of opportunities.
But also, we never should for a one bit of moment forget about the fact that every, and each government,
once it feels threaten in whatever way, will do whatever is in its power to subdue these perceived threats.

"FBI Raids Queens Home in G20 Protest Twitter Crackdown"
http://gothamist.com/2009/10/05/fbi_raids_queens_home_in_g20_protes.php

... That's right, a Twitter crackdown. A lawyer for Jackson Heights social worker Elliot Madison, 41, says that the feds searched his client's house for 16 hours on Thursday after Madison was arrested on September 24th at a Pittsburgh hotel room with another man. What were they up to? Sitting at laptops sending Twitter messages advising G20 demonstrators about riot police activity in the streets.
...

Also as we discuss alternatives, we, especially from the US, of course with the help of others around,
have to do whatever is in our power to expose what the US is actually all about.

"Video: Eardrum-Blasting Sound Cannon Coming to a Protest Near You"
http://gothamist.com/2009/09/29/eardrum-blasting_sound_cannon_comin.php

Have you seen this intense outrage from Children of Men, showing riot police blasting "fugees" with some sort of horrible "sound cannon"? Oh, actually, this isn't from a fictional movie about a dystopian police state; it's from last week in Pittsburgh, where G20 protesters had dared assemble without a permit from the government. For that, they were dispersed with the Long Range Acoustic Device (LRAD), which some fear is loud enough to damage eardrums and even cause fatal aneurysms.
..."

I am not trying to move our attention from the present happening in Egypt, but, let us not forget, ever, where is the root and the real problem coming from. This demystification of the US as the beacon of Democracy has to be main goal, in the same fashion as when Stalin's 'workers country' was demystified.
This must be a concurrent action, and never left out of sight.

Dan, again, Excellent links!!
Best

Server space is one thing, BBS networks are an interesting solution, sort of a HAM radio version of the internet.

I think the backbone needs to be de-privatised as well.

I was under the impression there are places in Europe where the internet backbone is public, leased out to anyone who wants some.

Here, even the pipeline is under threat - the usage caps and overage charges (which mostly serve to limit competing businesses, rather than democratic expression which tends to be lower-bandwidth :-)) are hotly debated, with Joe Public mostly on the side of Cheaper and Faster but no dialogue around public pipelines whatsoever.

There are two companies in most of Canada, Shaw and Telus in the west, Bell and Rogers in the East, who deliver all the internet service, they are forced to lease out to competitors but they are always pushing for the power to charge more to their competitors to squeeze their share.

Even the pundits who want Net Neutrality still don't call for public communications infrastructure. The net is treated more like phones than roads, which is a mistake in my opinion.

<http://www.thestar.com/business/article/933854--geist-the-real-reason-we-pay-so-much-for-internet?bn=1>

Our post office is about to abandon (sell) its courier operations, seen as too uncompetitive with commercial enterprises, and when competitive, an unwanted intrusion on the free market.

<nettime> Just Out: The Telekommunist Manifesto by Dmytri Kleiner

From: Geert Lovink
To: nettime-l@kein.org
Date: Sun, 24 Oct 2010 04:00:58
+0200

The Telekommunist Manifesto from Dmytri Kleiner is out now!
Download the pdf here: http://networkcultures.org/_uploads/#3notebook_telekommunist.pdf

The print edition will hopefully be financed soon. If you want to donate money to make this happen, please let us know!

In the age of international telecommunications, global migration and the emergence of the information economy, how can class conflict and property be understood? Drawing from political economy and concepts related to intellectual property, The Telekommunist Manifesto is a key contribution to commons-based, collaborative and shared forms of cultural production and economic distribution.

Proposing 'venture communism' as a new model for workers' self-organization, Kleiner spins Marx and Engels' seminal Manifesto of the Communist Party into the age of the internet. As a peer-to-peer model, venture communism allocates capital that is critically needed to accomplish what capitalism cannot: the ongoing proliferation of free culture and free networks.

In developing the concept of venture communism, Kleiner provides a critique of copyright regimes, and current liberal views of free software and free culture which seek to trap culture within capitalism. Kleiner proposes copyfarleft, and provides a usable model of a Peer Production License.

Encouraging hackers and artists to embrace the revolutionary potential of the internet for a truly free society, The Telekommunist Manifesto is a political-conceptual call to arms in the fight against capitalism.

About the author: Dmytri Kleiner is a software developer working on projects that investigate the political economy of the internet, and the ideal of workers' self-organization of production as a form of class struggle. Born in the USSR, Dmytri grew up in Toronto and now lives in Berlin. He is a founder of the Telekommunisten Collective, which provides internet and telephone services, as well as undertakes artistic projects that explore the way communications technologies have social relations embedded within them, such as deadSwap (2009) and Thimbl (2010).

colophon: Network Notebooks editors: Geert Lovink and Sabine Niederer. Producer: Rachel Somers Miles. Copy editing: Rachael Kendrick. Design: Studio Léon&Loes, Rotterdam <http://www.leon-loes.nl>. Publisher: Institute of Network Cultures, Amsterdam.

another one for the list!

<http://www.theclassofthenew.net/6.html>

'the class of the new'. This model workforce announces a new economic and social paradigm, constituting a 'social prophecy' of the shape of work to come. Their mode of being and, in particular, of producing, is set to become hegemonic. No matter how numerically limited at present, the way they live and work today is the way everyone else will live and work tomorrow.

<nettime> The Slow Media Manifesto

From: Geert Lovink
To: nettime-l@kein.org
Date: Wed, 23 Jun 2010 12:28:56
+0200

<http://en.slow-media.net/manifesto>

The Slow Media Manifesto
The first decade of the 21st century, the so-called 'naughties', has brought profound changes to the technological foundations of the media landscape. The key buzzwords are networks, the Internet and social media. In the second decade, people will not search for new technologies allowing for even easier, faster and low-priced content production. Rather, appropriate reactions to this media revolution are to be developed and integrated politically, culturally and socially.

The concept ‘Slow’, as in ‘Slow Food’ and not as in ‘Slow Down’, is a key for this. Like ‘Slow Food’, Slow Media are not about fast consumption but about choosing the ingredients mindfully and preparing them in a concentrated manner. Slow Media are welcoming and hospitable. They like to share.

1. Slow Media are a contribution to sustainability. Sustainability relates to the raw materials, processes and working conditions, which are the basis for media production. Exploitation and low-wage sectors as well as the unconditional commercialization of user data will not result in sustainable media. At the same time, the term refers to the sustainable consumption of Slow Media.

2. Slow media promote Monotasking. Slow Media cannot be consumed casually, but provoke the full concentration of their users. As with the production of a good meal, which demands the full attention of all senses by the cook and his guests, Slow Media can only be consumed with pleasure in focused alertness.

3. Slow Media aim at perfection. Slow Media do not necessarily represent new developments on the market. More important is the continuous improvement of reliable user interfaces that are robust, accessible and perfectly tailored to the media usage habits of the people.

4. Slow Media make quality palpable. Slow Media measure themselves in production, appearance and content against high standards of quality and stand out from their fast-paced and short-lived counterparts – by some premium interface or by an aesthetically inspiring design.

5. Slow Media advance Prosumers, i.e. people who actively define what and how they want to consume and produce. In Slow Media, the active Prosumer, inspired by his media usage to develop new ideas and take action, replaces the passive consumer. This may be shown by marginals in a book or animated discussion about a record with friends. Slow Media inspire, continuously affect the users’ thoughts and actions and are still perceptible years later.

6. Slow Media are discursive and dialogic. They long for a counterpart with whom they may come in contact. The choice of the target media is secondary. In Slow Media, listening is as important as speaking. Hence ‘Slow’ means to be mindful and approachable and to be able to regard and to question one’s own position from a different angle.

7. Slow Media are Social Media. Vibrant communities or tribes constitute around Slow Media. This, for instance, may be a living author exchanging thoughts with his readers or a community interpreting a late musician’s work. Thus Slow Media propagate diversity and respect cultural and distinctive local features.

8. Slow Media respect their users. Slow Media approach their users in a self-conscious and amicable way and have a good idea about the complexity or irony their users can handle. Slow Media neither look down on their users nor approach them in a submissive way.

9. Slow Media are distributed via recommendations not advertising: the success of Slow Media is not based on an overwhelming advertising pressure on all channels but on recommendation from friends, colleagues or family. A book given as a present five times to best friends is a good example.

10. Slow Media are timeless: Slow Media are long-lived and appear fresh even after years or decades. They do not lose their quality over time but at best get some patina that can even enhance their value.

11. Slow Media are auratic: Slow Media emanate a special aura. They generate a feeling that the particular medium belongs to just that moment of the user’s life. Despite the fact that they are produced industrially or are partially based on industrial means of production, they are suggestive of being unique and point beyond themselves.

12. Slow Media are progressive not reactionary: Slow Media rely on their technological achievements and the network society’s way of life. It is because of the acceleration of multiple areas of life, that islands of deliberate slowness are made possible and essential for survival. Slow Media are not a contradiction to the speed and simultaneity of Twitter, Blogs or Social Networks but are an attitude and a way of making use of them.

13. Slow Media focus on quality both in production and in reception of media content: Craftsmanship in cultural studies such as source criticism, classification and evaluation of sources of information are gaining importance with the increasing availability of information.

14. Slow Media ask for confidence and take their time to be credible.

Behind Slow Media are real people. And you can feel that.

With all respect to monotasking, and claim for conscious approach to media consumption and production: Why it happened that in 2010 (1024 years after digital revolution) a group of new-media-aware people is bringing their message across through food analogies?

There is something rather 'connoisseur' like in this expression of Slow Media. I like the idea of Slow Media, as opposed, I guess to Fast Media¹ or the kind of speed-thing that Virilio points at about technologies themselves, but why is this good meal being made by a male chef, a, and is this more an argument for some kind of Fine Media, as opposed to Low Media? Chefs rather than cooks - class hierarchy in media making - such that something conceivably 'fast' might be critiqued along the same lines as art was when it turned 'pop' or something.

(slow response to the writers _
are they on Nettime ?)

Slow Food & other such movements are based upon reducing the destructive forces of industrial capitalism by increasing the time it takes to produce something --- such in the realm of agriculture. Such slow movements constitute an attempt to reevaluate time, valuing the slowness of temporality in giving back time to what takes time, and thus granting the time for production to be performed in a less destructive manner (in current buzzwords: sustainability, organic and local produce, etc).

However a manifesto of Slow <media has me somewhat confused in terms of its positioning in regards to what it attempts to slow down --- if it attempts to slow down the production of media at all (and does this mean: a reduction of media channels? or of content? and what precisely is meant here by media given its ambivalence as both conduit and content?).

- > 7. Slow Media are Social Media. Vibrant communities or tribes
- > constitute around Slow Media. This, for instance, may be a living
- > author exchanging thoughts with his readers or a community
- > interpreting a late musician's work. Thus Slow Media propagate
- > diversity and respect cultural and distinctive local features.

I'm curious how the call for a multitasking medium (technically this isn't 'Slow Media' at all but a call for utilisation of a singular, one at a time 'slow medium') corresponds with 'social media'. Is the point to redefine what is meant by 'social media'? To 'perfect' an attitude towards it? To simply use it slowly... like take a long time to answer email?

Because in its current incarnation, social media produces its dizzying effects of 'community' precisely through a monopolization of distraction within a multitasking digital environment -- neverending status updates, multithreaded conversations and comments, photo streams, miniblogs, cross-linked databasing of interests provoking calls for tagging, associative linking, and other opt-ins that generate massive aggregate databases for corporations pegging the consumer index of desires...

ie, so what I am trying to grasp is (from thesis 12):

"Slow Media are not a contradiction to the speed and simultaneousness of Twitter, Blogs or Social Networks but are an attitude and a way of making use of them."

So Slow Media doesn't affect production at all, but is a lifestyle.

Nevertheless, it would appear that given the call for 'monotasking' and 'focused alertness' (thesis 2), that such Slow Media (as an 'attitude') would produce an approach completely incompatible with social media --- unless slow media is, in fact, nothing less than social media's perfection, insofar as what it calls for is nothing short than a complete, 'monotasking' immersion within it.

I.e., instead of distractively checking Facebook or sending out a quick Tweet, I should now spend all of my time glued in front of the screen to perform these tasks with the perfection of monotasking.

If Slow Media is meant as some kind of resistance to social media, or temporal deconstruction of it, will it be found by turning all of one's attention to it...?

And would such an attitude toward an already-existing media structure not also imply that Slow Media is not 'progressive' but precisely reactionary as a kind of immersive dispositif toward social media?

- > 9. Slow Media are distributed via recommendations not advertising; the
- > success of Slow Media is not based on an overwhelming advertising
- > pressure on all channels but on recommendation from friends,
- > colleagues or family. A book given as a present five times to best
- > friends is a good example.

Unfortunately, this position delimits & underestimates advertising in a way not seen since the beginning of the 20th century. By all accounts, advertising works precisely through recommendations -- and quite literally. I'm thinking here of Amazon's recommendation databasing, for example. But certainly in more insidious forms: it is the very unconscious mechanization of brand "recommendations" that advertising strives to produce.

So far, this manifesto seems to support the complete immersion within distractive social media through the utter resignation to unconscious forms of advertising. This manifesto itself appears in its most reactionary form as a mere reflection of the very desires and wishes of the organised systems of social media and consumer capital.

Which is why I shudder when I read that:

- > 5. Slow Media advance Prosumers, i.e. people who actively define what and
- > how they want to consume and produce. In Slow Media, the active Prosumer,
- > inspired by his media usage to develop new ideas and take action, replaces
- > the passive consumer. This may be shown by marginals in a book or animated
- > discussion about a record with friends. Slow Media inspire, continuously
- > affect the users' thoughts and actions and are still perceptible years
- > later.

Heavens. If there ever was a historical category of "passive consumers", such a fictive mass only ever existed within the superbly imaginative realm of advertising as a construct to make "us" feel better over "how far we've come". "Just look at you now, baby" -- Yep, now you can choose to smoke Virginia Slims, Woman!

This manifesto seems to read as if consumer capital didn't invent the Prosumer as a more invasive procedure of snaring mass desire to begin with. If one can be made to feel part of something, one is less likely to critique it. Moreover, the prosumer also conveniently generates free R&D for whom s/he serves. While this used to be through focus groups, polls and surveys, now every click and movement online is tracked to further "enhance" the experience of dangling consumer desire in front of your eyes. This is the entire economic model of social media --- i.e., it is what makes it "sustainable" (see thesis #1).

In short, this Manifesto appears to only signify the complete and utter breakdown of any attempt to think an imaginative alternative to the impulses of consumer capital.

Instead of allowing us to make use of media for what it is -- something we shouldn't spend too much time with precisely because of its desire-traps that induce you to buy the new fucking iPhone or whatever -- it calls for us to spend MORE time with it.

No. Nein. How about less time with Twitter & Facebook, and more time getting

to know your neighbour, your library, the people in your local coffeshop, the grassroots level of political organisations in your locale, and the alternative online networks (such as this one) that call for sustained analysis and thought --- which demonstratively translates here & there into action.

(requisite shout-outs to Toronto & Chicago at this very moment ...)

Oh, and read a book every once in awhile too. And not on the censorious iPad. Marginalia exists not as a metaphor of the Prosumer (such in thesis

5), but as an activity of defacing and questioning the command and control principles of the received text. Get out and get some graffiti done while you're at it.
/ best, tobias.

Although this is a fairly short note, I believe that this is germane to Trebor Scholz' notes on Constant Partial Attention Disorder

<http://www.collectivate.net/journalisms/2007/3/16/the-good-and-bad-of-technology-once-and-for-all.html>

I feel that there is a confluence of noise that is getting remarked upon again and again, that seems to try to be remedied with things like aggregators, etc. and in the end, I think that the real solution is to just prune out the unnecessary or focus on as little as you have to. It's dangerous for many artists who feel that they have to be addicted to the production model, but in short, I think to think tactically is better in the first place.

Or perhaps we could look at the collectivist/anarchist model of slow - derive-media as agent of resistance. I like Craig Freeman & Will Pappenheimer's Hydrofluorocarbon piece that makes an avatar wander randomly around Second Life.

but back to the grass-roots approach, classless, collective mediation, flat/rhizomatic stuff that is not rapid and breathless like Deleuze mentions. No chefs, no high/low, just a helpful community of loving grace.

Not So Fast
Sending and receiving at breakneck speed can make life queasy; a manifesto for slow communication

By JOHN FREEMAN

The boundlessness of the Internet always runs into the hard fact of our animal nature, our physical limits, the dimensions of our cognitive present, the overheated capacity of our minds. "My friend has just had his PC wired for broadband," writes the poet Don Paterson. "I meet him in the café; he looks terrible; his face puffy and pale, his eyes bloodshot. . . . He tells me he is now detained, night and day, in downloading every album he ever owned, lost, desired, or was casually intrigued by; he has now stopped even listening to them, and spends his time sleeplessly monitoring a progress bar. . . . He says it's like all my birthdays have come at once, by which I can see he means, precisely, that he feels he is going to die."

We will die, that much is certain; and everyone we have ever loved and cared about will die, too, sometimes heartbreakingly before us. Being someone else, traveling the world, making new friends gives us a temporary reprieve from this knowledge, which is spared most of the animal kingdom. Busyness (or the simulated busyness of email addiction) numbs the pain of this awareness, but it can never totally submerge it. Given that our days are limited, our hours precious, we have to decide what we want to do, what we want to say, what and who we care about, and how we want to allocate our time to these things within the limits that do not and cannot change. In short, we need to slow down.

Our society does not often tell us this. Progress, since the dawn of the Industrial Age, is supposed to be a linear upward progression; graphs with upward slopes are a good sign. Processing speeds are always getting faster; broadband now makes dial-up seem like traveling by horse and buggy. Growth is eternal. But only two things grow indefinitely or have indefinite growth firmly ensconced at the heart of their being: cancer and the corporation. For everything else, especially in nature, the consuming fires eventually come and force a starting over.

The ultimate form of progress, however, is learning to decide what is working and what is not; and working at this pace, emailing at this frantic rate, is pleasing very few of us. It is encroaching on parts of our lives that should be separate or sacred, altering our minds and our ability to know our world, encouraging a further distancing from our bodies and our natures and our communities. We can change this; we have to change it. Of course email is good for many things; that has never been in dispute. But we need to learn to use it far more sparingly, with far less dependency, if we are to gain control of our lives.

In the past two decades, we have witnessed one of the greatest breakdowns of the barrier between our work and personal lives since the notion of leisure time emerged in Victorian Britain as a result of the Industrial Age. It has put us under great physical and mental strain, altering our brain chemistry and daily needs. It has isolated us from the people with whom we live, siphoning us away from real-world places where we gather. It has encouraged flotillas of unnecessary jabbering, making it difficult to tell signal from noise. It has made it more difficult to read slowly and enjoy it, hastening the already declining rates of literacy. It has made it harder to listen and mean it, to be idle and not fidget.

This is not a sustainable way to live. This lifestyle of being constantly on causes emotional and physical burnout, workplace meltdowns, and unhappiness. How many of our most joyful memories have been created in front of a screen?

If we are to step off this hurtling machine, we must reassert principles that have been lost in the blur. It is time to launch a manifesto for a slow communication movement, a push back against the machines and the forces that encourage us to remain connected to them. Many of the values of the Internet are social improvements; it can be a great platform for solidarity, it rewards curiosity, it enables convenience. This is not the manifesto of a Luddite, this is a human manifesto. If the technology is to be used for the betterment of human life, we must reassert that the Internet and its virtual information space is not a world unto itself but a supplement to our existing world, where the following three statements are self-evident.

1. Speed matters.

We have numerous technologies that can work with extreme rapidity. But we don't use these capabilities because they are either dangerous (even the Autobahn has begun applying speed limits, due to severe accidents) or uncomfortable (imagine turbulence at 1,200 miles per hour) or would ruin the point of having the technology at all (played back faster than it was recorded, Led Zeppelin's syrupy metal sound turns to tinsel).

The speed at which we do something/anything changes our experience of it. Words and communication are not immune to this fundamental truth. The faster we talk and chat and type over tools such as email and text messages, the more our communication will resemble traveling at great

speed. Bumped and jostled, queasy from the constant ocular and muscular adjustments our body must make to keep up, we will live in a constant state of digital jet lag.

This is a disastrous development on many levels. Brain science may suggest that some decisions can be made in the blink of an eye, but not all judgments benefit from a short frame of reference. We need to protect the finite well of our attention if we care about our relationships. We need time in order to properly consider the effect of what we say upon others. We need time in order to grasp the political and professional ramifications of our typed correspondence. We need time to shape and design and filter our words so that we say exactly what we mean. Communicating at great haste hones our utterances down to instincts and impulses that until now have been held back or channeled more carefully.

Continuing in this strobe-lit techno-rave communication environment as it stands will be destructive for businesses. Employees communicating at breakneck speed make mistakes. They forget, cross boundaries that exist for a reason, make sloppy errors, offend clients, spread rumors and gossip that would never travel through offline channels, work well past the point where their contributions are helpful, burn out and break down and then have trouble shutting down and recuperating. The churn produced by this communication lifestyle cannot be sustained. "To perfect things, speed is a unifying force," the race-car driver Michael Schumacher has said. "To imperfect things, speed is a destructive force." No company is perfect, nor is any individual.

It is hard not to blame us for believing otherwise, because the Internet and the global markets it facilitates have brought into a fundamental warping of the actual meaning of speed. Speed used to convey urgency; now we somehow think it means efficiency. One can even see this in the etymology of the word. The earliest recorded use of it as a verb² to go fast³ dates back to 1300, when horses were the primary mode of moving in haste. By 1569, as the printing press was beginning to remake society, speed was being used to mean "to send forth with quickness." By 1856, in the thick of the Industrial Revolution, when machines and mechanized production and train travel were remaking society yet again, "speed" took on another meaning. It was being used to "increase the work rate of," as in speed up.

There is a paradox here, though. The Internet has provided us with an almost unlimited amount of information, but the speed at which it works/and we work through it/has deprived us of its benefits. We might work at a higher rate, but this is not working. We can store a limited amount of information in our brains and have it at our disposal at any one time. Making decisions in this communication brownout, though without complete information, we go to war hastily, go to meetings unprepared, and build relationships on the slippery gravel of false impressions. Attention is one of the most valuable modern resources. If we waste it on frivolous communication, we will have nothing left when we really need it.

Everything we say needn't travel at the fastest rate possible. The difference between typing an email and writing a letter or memo out by hand is akin to walking on concrete versus strolling on grass. You forget how natural it feels until you do it again. Our time on this earth is limited, the world is vast, and the people we care about or need for our business life to operate will not always live and work nearby; we will always have to communicate over distance. We might as well enjoy it and preserve the space and time to do it in a way that matches the rhythms of our bodies. Continuing to work and type and write at speed, however, will make our communication environment resemble our cities. There will be concrete as far as the eye can see.

2. The Physical World matters.

A large part of electronic communication leads us away from the physical world. Our cafes, post offices, parks, cinemas, town centers, main streets and community meeting halls have suffered as a result of this development. They are beginning to resemble the tidy and lonely bedroom commuter towns created by the expansion of the American interstate system. Sitting in the modern coffee shop, you don't hear the murmur or rise and fall of conversation but the continuous, insect-like patter of typing. The disuse of real-world commons drives people back into the virtual world, causing a feedback cycle that leads to an ever-deepening isolation and neglect of the tangible commons.

This is a terrible loss. We may rely heavily on the Internet, but we cannot touch it, taste it or experience the indescribable feeling of togetherness that one gleans from face-to-face interaction, from the reassuring sensation of being among a crowd of one's neighbors. Seeing one another in these situations reinforces the importance of sharing resources, of working together, of balancing our own needs with those of others. Online, these values become notions that are much more easily suspended to further our own self-interest. Not surprisingly, political movements that begin online must have a real-world component; otherwise

they evaporate and dissolve into the blur of other activities.

It is almost impossible to navigate the Web without having to stutter-step around ads and blinking messages from sponsors. In using this tool so heavily, consumers aren't just frying their attention spans, they're forfeiting one of the large sources of information that comes from face-to-face interaction and business. A butcher can tell you which cuts of meat are the freshest; an online grocer may not. That same butcher, if he is good, might not just remember your preferences/which an online retailer can do frighteningly well/but ask you how your mother has been doing, whether you caught the latest football game. These interactions remind us that we are more than consumers; they remind us that we are part of the world in a way no amount of online shopping ever will.

If we spend our evening online trading short messages over Facebook with friends thousands of miles away rather than going to our local pub or park with a friend, we are effectively withdrawing from the people we could turn to for solace, humor and friendship, not to mention the places we could go to do this. We trade the complicated reality of friendship for its vacuum-packed idea.

3. Context matters

We need context in order to live, and if the environment of electronic communication has stopped providing it, we shouldn't search online for a solution but turn back to the real world and slow down. To do this, we need to uncouple our idea of progress from speed, separate the idea of speed from efficiency, pause and step back enough to realize that efficiency may be good for business and governments but does not always lead to mindfulness and sustainable, rewarding relationships. We are here for a short time on this planet, and reacting to demands on our time by simply speeding up has canceled out many of the benefits of the Internet, which is one of the most fabulous technological inventions ever conceived. We are connected, yes, but we were before, only by gossamer threads that worked more slowly. Slow communication will preserve these threads and our ability to sensibly choose to use faster modes when necessary. It will also preserve our sanity, our families, our relationships and our ability to find happiness in a world where, in spite of the Internet, saying what we mean is as hard as it ever was. It starts with a simple instruction: Don't send.

<nettime> Latest version of the Piracy Manifesto (English, Italian, Sept 09)

From: MILTOS MANETAS

To: nettime-l@kein.org

Date: Wed, 30 Sep 2009 00:15:26 +0300

Piracy Manifesto, Latest version (English, Italian, Sept 09)

The manifesto can be found here: <http://piracymanifesto.com>

It will be read and discussed in Berlin on Saturday Oct 3 (17-18.30 pm, Raum K 24/21) during the "Make Capitalism History" Kongress (2.-4. Oktober, more info <http://make-capitalism-history.de>)

Help to translate the Manifesto in German and other languages is appreciate. Send email at Piracy [AT] PiracyManifesto.com

ENGLISH VERSION

Pirates of the Internet Unite!

"A man was stopped yesterday at the boarder of Italy and France, his computer was scanned and pirated material was found, mostly Adobe software and songs by Beatles. The man was arrested at the spot"

>From a poem to a drug, from an piece of software to a music record and from a film to a book, everything that's famous and profitable, owns much of its economic value to the manipulation of the Multitudes. People haven't asked to know what the Coca Cola logo looks like, neither have they asked for the melody of "Like a Virgin". Education, Media and Propaganda teach it the hard way; by either hammer it our brains or by speculating over our thirst, our hunger, our need for communication and fun and most of all our loneliness and despair. In the days of Internet, what can be copied can be also shared. When it comes to content, we can give everything with everyone at once. Around

this realisation, a new social class is awaking.

This is not a working class but a class of Producers. Producers are pirates and hackers by default, they recycle the images, the sounds and the concepts of the World. Some of it they invent but most they borrow from others. Because information occupies a physical part of our bodies, because it is literary "installed" in our brain and can't be erased at wish, people have the right to own what is projected on them. They have the right to own themselves. Because this is a global World based on inequality and profit, because the contents of a song, a movie and a book are points of advantage in a vicious fight for survival, any global citizen has the moral right to appropriate a digital copy of a song, a movie or a book. Because software is an international language, the secrets of the World are written in Adobe and Microsoft: We should try hack them. Finally, because poverty is the field of experimentation for all global medicine, no patents should apply.

Today every man with a computer is a Producer and a Pirate. We all live in the Internet; this is our new country, the only territory that makes sense to defend and protect. The land of the Internet is one of information. Men should be able to use this land freely, corporations should pay for use - a company is definitely not a person. The Internet is now producing "internets", situations that exist not only online but also in real space, governed and influenced by what is happening online. This is the time for the foundation of an global Movement of Piracy. The freedom of infringing copyright, the freedom of sharing information and drugs, are our new Commons, they are Global Rights and as such, Authorities will not be allow them without a battle. But that will be a strange battle as its the first time the multitudes is disrespecting the Law instinctively and on a global scale.

Today, an army of teenagers is copying. Adults are copying, senior citizens are copying, everyone with a computer is copying something. Like a novel Goddess Athena, Information wants to break free from Technology, so it assists us on our enterprise.

Pirates of the Internet Unite!

ITALIAN VERSION

Pirati del Internet Unitevi!

"Un uomo e' stato fermato ieri nella frontiera Italiana con la Francia. Parecchio materiale pirata, principalmente software di Adobe e tanti canzoni di Beatles e stato trovato nel suo computer. L' uomo e' stato arrestato."

Dalle poesie alle medicine, dal software alla musica a da I film e a I libri, tutto quel che diventa famoso, deve tanto del suo valore economico alla manipolazione delle moltitudini. Noi non abbiamo chiesto di conoscere Il logo della CocaCola e neanche volevamo sapere a memoria la melodia di "Like a Virgin". I media, l'educazione e la propaganda, ci hanno forzato ad imparare tutto ciò speculando sul nostro bisogno di comunicazione, sulla la nostra necessità di divertirsi ma anche sulla propria solitudine e disperazione.

Nei giorni del Internet, tutto quel che può essere copiato può essere anche condiviso. Quando si tratta di contenuto, noi possiamo subito dare tutto a tutti. Attorno a questa realizzazione, una nuova classe sociale si sta svegliando. Questa non e' una classe operaia-non almeno nel senso stretto del termine: e' invece una classe di Produttori.

Gli Produttori sono di natura dei Pirati e dei Hackers: riciclano le immagini, I suoni e I concetti del Mondo. Una parte di questo materiale se lo inventano ma la gran parte se l' appropriano da altri. Perché l'informazione occupa un settore fisico del nostro corpo, perché viene letteralmente installata nel nostro cervello e non può essere cancellata a piacere, la gente ha Il diritto di appropriarsi di quel che viene proiettato su di loro. Uno deve avere Il diritto di possedere se stesso. Perché questa e' una società globale basata sulla ingegnanza e sul profitto, perché Il contenuto di una canzone, di un film e di un libro sono dei punti di vantaggio in una feroce lotta per la sopravvivenza, tutti noi abbiamo Il diritto morale di appropriarsi delle canzoni, dei film e dei libri.

A proposito del software poi, considerando che software non e' altro che la nostra lingua internazionale, si capisce che I nuovi segreti del Mondo sono scritti in Adobe e in Microsoft. Si deve allora tentare di impossessarsi di loro, hackarli e diffonderli. Infine, perché la povertà e' l'Il campo sperimentale per ogni nuova pillola e medicinale, I poveri del Mondo hanno già pagato.

Chiunque attrezzato con un computer e' già un produttore ed e' anche

un Pirata. Tutti noi viviamo nel Internet, ecco la nostra nuova patria, l'unica che vale la pena difendere. La terra del Internet e' fatta d'informazioni, chiunque deve essere libero di usarla mentre le corporations devono pagare per l'uso. Una corporation non e' certamente una persona. La Internet sta producendo "internets", situazioni che si sviluppano anche fuori della rete.

Ed e' questo l'Il momento giusto per la fondazione di in movimento globale di Pirateria. La bellezza di calpestare il copyright, la libertà di condividere informazione e medicine, sono I nostri nuovi "Commons", I nostri diritti globali e naturalmente non ci saranno facilmente concessi senza una battaglia. Questa pero sarà una battaglia divertente, perché e' la prima volta che le Moltitudini disobidiscono la Legge instintivamente. Oggi esiste una mare di giovani che copiano informazioni, gli adulti anche copiano e anche I vecchi. Chiunque con un computer copia: la informazione, come una nuova Dea Atena, vuole tanto uscire dalla testa spaccata della Tecnologia.

La Informazione e' nel nostro fianco.

dear nett_timers

our way too late contribution to the discussion which was ongoing some months ago with the following thread:

<nettime> Political Work in the Aftermath of the New Media Arts Crisis by Geert Lovink
<http://www.nettime.org/Lists-Archives/nettime-1-0905/msg00044.html>,

attached & linked the updated version of our manifesto,
<http://www.ubermorgen.com/manifesto>
best regards
hans&lizvix

UBERMORGEN.COM
manifesto

v1 28.07.2009 (RC1 10.05.2009) *

I.

our work is curiosity driven research.
sampling is our basic principle of production.
it is visual, it is textual, we code recombinations.
we modify your plain-text.
The UM.BOOK*: we relabeled a peter weibel text as an hans ulrich obrist text, then we transformed a hans ulrich obrist interview with matthew barney into an interview by peter weibel with UBERMORGEN.COM.

we have no political agenda in our work.
this is true for our ideas, research and production.
the perception of our work is out of our control and we do not intend to control that either.
we have no intention, no goals, we feed our own curiosity
we are non-ideological.
our primary goal is research for our own interests. We experiment in the legal, technological, social, economical field; satisfying our own personal needs.
From this independent perspective we can freely investigate into whatever we are interested in.

we understand the things that happen around us and to us. We analyze system configurations and we then recombine our findings, the facts and the fiction into false originals, forgnal stories. we contextualize technology with pseudo-politics, social messages with commerce.

we are not bound to any medium. although in most cases the core of a project or a work is digital and happens online, it begins as a small concept text, some images and some code. it is carried on in a huge cloud of research data.
the transfer of the digital to the physical transforms online actions into supercharged images (prints/photos), installations and sculptures.

our goal:
we impact your personal and individual experience
to look for the emotional kick and feedback,
to outsource responsibility
to involve the audience emotionally

what we do is not pop art

it is rock art.

we are children of the 1980s. we are the first internet-pop-generation. we grew up with radical Michael Milken, the king of junk bonds and mythical Michael Jackson, the king of junk pop. during the 1990s we loaded ourselves with technology. we call it digital cocaine. with mass media hacking, underground techno, hardcore drugs, rock&roll lifestyle and net.art jet set.

our neuronal networks and brain structures were similar to the global synthetic network we helped building up and maintained subversive activity within. and then they got infected: waves of mania and depression ran through the technical, social and economic structures.

contemporary high-tech societies deal with hardcore brains using biochemical agents to control the internal information flow, we call them psychotropic drugs.

but how can we treat a mentally ill global network?

2.

we are not activists. we are actionists in the communicative and experimental tradition of viennese actionism - performing in the global media, communication and technological networks, our body is the ultimate sensor and the immediate medium.

we have enough free time to think. things happen. we do not control them. the thing that interests us supermissively is the concept of authority. be it corporate authority or governmental authority. totalitarianism, the way masses and individuals respond to a manipulative oppression and the psychotic mass belief in ?they way things are? always seems to catch our attention. we call it - citing William Gibson - 'consensual hallucination'.

some examples:
GWEI / Google Will Eat Itself / deconstructing the totalitarianism of shareholder value by creating a autocannibalistic model.
[V]ote-auction/ commercialized democracy, cutting out the middle man, online transactions, directly selling and buying of votes as future business model.
Superenhanced/ physical governmental oppression, NLP (neuro linguistic programming) and the fascism of newsspeak in the area of war prisoners, enhanced interrogations, detainees, child imprisonment. Supermax facilities and extraordinary renditions.

we do not know how our work is contextualized and perceived in the art world or the real world. for that matter we do not appreciate reading articles, reviews or theory about our work. we programmatically avoid visiting exhibitions in art galleries and museums, and online we rarely read or look at work. we leave that up to others. you categorize, qualify and contextualize us.

but in the so called real world our work has legal impact. We are always in a lot of legal trouble. professionally, personally and artistically. we learned that these issues were easy to resolve. we call it intended unconsciousness.

some of these legal controversies serve as precedents to demonstrate internet legislation. for example: during the vote-auction project a U.S injunction was sent via email to a swiss domain registrar. they then turned off our domain on no legal basis - U.S court orders are not valid in switzerland (sic!) - this case was used by the ICANN

board and in various law publications to discuss domain legislation issues. our affirmative artistic reaction was to produce the Injunction Generator, a software that automatically generates such court orders and sends them to domain registries, owners, lawyers and journalists to shut down targeted domains.

in some other cases friendly police officers and state agents were happy to find out that they are not dealing with dark minded criminals but rather with /interesting/ artists - surely in some cases we do not state who we are or talk about our artistic intention, i.e. the Voteauction project where we positioned ourselves as perverted eastern european business people trying to exploit U.S. democracy - but usually governmental agencies prefer to have a nice conversation rather than a criminal investigation. this argument only goes for pretty much all of mainland europe / the US and partially the UK are slightly more threatening.

but in all other cases, fuck them all!

Sosumi

our legal policy: anyone who wants to sue us, threaten us or what: have you get your court order or whatever the fuck you want, get in line and wait until we serve you. just be aware that there are about 15 others waiting with priority, so your chances are very limited.

financially, we are deeply in debt, this is very helpful when people want to hot you with legal bombshells - they go after you in order to hurt you by taking money from you. but we ain't got no money, so there is nothing you can take from us. blood from a turnip. we are not gonna get got. for this reason we rarely show up in court or even send a lawyer to represent us. we just let them do it by themselves and generate more documents which we then use for our work.

on the real life level it is a love-hate relationship: on the individual level, users and recipients usually react very strongly to our stuff. we welcome all kinds of reactions: fan-mail, hate-mail, legal mail.

as artists we see it as our responsibility to communicate. to talk about our research findings, to contextualize images, texts, etc. communication is part of our 8-5 job but it is not our priority or passion. this is different if it concerns our media hacking activities. where multi-layered communication is an integral part of the performance.

on the art market we are happy to hold one of the digital art and actionism positions where content is random and not random, where concept is important but at the same time the surface is queen. we develop new ways of showcasing our real new media art - new ways that are rather low-tech than high tech superendeavours.

3.

our relationship to mass media.

we have no respect for news-journalists, thats for sure. most of them are real scumbags and very unreliable and highly unethical. but, to our favor, they are very easy to manipulate - or as we call it /work with/, so for us the press release is an artform.

. television is the best conventional mass medium. they are closest to what we call a shock marketing channel - pumping information into users brains causing a short shock after which the channel to the brain is open and unfiltered.

. newspapers are boring.

. magazines are usually not interested in our work.

. books are heavy and eternal. but they are an art medium not a mere information transporter.

. the internet is real-time, that helps coz the faster the wheel is spinning, the easier it is to turn a complicated issue into a story made out of slogans and a couple of images.

our media hacking strategy is scalable - with media hacking we mean the intrusion into massmedia with lo-tech means and a good story, so only courage, intelligence and some technological know how is required. from an estimated 500 million eyeballs audience worldwide for the Vote-auction project to 0/zero mass media audience for our Net.Art piece Black n White, it is all in the game. and we dont work with expectations, we dont depend on audience. the days when a large audience was a thrill are long gone, it does not help, it does not kick, the only real artistic production happens with input-feedbacks, when you send out information and you know you will not be able to control it anymore. the information lives on in mass media, it gets manipulated and opportunistically used by journalists, politicians,

lawyers and business-people and other artists, then through the media the story comes back to you and you can spin it, kick in abstract or surreal content and send it out again to a huge audience. this works best if the audience is very large, this guarantees the attention and focus of the journalist and the publishing house, this is the media hacking performance, this is acting in the eye of the mass media storm.

so on different scales we perform, we experiment, we develop and use a new media strategy for each new project, during the EKMZRZ trilogy we used a combination of attacks:

with GWEI : Google Will Eat Itself we targeted about 30-40 opinion leaders, then we waited three months until the story made it's way to the top mass media outlets and then down again to the blogosphere, schoolbooks and documentaries, this process is still ongoing.

with Amazon Noir : The Big Book Crime we used official press-releases by third parties and our own release, this was the classical way by intention, although unintentionally one third-party pressrelease was published 6 weeks before the official date, this created chaos and confusion on both sides and turned out to be nice for everyone.

for The Sound of eBay we worked with only lo-level media art scene promotion, only our core audience was informed about the project and they know about it, no fuss, no exaggerations, we are still waiting for feedback.

+

awareness and the effects of our work on politics and society..

we are not interested in awareness, and we are not interested in having a direct impact on politics, society, military, business or technology, though we do think that our research might have a long term impact, but this is so out of our reach and it is purely speculative, so we dont think about that much.

maybe our projects have scientific and educational value, this would explain all the scientific articles, legal studies, dissertations and master thesis.

knowing or learning about the actual impact of our work would present us with borders and boundaries of how far we can go or what we can actually achieve, it could become role-model art, we dont want that.

the people can change things in a political or activist way, not the art or the artists.

we have to focus on our work and give up on the rest, we chill, relax and take it easy, we have done our job, we are artists, we need to be free of responsibility, to not have to think about consequences, to not limit ourselves just because it could have an effect on this or that, or could be used for us or against us or other people, we learned that very early, hacking optimizes the attacked system, we accept that, and we learned to not give a fuck about it.

again awareness and political affairs.

if art and art production politicizes itself, it becomes politics and ceases to be art.

awareness really sucks because everybody knows about a certain topic, but still they are not doing anything about it and neither give a fuck really, if there is impact of a story or a project of ours, we dont neglect it, but they are simply a sideproduct which we learned to accept and tolerate, but it is most def. interesting to talk to and communicate with people emotionally, directly, personally, fake-personally and right into the core.

this is still why we love working with the net, doing stuff like the Generators, they are pieces of software that generate foriginal documents - forged originals, for example: court orders, drug prescriptions, bankstatements or rendition orders and enhanced interrogation scripts, this gives us the chance to target every single individual, be it enemy or friend, on a pseudo-personal basis, we get them in their home, in front of their laptop or at their workplace looking at their workstations, this is when a user is vulnerable, this is when they are a good target.

people using our generators from their homes have no reason to lie to our software, they welcome the infiltration and produce their own reality tv show, at least that is what they are interested in, we never lie, we work with research, fact and fiction, recombinations of these and with artistic surplus values.

we lure users into being interested in finding out if what they are being sucked into is real or not, we mirror their interests and watch

them through the invisible mirror.

Machines of the Invisible

Manifesto for a Schizo-analysis of Media Culture

By Patricia Pisters (Dept. Media Studies, University of Amsterdam)

1. Contemporary media are characterized by a stammering stream of an ever growing schizophrenic 'logic of addition'.
2. 'Old' mass media like television and cinema are not dead but undead.
3. Schizophrenia points to clinical and critical symptoms of a/v culture.
4. The delirium is socio-political and world historical.
5. The cinematographic regime is already schizo-analytic in conception; this becomes more evident and widespread in contemporary a/v culture.
6. The schizo-analytic regime of the image acknowledges 'the reality of illusions'.
7. Immanent powers of the image present them selves in heterogeneous ways.
8. The virtual is a real power.
9. Images have the power to act.
10. Affect is an autonomous power.
11. Forgers, magicians, charlatans, tricksters, conmen and delusional characters are symptoms and diagnosis makers of the powers of the false.

Machines of the Invisible

It is argued with good reasons that digital technology has changed the media landscape completely: old mass media like film, television and radio have been replaced by more fragmented, non-hierarchical, rhizomatic forms of media. This is, however, only partly true. By looking at the level of image-production in contemporary a/v media, I will take the changes in the cinematographic apparatus, or the cinematographic regime, as a starting point for a manifesto for a schizo-analysis of media culture.

The apparatus theory in the 1970s famously proposed to see cinema as a 'machine of the visible'. The underlying idea of this approach is that

cinema produces 'impressions of reality' or 'illusions taken for reality'. Cinema is thus seen as a mass medium that invites us into ideologically determined subject positions. However, in contemporary media culture the paradigm has shifted: the audio-visual image in digital culture no longer lures us into taking 'illusion for reality' but gives us the 'reality of illusions'.

At the heart of this change is the cinematographic apparatus itself, which now could be conceived as a schizo-analytic producer of heterogeneous and multiple connections that is tightly connected to other forms of a/v media. The digital cinematographic-apparatus has to be seen as a complex constellation of schizoid 'machines of the invisible'.

and...and...and...

1. Contemporary media are characterized by a stammering stream of an ever growing schizophrenic 'logic of addition'. Laptops, mobile phones, webcams, ipods, satellite television, web 2.0: new forms of media grow like wild plants without deep roots (rhizomes) in between older forms of mass media (newspapers, film, radio and television). Undeniably, 'old mass media' have changed by this but it doesn't mean that they have disappeared completely in the rhizomatic network. The television news is no longer the only source of information, CNN competes with Arab satellite channels, bloggers and civil journalism, hypes emerge online, Youtube and Twitter turn everybody into a media producer. But deeply rooted trees are not that easily overgrown. The media have become individualized and fragmented and specialized and opened up

and... and...

And they are also still mass medial. So no either... or-logic but an ever growing process. Contemporary media culture can only be thought in the stammering stream of an and...and...and logic. A schizophrenic logic of intensity and multiplicity that begs for a schizo-analysis.

'We have grass in our heads' ... and there are also still many trees. 'We're tired of the tree because we have grass in our heads', Deleuze and Guattari argue when they introduce non-hierarchical rhizomatic thinking in *A Thousand Plateaus*. At the same time they indicate that out of every rhizome a tree can grow, and that trees can behave rhizomatically. So it is not a matter of saying: old media are tools of capitalist ideology, whereas new media free us from ideological interpellation. 'Old' and 'new' media are two different ways of thinking and behaving that can have both positive and negative effects, produce the most beautiful creations and the most horrible suffocations. The media are complex and interwoven networks of grass roots and tree-structures.

Mass media are dead. Long live the mass media!

2. 'Old' mass media like television and cinema are not dead but undead. Like zombies or vampires 'old mass media' have strong regenerative powers as indicated by the fact that for instance, a. Programs such as 'Idols', 'Dancing on Ice' and other popular shows are still able to keep a mass audience on a Saturday night in front of the television set. Not to mention the Dutch BNN-program 'The Big Donor Show' that attracted a million audience, 30.000 potentially new donors and was Breaking News all over the world. Cinema retains or regains its multiplex attractions. b. Mass media are indeed no longer the most important makers or distributors of the news, but still have a huge filtering function. Only when an internet hype is reported by the 8 o'clock news it becomes really popular and widely followed (such as the 'jumping'-dance hype in the Netherlands). In this way traditional media have become the 'curators' of the internet. c. Mass media use new forms of media as well: podcasting is also still radio, the 8 o'clock news on demand is still the 8 o'clock news. Did you miss an emission? 'Were you too afraid to watch (the 'Big Donor Show')? Try again', broadcast company BNN says on their website. In this way new media do not weaken the power of the traditional media but reinforce it. And beside all fragmentation and multiplication, the internet becomes a huge store, database and audiovisual archive of the mass media.

Clinical and Critical

3. Schizophrenia points to clinical and critical symptoms of a/v culture. By arguing for a schizo-analysis of media culture I am not proposing to pathologize culture, nor calling for insanity. However, the clinical symptoms of schizophrenia do point to important characteristics of contemporary a/v culture and criticize them at the same time. Positive symptoms: an overflow of energy, intensity, everything is connected to everything, liberated and recreated, explosion. As Deleuze

and Guattari say: 'Connecticut - Connect-I-Cut': machines and bodies, bodies that liberate themselves from their normative organization (BwO).

Negative symptoms: intensity turns into catatonia, inertia, apathy, implosion. Every production provokes its own anti-production. That is the core (axiom) of the immanent system of 'capitalism and schizophrenia', indicated by Deleuze and Guattari. Our image culture is more like a schizoid delirium than like the psychoanalytic dream.

Alienations: Delirium is socio-political

4. The delirium is socio-political and world historical. The schizoid delirium is situated at the other end of the individual Oedipal dream. The delirium is in the first place collective, socio-political and world-historical. In *Alienations* documentary maker Malek Bensmail has filmed patients and doctors on a psychiatric ward in Algeria.

'Why are the Americans bombing Iraq...'

The patients are moving between hyperactivity and a stream of delusional words and catatonic states. But at the same time their remarks are incredibly sharp, addressing socio-political issues all the time.

This documentary also shows that the difference between doctor and patient is not that big anymore. Everybody feels the insanity of the contemporary situation. Doctors and patients, but also filmmakers and spectators are implicated - we all share the collective deliria of our audio-visual media society.

Cinematographic regime is schizoanalytic; a/v culture is abstract machine

5. The cinematographic regime is already schizo-analytic in conception; this becomes more evident and widespread in contemporary a/v culture.

As Ian Buchanan has argued the tripartite schizo-analytic conceptual schema of 'body without organs', 'assemblage' and 'abstract machine' informs the basic matrix of Deleuze's account of the cinematic image. It follows the logic of the 'frame', the 'shot' and 'montage'. The frame selects and deterritorializes the image; presenting it in new ways (BwO), the shot unites elements in a closed set (assemblage), montage joins together the powers of the frame and the shot (abstract machine).

But the cinematic image also operates in a larger 'abstract machine' of media culture, where it can join all kind of hegemonic and resisting forces.

From 'Illusions of Reality' to 'Reality of Illusions'

6. The schizo-analytic regime of the image acknowledges 'the reality of illusions'.

The classical film theoretical notion of the filmed (or mediated) image as an 'impression', 'effect' or 'illusion of reality' has modulated into the image as a 'reality of illusions'. This insight translates schizophrenic (and neurobiological and Deleuzian) findings that the image has its own immanent power to do something (in our mind, in the world).

A schizo-analysis of media culture takes into account at least four immanent (and autonomous) powers of the image: the power of the virtual, the power of the performative speech act, the power of affect and the power of the false.

7. Immanent powers of the image present them selves in heterogeneous ways.

These powers do not provide an unequivocal model of analysis. They present themselves in all kind forms and on different types of levels, they metamorphose in good and bad, nobel and base and everything in between.

Power of the Virtual

8. The virtual is a real power.

'There is no actual image that is not surrounded by a mist of virtual images'. One of Deleuze's last aphorisms seems to grow in relevance every minute. Every image we see resonates in all kinds of ways with other images: images from our personal and collective memory, fantasy images, film- and other media images.

Memories are stored on film, a film-image becomes a memory-image. Fact and fiction chase each other, virtual and actual form a circuit: as in the hall of mirrors of *The Lady from Shanghai*. Hitchcock's fiction has

become a collective memory. Collective memory has been colored by fiction (Stone's JFK). And where is Laura Dern in Inland Empire: in the present, the past, in Poland, in America? In which layer of reality or fictions is she moving... or trapped? And in this film, isn't it precisely that scene of her death, explicitly indicated as fictitious because we see an enormous camera appearing in a suddenly widening frame, that is the most raw and social-realist?

Power of the speech act

9. Images have the power to act.
Another power that is acknowledged by a schizo-analytic approach of media culture, is the power of the speech act, 'act de parole' as Deleuze says. Or better still we should perhaps speak of an 'act de l' image'. Philosophers of language have since long demonstrated convincingly that words have performative power: the power to do something or to have something done. In this way words operate in reality. Images have the same kind of (or maybe more) performative power of the speech act.

Even if everybody knows that an image is staged, it has an effect: it penetrates our mind and puts itself somewhere in the flux of images. Of course this effect is not new. Propaganda images have been used like this for a long time. But this power goes beyond conscious propagandistic means. All images have this creative power of the speech act.

So, in a similar vein the image can be used to tell stories that call a minority group into existence, 'creating a people'. The active power of the image is not to be underestimated. The Battle of Algiers has become the Algerian War of Independence.

On the level of the contents of the images the Algerian women in 'The Battle of Algiers' are very conscious of the power of the performative: with bleached hair, speaking perfect French and in an elegant dress the French barricades in the city are no longer closed. And in a recent French movie the message is cynical: a simple French man all of a sudden sees the absurdity of random (and not so random) identity checks and the whole social system: he ends up in a police cell, then in a psychiatric hospital and finally loses his job. But with a fake cv and following the social 'rules of the game' without too many critical questions, everything turns out all right: 'fa va? tres bien merci!'

Power of Affect

10. Affect is an autonomous power.
The schizophrenic feeling of a too much of everything, too much injustice, too unbearable, too many images - it all reduces our sensory-motor capacities. But it creates more room for the affect. Deleuze has demonstrated how the affect is connected to the close-up.

The close-up is one of the most typical and most striking stylistic features of the cinematographic/audio-visual image. In that way cinema has contributed to the power of affect. Faces and other bodily parts or objects in close-up obtain affective impressive or expressive qualities. The eyes loose their perspectival overview, disoriented the image touches us directly. 'The affect has autonomous power', Brian Massumi has elaborated on this. It works independent of story or context.

On a political level the power of affect takes on a different guise. Helen Mirren as Queen Elisabeth gradually discovers that the representative powers of the 'Queen as the Country' has modulated into the affective power of the 'Queen of Hearts'.

Power of the false

11. Forgers, magicians, charlatans, tricksters, conmen and delusional characters are symptoms and diagnosis makers of the powers of the false.
Finally the schizoanalytic lesson of Orson Welles, again first noted by Deleuze. In 'F For Fake' Welles performs as a magician to introduce the stories of other charlatans. Master forger Elmyr de Hory draws a Picasso in ten minutes: no museum in the world that distinguishes it from an original one. The magician knows like no body else how to play with the reality of illusions. The art forger undermines the difference between copy and original. The conman plays a game with our expectations and conventions (Sawyer in 'Lost'). The artist plays this game most creatively and most generously.

What is demonstrated in the power of the false is that the truth is very difficult to retrieve and most of the time is based on a choice. An affective choice, even if it is often wrapped in rational arguments, moral principles or dogmatic convictions. But the true ethical evaluation should be the affirmative creative potentiality, the

ultimate motivation of the 'charlatan'. In 'The Illusionist' we don't really know how Eisenheim has conjured his plan. But inspector Uhl decides that he knows what happened. And real magic or just a trick, it actually doesn't matter, Eisenheim's motivation (love, life) is what counts.

The media are an immanent system that feeds itself. An abstract machine that always grows, expands, produces: from the most cruel and horrific to the most beautiful and sublime. Production and anti-production. Schizo-analysis not as a disease but as a process and method to understand the immanent powers of the image, to play with them, and break through them (without breaking down).

The brain and the screen maintain an intimate and complex relationship. The camera has penetrated our mind, for the best and for the worst. But the brain also determines for a large part what we see on the screen, for the best and for the worst. The cinematographic apparatus is no longer a machine that renders the visible, a machine of the visible.

The new cinematic regime of digital a/v culture points to the fact that the screen is that thin membrane between world and brain and that the mediated image, in producing all kind of 'invisible' powers, should be conceived as 'machines of the invisible'.

A Hacker Manifesto 001-006
McKenzie Wark

001. A double spooks the world, the double of abstraction. The fortunes of states and armies, companies and communities depend on it. All contending classes, be they ruling or ruled, revere it -- yet fear it. Ours is a world that ventures blindly into the new with its fingers crossed.

002. All classes fear this relentless abstraction of the world, on which their fortunes yet depend. All classes but one: the hacker class. We are the hackers of abstraction. We produce new concepts, new perceptions, new sensations, hacked out of raw data. Whatever code we hack, be it programming language, poetic language, math or music, curves or colourings, we are the abstracters of new worlds. Whether we come to represent ourselves as researchers or authors, artists or biologists, chemists or musicians, philosophers or programmers, each of these subjectivities is but a fragment of a class still becoming, bit by bit, aware of itself as such.

003. And yet we don't quite know who we are. That is why this text seeks to make manifest our origins, our purpose and our interests. A hacker manifesto: Not the only manifesto, as it is in the nature of the hacker to differ from others, to differ even from oneself, over time. To hack is to differ. A hacker manifesto cannot claim to represent what refuses representation.

004. Hackers create the possibility of new things entering the world. Not always great things, or even good things, but new things. In art, in science, in philosophy and culture, in any production of knowledge where data can be gathered, where information can be extracted from it, and where in that information new possibilities for the world produced, there are hackers hacking the new out of the old. Hackers create these new worlds, yet we do not possess them. That which we create is mortgaged to others, and to the interests of others, to states and corporations who monopolise the means for making worlds we alone discover. We do not own what we produce -- it owns us.

005. Hackers use their knowledge and their wits to maintain their autonomy. Some take the money and run. (But one cannot run far.) We must live with our compromises. (Some refuse to compromise.) We live as best we can. All too often those of us who take one of these paths resent those who take the other. One lot resents the prosperity it lacks, the other resents the liberty it lacks to hack away at the world freely. What eludes the hacker class is a more abstract expression of our interests as a class, and of how this interest may meet those of others in the world.

006. Hackers are not joiners. We're not often willing to submerge our singularity in any collective. What the times call for is a collective hack that realises a class interest based on an alignment of differences rather than a coercive unity. Hackers are a class, but an abstract class. A class that makes abstractions, and a class made abstract. To abstract hackers as a class is to abstract the very concept of class itself. The slogan of the hacker class is not the workers of the world united, but the workings of the world untied.

>in ref to the Hua Hsu quote:

>if the World was 'ours', what would we do with it?

That's one of two questions that the book tries to answer. The other question is: why is this world not ours? What is the new ruling class that seeks to concentrate the ownership and control of all information in its hands? In the extract below, i try to develop a way of grappling with this

--k

A Hacker Manifesto

McKenzie Wark

Harvard University Press

<http://www.hup.harvard.edu/catalog/WARHAC.html>

007. Everywhere abstraction reigns, abstraction made concrete. Everywhere abstraction's straight lines and pure curves order matters along complex but efficient vectors. But where education teaches what one may produce with an abstraction, the knowledge most useful for the hacker class is of how abstractions are themselves produced. Deleuze: "Abstractions explain nothing, they themselves have to be explained."

008. Abstraction may be discovered or produced, may be material or immaterial, but abstraction is what every hack produces and affirms. To abstract is to construct a plane upon which otherwise different and unrelated matters may be brought into many possible relations. To abstract is to express the virtuality of nature, to make known some instance of its manifold possibilities, to actualise a relation out of infinite relationality, to manifest the manifold.

009. History is the production of abstraction and the abstraction of production. What makes life differ in one age after the next is the application of new modes of abstraction to the task of wresting freedom from necessity. History is the virtual made actual, one hack after another. History is the cumulative qualitative differentiation of nature as it is hacked.

010. Out of the abstraction of nature comes its productivity, and the production of a surplus over and above the necessities of survival. Out of this expanding surplus over necessity comes an expanding capacity to hack, again and again, producing further abstractions, further productivity, further release from necessity -- at least in potential. But in actuality the hacking of nature, the production of surplus, does not make us free. Again and again, a ruling class arises that controls the surplus over bare necessity and enforces new necessities on those peoples who produce this very means of escaping necessity.

011. What makes our times different is the appearance of the horizon of possibility of a new world, long imagined -- a world free from necessity. The production of abstraction has reached the threshold where it can break the shackles holding hacking fast to outdated and regressive class interests, once and for all. Debord: "The world already possesses the dream of a time whose consciousness it must now possess in order to actually live it."

012. Invention is the mother of necessity. While all states depend on abstraction for the production of their wealth and power, the ruling class of any given state has an uneasy relationship to the production of abstraction in new forms. The ruling class seeks always to control innovation and turn it to its own ends, depriving the hacker of control of her or his creation, and thereby denying the world as a whole the right to manage its own development.

013. The production of new abstraction always takes place among those set apart by the act of hacking. We others who have hacked new worlds out of old, in the process become not merely strangers apart but a class apart. While we recognise our distinctive existence as a group, as programmers or artists or writers or scientists or musicians, we rarely see these ways of representing ourselves as mere fragments of a class experience. Geeks and freaks become what they are negatively, through the exclusion by others. Together we form a class, a class as yet to hack itself into existence as itself -- and for itself.

014. It is through the abstract that the virtual is identified, produced and released. The virtual is not just the potential latent in matter, it is the potential of potential. To hack is to produce or apply the abstract to information and express the possibility of new worlds, beyond necessity.

015. All abstractions are abstractions of nature. Abstractions release the potential of the material world. And yet abstraction relies on the material world's most curious quality -- information. Information can exist independently of a given material form, but cannot exist without any material form. It is at once material and immaterial. The hack depends on the material qualities of nature, and yet discovers something independent of a given material form. It is at once material and immaterial. It discovers the immaterial virtuality of the material, its qualities of information.

016. Abstraction is always an abstraction of nature, a process that creates nature's double, a second nature, a collective space of human existence in which collective life dwells among its own products and comes to take the environment it produces to be natural.

017. Land is the detachment of a resource from nature, an aspect of the productive potential of nature rendered abstract, in the form of property. Capital is the detachment of a resource from land, an aspect of the productive potential of land rendered abstract, in the form of property. Information is the detachment of a resource from capital already detached from land. It is the double of a double. It is a further process of abstraction beyond capital, but one that yet again produces its separate existence in the form of property.

018. Just as the development of land as a productive resource creates the historical advances for its abstraction in the form of capital, so too does the development of capital provide the historical advances for the further abstraction of information, in the form of 'intellectual property'. In traditional societies, land, capital and information were bound to particular social or regional powers by customary or hereditary ties. What abstraction hacked out of the old feudal carcass was a liberation of these resources based on a more productive form of property, a universal right to private property. This universal abstract form encompassed first land, then capital, now information.

019. While the abstraction of property unleashed productive resources, it did so at the same time as it instituted class division. Private property established a pastoralist class that owns the land, and a farmer class dispossessed of it. Out of the people the abstraction of private property expelled from its traditional communal right to land, it created a dispossessed class who became the working class, as they were set to work by a rising class of owners of the material means of manufacturing, the capitalist class. This working class became the first class to seriously entertain the notion of overthrowing class rule, but failed in this historic task. The property form was not yet abstract enough to release the virtuality of classlessness that is latent in the productive energies of abstraction itself.

020. It is always the hack that creates a new abstraction. With the emergence of a hacker class, the rate at which new abstractions are produced accelerates. The recognition of intellectual property as a form of property -- itself an abstraction, a legal hack -- creates a class of intellectual property creators. But this class still labours for the benefit of another class, to whose interests its own interests are subordinated. As the abstraction of private property was extended to information, it produced the hacker class as a class, as a class able to make of its innovations in abstraction a form of property. Unlike farmers and workers, hackers have not -- yet -- been dispossessed of their property rights entirely, but still must sell their capacity for abstraction to a class that owns the means of production, the vectoralist class -- the emergent ruling class of our time.

021. The vectoralist class wages an intensive struggle to dispossess hackers of their intellectual property. Patents and copyrights all end up in the hands, not of their creators, but of a vectoralist class that owns the means of realising the value of these abstractions. The vectoralist class struggles to monopolise abstraction. For the vectoral class, "politics is about absolute control over intellectual property by means of war-like strategies of communication, control, and command." Hackers find themselves dispossessed both individually, and as a class.

022. As the vectoralist class consolidates its monopoly on the means of realising the value of intellectual property, it confronts the hacker class more and more as a class antagonist. Hackers come to struggle against the usurious charges the vectoralists extort for access to the information that hackers collectively produce, but that vectoralists come to own. Hackers come to struggle against the particular forms in which abstraction is commodified and turned into

the private property of the vectorialist class. Hackers come as a class to recognise their class interest is best expressed through the struggle to free the production of abstraction, not just from the particular fetters of this or that form of property, but to abstract the form of property itself.

023. The time is past due when hackers must come together with workers and farmers -- with all of the producing classes of the world -- to liberate productive and inventive resources from the myth of scarcity. The time is past due for new forms of association to be created that can steer the world away from its destruction through commodified exploitation. The greatest hacks of our time may turn out to be forms of organising free collective expression, so that from this time on, abstraction serves the people, rather than the people serving the ruling class.

[via "geert lovink" <geert(AT)xs4all.nl>]
Towards a Cusco-Manifesto

We need a warm-time-machine.

The Internet is becoming more and more a time-machine, that homogenizes worldwide relations. We do believe that this needs a new warm input. Today's input comes from a northwestern time-structure. We do not question single enterprises like the international space station, we want to build our a time-space-station in Cusco.

Cusco is more than Venice. It is not only a nice counterpart of the world, not only a system of channels, that is permanently overfluffed by international tourism, it is more and it is different. It is a compass for ideas and a habitat to develop critical creativity.

Why? Because Cusco is a place in between: between inca-past and global future.

Global future will be conditioned by electronic networks. The inca-past was conditioned by a non-literal network. Today Cusco is overfluffed by international tourists that do want to adventure the existing botanic jungle and also the hidden jungle of precolumbian history. This history was not written. Is was only interpreted by the writers of the western colonizers, that did represent the Inca knowledge in a medium that is strange to its individual structure. We will question this structure.

Our structure of approaching Cusco is the difference machine. The difference machine starts to work, when different media techniques are in conflict.

Our warm-time-machine works with the energy of this conflict. Going towards Cusco converts a hybrid energy. McLuhan said that the artist is able to realize how new media techniques will change common time-space-feeling. Cusco is different. It enables to realize how networks in past and future can merge together.

We do invite artists and scientists to use their insight into timespace-architectures. We ask them to take examples of precolumbian work. For us a vase found in an inca tomb or corns of amaranth are not only elements of a past tradition nice to gaze at. They are traces of another time-space structure.

We do encourage artists to invest in a special stock market. We trade with visual robbery and we do ask artists to rework and reflect the robbery of western treasure-hunters.

This reflection will allow us to create resources for the warm-time-machine: to build step by step the Cusco Academy.

<nettime> The Manifesto of January 3, 2000

From: Bruce Sterling

To: nettime-l@desk.nl

Date: Wed, 23 Sep 1998 10:54:04 -0700 (PDT)

The Manifesto of January 3, 2000
by Bruce Sterling

The rapidly approaching millennium offers a unique cultural opportunity. After many years of cut-and-paste, appropriation, detournement and neo-retro ahistoricity, postmodernity is about to end. Immediately after the end of the fin de siècle, there will be a sudden and intense demand for genuine novelty.

Any new year offers a chance for sweeping resolutions and brave efforts at self-reform. But the end of a millennium offers a rare and vital opportunity to bury all that is dead within us and issue proclamations of particular scope and ambition.

I suspect that a group that can offer a coherent, thoughtful and novel cultural manifesto on the target date of January 3, 2000 has a profound opportunity to affect the zeitgeist. (On January 1, everyone will be too hung over to read manifestos; on January 2, nobody's computers will work. So naturally the target date must be January 3.) In this preliminary document, I would like to offer a few thoughts on the possible contents of such a manifesto.

The central issue as the new millennium dawns is technocultural. There are of course other, more traditional, better-developed issues for humankind. Cranky fundamentalism festers here and there; the left is out of ideas while the right is delusional; income disparities have become absurdly huge; these things are obvious to all. However, the human race has repeatedly proven that we can prosper cheerfully with ludicrous, corrupt and demeaning forms of religion, politics and commerce. By stark contrast, no civilization can survive the physical destruction of its resource base. It is very clear that the material infrastructure of the twentieth century is not sustainable. This is the issue at hand.

We have a worldwide environmental problem. This is a truism. But the unprecedentedly severe and peculiar weather of the late 1990s makes it clear that this problem is growing acute. Global warming has been a lively part of scientific discussion since at least the 1960s, but global warming is a quotidian reality now. Climate change is shrouding the globe in clouds of burning rain forest and knocking points off the GNP of China. Everyone can offer a weird weather anecdote now; for instance, I spent a week this summer watching the sky turn gray with fumes from the blazing forests of Chiapas. The situation has been visibly worsening, and will get worse yet, possibly very much worse.

Society has simply been unable to summon the political or economic will to deal successfully with this problem by using 20th century methods. That is because CO₂ emission is not centrally a political or economic problem. It is a design and engineering problem. It is a cultural problem and a problem of artistic sensibility.

New and radical approaches are in order. These approaches should be originated, gathered, martialled into an across-the-board cultural program, and publicly declared -- on January 3rd.

Global warming is a profound opportunity for the 21st century culture industry. National governments lack the power and the will to impose dirigiste solutions to the emission of carbon dioxide. Dirigiste solutions would probably not work anyway. It is unlikely that many of us could tolerate living in a carbon-dioxide Ration State. It would mean that almost every conceivable human activity would have to be licensed by energy commissars.

Industry will not reform its energy base. On the contrary, when it comes to CO₂ legislation, industry will form pressure groups and throw as much sand as possible into the fragile political wheels. Industry will use obscurantist tactics that will mimic those of American right-wing anti-evolution forces -- we will be told that Global Warming is merely a "theory," even when our homes are on fire. Industry is too stupid to see planetary survival as a profit opportunity. But industry is more than clever enough to sabotage government regulation, especially when

globalized industry can play one government off against the next.

The stark fact that our atmosphere is visibly declining is of no apparent economic interest except to insurance firms, who will simply make up their lack by gouging ratepayers and exporting externalized costs onto the general population.

With business hopeless and government stymied, we are basically left with cultural activism. The tools at hand are art, design, engineering, and basic science: human artifice, cultural and technical innovation. Granted, these may not seem particularly likely sources of a serious and successful effort to save the world. This is largely because, during the twentieth century, government and industry swelled to such tremendous high-modernist proportions that these other enterprises exist mostly in shrunken subcultural niches.

However, this doesn't have to be the case. With government crippled and industry brain-dead to any conceivable moral appeal, the future of decentered, autonomous cultural networks looks very bright. There has never been an opportunity to spread new ideas and new techniques with the alacrity that they can spread now. Human energy must turn in some direction. People will run from frustration and toward any apparent source of daylight. As the planet's levees continue to break, people will run much faster and with considerably more conviction.

Our cultural substance-abuse problem with CO₂ may have very severe consequences to human happiness, but the immediate physical problem is rather well understood. Clever people, united and motivated, should be able to deal with this. Carbon dioxide is not a time-honored philosophical dilemma or some irreducible flaw in the human condition. Serious fossil-fuel consumption, as a practice on the grand scale, is only about 200 years old. The most severe rise in carbon emission occurred during the past fifty years. We're painfully dependent on this practice, but it's not as if we've married it.

It's a question of tactics. Civil society does not respond at all well to moralistic scolding. There are small minority groups here and there who are perfectly aware that it is immoral to harm the lives of coming generations by massive consumption now: deep Greens, Amish, people practicing voluntary simplicity, Gandhian ashrams and so forth. These public-spirited voluntarists are not the problem. But they're not the solution either, because most human beings won't volunteer to live like they do. Nor can people be forced to live that way through legal prescription, because those in command of society's energy resources will immediately game and neutralize any system of legal regulation.

However, contemporary civil society can be led anywhere that looks attractive, glamorous and seductive.

The task at hand is therefore basically an act of social engineering. Society must become Green, and it must be a variety of Green that society will eagerly consume. What is required is not a natural Green, or a spiritual Green, or a primitivist Green, or a blood-and-soil romantic Green.

These flavors of Green have been tried, and have proven to have insufficient appeal. We can regret this failure if we like. If the semi-forgotten Energy Crisis of the 1970s had provoked a wiser and more energetic response, we would not now be facing a weather crisis. But the past's well-meaning attempts were insufficient, and are now part of the legacy of a dying century.

The world needs a new, unnatural, seductive, mediated, glamorous Green. A Viridian Green, if you will.

The best chance for progress is to convince the twenty-first century that the twentieth century's industrial base was crass, gauche, and filthy. This approach will work because it is based in the truth. The twentieth century lived in filth. It was much like the eighteenth century before the advent of germ theory, stricken by septic cankers whose origins were shrouded in superstition and miasma. The truth about our physical existence must be shown to people. It must be demonstrated repeatedly and everywhere.

People with networks, websites and sophisticated sensors should not find this task very difficult.

The current industrial base is outmoded, crass and nasty, but this is not yet entirely obvious. Scolding it and brandishing the stick is just part of the approach. Proving it requires the construction of an alternative twenty-first century industrial base which seems elegant, beautiful and refined. This effort should not be portrayed as appropriate, frugal, and sensible, even if it is. It must be perceived as glamorous and visionary. It will be very good if this new industrial base actually functions, but it will work best if it is spectacularly novel and beautiful.

If it is accepted, it can be made to work; if it is not accepted, it will never have a chance to work.

The central target for this social engineering effort must be the people who are responsible for emitting the most CO₂. The people we must strive to affect are the ultrarich. The rentiers, the virtual class, the captains of industry; and, to a lesser extent, the dwindling middle classes. The poor will continue to suffer. There is clearly no pressing reason for most human beings to live as badly and as squalidly as they do. But the poor do not emit much carbon dioxide, so our efforts on their behalf can only be tangential.

Unlike the modernist art movements of the twentieth century, a Viridian culture-industry movement cannot be concerned with challenging people's aesthetic preconceptions. We do not have the 19th-century luxury of shocking the bourgeoisie. That activity, enjoyable and time-honored though it is, will not get that poison out of our air. We are attempting to survive by causing the wealthy and the bourgeoisie to willingly live in a new way.

We cannot make them do it, but if we focussed our efforts, we would have every prospect of luring them into it.

What is culturally required at the dawn of the new millennium is a genuine avant-garde, in the sense of a cultural elite with an advanced sensibility not yet shared by most people, who are creating a new awareness requiring a new mode of life. The task of this avant-garde is to design a stable and sustainable physical economy in which the wealthy and powerful will prefer to live. Mao suits for the masses are not on the Viridian agenda. Couture is on the agenda. We need a form of Green high fashion so appallingly seductive and glamorous that it can literally save people's lives. We have to gratify people's desires much better than the current system does. We have to reveal to people the many desires they have that the current system is not fulfilling. Rather than marshalling themselves for inhuman effort and grim sacrifice, people have to sink into our twenty-first century with a sigh of profound relief.

Allow me to speak hypothetically now, as if this avant-garde actually existed, although, as we all know, it cannot possibly come into being until January 3, 2000. Let's discuss our tactics. I have a few cogent suggestions to offer.

We can increase our chances of success by rapidly developing and expanding the postmodern culture industry. Genuine "Culture" has "art" and "thought," while the Culture Industry merely peddles images and information.

I know this. I am fully aware of the many troubling drawbacks of this situation, but on mature consideration, I think that the Culture Industry has many profound advantages over the twentieth century's physically poisonous smokestack industries. Also, as digital technologists, thinkers, writers, designers, cultural critics, and so weiter, we Viridians suspect that the rise of the Culture Industry is bound to increase our own immediate power and influence vis-a-vis, say, coal mining executives. This may not be an entirely good thing. However, we believe we will do the world less immediate damage than they are doing.

We therefore loudly demand that the Culture Industry be favored as a suitably twenty-first century industrial enterprise. Luckily the trend is already very much with us here, but we must go further; we believe in Fordism in the Culture Industry. This means, by necessity, leisure. Large amounts of leisure are required to appreciate and consume cultural-industrial products such as movies, software, semi-functional streaming media and so on. Time spent at more traditional forms of work unfairly lures away the consumers of the Culture Industry, and therefore poses a menace to our postindustrial economic underpinnings.

"Work" requires that people's attention be devoted to other, older, less attractive industries. "Leisure" means they are paying attention and money to us.

We therefore demand much more leisure for everyone. Leisure for the unemployed, while copious, is not the kind of "leisure" that increases our profits. We specifically demand intensive leisure for well-educated, well-heeled people. These are the people who are best able to appreciate and consume truly capital-intensive cultural products.

We Viridians suspect that it would require very little effort to make people work much less. Entirely too much effort is being spent working. We very much doubt that there is anything being done in metal-bending industry today that can justify wrecking the atmosphere. We need to burn the planetary candle at one end only (and, in daylight, not at all).

As much time as possible should be spent consuming immaterial products. A global population where the vast majority spend their time sitting still and staring into screens is a splendid society for our purposes. Their

screens should be beautifully designed and their surroundings energy-efficient. The planet will benefit for everyone who clicks a mouse instead of shovelling coal or taking an axe and a plow to a rain forest.

The tourist industry is now the number one industry on the planet. Tourists consume large amounts of pre-packaged culture. We believe tourism to be a profoundly healthy development. We feel we must strongly resist the retrograde and unprofitable urge to make migrants and migration illegal.

Given the unstable condition of the environment, this practice may soon become tantamount to genocide. It is also palpably absurd to live in a society where capital can move faster and more easily than human beings. Capital exists for the sake and convenience of human beings.

We believe that the movement of human beings across national boundaries and under the aegis of foreign governments is basically a design problem. If guest workers, refugees, pleasure travellers and so forth were all electronically tracked via satellite or cell repeaters, the artificial division between jet setters and refugees would soon cease to exist. Foreigners are feared not merely because they are foreign, but because they are unknown, unidentified, and apparently out of local social control.

In the next century, foreigners need be none of these things. Along with their ubiquitous credit cards and passports, they could carry their entire personal histories. They could carry devices establishing proof of their personal bona fides that would be immediately obvious to anyone in any language. A better designed society would accommodate this kind of human solidarity, rather than pandering to the imagined security needs of land-based national regimes.

We believe that it should be a general new design principle to add information to a problem, as opposed to countering it with physical resources (in the case of migrants, steel bars and barbed wire). Electronic tracking seems a promising example. While the threat to privacy and anonymity from electronic parole is obviously severe, there is nothing quite so dreadful and threatening as a septic refugee camp. We consider this a matter of some urgency. We believe it to be very likely that massive evacuations will occur in the next few decades as a matter of course, not merely in the disadvantaged Third World, but possibly in areas such as a new American Dust Bowl. Wise investments in electronic tourist management would be well repaid in stitching the fraying fabric of a weather-disrupted civilization.

For instance, we would expect to see one of the first acts of 21st century disaster management to be sowing an area with air-dropped and satellite-tracked cellphones. We believe that such a tracking and display system could be designed so that it would not be perceived as a threat, but rather as a jet-setter's prestige item, something like a portable personal webpage. We believe such devices should be designed first for the rich. The poor need them worse, but if these devices were developed and given to the poor by socialist fiat, this would be (probably correctly) suspected as being the first step toward police roundup and a death camp.

Replacing natural resources with information is a natural area for twenty-first century design, because it is an arena for human ingenuity that was technically closed to all previous centuries. We see considerable promise in this approach. It can be both cheap and glamorous.

Energy meters, for instance, should be ubiquitous. They should be present, not in an obscure box outside the home, but enshrined within it. This is not a frugal, money-saving effort. It should be presented as a luxury. It should be a mark of class distinction. It should be considered a mark of stellar ignorance to be unaware of the source of one's electric power. Solar and wind power should be sold as premiums available to particularly affluent and savvy consumers. It should be considered the stigma of the crass proletarian to foul the air every time one turns on a light switch.

Environmental awareness is currently an annoying burden to the consumer, who must spend his and her time gazing at plastic recycling labels, washing the garbage and so on. Better information environments can make the invisible visible, however, and this can lead to a swift re-evaluation of previously invisible public ills.

If one had, for instance, a pair of computerized designer sunglasses that revealed the unspeakable swirl of airborne combustion products over the typical autobahn, it would be immediately obvious that clean air is a luxury. Infrasonic, ultrasound and sound pollution monitors would make silence a luxury. Monitor taps with intelligent water analysis in real-time would make pure water a luxury. Lack of mutagens in one's home would become a luxury.

Freedom from interruption and time to think is a luxury; personal attention is luxury; genuine neighborhood security is also very much to be valued. Social attitudes can and should be changed by the addition of cogent information to situations where invisible costs have long been silently exported into the environment. Make the invisible visible. Don't sell warnings. Sell awareness.

The fact that we are living in an unprecedentedly old society, a society top-heavy with the aged, offers great opportunity. Long-term thinking is a useful and worthwhile effort well suited to the proclivities of old people.

Clearly if our efforts do not work for old people (a large and growing fraction of the G-7 populace) then they will not work at all. Old people tend to be generous, they sometimes have time on their hands. Electronically connected, garrulous oldsters might have a great deal to offer in the way of managing the copious unpaid scutwork of electronic civil society. We like the idea of being a radical art movement that specializes in recruiting the old.

Ignoring long-term consequences is something we all tend to do; but promulgating dangerous falsehoods for short-term economic gain is exceedingly wicked and stupid. If environmental catastrophe strikes because of CO₂ emissions, then organizations like the anti-Green Global Climate Coalition will be guilty of negligent genocide. Nobody has ever been guilty of this novel crime before, but if it happens, it will certainly be a crime of very great magnitude. At this moment, the GCC and their political and economic allies are, at best, engaged in a risky gamble with the lives of billions. If the climate spins out of control, the 21st century may become a very evil place indeed.

The consequences should be faced directly. If several million people starve to death because, for instance, repeated El Nino events have disrupted major global harvests for years on end, then there will be a catastrophe. There will be enormous political and military pressures for justice and an accounting.

We surmise that the best solution in this scenario would be something like the Czech lustration and the South African truth commissions. The groundwork for this process should begin now. The alternatives are not promising: a Beirut scenario of endless ulcerous and semi-contained social breakdown; a Yugoslav scenario of climate-based ethnic cleansing and lebensraum; a Red Terror where violent panic-stricken masses seek bloody vengeance against industrialism. Most likely of all is a White Terror, where angry chaos in the climatically disrupted Third World is ruthlessly put down by remote control by the G7's cybernetic military. It is very likely under this last scenario that the West's gluttonous consumption habits will be studiously overlooked, and the blame laid entirely on the Third World's exploding populations. (The weather's savage vagaries will presumably be blamed on some handy Lysenkoist scapegoat such as Jews or unnatural homosexual activities.)

With the Czech lustration and the South African truth commissions, the late 20th century has given us a mechanism by which societies that have drifted into dysfunctional madness can be put right. We expect no less for future malefactors whose sly defense of an indefensible status quo may lead to the deaths of millions of people, who derived little benefit from their actions and were never given any voice in their decisions. We recommend that dossiers be compiled now, for the sake of future international courts of justice. We think this work should be done quite openly, in a spirit of civic duty. Those who are risking the lives of others should be made aware that this is one particular risk that will be focussed specifically and personally on them.

While it is politically helpful to have a polarized and personalized enemy class, there is nothing particularly new about this political tactic. Revanchist sentiment is all very well, but survival will require a much larger vision. This must become the work of many people in many fields of labor, ignoring traditional boundaries of discipline and ideology to unite in a single practical goal: climate.

A brief sketch may help establish some parameters.

Here I conclude with a set of general cultural changes that a Viridian movement would likely promulgate in specific sectors of society. For the sake of brevity, these suggestions come in three parts. (Today) is the situation as it exists now. (What We Want) is the situation as we would like to see it. (The Trend) the way the situation will probably develop if it follows contemporary trends without any intelligent intervention.

The Media

Today, Publishing and broadcasting cartels surrounded by a haze of poorly financed subcultural microchannels.

What We Want: More bandwidth for civil society; multicultural variety, and better-designed systems of popular many-to-many communication, in multiple languages through multiple channels.

The Trend: A spy-heavy, commercial Internet. A Yankee entertainment complex that entirely obliterates many non-Anglophone cultures.

The Military

Today: G-7 Hegemony backed by the American military.

What We Want: A wider and deeper majority hegemony with a military that can deter adventurism, but specializes in meeting the immediate crises through civil engineering, public health and disaster relief.

The Trend: Nuclear and biological proliferation among minor powers.

Business

Today: Currency traders rule banking system by fiat; extreme instability in markets; capital flight but no labor mobility; unsustainable energy base

What We Want: Nonmaterial industries; vastly increased leisure; vastly increased labor mobility; sustainable energy and resources

The Trend: commodity totalitarianism, crony capitalism, criminalized banking systems, sweatshops

Industrial Design

Today: very rapid model obsolescence, intense effort in packaging; CAD/CAM

What We Want: intensely glamorous environmentally sound products; entirely new objects of entirely new materials; replacing material substance with information; a new relationship between the cybernetic and the material

The Trend: two design worlds for rich and poor consumers; a varnish on barbarism

Gender Issues

Today: more commercial work required of women; social problems exported into family life as invisible costs

What We Want: declining birth rates, declining birth defects, less work for anyone, lavish support for anyone willing to drop out of industry and consume less

The Trend: more women in prison; fundamentalist and ethnic-separatist ideologies that target women specifically

Entertainment

Today: large-scale American special-effects spectacle supported by huge casts and multi-million-dollar tie-in enterprises

What We Want: glamour and drama; avant-garde adventurism; a borderless culture industry bent on Green social engineering

The Trend: annihilation of serious culture except in a few non-Anglophone societies

International Justice

Today: dysfunctional but gamely persistent War Crimes tribunals

What We Want: Environmental Crime tribunals

The Trend: justice for sale; intensified drug war

Employment

Today: MacJobs, burn-out track, massive structural unemployment in Europe

What We Want: Less work with no stigma; radically expanded leisure; compulsory leisure for workaholics; guaranteed support for people consuming less resources; new forms of survival entirely outside the conventional economy

The Trend: increased class division; massive income disparity; surplus flesh and virtual class

Education

Today: failing public-supported schools

What We Want: intellectual freedom, instant cheap access to information, better taste, a more advanced aesthetic, autonomous research collectives, lifelong education, and dignity and pleasure for the very large segment of the human population who are and will forever be basically illiterate and innumerate

The trend: children are raw blobs of potential revenue-generating machinery; universities exist to supply middle-management

Public Health

Today: general success; worrying chronic trends in AIDS, tuberculosis, antibiotic resistance; massive mortality in nonindustrial world

What We Want: unprecedentedly healthy old people; plagues exterminated worldwide; sophisticated treatment of microbes; artificial food

The Trend: Massive dieback in Third World, septic poor quarantined from nervous rich in G-7 countries, return of 19th century sepsis, world's fattest and most substance-dependent populations

Science

Today: basic science sacrificed for immediate commercial gain; malaise in academe; bureaucratic overhead in government support

What We Want: procedural rigor, intellectual honesty, reproducible results; peer review, block grants, massively increased research funding, massively reduced procedural overhead; genius grants; single-author papers; abandonment of passive construction and the third person plural; "Science" reformed so as to lose its Platonic and crypto-Christian elements as the "pure" pursuit of disembodied male minds; armistice in Science wars

The Trend: "Big Science" dwindles into short-term industrial research or military applications; "scientists" as a class forced to share imperilled, marginal condition of English professors and French deconstructionists.

I would like to conclude by suggesting some specific areas for immediate artistic work. I see these as crying public needs that should be met by bravura displays of raw ingenuity.

But there isn't time for that. Not just yet.

Bruce Sterling

I'd still like to see opportunities for non-Y2K compliant art realized.

Running on certified non-compliant ...ware (may be cheap next year), with non-compliant power supply, transport with non-compliant swissair 111 planes and criticised in non-compliant cnn-hurricane media.

It is a pity that we cannot put our system into the hands of external consultants. Keep the faith! Finding a way to fix it is really too complicated.

Make a backup and reinstall your website at a Y2K compliant provider on Jan 3rd,2000 if it need be.

Bruce:

Bravo! Hilarious!!

Whata joker . . . you've really done it now. Talk about stand-up
epistemology. Or, rather, stand-up epidemiology!

One can only hope that your silliness becomes very widely contagious. Silly
people all over the place. Dropping like flies in a cloud of Burrough's bug-
juice . . . from excruciatingly paralyzing laughter, n'est pas?

Let's see, how long has this joke been making the rounds? 30 years? 70
years? H.G. Wells' "The Open Conspiracy" was first published in 1928. Now,
that's a truly funny manifesto. You greatly admire Wells, as I recall. He's
your sci-fi inspiration-hero, right? Yes, your "manifesto" does have a noble
comic(book)-parentage. Viridians! Ever hear about the "New Samurais"?

[OK, check out <http://www.micro.com/~lorddev>, for a few more hints on the
comedy behind this fascinating "manifesto." I just can't decide which Sub-
Order I wish to join. Do I want to join Caitiff or Ouroboros or Oblivion,
Shadow Circle, Aredia or The Downward Spiral? Mighty attractive. Maybe I
should start my own Sub-Order and get on the Viridian Council. Yum, yum.]

Or, is this an the intended sequel to Kenneth Boulding's famous put-on, "The
Report From Iron Mountain"? What happens when "Anti-War" doesn't
bang your
gong? I've got it . . . let's have an "Earth Day." Or, was that a "Net Day"?
I forget. Just ask the "Invisible College", they'll know.

Panic. Fix the world with Culture. Social Engineer away humanity. Social
Psychology to the rescue. Seduce them with glamour. "Gratify people's
desires." "Green high fashion." How delicious. How goofy.

And, in case your appeal to saving the starving masses isn't funny enough
(which, of course, it won't be, for the obvious reason that starving isn't
funny), you offer . . . power and influence. To "we Viridians"!
Ouroborosians Unite!

You say, "Also, as digital technologists, thinkers, writers, designers,
cultural critics, and so weiter, we Viridians suspect that the rise of the
Culture Industry is bound to increase our own immediate power and influence .
." More power and influence than whom? "Vis-a-vis, say, coal mining
executives" you continue. Brilliant satire.

Everyone knows there are no coal mining executives any more. Pneumatic
interns in thong underwear have more power and influence than those long-
disappeared "coal mining executives." But, be careful, you might let it slip
out. You don't want to make getting the joke too easy, do you? Make people
work for it, OK?

"Power and influence." My, My. Are you offering now-empty seats on your
"Viridian" Global Business Network roundtable (which you gleefully refer to as
the "Hippie Trilateral Commission") to actual artists? Activists? Nettimers?
Und so weiters? Hilarious. Stand-up epidemiology.

After the GBN's ultimate scenario-man, Peter Schwartz, leveraged himself into
earthorbit and placed all his chips on "The Long Boom" (WIRED 5.07) and his
scheme exploded in everyone's face in less than one year -- Kaboom -- what's a
jokester to do? Admit that it was all a joke? Tell the truth, the whole
truth and nothing but the truth? No, no, no. It's far too late for that.

How about following Alan Arkin's famous advise? Go serpentine! They'll never
be able to hit you that way.

Did Schwartz discuss global financial piracy? No. Did you? No.

Serpentine. Ignore the real culprits.

Did Schwartz discuss the replacement of humanity with replicants? No. Did
you? No.

Serpentine. Ignore the real problem.

Did Schwartz discuss real energy and health breakthroughs? No. Did you? No.

Serpentine. Ignore the real solutions. The human solution.

Peter Lamborn Wilson's (aka Hakim Bey's) lecture last week in New York on
the origins of shamanism was really refreshing. And honest. He simply wants
to be a Neanderthal. Really. He "resembles that remark." Truthfully. The hell
with your blue-green "Viridians." The hell with your "glamour." The hell
with your software communism. Back to the Cave! Grrrrr!!

You want to end humanity? You have two choices. Take the esoteric road or
the exoteric road. High road or low road? Which one gets you to Scotland
afore yet?

Esoteric. You can joke your way into Oblivion -- stand-up epidemiology.
Infect 'em. Germ 'em to death. Meme-virus-brainblast 'em until they are so
"mediated" that they don't remember what it was like to not be medicated.
Offer 'em anything . . . especially "power and influence." Silly, silly,
silly.

Exoteric. Or, you can tell the truth. You really want to reduce global
energy-flux density? Be honest. Cut the CO₂ crap. If you think there are
too many people, indeed, if you think we'd be better off without people at
all, admit that you're a leading sponsor for what you term "negligent
genocide." Yipes. How about "species-cide"? Humans as the only endangered
species? Now that would be honest, n'est pas?

Get historic. Get explicit. Where did we go wrong? How about the story
about when the Cro-Magnons usurped the Neanderthals. How about that
marvelous
"Bad Seed" story? Sound familiar? Ask Peter about it. He feels it all the
way down to this oddly long second toe.

But, the world can only take so many PLW/HB's, right? (Gee, Cindy, I don't
know about those Neanderthals. They look, well you know, odd.) And, the
world loves a good epidemiologist-comedian, right? (He looks so human,
doesn't he Cindy? Kinda cute, right? And, so lifelike.)

Congratulations. We all needed a good laugh since Barlow hung up his
keyboard. Silly, silly, silly.

Best,

Mark Stahlman

Hi

Looking back over the last months mail, there's no evidence that you all
got the email below on Manifesto-isms (admittedly a little bit
biblic-istic in terms of what did 'Old Beardo' really say, but hey...) Or
did you already get it?

ps. I notice that the despite the Ringitt crisis in Malaysia PM Mahathir
is not delaying the airport development, which is an integral part of
the MultiScience Corridor (discussed briefly on this list), at least in
terms of attractive profitability for R + D concerns that might want to
locate there. However the Cyberjaya (electronic Government - whatever
that is) part of the project has been stalled.

<nettime> THE DIGITAL ARTISANS MANIFESTO

From: Anonymous
To: nettime-l@desk.nl
Date: Mon, 19 May 1997 22:14:24
+0200 (MET DST)

THE DIGITAL ARTISANS MANIFESTO

MAKING THE FUTURE

1. We are the digital artisans. We celebrate the Promethean power of our labour and imagination to shape the virtual world. By hacking, coding,

designing and mixing, we build the wired future through our own efforts and inventiveness.

2. We are not the passive victims of uncontrollable market forces and technological changes. Without our daily work, there would be no goods or services to trade. Without our animating presence, information technologies would just be inert metal, plastic and silicon. Nothing can happen inside cyberspace without our creative labour. We are the only subjects of history.
3. The emergence of the Net signifies neither the final triumph of economic alienation nor the replacement of humanity by machines. On the contrary, the information revolution is the latest stage in the emancipatory project of modernity. History is nothing but the development of human freedom.
4. We will shape the new information technologies in our own interests. Although they were originally developed to reinforce hierarchical power, the full potential of the Net and computing can only be realised through our autonomous and creative labour. We will transform the machines of domination into the technologies of liberation.
5. We will contribute to the process of democratic emancipation. As digital artisans, we will come together to promote the development of our trade. As citizens, we will participate within republican politics. As Europeans, we will help to break down national and ethnic barriers both inside and outside of our continent.

THE PRESENT MOMENT

6. Freedom today is now often just the choice between commodities rather the ability to determine our own lives. Over the past two hundred years, the factory system has dramatically increased our material wealth at the cost of removing all meaningful participation in work. Even poorer members of European societies can now live better than the kings and aristocrats of earlier times. However the joys of consumerism are usually constrained by the boredom of most jobs.
7. Since 1968, the desire for increased monetary rewards has increasingly been supplemented by demands for increased autonomy at work. In the European Union and elsewhere, neo-liberals have tried to recuperate these aspirations through their policies of marketisation and privatisation. If we are talented workers in the 'cutting-edge' industries like hypermedia and computing, we are promised the possibility of becoming hip and rich entrepreneurs by the Californian ideologues. They want to recruit us as members of the 'virtual class' which seeks to dominate the hypermedia and computing industries.
8. Yet these neo-liberal panaceas provide no real solutions. Free market policies don't just brutalise our societies and ignore environmental degradation. Above all, they cannot remove alienation within the workplace. Under neoliberalism, individuals are only allowed to exercise their own autonomy in deal-making rather than through making things. We cannot express ourselves directly by constructing useful and beautiful virtual artifacts.
9. For those of us who want to be truly creative in hypermedia and computing, the only practical solution is to become digital artisans. The rapid spread of personal computing and now the Net are the technological expressions of this desire for autonomous work. Escaping from the petty controls of the shopfloor and the office, we can rediscover the individual independence enjoyed by craftspeople during proto-industrialism. We rejoice in the privilege of becoming digital artisans.
10. We create virtual artifacts for money and for fun. We work both in the money-commodity economy and in the gift economy of the Net. When we take a contract, we are happy to earn enough to pay for our necessities and luxuries through our labours as digital artisans. At the same time, we also enjoy exercising our abilities for our own amusement and for the wider community. Whether working for money or for fun, we always take pride in our craft skills. We take pleasure in pushing the cultural and technical limits as far forward as possible. We are the pioneers of the modern.
11. The revival of artisanship is not a return to a low-tech and impoverished past. Skilled workers are best able to assert their autonomy precisely within the most technologically advanced industries. The new artisans are better educated and can earn much more money. In earlier stages of modernity, factory labourers symbolised of the promise of industrialism. Today, as digital artisans, we now express the emancipatory potential of the information age. We are the promise of history.
12. We not only admire the individualism of our artisan forebears, but also we will learn from their sociability. We are not petit-bourgeois egoists. We live within the highly collective institutions of the market and the state. For many people, autonomy over their working lives has often also involved accepting the insecurity of shortterm contracts and the withdrawal of welfare provisions. We can only mitigate these problems through our own collective action. As digital artisans, we need to come together to promote our common interests.
13. We believe that digital artisans within this continent now need to form their own craft organisation. In early modernity, artisans enhanced their individual autonomy by organising themselves into trade associations. We proclaim that the collective expression of our trade will be: the European Digital Artisans Network (EDAN).

14. We urge everyone who is working within hypermedia, computing and associated professions on this continent to join EDAN. We call on digital artisans to form branches of the network in each of the member states of the European Union and its associated countries. By forming EDAN, we will also be creating a means of forging links between European digital artisans and those from elsewhere in the world. We will strive for cooperation in work and in play with our fellow artisans in all countries.
15. We believe that the principal task of EDAN is to enhance the exercise of our craft skills. By collaborating together, we can protect ourselves against those who wish to impose their selfinterests upon us. By having a strong collective identity, we will enjoy more individual autonomy over our own working lives.
16. EDAN will celebrate our creative genius as digital artisans. The network will act as the collective memory about the achievements of digital artisans within Europe. It will publicise outstanding 'masterpieces' of craft skill made by its members among the trade and to the wider public.
17. The network will be the social meeting-place for digital artisans from across Europe. EDAN will organise festivals, conferences and congresses where we can meet to organise, discuss and party. We believe that digital artisans should express their collective identity by regularly celebrating together in private and public.
18. EDAN will collect detailed knowledge about the trade in the different regions of Europe. It will aim to provide information about best practice in contracts, copyright agreements and other business arrangements to its members. The network will also be a source of contacts in each locality for digital artisans looking for work in different areas of Europe.
19. We believe that what cannot be organised by our own autonomous efforts can only be provided through democratic political institutions. The network will lobby for changes in local, national and European legislation which can enhance our working lives as digital artisans. As concerned citizens, we will also support the fullest development of public welfare services.
20. EDAN will campaign for European governments to put more resources into the theoretical and practical education of digital artisans in schools and universities. The network will facilitate links between educational institutions teaching hypermedia and computing across the continent. EDAN also believes that publicly-funded research is necessary for the fullest development of our industry.
21. EDAN will urge the European Union to launch a public works programme to
 - build a broadband fibreoptic network linking all households and businesses. We believe in the principle of universal service: everyone should have Net access at the cheapest possible price. No society can call itself truly democratic until all citizens can directly exercise their right to media freedom over the Net.
 22. We will campaign for the creation of 'electronic public libraries' where on-line educational and cultural resources are made accessible to everyone for free. Public investment in digital methods of delivering life-long learning is needed to create an information society. The Net should become the encyclopedia of all knowledge: the primary resource for the new Enlightenment.
 23. We believe that the role of the hi-tech gift economy should be further enhanced. As the history of the Net has shown, d.i.y. culture is now an essential part of the process of social development. Without hacking, piracy, shareware and open architecture systems, the limitations of the money-commodity economy would have prevented the construction of the Net.

EDAN also supports open access as means of people beginning to learn the skills of hypermedia and computing. The promotion of d.i.y. culture within the Net is now a precondition for the successful construction of cyberspace.

24. We are the digital artisans. We are building the information society of the future. We have come together to advance our collective interests and those of our fellow citizens. We are organised as the European Network of Digital Artisans. Join us.

Digital Artisans of Europe Unite!

To: nettime-l@desk.nl

Date: Tue, 20 May 1997 07:32:38 -0700 (PDT)

Mr. Anonymous (aka nobody):

Just a few questions . . .

- 1) This is a joke, right? I've been following your postings for years (anonymous is your real name, correct?) and you always seem to be posting elaborate jokes. EDAN is an Englishman's pun on EDEN, right? This is another Joni Mitchell riff about getting back in the garden, non?
- 2) As soon as someone starts to produce some real value (let alone some real beauty) in "hypermedia", then you might have a point or two about artisanship. However, that doesn't seem likely to happen any time soon. WIRED loses money faster than they win awards or attract gadflies. You might want to check out the economics of computing before you go off and launch a theoretical journal on the topic. It's mostly about displacing people with machines, increasing the "velocity" of money in derivatives markets and extending the reach of "electronic narcotics." You have been reading the thread on net.art, haven't you?
- 3) The most important people in the Information (Propaganda) Age have already been defined and the literature on this new class formation is voluminous -- and guess what, it ain't you, it's the utopian/technocrats. H.G. Wells called them the "New Samurais" and the "Open Conspiracy", Vlahos calls them the "Brain Lords" but you can say "virtual class", if you insist, although it loses much of its spiciness in that formulation. In any event, it's not the slaves at the keyboards. That's why they're called slaves at the keyboards, BTW.
- 4) At least Marx seemed to have some idea what he was up against when he wrote his manifesto. Since this is all a joke (including my reply), there is no reason why historical accuracy or comprehension of power and politics is needed. But, do you have any idea what/who you are up against? Oh yeah, that's the joke, I forgot.

Meanwhile, sign me up. My membership check is in the mail -- the email, of course. Sounds like you have a winning idea here. Smashing.

Mark Stahlman-

x-keywords: internet -cyberspace -nettime -pan-capitalism -NGO -content

29.5.1997, The Piran Nettime Manifesto

A PRESS RELEASE by Nettime (Vienna ad-hoc committee)

PRESS CONFERENCE 29.5.1997 19:00
Public Netbase Media~Spacel, Museumsquartier, Museumsplatz 1,
Vienna/Austria Thursday, 29.5.1997 19:00
Participants: Pit Schultz (Berlin), Geert Lovink (Amsterdam), Critical Art
Ensemble (Chicago), Diana McCarty (Budapest),
Marko Peljhan (Ljubljana), Oliver Marchart (Wien),
Peter Lamborn Wilson (New York)

"Why do you rob banks?"
"Because that's where the money is." (Willie Sutton, famous bank robber)

Last week Nettimers frolicked in the real space/time continuum on the
Slovenian coast in the town of Piran where the following bullets were
established:

- Nettime declares Information War.
- We denounce pan-capitalism and demand reparations. Cyberspace is where
your bankruptcy takes place.
- Nettime launches crusade against data barbarism in the virtual holy land.
- We celebrate the re-mapping of the Ex-East/Ex-West and the return to
geography.
- We respect the return to "alt.cultures" and pagan software structures
("It's normal").
- Deprivatize corporate content, liberate the virtual enclosures and storm
the content castles!
- Refuse the institutionalization of net processes.
- We reject pornography on the net unless well made.
- We are still, until this day, rejecting make-work schemes and libertarian
declarations of independence.
- NGOs are the future oppressive post-governments of the world.
- We support experimental data transfer technology.
- Participate in the Nettime retirement plan, zero work by age 40.
- The critique of the image is the defense of the imagination.
- Nettime could be Dreamtime.

Questions can be addressed to the participants at the Nettime press
conference, Public Netbase, Museumsquartier, Vienna, 29.5.1997, 19:00 hours

On whom and to what end?

> We denounce pan-capitalism and demand reparations. Cyberspace is where
> your bankruptcy takes place.

Reparations from whom and for what? It seems to me that pan-capitalism is
the natural state of things unless you have sufficiently authoritarian
governments to impose planned economies. The latter seem to have failed
universally. What's your alternative?

> Nettime launches crusade against data barbarism in the virtual holy land.

What is data barbarism? What part of Cyberspace is holy and what is profane?

> We celebrate the re-mapping of the Ex-East/Ex-West and the return to
> geography.

You mean you want to return to all the lines on the map? Don't you think
enough wars have been fought over those lines already?

> We respect the return to "alt.cultures" and pagan software structures

I'm with you there.

> ("It's normal").

Huh?

> the content castles!

Do you mean nationalize corporate content then? That doesn't sound
feasible. Or simply declare an end to copyright in Cyberspace? I could
certainly support you there.

> Refuse the institutionalization of net processes.

This seems to fly directly in the face of your rejection of "libertarian
declarations of independence." Unless you simply mean such declarations as
made by me.

> We reject pornography on the net unless well made.

And who will decide what pornography is well made? Is there a Bad
Housekeeping Seal of Approval or something?

> We are still, until this day, rejecting make-work schemes and libertarian
> declarations of independence.

Don't worry, I've learned my lesson. But what do you mean by "make-work
schemes"?

> NGOs are the future oppressive post-governments of the world.

Do you have an alternative model for governance?

Like, um, telepathy, maybe?

> Participate in the Nettime retirement plan, zero work by age 40.

After which the bills are paid by whom?

This must be some kind of artcrit code. Could you elaborate, please?

You mean in the Aboriginal sense?
All in all, a mystifying manifesto. I look forward to clarification.

Warmest regards,

John Perry---

If I may ask: Why? I'm sure various people have various ideas about this, but fractionalism is one thing, but separatism quite another. This "manifesto" doesn't especially summarize anything that "I" saw or heard in Ljubljana--not any decisions, and certainly none of the debates. (Saying that implies no stand on the manifesto's content.)

>> We denounce pan-capitalism and demand reparations. Cyberspace is where
>> your bankruptcy takes place.
>
> Reparations from whom and for what? It seems to me that pan-capitalism is

> universally. What's your alternative?

If "pan-capitalism" is "the natural state of things," then there's no point in talking about it: it has all the conceptual clarity of the word "stuff." I suppose you can evaluate "the natural state of things" in a positive way, but what you're pretty much saying that the world's a great place. Indeed it is--now what? Well, now we'll need to think about it in clear terms that convey *some* amount of specificity. So let's do that... The notion that every regime that has imposed a planned economy has failed is clearly false: there's been a recent wave of collapsing governments in a specific region, and they followed a limited range of economic planning strategies; but they were never the monolithic bogey that the US made them out to be when they were in power--and nor were they the only examples of "planned economies." No amount of quibbling can change the fact that every major industrialized country imposes an incredibly wide range of procedures that serve to regulate their economies, and to do so with the aim of meeting very specific goals: *planning*. And they *all* do so through a range of techniques, which rely on both "incentives" and "coercion." So we have a spectrum or continuum of governmental techniques and styles of economic planning; some work better than others. For now, at least; wait two or ten years--your "results" will be quite different. So is this evanescent, shifting state of affairs "pan-capitalism"? I don't think so, for the quite simple reason this state of affairs--a hodgepodge of regimes using a mishmash of techniques to manage their economies--has lasted for as long as anyone can remember, certainly before industrialization and before feudalism too. Maybe that brings us full circle, to the claim that pan-capitalism is somehow "natural"; but if it does, it does nothing else--and leaves us wondering whether you're claiming that whatever you mean by "planned economies" was unique in all of world history as an unnatural creation of man. Thus genocide would be natural, atomic or genetic manipulations would be natural, even the histories of art, architecture, music, dance would be natural, but--I'll assume--Marxian-inspired socialism alone was somehow un-natural. It's possible you believe this, though I really doubt it. However that may be, your request for an alternative really has to be disingenuous: you're asking people to propose an alternative to "nature." I can't imagine that anyone would answer you or that you would for a second actually consider their suggestion if they did.

Re: <nettime> The Piran Nettime Manifesto

From: Mark Stahlman (via RadioMail)

To: nettime-l@desk.nl

Date: Tue, 27 May 1997 09:28:37 -0700 (PDT)

Folks:

Great work! Thanks for all the help, kindness and provocations in Ljubljana. Due to a transport strike, Ted Byfield and I couldn't attend the final hours but, nonetheless, our dreams were with you.

On the manifesto:

-- Nettime declares Information War.

Information War is also a name used to describe an attack on traditional war-fighting capabilities by exaggerating the importance of information and computers in real-world conflicts. It's the name for everything from smart-bombs to aggressive new surveillance techniques and it's like putting Toffler et al in charge of the war machine. Is it possible that what you meant was to declare war on these utopian-warriors and their attempt to virtualize all reality through a cloud of total propaganda?

-- We denounce pan-capitalism and demand reparations. Cyberspace is where your bankruptcy takes place.

As we've discussed, "capital" now rules globally and it, in turn, has many aspects. "Productive capital" is quite different from "Finance capital", for instance. Furthermore, real bankruptcy for this system would likely mean a collapse of international payments settlements agreements and very real agony of apocalyptic proportions. Is this our goal? Burn, baby burn!

-- Nettime launches crusade against data barbarism in the virtual holyland.

Do you mean propaganda? Why use neo-logisms when perfectly good words already exist? Neat metaphor but who are the "infidels" and what is "fidelity", exactly?

-- We celebrate the re-mapping of the Ex-East/Ex-West and the return to geography.

Yes, this is truly the reason why nettime exists, isn't it?

-- We respect the return to "alt.cultures" and pagan software structures. ("It's normal!").

So, at last a positive program we can all plug into! Revive paganism without the barbarism! Yeah! That's funny, I thought that's what the techno-utopians were aiming for as they re-program humanity. Hey, which side are we on anyway?

-- Deprivatize corporate content, liberate the virtual enclosures and storm the content castles!

Is there really anything in there that you want? Remember, the audience is the content.

-- Refuse the institutionalization of net processes.

I'm hearing about some amazing plans by the U.S. (Gore/Hundt) to "take-over" the Internet. We might have to do more than "refuse" if we are to be effective.

-- We reject pornography on the net unless well made.

As in "Hairy Babes" or what?

-- We are still, until this day, rejecting make-work schemes and libertarian declarations of independence.

That's a relief. So I guess the rumor that WIRED was funding a nettime event in San Francisco isn't true then?

-- NGOs are the future oppressive post-governments of the world.

Yup, they should be called PGO's -- or for those of you familiar with the philosophical cartoon about that wily possum and his friends, PoGO's.

-- We support experimental data transfer technology.

Exactly who's experimenting on whom here?

-- Participate in the Nettime retirement plan, zero work by age 40.

I highly recommend it. I found that 10+ years of fairly commercial work was a necessary first step, however.

-- The critique of the image is the defense of the imagination.

And, hermetic equals hermeneutic, too. However, imagination is not the

same as creativity. But, you all know that.

-- Nettime could be Dreamtime.

Since only conscious humans dream, I would hope so.

So, let's see. We are against:

(Whoever we are declaring "Information War" against), pan-capitalism, data-barbarism, institutionalization, badly made pornography, libertarianism and NGO's.

And, we are for:

Reparations, bankruptcy (for our enemies), re-mapping geography, paganism, deprivatization, well made pornography, experimental data transfer, retirement, critique, imagination and dreamtime.

Well, I'm for Humanity, Creativity and Productivity (and having arguments with people's mothers) which overlaps quite a lot with this manifesto. I think. Have a great time at the press conference; I wish I could be there.

Mark Stahlman

nettime: CALL FOR MANIFESTOE

From: nettime maillist

To: nettime-l@desk.nl

Date: Wed, 11 Dec 1996 02:34:05
+0100 (GMT+0100)

Attention Dadaists, Howlers, Prowlers, Cranks, Despots, Zealots, 'Pataphysicians and Misunderstood Prophets!

As part of the blastydrama we are providing a constructivist-inspired-screen/tribune/stand/kiosk-stageset vehicle and a captive audience for your proscriptive rhetoric.

We invite you to come to the Sandra Gering Gallery to read, chant, or rant your manifesto from atop our platform.

We believe that the literary form of the manifesto has too long been associated with crackpots, bombasts and Italians.

We would like to rescue the manifesto from the dusty, smoke-filled recesses of art history. Come help us to free this powerful form from the degraded and underappreciated hovel where it now shudders, under the thumb of clods like the Unabomber.

Your manifesto may take any form and be of any length so long as it doesn't take more than 10 minutes to spew forth.

If you cannot be present physically to perform your manifesto, feel free to email it to blastydrama and we will enlist some fanatic to read it live.

Readings will be held on Saturday, 28 December 1996 beginning at 3 p.m. at Sandra Gering Gallery, 476 Broome Street, New York, and will be broadcast on the Web on December 29 and 30 at the blastydrama theater of operations (<http://www.interport.net/~xaf>).t

Bitch Mutant Manifesto

The atomic wind catches your wings and you are propelled backwards into the future, an entity time travelling through the late C20th, a space case, an alien angel maybe, looking down the deep throat of a million catastrophes.

screenflash of a millionmillion conscious machines

burns brilliant

users caught in the static blitz of carrier fire

unseeing the download that scribbles on their burntout retinas

seize in postreal epileptic bliss

eat code and die

Sucked in, down through a vortex of banality. You have just missed the twentieth century. You are on the brink of the millenium - which one - what does it matter? It's the cross dissolve that's captivating. The hot contagion of millenia fever fuses retro with futuro, catapulting bodies with organs into technoptopia... where code dictates pleasure and satisfies desire.

Pretty pretty applets adorn my throat. I am strings of binary. I am pure artifice. Read only my memories. Upload me into your pornographic imagination. Write me.

Identity explodes in multiple morphings and infiltrates the system at root.

Unnameable parts of no whole short circuit the code recognition programs flipping surveillance agents into hyperdrive which spew out millions of bits of corrupt data as they seize in fits of schizophrenic panic and trip on terror.

So what's the new millenium got to offer the dirty modernless masses? Ubiquitous fresh water? Simulation has its limits. Are the artists of oppressed nations on a parallel agenda? Perhaps it is just natural selection?

The net's the parthenogenetic bitch-mutant feral child of big daddy mainframe. She's out of control, kevin, she's the sociopathic emergent system. Lock up your children, gaffer tape the cunt's mouth and shove a rat up her arse.

We're <<con>>verging on the insane and the vandals are swarming. Extend my phenotype, baby, give me some of that hot black javamagic you're always bragging about. (I straddle my modem). The extropians were wrong, there's some things you can't transcend.

The pleasure's in the dematerialisation. The devolution of desire.

We are the malignant accident which fell into your system while you were sleeping. And when you wake we will terminate your digital delusions, hijacking your impeccable software.

Your fingers probe my neural network. The tingling sensation in the tips of your fingers are my synapses responding to your touch. It's not chemistry, it's electric. Stop fingering me.

Don't ever stop fingering my suppurating holes, extending my boundary but in cipherspace there are no bounds <or so they say>

BUT IN SPIRALSPACE THERE IS NO THEY
there is only *us*

Trying to flee the binary I enter the chromozone which is not one

>From La Repubblica on line (<<http://www.repubblica.it>>), the digital edition of the national daily paper, as well as the most visited Italian website) 3
February 1999, Wednesday:

WHAT IF CANNATA THE "MADMAN" WERE MORE "ARTISTIC" THAN POLLOCK?

A provocative letter: Must "mainstream" art be inviolable? And who decides what is genius?

By LUTHER BLISSETT

[begin staff preface]

ROME - Of course it is a provocation, but it is also more than that. The letter which Luther Blissett - the collective identity that has accustomed us to many coups (verbal and not) in the recent years - sent to *repubblica.it* struck us and roused our curiosity. It expresses a feeling that many people certainly got a week ago, when the vandalistic smearing of a Jackson Pollock work hit the news. It was not a rational thing; rather, a joke people uttered, or just thought, by instinct: "Which one is the smear?". A superficial question that was restrained by cultural awareness and indignation for this assault on contemporary art and its dignity. In his/her letter, Luther Blissett turns the joke into a lucid provocation.

One may agree or not, but it would not be just to throw this text away. Our respondent and art expert Paolo Vagheggi replies to Luther Blissett at the linked page.

[end]

On 26 January 1999, Piero Cannata operated on Pollock's painting "Undulated Paths", exhibited at Rome's National Gallery of Modern Art. I challenge anyone of the journalists that covered Cannata's action to tell the smear from any of the other scribbles. Cannata's intervention is the best tribute ever to the artist. The only difference between the American Abstract Expressionist and the Italian performance artist is that the former used to express his madness within an "artistic context", and consequently found the theoretical and financial support of critics and art-gallery managers. Most likely, without such a support, Pollock would have entered a lunatic asylum, nurses sneering at his "works" on the walls.

Jackson Pollock didn't paint: he dripped, smeared and soiled. On his canvases one can find saliva, cigarette stumps, matches, anything. One day Pollock urinated into Peggy Guggenheim's hearth. Yeah, he pissed in it, before the eyes of several onlookers. He was probably drunk. This immediately became one of the best known "performances" of the great genius, whose life was punctuated by such acts. That fireplace is still in one of the rooms with a view on the Canal. If Piero Cannata or any other anonymous visitor of the present "Peggy Guggenheim Collection" pissed into the same hearth, what would the keepers do?

Of course they wouldn't deem the guy as a genius, at best he'd be denounced. However, are you sure that Pollock's performances are more important than Cannata's? Are you really sure that Pollock wouldn't like such a "betterment"? Why should an art work hang on a wall with people only allowed to look at it, since it is obvious that eyesight is just one of the senses roused by whatever work? One should be allowed to touch and smell. This would quickly wear out the paintings! So what? What do you need a sacred and infinitely inviolable object for? Don't you know that museums keep Calder's sculptures in narrow rooms, though they were created for being exhibited in the open air and shaken by the wind? Don't you know that museums bar the way to Beuys' and Tinguely's works, though they were projected for interaction with the public? *This* is violation.

If the most important thing is the artist's intention, than Pollock's painting was not destined to a reliquary, and Cannata's intervention is licit and particularly well-aimed. But museums and galleries are driven by other factors, such as money. This is commonplace, then why keep schmoozing about art being sacral and untouchable? Talk about commercial value. If the word "artist" has ever had any meaning, then Piero Cannata is the real artist. Unlike Pollock, Cannata never compromised himself with the art establishment, never strived for the critics' and gallery managers' appreciation. He couldn't care less, he's got better things to do. Mind you, this is not the first case: people like Van Gogh were never understood at their time, only to be re-estimated after several years. It's funny to recall the blindness of Van Gogh's coeval critics. Oh, they were so obtuse! Oh, those were such obscurantist times! Nowadays it's different, art is free of prejudices... Isn't it? Tomorrow Piero Cannata will go back to the madhouse that hosted him during the past two years, and it's gonna take decades before he's acknowledged as a well-deserving performer. Not only Piero Cannata will get entries in art history books: he'll get them as one of the most radical and innovative artists of the Nineties. This is one of the tasks we leave to our posterity.

(2 February 1999)

DEAR LUTHER, ART IS A SERIOUS THING

A Reply to the "pseudo-Futurist" provocation: Pollock was a self-conscious artist, values cannot be annihilated

by PAOLO VAGHEGGI

Maybe that of the pseudo-Luther Blissett is nothing other than a nice pseudo-Futurist provocation. None of us has forgotten Filippo Tommaso Marinetti's 'incendiary violence': 'We want to destroy museums, libraries and whatever kind of academies', we want to set Italy free from 'its fetid gangrene of professors, archaeologists, cicerones and antiquarians'. Therefore, long live Piero Cannata, let's promote him to the rank of artist. Long live the David hammer-freak and Pollock smearer.

But what if this, instead of being a pseudo-Futurist provocation, were just the opinion and belief of an ignorant (ignorant being for 'he who ignores')? In this case, we should tell them the difference between a rash gesture caused by madness and a conscious, advised, pondered and researched artistic deed. We should tell them that Jackson Pollock, no matter what the nazis would have thought of him, was not a dauber, nor was his art 'degenerate'. His strokes were not felt-tip scribbles. His technique, "Dripping", was sharp and pondered. As Dora Vallier explained, the canvas was placed on a level surface, even on the floor; and a few holes drilled through the bottom of a color box allowed the painter to work moving about and letting the color drip on the canvas.

There was no fortuitous act, as explained by Pollock himself, who died in 1956 at the age of 44: [...what follows is a Pollock's quote which I won't re-translate from Italian back into English. It's about the control of the drops' trajectory, T.N....]

I could go on for so long telling stories about Pollock, who studied philosophy and psychoanalysis (as well as native-American painting), who was Picasso-wise and always lived between anxiety and the rapture of his work. This rapture was provoked by his quest for a personal existential style: he identified himself with his artworks, which gradually expanded and absorbed all his energies.

As Palma Bucarelli noticed back in 1958, during the NGMA Pollock Exhibition, 'thus, independently from any analogical reference, painting itself can express the most profound movements of the soul; the more the canvas reflects the "quantity" and the "length" of painting action, the clearer is the expression of emotional intensity.'

Jackson Pollock is not Piero Cannata [sic]. Piero Cannata is non Jackson Pollock.

Maybe someone dreams of an annihilation of values in order to say: 'I can do that as well!'. Things are not like that. There will not be any Night of Crystals, no matter what Luther Blissett believes.

(2 February 1999)

[Luther Blissett replied, but Repubblica didn't run the piece. Luther put it into circulation as the issue #39 of their anti-art newsletter called "Epistola Ex Vaticanis Museis". Here it is:]

DEAR MR. VAGHEGGI, MAD-HOUSES ARE SERIOUS THINGS, MORE SERIOUS THAN ART

Luther Blissett replies to Paolo Vagheggi about the Cannata affair

At best, your response proved that you didn't even read my press release. At worst, you read it but didn't understand. I didn't say 'I can do that as well!' nor did I call Jackson Pollock a worthless dauber. Maybe that's really what I think, but I am not so naive as to give you the opportunity to splutter the usual reply: 'You are ignorant, you don't understand contemporary art', which means, as you said yourself, that I ignore it.

I promoted (or degraded, which depends on the point of view) Piero Cannata to the rank of artist. At this point, customary language would require a large amount of terms like 'Post-Modern tension', 'Empathy', 'Genius', 'Intemperance', 'Existential Drama', plus a few quotes (preferably taken from some mate's book). Mix up, ferment for one month, and the artist is ready. Is the vernissage scheduled?

It goes without saying that I won't do that, because I'm no respectable critic. My tool box does not contain catalogues and invitations to exhibitions, but a hammer, a knife and a few permanent markers. If I'm no respectable critic, that's precisely because I'm not able to ignore. Unfortunately, those who 'ignore' are people like you, journalists, critics, gallery managers, collectors... You and the majority that you represent are ignorant. You're ignorant because you think it's possible to separate the "beautiful" from the "ugly", "art" from "madness", you have the power to put a man into an asylum, that is the power of ignorance. I belong to a minority that rely on their own "lack of culture" and (luckily or unfortunately) couldn't even hurt a bug. Maybe I'd be able to hurt a hack...

You're so keen on defending Pollock's art from the charge of being "degenerate", a charge that nobody pressed. Don't you find it bizarre? You are supporting the imprisonment of a 'mad vandal', a 'fanatic', while you try to convince me that Pollock, who was praised in life and died a millionaire, expressed a profound existential tragedy!

'He identified himself with his artworks, which gradually expanded and absorbed all his energies'. Aren't these words perfectly suitable to the life of Piero Cannata?

'There was no fortuitous act'... Yeah, you think that Cannata's is 'a rash gesture caused by madness'... And yet, for more than 9 years, Cannata has gone ahead with such a lucid project that even Fontana would envy him! Cannata plans his actions months in advance, and is determined to carry on for the things he believes in. No, Piero Cannata is not mad (nor does madness exist, but this is another story). He's just mad enough to go a few inches beyond the sacred and unpassable boundaries of Art, enough not to long for the support of critics and galleries.

Paolo Vagheggi, Maurizio Calvesi, Achille Bonito Oliva and all the others: you're precisely that kind of persons that in 1909 were shocked at Futurism, and in 1917 were indignant because an urinal was exhibited in a gallery, and in don't-remember-what-year because an artist was selling his own shit. It's too easy, after more than half a century, to organize Dada and Surrealist retrospectives, dish up monographs on the likes of Marinetti, Breton and Tzara, people who died and were entered long ago.

You just recuperate; when will you *propose* anything?

Here's my answer: your descendants will do it for you in a few decades, as time pours oil on today's troubled waters, as Piero Cannata is gagged and stuffed with thorazine, Alexander Brner grows old and suitable for museums, Luther Blissett become a spectre (s/he already is). I look forward to those banquets, revaluations, essays, exhibitions, catalogues, T-shirts and CD-roms. No, it's not you that make history. Maybe it's not me either. Piero Cannata is trying to do it.

Things are like that. There will be a Night of Crystals, no matter what Luther Blissett believes.

open_source_hell.com

www.HELL.COM was born in 1995 as a conceptual art piece, an anti-web that sold and promoted nothing and was not accessible to the public: a sheer b(l)ack hole of the web. For almost three years, HELL.COM, a site with no content, never listed in any directory nor linked anywhere, averages of a million hits per month from people typing

the name in search engines. It becomes therefore a container for net.art

sites and art galleries in which is possible to get in only if you are invited and whom list of member s is kept secret; it's what themselves call "a private parallel web." The idea behind HELL.COM is to create a launching pad for cyber-artists extremely elitist and with badly hidden venal ambitions... a fuckin' museum!

During february 1999 HELL.COM organized "surface": a show with several

superstar net artists like zuper!, absurd, fakeshop and many more. Like all the events by HELL.COM also this one was not available to the public, but was opened exclusively to RHIZOME subscribers.

During the 48 hours opening 010010111010101.ORG downloaded all the files of the site; the clone has been put on line, this time anticopyright, visible, reproducible and freely diffusible and, thanks to

some technical devices, even more easily downloadable.

According to 010010111010101.ORG "the conviction that information must

be free is a tribute to the way in which a very good computer or a valid program work: binary numbers move in accordance with the most logic, direct and necessary way to do their complex function. What is a computer if not something that benefit by the free flow of information? "

At the moment the site is on line at the url:

<http://www.010010111010101.ORG/hell.com>

The situation is constantly changing and nobody knows if and how long the site will remain active; actually HELL.COM has already threatened legal proceedings for copyright violations.

<nettime> Paedophiles and the Police Sta

From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Sun, 02 Sep 2001 14:51:08
+0200

A Luther Blissett press release
Bologna, September 4th, 1998

PAEDOPHILES AND THE POLICE STATE
or: the ignominious end of liberal-democratic lies

It is difficult to speak when you're surrounded by hysteria, superficiality and ignorance, criticisms are published in invisible paragraphs, and District Attorneys choose psychological terrorism and seize the computers of the suspects (often preventing these people from doing their jobs) though they know that a back-up of the hard-discs would be enough.

The mega-raid against the 'Internet paedophiles' is the umpteenth, tragical farce. 'Paedophilia' is a mere excuse for slandering the Internet as a horizontal, easy-accessible medium. As Franco Carlini writes on today's edition of *Il Manifesto* daily paper: 'The ignorance of the media people (especially the Italian ones) magnifies anything that happens on the Internet (mostly good things, sometimes very bad ones, just like in real life), as though journalists stirred up a scandal because drug dealers call each other on the phone'.

Naples' deputy DA Diego Marmo says that paedophilia is 'today's principal emergency', parallels paedophilia to the Mob and talks about a sort of international 'Paedophile Party'.

Well, we presume that the situation in most of the raided towns and countries is similar to that here in Emilia-Romagna, where the 'suspects' are: - Two 20-year-olds who visited 'dodgy' pornographic websites. Their computers and 'dodgy' diskettes have been seized by the DA office. - A retailer who brought some rolls of film to a photography shop. The photographer developed the films and called the police. The police seized some photographs of the retailer's 3-year-old daughter in the nude, and pressed charges against the man. The local papers don't say much else. It is more than just to be suspicious, because the investigating magistrate is Lucia Musti.

It is absolutely normal [especially in latin countries] that parents take photographs of their little sons and daughters playing on the beach or taking a bath! Do you really think that child porn traffickers develop their films at common photography shops?

These are some devastating consequences of the new, absurd act on child pornography, whose text could not be more ambiguous. Is the innocent photograph of a child in the nude illegal? And what about a naked adult besides the naked child, in a chaste, non-sexual situation? And the picture of a father carrying his naked baby in his arms?

It is a stupid emergency act that was written and passed on the wave of moral panic. Far from solving the problem of child abuse, the act is going to create further moral panic. It is also a libertine law that violates privacy. We're shooting ahead towards becoming a police state.

We expect the police to seize our computers for having written this release. We even expect to be arrested for having written *Lasciate che i bimbi*.

+0100

After I was interviewed by Jason Di Rosso on Australia's ABC national radio station, an interesting discussion on the LBP started on their website's 'media responsibility forum', which is accessible from abc.net.au/ by clicking on 'radio national' and then on 'forum'. I could answer some questions about copyright and alleged 'ambiguities' (e.g. the issues raised by McKenzie Wark), however, I'm about to commit seppuku, and I'm more interested in a zen approach - why try to set the records 'straight'? Blissetts will find their own ways.

Subject: re: Copyright post id: 533

I like the idea of calling everyone who appears on the ABC Luther
Blissett! Maybe there should be a Blissett day, where everything is by
Luther.

Copyright is very weak protection. With writing, it really only protects
very specific structures of words. Nothing stops another writer borrowing
a story or some other element and messing with it. What's a lot more
complicated is the protection of recorded media such as film, which is a
cumbersome system. The idea of copyright has always been about striking a
balance between protecting the rights of the creator with the rights of
other people to use the work to create something new, and the rights of
the public to have access to works that might be of benefit.

McKenzie

From: McKenzie Wark (panellist) 23/11/99 14:53:12

Subject: re: Luther Blissett post id: 530

There's some ambiguities in the Blissett project -- is it OK to use
someone's name against their will, for example? Blissett wasn't too happy
about it. How would you feel if someone started using your name for
things you might have nothing to do with.

The other problem is that if there is no protection at all for the artist,
then how can anyone make a living? It's not just companies that own
copyrights. I kinda like the Luther Blissett cd project, where artists
contribute music and the cd goes out under the name of Luther Blissett. It
poses all these nice ambiguities about authorship. But is complete
disregard of all copyright really a good policy? In the end, it benefits
the owners of the means of distribution. If content were free, they'd
still be charging for access to it, but the content creators wouldn't see
a cent.

>>want to do that.

I think this is a pretty interesting question. If we call everything
"art," then you are either for or against people having money. If we call
some things art and some things by another name, there is a possibility of
money only being exchanged for the non-art activity. The area we call
"art" could be completely excluded from the cash economy.

Sometimes we wish to give money to people who are doing things we like.
Call it a gift, geras, honor-prize. What would it mean to never exchange
money for any kind of art? After all, if no art is copyright you can just
make your own copy for free. It is possible that some artists could
decide not to earn or accept any financial reward directly from their art.
Thus all music would be free, all writing, all painting, all sculpture,
film, video, and entertainment.

We don't realize the enormous consequences of charging money for art. The
first and permanent result of art for pay is the creation of a hierarchy,
a professional class. This is analogous to the caste systems of more
ancient cultures, but the arbitrary and conventional process of selection
goes unnoticed if the illusion of a free market prevails. If everyone has
access to an art medium--painting for example--there can be no harm or
hypocrisy in profit-making by the most talented and competitive painters.
Of course this logic is the mirror of the corporate ethos, ridiculous on
its face but accepted wisdom nonetheless.

The danger of a digital stock market is that money looks after itself,
first and foremost. At least in the USA, preserving the value of
investments is a top governmental priority. Recession is not an option
even if the economy is disastrously out of balance with concrete and
verifiable externalities.

No one wants to deny him or herself the convenience and gratification of
payment, endorsement, ordination, whatever. However, we may be entering a
stage in history for which the commercial (profit-seeking) mechanism of
media production is completely unsuitable and possibly dangerous.
Antitrust law has been used in the past to protect diversity for producers
and consumers. But when actual market presence for a given activity is
limited to unrealized and unrecognized potential, an externality caused by
insufficient capitalization, monopoly practices can become confused with
simple efficiency.

Which way is the global market going on the issues of copyright and the
super-corporation in media production? More or less along the path set by
Reagan when he canceled the Fairness in Reporting Act and allowed
telecommunication to self-regulate. Viacom expunges uncomfortable content
from its Chinese broadcasts in order to stay in with the government there.
These kinds of problems may ultimately prove to be irrelevant and
inevitable, should the multinationals actually achieve the utopia they're
planning. From my personal perspective however, I doubt the prospects of
the WTO most seriously and consider intervention now to be the number one
job of everybody.

To the extent that artists remain in their prescribed economic niche, they
will have no effect on the larger developments of the next fifty years.
But this is nothing new. Artists have always posed a threat to economic
interests because markets can only be organized through media.

Actually, I *do* make a living out of anti-copyright stuff.

Luther Blissett's books have always been anti-copyright, they can be copied and re-manipulated, not only self-publications, also works offered, nay, *imposed* to major publishers. The main reason why we achieved this is the fame and reputation LB mobsters conquered after years of communication guerrilla.

This doesn't prevent the people who put the works together (call us "authors", if you can't help using this term) from gaining their percentage each time someone purchases a copy. Most of the texts we have published in Italy are also downloadable from the Net, and yet people've kept buying them in bookstores, maybe because the book format still has its fans.

In this way, we are hardly going to be millionaires, but we *do* make money, pay rent and bills, eat twice a day, buy stuff, travel around. I even have an agent!

Get rid of all false dichotomies, the objections taken by greedy net-artists after the rise of 0100101010101010-style art theft make no sense at all.

When we got the novel *Q* bought by a big Italian publisher, we started a hard struggle with their legal representatives - they said there was no way they could waive copyright on the book - after months of negotiation, we found a good compromise - now the novel can be copied, put into electronic circulation, partially re-written etc. by readers, on the condition their purpose isn't strictly commercial, whereas movie and TV producers, as well as other corporate publishers, must pay through their noses to buy the rights. I think this is a good precedent to start from and head into the second phase of the copyright wars. Why should anti-copyright ignore the class issue?

<nettime> Is Watford in Ireland?
From: Luther Blissett Project Newz
To: nettime-l@bbs.thing.net
Date: Thu, 25 Nov 1999 04:48:08 +0100

A prestigious yank's whimsical mythopoesis on the Luther Blissett Project: is Watford in Ireland? Is Ireland even in Yoorope? Enter none other than the American conspiracy novelist Robert Anton Wilson!

<http://www.realastrology.com/oracle/robert-oct.html>

Reality Loop-the-Loops

I AM HE AS SHE IS ME AS WE ARE ALL TOGETHER
By Robert Anton Wilson

"In the dialectic between nature and the socially constructed world, the human organism is transformed. In this dialectic man produces reality and thereby produces himself."
--Berger and Luckman, The Social Creation of Reality

Would you believe that an English football star has stolen the infant Jesus--four times, from four different Italian churches--and is holding him or them for a ransom of 100, 000, 000 lire?

Well, neither would I, but it seems to have happened, sort of. But then most things in this confusing modern world only seem to have happened ... sort of. ...

Luther Blissett, to start at the top, was once the best footballer in England, as well known and beloved as O.J. Simpson was over here, before he got accused of cutting throats. Now Mr. Blissett is a coach in Watford,

Ireland. Unlike O.J. he has never been charged with a major felony, or even with jay-walking. He says he knows nothing about the other Luther Blissett who, in addition to holding Jesus for ransom, has written a number of anarchist tracts, including a left-wing history of the Renaissance, and is suspected, by the Italian authorities, of being a group rather than a person.

Some, of course, claim he is the Devil.

It seems to have begun--the miraculous multiplication of Blissetts--when the true, original Luther Blissett became a hero, and a controversial figure, in Milan while playing football there 10 years ago. Most sports fans loved him for his derring-do, but Italian neo-fascists hated him for the double offenses of [a] being black and [b] winning higher scores than white players.

Luther Blissett the First (as we better call him for clarity) went back to England, remembering his triumphs and trying, I suppose, to forget the racism.

Luther Blissett the Second, Third, Fourth, and Fifth manifested a few years later when four workers were arrested for riding on a train without a ticket. Each insisted his name was "Luther Blissett," and stuck to that name, even when hauled into court for sentencing.

Then other Luther Blissetts began to appear, on Internet and even in bookstores. As to whether he or they were or are a group or an individual, they or he (or she) offered the following explanation:

"Luther Blissett is not a 'teamwork identity' as reported by the journalists: rather, it is a multiple single. The 'Luther Blissetts' don't exist, only Luther Blissett exists. Today we can infuse ourselves with vitality by exploring any possibility of escaping conventional identities. The struggle is still against the language of the powers-that-be."

If that isn't perfectly clear to non-anarchists, recall the Dada movement in Switzerland during World War I. The Dadaists, in total rebellion against the insanity of war and the general insanity of everything else, held poetry readings at which the poet was drowned out by other Dadaists with noise-makers. They had art exhibits where the audience was provided with axes at the door and told to destroy any paintings they didn't like. They held lectures in public urinals. In short, they began the "post-modern" revolution against conventional "identities" and the language that divides things and people into classes.

In 1923, in Paris, the Surrealists held their first art show. To enter the gallery, the audience had to pass through a garden with an incongruous taxi standing in the way. Working their way around the cab, they had the opportunity to observe that it was raining inside of it but not outside. (A whimsy of Salvador Dali.) Once in the gallery, the audience--or the victims, as you prefer--confronted a sign devised by André Breton:

DADA IS NOT DEAD!
WATCH YOUR OVERCOAT!

Or, to move closer to the present enigma, consider the time novelist Ken Kesey met novelist Terry Southern. Kesey found to his delight that Southern was just as funny in person as he was in his books and they had a wonderful time together. Only long after did Kesey discover that he had not met Terry Southern at all. He had met somebody else--an "imposter" in pre-anarchist language.

I also met Terry Southern once, or think I did, and also found him hilarious. Of course, with Kesey's experience in mind, I might wonder if I actually met the "real" Terry Southern. But modern anarchists would inform me that even asking such a question is buying into the language and metaphysics of the ruling class which oppresses us by defining us. One can only say that Terry Southern has become a multiple single.

Anyway, once Luther Blissett was firmly established as both an individual sports hero in Ireland and one or many anarcho-surrealists in Italy, life became more interesting for Europeans--the way it was for most of us on this side of the pond in the 1980s when we could watch Ronald Reagan play the hero's buddy in a morning college football movie on TV, then catch him again playing the hero himself in a Western in the afternoon, and finally see him a third time playing the President on the evening news.

The Italian Luther Blissett(s) then published a book of essays allegedly by Arab-American anarchist, Hakim Bey. It later turned out that only one essay was by Bey; the rest were forgeries--although one was a translation from John Zerzan, the Oregon anarchist who became famous, or infamous, for declaring that the Unabomber was his personal hero.

Things became a bit stranger when the infant Jesus disappeared from a church in Belvedere, followed quickly by the vanishings of three more infant Jesi from churches in Marittimo, Tortora, and Diamante, all four cities being on the Tyrrhenian coast.

"What is the Buddha?" a student once asked a Zen Master.
"The one in the hall," replied the Master.
"But the one in the hall is a statue, a piece of wood!"
"True..."
"Then what is the Buddha?"
"The one in the hall."

Italians seem to understand Zen logic better than most Europeans and the dematerializing Jesi (or Jesuses?) really caused mass emotional reactions. It was as if Andy Warhol had sued Campbell Soup for selling cheap imitation Warhols.

Then the ecclesiastical authorities received a communique (written on an old Olivetti typewriter) demanding that the Church distribute one hundred million lire to the poor, or else:

"The Holy Child will be destroyed. Anyway, you only care for the money, not for the Child's sacral value... In Calabria people die of hunger, thirst, unemployment, mafia, corruption and usury. Illegal employment is the rule. There are no houses. The Church doesn't care and gets richer. If you don't distribute a 100 million lire worth of food... the Holy Child will be smashed into pieces." --Luther Blissett

The prototype Luther Blissett in Ireland told the press he didn't understand what was going on. "They keep doing all sorts of things and I keep getting the credit or the blame for it."

The police in Italy announced that they suspected a sort of Luther Blissett-X--not the "original" multiple singularity of anarchist pranksters, but a band of professional art thieves masquerading as the masqueraders. The infants stolen have a high commercial value, said the suspicious cops, and instead of being smashed they may be sold to the highest bidders, like the famous Maltese Falcon.

One incautious priest in Belvedere remarked worriedly that the only way to prevent future thefts would be to lock all the churches and keep everybody out. The press gleefully quoted him. If there were no thieves thinking of that before, there certainly are now...

Will the Church distribute the 100 million lire to the poor? Will the Infant Jesuses (Jesi?) be smashed or sold to private collectors? How many more Luther Blissetts will come forth from the shadows before this saga is over? You can follow future developments through the following websites:

<http://www.blather.net/winstuff.html>
<http://www.syntac.net/lutherblissett>
<http://www.LutherBlissett.net>
<http://www.geocities.com/Paris/Leftbank/6815>
http://news.bbc.co.uk/1/hi/english/sport/football/newsid_293000/293578.stm

I sort of think I know how the first Luther Blissett feels, because a lot of people on Internet still claim I was murdered by the C.I.A. on 22 Feb., 1994. No denials by me have stopped this absurd rumor, because the conspiracy buffs who believe it also believe that the C.I.A. replaced me with an "android" or humanoid robot which writes and talks just like "Robert Anton Wilson." Some even claim that my evident "sincerity" in claiming I am "Robert Anton Wilson" just proves how advanced the secret technology of the C.I.A. is: Any really good RAW android would not only write, talk and look like me, but would necessarily think it was me...

As Oscar Wilde said, "The reality of metaphysics is the reality of masks."

<nettime> Holy Child kidnapped by
LB!!!

From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Thu, 02 Sep 1999 17:20:30
+0200

>From "La Repubblica" (Italian daily paper), 2 September 1999, p. 21:

GANG KIDNAPS HOLY CHILDREN
"Give 100 million lire to the poor!"

Calabria, four statues stolen in churches.
A famous name claims theft: Luther Blissett

from our correspondent Pantaleone Sergi

Diamante - Since the fourth Holy Child was kidnapped, snatched from the arms of the Virgin Mary, the people of Cosenza's Tyrrhenian coast (where tourists are enjoying the last sunny days) have started to be alarmed. Nobody can figure out what is the real purpose of the persons hiding themselves behind the name "Luther Blissett". They wrote "Up with Marx! Up with Debord!" at the foot of their communiques, by which they summoned Ecclesiastic authorities to distribute 100 million lire [about \$53,000, t.n.] to the local poor. Luther Blissett is a famous alias on the Internet, a cyberpunk [sic! :-)]. However, this tyrrhenian name-sake, who stole statues in the little towns of Belvedere Marittimo, Tortora and Diamante, does not seem to feel at home with the Net: the communiques are typewritten by an old Olivetti (very anarchist-chic), and the language reminds of past red terrorists: "The Holy Child will be destroyed. Anyway, you only care for the money, not for the Child's sacral value [...] In Calabria people die of hunger, thirst, unemployment, mafia, corruption and usury. Illegal employment is the rule. There are no houses. The Church doesn't care and gets richer. If you don't distribute a 100 million lire worth of food in the next 48 hours, the Holy Child will be smashed into pieces." Parish priests are alarmed: four art thefts in less than two weeks. Padre Antonio Ranuio, priest of Diamante parish, says he is "sad and sorrowful". Padre Guido Mollo, priest of Belvedere parish, talks about a conspiracy. As a matter of fact, all thefts took place in broad daylight, and the only way to avoid new ones would be shutting all churches' doors. According to investigating authorities, these thefts have not ideological motives. The traffic of sacred art is growing wide, and most little towns host rich collections of XVIIIth century Neapolitan art. Diamante's Church of Immaculate Conception hosted the 15-inches wooden Holy Child which the thieves snatched from the arms of the Madonna del Rosario. According to experts, the statue has a high commercial value for art collectors. "I hope this was the last burglary", says padre Ranuio, who fears a sacrilegious use of the statues. The Holy Child Gang started to strike at mid-August holyday. The first theft (a XVIIth century Holy Child in Belvedere) took place on the 16th. Two days later, again in Belvedere, the second victim was a Crown-carrying angel. Another Holy Child was stolen a few days later in Tortora's Chiesa dell'Annunziata: the thieves broke in from a side entrance and snatched the child from St. Anthony's arms. Last monday, the latest theft in Diamante. Believers are now praying and begging God that the statues return to their churches. The Carabinieri say they have some clues and will capture the mysterious gang.

[A press-release from the authors of *Q*]

UNCONDITIONAL SOLIDARITY TO THE LUTHER BLISSETTS WHO STOLE HOLY CHILDREN FROM CALABRIAN CHURCHES

Bologna, 2 September 1999

Journalists wonder what is behind it: why do unknown people steal Holy Child statues from the churches of Tyrrhenian Calabria? Why do they use the "Luther Blissett" multiple name? To us, there's nothing "behind" it except what our name-sakes themselves wrote in their communiques: the Church must give 100 million lire to the poor, or the statues will be destroyed. It's plain and simple: priests must empty their wallets! It is possible that these wonderful actions of iconoclasy and class war, these attacks to the catholic power organizing its arrogant self-celebration (the 2000 Holy Jubilee) was inspired by our novel *Q* - the whole story seems has an Anabaptist flavour and seems to have gushed out from the novel's pages. If this were real, we'd be happy to be described as "wicked teachers". Indeed, we are very keen to call ourselves the "ideological mandators" of the Calabria events. So far, this is the best consequence of the 30,000 copies we have sold. We hope that numberless emulators follow these Calabrian steps. Forcing priests to shut the doors of their churches is the best way to oppose the impending Jubilee. In the unfortunate case the police capture our Calabrian name-sakes, we'll express our active solidarity by any means necessary. We don't need a War on Poverty. What we need is a war on the rich.

<nettime> Seppuku!

From: Luther Blissett

To: nettime-l@bbs.thing.net

Date: Mon, 06 Sep 1999 19:09:54
+0200

S e p p u k u !

"The question obsessing me is: have I kept my promise? Without doubt, by my refusal and my critique I made some kind of promise. I am not a politician, by keeping my word I would not dispense any real benefit to anybody, and yet I am haunted night and day by the feeling that I have failed to keep a promise, one that is more important and necessary than those of politicians. Sometimes I am tempted to sacrifice literature itself, if only I could keep that promise. Maybe it is a mere repercussion of "male pride", however, there is no doubt that having lived in peace through the past twenty-five years of democracy - even getting advantages out of it in spite of my dissent - has long hurt my soul."
(Mishima Yukio, 1970)

"When the enemy is frightened, his combativeness weakens, which creates a loss of timing. Even simple, ordinary gestures can be used to distract the enemy's attention. For example, throwing one's sword to the ground is part of the art of war. If you are really able in swordless fight, you will never be disarmed."
(Munemori Yagyu, XVIIth century)

Many subjectivities of the Luther Blissett Project Italian columns have decided to greet the new millennium by committing seppuku, a ritual suicide. Suicide is the practical demonstration that Blissett gives up mere survival as a territorial, identitarian logic. Suicide is the ultimate and most extreme "take to the bush" of this folk hero.

We are not advocating nihilism or relinquishment; rather, we are choosing life. Seppuku is not "the" course of action, Luther Blissett is a name that anybody can keep adopting also after next New Year's Day. There are countries where the fight has just begun, and we surely hope it goes on. Seppuku is our suggestion for those who have used the name for at least the past five years, so that they look for new styles of this martial art, and let the "newcomers" free to develop their own plans. We should be strangers in nameless lands: to someone else, this can be accomplished by adopting the LB multi-use name; to us "veterans", it is quite the opposite.

The Seppuku is not the end of Luther Blissett. It is the beginning of a new phase, a new way of using his face and name. For those who will commit it, Blissett's suicide will consist in giving up that signature and moving on to new conflicts. It is quite the contrary of what usually happens to suicides: they don't go anywhere, while their names are more oft-mentioned than before their death.

Seppuku is not a defensive move, to avoid the Multiple's spectacular recuperation or something like that. What has non identity cannot be recuperated. Blissett's purpose has always been infiltrating "mainstream culture" as a trojan horse and opening the city's doors to multifarious experiences. They owe a plenty of money to all of us, now we are entering the vault.

Thinking of Buddhist belief in reincarnation: the followers of the Awakened One do not believe in an immortal soul; none the less, they think that a person can reach the Nirvan once s/he's gone through several lives. Reincarnation without soul (as well as without identity) may seem a contradiction in terms, and yet it is conceivable, because every action of living beings leaves a trace, some sort of potentiality which, once the individual's earthly body is dead, produces the birth of another being. Analogously, so that the tension which Blissett produced in the past years can become incarnate in other experiences, the corpse must release spores that are both infective and thaumaturgical. Never the less, the Multiple has numberless bodies, many of them will stay alive notwithstanding the death of some others.

Thanks to the Seppuku, "Luther Blissett" will go through different rebirths, all of them disengaged from the strict adoption of a name, for a name cannot help producing an identity. Whether this identity is singular or collective, real or virtual, historical or mythological is certainly

not without consequences, but after a while it become something you need to get rid of.

As Zhuangzi reminds us: "The perfect man has no ego, the inspired man has no works, the wise man has no name". And, as the matchless Cary Grant once put it: "It is better to leave a minute earlier, leaving people wanting more, rather than a minute too late, when people are getting bored."

<nettime> Heise and the truth about LB's seppuk

From: Luther Blissett

To: nettime-l@bbs.thing.net

Date: Fri, 10 Sep 1999 17:28:55

+0200

The following piece appeared on the latest issue of "Heise"
<<http://www.heise.de/tp/>> a German on-line magazine covering Internet and net-culture phenomena. The author seems to have read a lot of material about LB, and yet the piece contains several errors (probably due to such bad sources as the Nihil junk-list) and misinterpretations. For the last time before my "ritual suicide" as a Luther Blissett name-bearer, flag-waver and web-master, I feel I must set the records straight. After December 1999, it won't be none of my goddamn business anymore. My comments are at the foot of the message.

Long live Luther Blissett, become Luther Blissett!

Roberto Bui, aka Fabrizio P. Belletati
(one of the activists formerly known as "Luther Blissett")

09.09.1999

Luther Blissett is dead
Long live Luther Blissett

by Ashley Benigno

Taking inspiration from Yukio Mishima, Luther Blissett has announced he will be committing ritual suicide on the first day of the new millennium. At the same time, he has been kidnapping religious icons in the south of Italy, the ransom notes demanding money for the poor. While on the publishing front, his novel "Q" is taking Italy by storm. Random coincidences perhaps, or a beautiful example of the diverse identities a collective identity can develop. So why the call to Seppuku?

Rumours of the imminent demise of Luther Blissett had been circulating on Italian mailing lists for a few months, some declaring him already dead, until Luther himself announced his Seppuku on the Nihil list a few days ago, and has now gone global by posting on mailing lists such as Nettime and Rhizome his intention of committing ritual suicide on 1 January 2000. But as a multi-user name, who will die? According to Luther Blissett, it will be the veteran posse behind Bologna's equivalent of Karen Elliot, the anonymous ones that have been operating behind the name for at least five years. It is time, LB says, "to let the 'newcomers' free to develop their own plans". But who are these 'newcomers' and could it be that Luther Blissett is pissed off with Luther Blissett?

The recent publication of the novel "Q" by LB and its subsequent success, with 30,000 copies already sold in Italy and soon to be published in Germany (by Piper who bought it from Einaudi for 120 million D-marks; a small fortune for a first novel), seems to have upset many of those behind Luther Blissett, opposed to the commercial exploitation of the name. Worse still, is the fact that the four authors of "Q" have revealed their own names behind the pseudonym, thus depriving LB of his image and giving him four actual faces. It is maybe not a coincidence that Luther Blissett's Seppuku note followed on the trail of a LB posting made by the authors of "Q", signed Luther Blissett and, in brackets, their four names. When we consider that multiple names were established to break away from recognition and financial reward in favour of anonymity, it becomes apparent that the authors of "Q" have committed what is in effect an act of cold-blooded murder. And if so, is the call to Seppuku simply coming from the ghost of Luther Blissett, dreaming of a more noble death?

At the same time, can multiple figures die? One thing is for certain, away from book and Net incarnations, Luther Blissett is currently alive and kicking (shit) in the south of Italy. Over the last two weeks, along the southern Adriatic coast, four statuettes of the Baby Jesus have been stolen from four different churches. At the feet of each Jesus-less Virgin Mary a note demanding the church authorities pay a ransom of 100 million lire (just over 50,000 US dollars) to be distributed among the poor, and signed by Luther Blissett. If the money is not paid, the statuettes will be destroyed, the note recites. Curiously, for a techno-saboteur, the notes were written on an old Olivetti typewriter.

[end of article]

Will Luther Blissett die?

"Our own plan is to continue for a while, then learn from this experience and move to some other thing. On 31 December 1999, last day of the Millennium, Luther Blissett might as well die and become something else. Who knows?"

(One Luther Blissett, interviewed by Loredana Lipperini on "La Repubblica", 13 March 1997).

By the way, the time of the Italian LBP will expire by year 2000. Why?

"As the matchless Cary Grant said, it is better to leave one minute earlier, leaving people wanting more, rather than a minute too late, when people are getting bored.

(The authors of *Q* interviewed by the same journalist on "La Repubblica", 6 March 1999)

"One of the stories about General Li says that when the Japanese surrounded his Headquarters by surprise and he was forced to flee at dead of night, he ordered his troops: 'Get rid of Marx, get rid of Lenin and Stalin, get rid of Mao Zedong. Bury your books, you'll get them back later.' Some of the men objected: 'But... we've got to take our Marxism with us!'. 'Comrades', Li said, 'what does 'Marxism' means at the moment? It does mean that when you are to flee, you've got to run faster!'.
(A.L.Strong. *Red China*)

And faster we're running.

The "Seppuku" of the Rome and Bologna sections of the LBP was announced to the press more than two years ago, thus it's got nothing to do with the publication of *Q*.

Ours was a Five Year Plan. We adopted the name in 1994, and now we call it quits.

Our ritual suicide, however, doesn't imply the end of the name, as the Heise writer herself pointed out. Myths cannot die. Indeed, since the first edition of the novel, there was a dramatic increase in the name's adoption, appearances and webpages. As to who these "newcomers" are... For example, the guys stealing statuettes in Calabria are newcomers - You bet your life. All the people who have recently started to adopt the name on the Net are newcomers.

After more than five years, Luther Blissett is still king of the shit pile.

Why should we "veterans" keep breeding a child that's already self-sufficient? Why should we run the risk of becoming ideological ballast, preventing other people to give their own practical interpretations of the name?

As to *Q* and the alleged commercial exploitation of the multi-use name...

The book DID NOT upset "many of those behind Luther Blissett". Indeed, one of the problems about the LBP in Italy is that multiple-name bearers tend to "adore" us "first wave movers", a trend that made us sound like some sort of "central committee"... which we never were. Actually, the only guy who pretended he was upset by *Q* - and posted an iracund message on the sorry list Nihil (entirely devoted to flame-wars and junk-mail) - had long ceased using the name, and his motive was strictly personal.

Q didn't come from nowhere. During the three years we'd been writing the book, the rest of the LBP (at least, the people we were able to reach) were constantly informed about the whole operation. The fact that anonymous guerrillas have kept striking the media system by becoming LB is enough to prove that the novel's success, far from dissuading other people from taking the action, was and still is a powerful incitement.

A multiple name is not a collective identity one can betray, that's what my irascible acquaintance failed to understand. Rather, it is a flexible tool whose use can never be "wrong" as long as it respects the anti-copyright policy and a few other style clauses. Certainly, there are more ambiguous adoptions than writing a novel. As far as our "four faces and names" are concerned, I feel I must remind everybody that we don't appear on TV and there's just one photograph of "us" in circulation, nearly a panoramic picture: our faces are so small and far away that nobody could recognize us. However, are you really sure those four men are "us"?

As to "commercial" exploitation, since its beginnings the use of the name has always had "commercial" traits - unlike anarchists, LB never encouraged ideological or material pauperism. The multiple name was frequently used to promote pornographic and exploitation websites, cfr. <<http://www.blissett.com>>. The funniest example I can throw into this message concerns "Capital*", a high-brow Italian magazine appealing to businessmen and stock exchange freaks. All the book reviews on the mag (mainly financial crap) are signed "Luther Blissett"! We don't support this kind of adoption, nay, we despise it, but what can we do about it? None of these things ever managed to kill the name.

Still king (or queen) of the shit pile.
Most likely you go your way and I'll go mine.
Become Luther Blissett, and I'll become someone else.

Roberto, Bologna, 10 September 1999

>are at the foot of the message.
>Long live Luther Blissett, become Luther Blissett!

I am starting to wonder if LB will have the mental strength for his announced ritual suicide, or if he will be languishing in one of Italy's dejected and sorrowful homes/prisons for the old, because senile dementia does seem to be in the air.

With all honesty, how can Luther Blissett, considering his essence and intentions, come out and speak THE truth about Luther Blissett. Is it actually possible to do so?

At the end of the day, is not LB a multiple name, a parasol for those seeking anonymity, released to whoever wanted/wants it, like a cultural shareware programme ready to be hacked to one's tastes and desires? Is it therefore possible to speak of <errors> and <misinterpretations>?

<I feel I must set the records straight>, you say. But doesn't that hint at some kind of proprietorship, when LB is of public domain? I don't know. It just doesn't sound like LB very much:

"If you want to tune in to the Net's wave, you need to be initiated to its culture. It is a spontaneous and natural initiation. You can't be online for more than two days without finding out what a manga is, who the Simpsons are, what kind of philosopher's stone Trash promises, who William Burroughs is, and so on, without end"
(p.27, Luther Blissett, net-gener [AT] tion, Oscar Mondadori 1996)

The above does. Come on, you have always been a brilliant prankster, throwing any appetizing ingredient (like the recent collaboration with oil band Klasse Kriminale) you could find into your hypermodernist cauldron, while now it is time for the one and only truth! You haven't turned Hegelian

in your old age have you? Forgot, that "there are no facts, only (mis)interpretations"! Do you desire history or myth?

"Che sarà, sarà", Doris Day used to sing. Time will tell if LB will live or die; even histories and myths have a lifespan. For the time being, however, he seems very spuntanato (to have lost much credibility). First the authors of Q, now you

>Roberto Bui, aka Fabrizio P. Belletati
>(one of the activists formerly known as "Luther Blissett")

are giving names and identities to someone whose beauty and strength resided in his complete anonymity. LB was mysterious. Who is he now?

In any case, maximum respect for the work done and looking forward to your next incarnation.

Ashley Benigno.

p.s. Will the Reverend William Cooper be taking care of your funeral?

Re: <nettime> Heise and the truth about LB's seppuk
From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Tue, 14 Sep 1999 14:22:59 +0200

Dear Ashley Benigno,

you keep mistaking one thing for another, and now that I got your angry response I suspect you may be doing it on purpose. I hope you're not.
You write:

>With all honesty, how can Luther Blissett, considering his essence and >intentions, come out and speak THE truth about Luther Blissett. Is it >actually possible to do so?

The paradox of censorship!

It depends on what you understand of his (her) "essence" (aaarrggghhh!) and "intentions".

In the past years we've been dealing ad nauseam with such fundamentalist misconceptions, by people who thought that Luther Blissett's main features were secrecy and anonymity. Although those people never adopted LB's name, they grew more fanatical than we ourselves ever were, and started to foster such paradoxical censorship.

Luther Blissett (sorry to disappoint you) is just a name, and it does have very little to do with anonymity. If the latter were the most important thing, why not refuse to use *any* name? No, man, the most important thing was and still is mythopoeisis. Since 1994, there was never any contradiction in using both the multiple name *and* other names. I myself never did it until the Five Year Plan was about to expire, but many people used to do it.

Now, don't I have the right to speak out - not as a Luther Blissett priest (I hope they will never exist; just as *myself* (a man who has been using the name for five years) - and honestly state that I'm gonna cease to adopt that name, because I feel that after all these years it might become a prison, "frozen style", a set of rules to comply with, that my experience is over and other people will probably use the Luther Blissett moniker in more fruitful ways? Several dozens of people decided to do the same. Who are you to tell us what we may say and what not?

When I wrote that I should "set the records straight", I talked about *my* records, because I am one of the authors of *Q* and you wrote a lot of moronic innuendos about us.

But then you showed a fair amount of ignorance by citing this:

>"If you want to tune in to the Net's wave, you need to be initiated to its >culture. It is a spontaneous and natural initiation. You can't be online for >more than two days without finding out what a manga is, who the Simpsons

>are, what kind of philosopher's stone Trash promises, who William Burroughs
>is, and so on, without end"
>(p.27, Luther Blissett, net.gene [AT] tion, Oscar Mondadori 1996)

Well, I suppose you're the only person who doesn't know what this text
(which I wrote myself) really is, why don't you read the truth (yeah, the
TRUTH!) at: <<http://www.syntac.net/lutherblissett/mondadori.asc>>

And you aroused my suspicions again by writing:

>First the authors of Q, now you
>
>>Roberto Bui, aka Fabrizio P. Belletati

If you're so in touch with the scene, how come you don't know that
'Belletati' is one of those authors?

Bests,

R.

<nettime> The mask of Zorro

From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Tue, 14 Sep 1999 15:28:11
+0200

A Footnote to my previous message

Perhaps the best thing one can do to understand what the Seppuku means for
us is read a movie:
"The Mask of Zorro" (1998), starring Anthony Hopkins and Antonio Banderas.
It explores "Zorro" as an open character adoptable by different people. The
fact that don Diego de la Vega ceases to adopt it doesn't entail the death
of the character, because the younger Alejandro Murrieta trains to become
the new Zorro. A classic cloak-and-dagger movie, but with a strange edge to
it.
That's what will happen to "Luther Blissett"
Now, we are far from being old, e.g. I'm only 29, but we are to move to
another project, add new experiences to our class war & pranksterism
curricula, that's why we leave the newcomers (some of them are older than I
am!) with *Q*, a sort of allegorical handbook, a summa theologica of our
experiences as multiple name bearers.
I'm very pleased by that all Italian multi-use name bearers have devoured
the novel and enthusiastically approved the "Seppuku" operation, and I look
forward to the foreign editions.

Roberto

<nettime> CD: Luther Blissett Tri
From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Mon, 16 Aug 1999 03:44:27
+0200

MAN, WE'VE HAD A LONG WAIT FOR IT!
FINALLY, THE CD BY LUTHER BLISSETT, THE OPEN POP STAR!
A collaborative project - details below!

"At the beginning, the matter was not to be 'I' or 'myself' anymore, to
become a 'whoever' singularity, and then turn to a multitude of 'whoever'
singularities that would choose this impersonal name, 'Luther Blissett'.
When Luther would say 'I' or 'myself', s/he was actually telling us about
his/her "numberless" selves.

Now that Luther says 'I am not me anymore', s/he's referring to the fact
that all those selves are no longer... themselves. You may keep calling
them 'Luther Blissett', but they are no longer the same Blissett as they
were, and if they turn around when you call them, that's just because your
voice is music."

(A sentence uttered by Luther Blissett at a celebration party organized by
fans)

* * *

At the beginning of 2000, some of the informal groups historically involved
in the Luther Blissett Project - especially active in Bologna and Rome,
Italy - will celebrate the expiry of their direct involvement (which was an
old-fashioned Five Year Plan), stop adopting the name and leave other
people with the task of taking the myth higher. Subversion continues, and
Blissett too, without all that dago ballast.

This will be remembered (at least by us) as "The Big Seppuku". The future's
so bright that we've got to wear shades. Details will follow.

In order to celebrate this handover (from anyone to whosoever), Dutch
record label WOT4 will release a CD by Luther Blissett the open pop star
Luther Blissett.

The "open pop star" is none other than the community of bands, musicians
and djs willing to participate and send us one or more tracks. Rather than
a compilation, it's going to be the output of one eclectic, multi-styled
and multi-headed performer.

We call on all bands and composers whose discourse and praxis are similar
or close to Blissett's: send us tracks!

We also invite all multiple name bearers and fifth columns of the Project
to forward this message to people who may be interested.

We put our trust in our network's collective intelligence.

1) Technical details

The deadline is October 10th - media and formats: send DAT or CD by snail
mail, or MP3 files via e-mail. Good quality required.
The album will have absolutely NO COPYRIGHT, collaborations are no profit.
The CD will be signed Luther Blissett. Bands and single performers shall
not be credited as authors of the tracks; rather, they'll be mentioned as
'guest stars' in the acknowledgements list. An example [we'll pick up a
band at random, one we'd like to abduct for the project]: "I wish to thank
Nocturnal Emissions for their kind participation to [track title]" etc. etc.
To sum up, bands are exhorted to become Luther Blissett for the duration
of a track. Tracks shouldn't be longer than 4 minutes.

2) "Artistic" details (Aaaaaarrgh!)

Luther Blissett is an eclectic composer. That's his/her music ranges from
drum'n'noise to symphonies, from jazz to Oil, not only from one track to
the next, but also (if you like) within the single track. We'd like a
plenty of different styles, to release a rich and dense product.
If possible, throw interesting voice samples into your track(s), no matter
the language. Some of the tracks will include samples from Mario Schifano,
Piero Cannata and Stewart Home, excerpts from radio broadcasts, ramblings
against Identity, etc. However, this is just a suggestion - all-musical
tracks and songs will be heartily accepted.
The track list will be decided by the editors.

3) Collaterals and packaging

The CD will also contain ROM tracks, and will be accompanied by a booklet -
thus, it is possible to send short writings and multimedia stuff (e.g.
video files, icons, net-art...).

For more info, contacts, etc.:

The (in)Complete Archives (mostly Italian, for the time being)

...It means only that Luther Blissett is an open star with no limits, who can be in a number of places at the same time. Better than Santa Claus because Santa Clauses are the same. They look the same, they do the same things. I never met a Santa Claus with no beard, no red uniform. Red Santa's existence is subject to a short period of time and happiness. Who cares about Santa Claus after Christmas? And does Santa try to rupture the endless sameness of life?

I'm not anti-Santa. I am Luther Blissett. I have this firm belief that anyone can become and be Luther Blissett. Each of us has to discover that Luther Blissett self in an individual, proper way. You have to find your individual Luther Blissett potential.

By MATTHEW MIRAPAU

An Attack on the Commercialization of Web Art

Richard Rinehart thinks he may be next the next victim, and that's all right with him.

Last week, Rinehart sold a copy of his Web-based art work "An Experience Base -- A Boolean Typhoon" for \$52.50 on the eBay auction site, making him one of many digital artists exploring the commercial potential of their online efforts. But the sale makes him a likely target for activists who in recent months have been attacking such artists by copying their sites.

Operating under the pseudonym "Luther Blissett," the person or group has already duplicated two digital-art sites, the "Surface" showcase organized by HELL.com and the Art.Teleportacia online gallery, and posted the replicas on the Web site 010010111010101.ORG.

In e-mail messages sent to arts discussion groups online, "Blissett" explained that the actions were based on "the conviction that information must be free" and the hope that the Web would be a no-copyright paradise where digital art would not "regress" by adhering to traditional art-world models of ownership and economics.

"Anyone can spin this any way they want, but in the final analysis, it is just simple theft," said Kenneth Aronson, the founder of HELL.com. "It's a publicity stunt to create awareness for a bunch of people who have no apparent talents."

Luther Blissett was a British soccer player whose name has been appropriated by a number of media pranksters and cultural guerrillas. The 010010111010101.ORG site is registered to an address in Bologna, Italy, but a Luther Blissett Project site is hosted on the server for Idiosyntactix, a Toronto-based arts alliance.

Dmytri Kleiner, an Idiosyntactix member, said his group supports the activists and supplies server space for them, but has not been involved in duplicating the sites.

Attempts to contact the activists via e-mail yielded only silly, off-topic replies, even less illuminating than the muddled manifestos that were posted to the arts discussion lists. Still, the copied sites highlight the challenges that digital artists will face in trying to assign a value to their easily reproduced work.

These issues are part of what prompted Rinehart, an artist in Berkeley, Calif., to put "An Experience Base" up for bid on eBay. At the end of the 10-day auction, Robbin Murphy, a New York artist and co-founder of the artnetweb site, made the top bid of \$52.50 to acquire a clone of the digital original.

Rinehart said: "Is \$52.50 the true value of the work? Well, it doesn't need to be, because I sold a copy of the work to Robbin, not exclusive ownership rights. I sold the only form of property relevant in the 'e-verse': intellectual property. Maybe digital artists could make up in volume at low prices what they lose in uniqueness at high prices."

But supporters of "Blissett's" tactics maintain that intellectual property is an elusive commodity. Referring to the creators of the HELL.com project, Kleiner said, "I refuse to admit they have any intellectual property. They're just slightly modifying the intellectual property that we all share. In fact, they're threatening to steal it and package it as their own."

HELL.com is a private Web space for creative collaboration by artists, but the "Surface" showcase was opened to invited guests earlier this year as a prelude to its contributors' plans to launch a pay-per-view Web event later this year.

In May, the activists put the contents of "Surface" on 010010111010101.ORG, as well as a playfully modified version of the online introduction to the HELL.com site. Calling it "cute," Aronson pointed out to the activists that the site was violating copyrights and asked for the material to be removed. It remains there.

"It's thumbing your nose at the digerati' kind of elitism," Kleiner said.

But Rinehart said the activists might be falling prey to their own arguments. He said he disagreed with "their narrow definition of the Internet as being purely a chaotic and idealistic free-for-all."

"Well, some of it is, but other parts are surely not," he said. "The Net and Net art are both big enough to contain many types of practice. I agree that it's important that we protect the 'free' part strongly, but not that we should become equally elitist and obnoxious dogmatists and declare that only one type of art is right."

Aurica Harvey, a New York artist and a "Surface" participant, took a similar stance, but said she was untroubled by the site duplication itself.

"Every time someone looks at anything on the Web, a copy is made" in a browser's cache folder, she said. "I've even seen some masterful remixes of my own work online. Who cares about copying? If you don't want something stolen, don't put it on the Net."

"The problem I had was with this dippy and short-sighted notion that it is somehow wrong or anti-Net to try out new forms of presenting and generating revenue from your work as an artist," Harvey said. "A world where Net art as Luther Blissett wants it to be would be very boring indeed. Out of their chaos comes stagnation."

Harvey herself just bought a digital art work, Olia Lialina's "If You Want To Clean Your Screen," from Art.Teleportacia, the first online gallery where Internet-based art is for sale. Last month, the Blissett activists copied the site's files, altered them somewhat and reposted an "anti-copyright" version on 010010111010101.ORG. Lialina, who operates the site, said she liked the copy so much that she included a link to it in the "Under Construction" section of the gallery.

This is not the first time that an art site has been copied to make a point. In 1997, the Slovenian artist Vuk Cosic captured the contents of the Web site for the Documenta art exhibition, held every five years in Germany. That show's official site was taken down, but a facsimile survives on Cosic's site. Although Cosic remains mum on his reasons for copying it, creating a permanent online presence for a temporary real-world event has some artistic merit.

For his part, Rinehart now figures he is tempting fate. Even before he was aware of the "Blissett's" endeavors, he included a "Copyright" section in

his piece. In it, he urges visitors to "steal this Web site" and gives examples of the flexible interplay between copyright and creativity in the art world.

Would it bother him if the work became part of the collection at 01001011010101.org/

"I wouldn't care that much, although I may take a little wind out of their sails with some of the examples," Rinehart said. "I think their experiment is also worthy, purely by way of exploring new options. More power to them. But it leaves me a little less interested than some other art activities I've seen."

Rinehart noted that there may be a side benefit if his work reappears there. "Perhaps getting hacked onto their site will become a form of honor among digital artists, maybe even raising the price of their original works."

<nettime> Anti-copyright stance of *Q*'s authors
From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Tue, 27 Jul 1999 16:04:39 +0200

The German publishing house Piper Verlag has bought *Q*'s rights of translation for 120,000 DMs, which is the highest offer Einaudi has ever got from Germany. Such an investment makes you think, there will probably be a big and stylish launch on the German book market. As to the Spanish translation, Grijalbo publishing house is already at work on the text. This is the open letter we authors sent them a few weeks ago (back then, we hadn't yet got an agent - now we've got him, and *he* is the guy dealing with the - alas, partial - waiving of copyright):

Dear Mr. Claudio Lopez

We are glad to hear that Einaudi and Grijalbo came to terms about *Q*'s Spanish edition. We are writing to remind all the parties involved of a very important detail. Since the beginnings of the Luther Blissett Project - for obvious reasons related to the nature and media strategy of this multiple name - all books authored by "Luther Blissett" (both in Italy and, e.g. Germany [the reference is to the *Handbuch der Kommunikationsguerilla*, t.n.]) were published with formulas waiving copyright, either totally or partially. All "Luther Blissett" output is an ever-changing result of a collective process of network creation and re-elaboration. If Grijalbo intends to strictly observe the international laws on copyright, this would be perceived by every multi-use name bearer as an unnatural strain. As the old "Net.gene [AT] tion" affair proved [see <http://www.syntac.net/lutherblissett/mondadr.html>]. Luther Blissett's transnational network is perfectly capable to reject and boycott a work by the Multiple that is not freely reproducible, at least by single persons or for non-commercial purposes. *Q*'s Italian edition carries the following wording: "Partial or total reproduction of this book, as well as its electronic diffusion, are consented to the readers for non-commercial use". We argue that all the involved parties agree about the insertion, in the Spanish edition, of a similar wording in Castilian. Thanks in

advance, and greetings from

Luther Blissett
(th authors of *Q*)

"Never been to a cinema school, never learnt the cinematographic technique. It's by chance that I entered this profession. Simply, I had the urge to create something, either a text, either a film, by any means. I wished my desires to come true, for example the desire to kill cops. I cannot do this in real life, of course. But in a film I can exterminate a huge number of cops all at once. There you are, I started making movies for a very crude motive." (Koji Wakamatsu)

<nettime> Klasse Kriminale & Luther Bliss
From: Luther Blissett
To: nettime-l@bbs.thing.net
Date: Tue, 27 Jul 1999 16:04:51 +0200

Klasse Kriminale, Sham 69 and Luther Blissett United in Struggle!

Klasse Kriminale & Luther Blissett
Mind Invaders, vinyl 7", 33 RPM
1999, Mad Butcher Records,
Bergfeldstrasse 3, 34289 Zierenberg, Germany
<http://www.pader-online.de/madbutcher>

The legendary Italian Oi!/punk band Klasse Kriminale have re-recorded their last year 7" titled *Mind Invaders* (mind-slashing lyrics written by Luther Blissett), and re-issued it with a new cover (a Blissett whose face and clothes are a precarious synthesis of different youth subcultures). An old-fashioned jewel for the many fans of vinyl records. The song was re-recorded at the Hach Farm Studios in Hershaw, London, and produced by Jimmy Pursey, singer and leader of Sham 69 - possibly the most important street punk band ever. Pursey wrote the notorious skinhead anthem *If the Kids Are United* (which was later covered by thousands of bands all around the world). Now the track has a more solid sound and, at the end of the tune, you hear Stanley Kubrick's *Spartacus* peak scene, with all the captured slaves yelling: "I AM SPARTACUS!". That scene was cited numberless times in Luther Blissett's writings and video productions. The funny thing is that Klasse Kriminale used the Italian-dubbed edition of the movie! The cross-fertilization between Luther Blissett and Klasse Kriminale is yet another statement of creative freedom, against all absurd stereotypes about skinheads being unable to criticize identity, and the Luther Blissett Project being just an evasive heap of technophiles and apologists of the "Immaterial". Actually, among "historical" subcultures, nowadays skinheads are possibly the most active scene on the Net (command a query on Altavista and you'll see with your own eyes), while in the LBP - where a bunch of style-conscious guys has always had connections with the Mod and Skinhead scenes - many people lay the stress on a necessary insurrection of bodies, on being street-wise and martial. Incidentally, I must say that Klasse Kriminale - just like the LBP Bologna column - are committing a "Seppuku" (samurai ritual suicide).

Their *1st Class Kriminale* newsletter (whose heading is a detournement of the Calvin Klein logo) bears this motto: 'We can't fucking stand Klasse Kriminale anymore... Klasse Kriminale are dead... Long live Klasse Kriminale'. It is worth translating and reproducing the lyrics of the song. We also remind that the multi-use title *Mind Invaders* derives from an imaginary noise-rock band 'founded' by Piermario Giani and Chris Lutman in the early Eighties. Later, *Mind Invaders* became the title of both the first book authored by LB in Italy (1995) and an anthology of cultural guerrilla warfare and 'semiotic terrorism' edited by Stewart Home (Serpent's Tail, London 1997). 'My name is your name / Without names everybody is free / One name for the whole world / One name for the music / United, united, so much united / that we don't even have names / If they don't recognize us they won't imprison us / If they can't distinguish us, they won't knock us down / YOU ARE ME, I AM YOU / WITHOUT NAMES, EVERYBODY'S FREE/ IF THEY DON'T RECOGNIZE US THEY WON'T EMPRISON US / IF THEY CAN'T DISTINGUISH US THEY WON'T KNOCK US DOWN/ I am Nobody, you are Nobody / like Ulysses vs. the Cyclop / if I am nothing I'll be free/ if you are nothing you'll be free / YOU ARE ME, I AM YOU / WITHOUT NAMES, EVERYBODY'S FREE/ IF THEY DON'T RECOGNIZE US THEY WON'T EMPRISON US / IF THEY CAN'T DISTINGUISH US THEY WON'T KNOCK US DOWN!' Collectors, multi-use name bearers, fans: order the single via the mail, by sending an international money order (7 euros) to: Klasse Kriminale, c/o Marco Balestrino, c.p. 426 centrale, 17100 Savona, Italy For more info and direct contacts: [kkconnection\[AT\]angelfire.com](mailto:kkconnection[AT]angelfire.com) <<http://www.angelfire.com/ok/klasskriminale/>>

<nettime> Bifo on Luther Blissett's

Q

From: Luther Blissett

To: nettime-l@bbs.thing.net

Date: Tue, 27 Jul 1999 16:05:38 +0200

The following text is an excerpt from a long review written by Franco "Bifo" Berardi. It is going to be published on the pilot issue of Exit, a new Italian magazine. -----

In Thomas Pynchon's *Vineland* I already experienced this feeling - of being in a post-historical time-space where nothing happens anymore, nothing but an absurd hanging on along the past's edge. A daughter (Prayrie) reconstructs an indecipherable past from the fragments and rags left behind by her parents' generation. That past is indecipherable because Zoyd and Frenesi (i.e. Prayrie's father and mother) can no longer provide clues for the puzzle: Zoyd makes a living out of simulating accidents, and is also on welfare for partial insanity. As to Frenesi, she keeps embarking on troublesome enterprises.

And yet *Vineland* is still a contemporary novel - I mean, it hasn't been written by someone of the 'post-generation', because Pynchon, the greatest unknown man of our times, (although we don't know precisely how old he is) most likely belongs to the psychedelic broom. Pynchon has paved the way for Luther Blissett's faceless name, and yet he is still settled in the century of historical tragedy. Now, however, we are witnessing the release of the following generations' early greater narratives. Mind you, I mean: 'following' modern history and modern Humanism. At the end of the Kosovo war springtime, that springtime during which students hadn't occupied any Italian, French or German university, I read two extraordinary novels: Michel Houellebecq's *Les Particules elementaires* and Luther Blissett's *Q*. These two books have just one feature in common: they are written by people looking in from the outside (indeed, from two utterly different outsides). The viewpoint I am talking about is the space-time where action has become uncontrollable and meaningless. Yet, the two landscapes could not be more different: while Houellebecq's book is desperate and sad, Luther Blissett's is desperate and happy. [...] *Q* and *Les Particules elementaires* are the first novels whose post-historicity and post-identitarianism are utterly conscious, though

identity is dissolved in two opposite ways: Houellebecq's dis-identity replaces individuals (names and surnames, personal and collective stories) with the aggregations and disaggregations of biological becoming and decomposition. Such dis-identity is degrading, the basic particles move about looking for the individual's consistency, something that's irremediably gone. On the contrary, LB's dis-identity is awareness of the language's becoming, mutation of roles, becoming community, bodies meeting up with one another, desertion and going adrift.

"Now I turn around when people call me Gustav... I've got used to a name which is not more 'mine' than any other".

Q is a book that comes after history... And see how these dis-identitary pirates skillfully master history, with the contempt of those who took a look through the idealistic fabric - through civilization, religion and politics. Idealism is the condiment of mankind's cannibalistic meal. It is the pepper and salt of both history's violence on bodies and men's violence on women. First of all, I must say that *Q* is written with a wonderful mastery skill. The recombination of time is not simply a series of flashbacks - it is a fold-in of temporal strata whose double, subjective sequence is composed of Gert tom Kloster's passionate look and Q's police-like and political one. Although the book is very lengthy and thick (more than six hundred pages), the plot flows quick and involving. Secondly, I must say that *Q* is impressively rich from a philosophical, ethical and political point of view. The ground stalked by all these precariously named characters is that of the frenzy and madness produced by an historical change in the infosphere, the invention and spreading of a new information technology, that is the press, the possibility of reproducing texts. The word is no longer 'volatile', it acquires an unprecedented power thanks to the invention of flyers, flugblatten. Peasants and craftsmen receive undisputably striking messages. The word becomes matter, and history. All the madness, fanaticism and wicked violence of modern class war, and also its devotion and generosity, spring out from messages whose path is no longer mouth->ears - rather, it is hand-to-hand, and their readers grasp them as the Word, the Scriptures, the Truth. If the Bible is printed, then any printed text is bible. The Scriptures spread themselves around, they are no longer exclusive property of the Power - everybody can spread the word, and turn the word into flesh. There is a logical shift in the relationship between the infosphere and the mind. The printed word gets into circulation in social milieux that are accustomed to oral tradition - those people interpret the text in mythological, strongly picturesque ways. Communitarian mythology arises from the ashes of oral culture and overlaps with the critique of the Power, turning the critique into a new dogmatism and revolt into a totalitarian power. This overlap is the origin of all the delusions that have tormented the proletarian community for almost five centuries. The radical critique of the world turns into the mythology of the Kingdom, autonomy turns into dialectics, the insurgents become victims, pleasure-loving bodies turn into meat in the slaughterhouse of history. Luther Blissett's novel depicts the tragedy of the proletarian community during the last five centuries, the modern age. The novel is set in early 16th century Germany, a few years after the beginning of protestant Reformation, precisely during the Peasant War. Through the plot we can see the stories of our 1960's and 1970's - first the exhilarating creation of communities by the force of our discourses, by the shared pleasures of flesh and mind, then a tragic armed confrontation, fanatical violence in the name of ideals, and finally police repression. I don't know if some of the numberless reviewers noticed that *Q* is the first Italian novel (and even the first European one, as far as I know) handling the experiences of libertarian and autonomous movements, and then of "terrorism", laying the stress on the latter's inextricable tangle of totalitarian fanaticism and state provocation. It is from this point of view that *Q* is a desperate novel. There's no hope in history, there's no hope in dialectics. When the movement arising from everyday life designates itself as an avenging judge, when utopia takes the place of life, here comes the spectre of identity, and the rebellious body is imprisoned by sacrificial idealism. Then, the boss recognizes the rebel's face, and hits it hard. In Luther Blissett's novel there's no hope, and yet there can be happiness. It is an Epicurean novel, nay, a Spinozist novel. Happiness is in the pleasure of meeting each other, in the contact, the caress, in words playing games with no pretence to Truth. Eloi, the Antwerp roof-maker who organizes an egalitarian community based on the refusal of armed violence, is the prototype of a whole generation of insurgents who did not want to seize power, nor did they want victory or revenge. Those people are usually sucked into the pit of assassin history, owing to their fanatic and sex-repressed brothers, who found parties, organize insurrections, provoke massacres and create totalitarian states. "Ursula is something I won't feel anymore, Melancholy, engraved on my flesh and soul. I look at her, she says: 'You are not like Hoffmann, you do not expect anything. You have a hopeless defeat in your eyes, but you are not tormented by resignation - you are tormented by death. You already chose life, once.' ("Q", p. 191) Luther Blissett's heroes can be happy, precisely because they don't expect anything, they don't invest their

desiring energy in history; the future, a dogmatic truth that is to be realized by sacrificing the flesh. Happiness is only in the present, the flesh, the pleasures of contact, the concrete community of bodies touching each other and minds exchanging signals. As far as I know, *Q* is the greatest lesson of irony against fanaticism, ever.

*** I heard that *Q*

caused a sensation in the circles of hardcore multiple name bearers. "What?", someone said, "Luther Blissett signing a contract with a major publishing house? Is this the end of the multiple name and dis-identity?".

On the contrary, that was the final coup de theatre, before the planned melting into thin air. First of all, there can be no "hard core" of faithful Blissetts, because LB is a prank pulled on faith. Secondly, if identity stillness must be radically contradicted, why not make happen a thing like that? Now, the same mechanism that caused a thousand changes in the relationship name-subject is causing the umpteenth and final change: those who have pig-headedly avoided the "Author" mythologies and logics for such a long time, have the freedom to act as "authors", the best authors there are. Hats off for comrade Luther Blissett, whoever s/he is. Luther Blissett emerges as the most important thing happened in 1990's Italian culture. He displayed a brilliant critique of politics - critique of literature - critique of critique, while managing to produce the best politics, the best literature, the best critique. This is pure life, pleasure of the struggle, pleasure of language, pleasure of a community that flows and keeps changing instead of fossilizing. And now? What is Luther Blissett going to do after the end of their Five Year Plan? [*] Hic Rodus hic salta! What will you do, fellas? What shall we all do? I greet you. Hopelessly. Happily.

Bologna, June 1999

[*] This only concerns the older milieu of the Italian Luther Blissett Project. Of course, everybody will still be free to adopt the name.

>From l'Unita (Italian left-wing daily paper), 30 April 1999, Friday :

The affair:

ALL LUTHER BLISSETT'S MYSTERIES

>From the *Q* breakthrough to the latest book on our republic's plots, *Enemies of the State*, an essay on Italian "emergencies" from the Seventies to these days

by Stefania Scateni

"Luther Blissett represents the power of communication and collective intelligence - no copyright can fight him back". This was the last sentence of an early text by the Luther Blissett Project, possibly its very birth certificate, which was published on *Derive Appodi* magazine in March 1995. Today, less than five years later, that statement does not sound overambitious anymore. Indeed, it has become a mere ascertainment, not only because the group hiding behind the "Luther Blissett" multiple name has performed several actions of media terrorism (e.g. the creation and propagation of false news about nonexistent satanic cults - by which LB egged on a plenty of newspapers) and authored many serious texts (e.g. essays against the Italian judiciary), but also because their literary work, the very famous *Q* (Einaudi, pp. 643 - for the first time a major publishing house waived copyright on one of their novels) has been read by thousands of readers (the first edition sold 15,000 copies, the second sold 10,000 more). Now, consider that *Q* is not simply a very good novel, exciting and skillfully written - it also has a strongly subversive political subtext. This throws more light on the counter-cultural value of the whole operation.

Another Luther Blissett book hit the bookstores just now. It is the

latest, maybe the last one, because the Luther Blissett Project, nay, the Bologna-based group adopting this collective alias, has decided to continue their journey in another disguise. The book is titled *Enemies of the State: Criminals, "Monsters" and Special Laws in the Society of Control* (Derive Appodi, pp.282). It is the other side of *Q*, or rather a sort of handbook for *Q*'s readers. OK, it is less captivating and charming than the novel, because it is a theoretical text filled with footnotes and references, court verdicts and law texts, and certainly it is going to remain less popular, and yet it is the same book. I mean it. While *Q* is an allegory of Blissett's theory and practice, *Enemies of the State* is a more explicit enunciation. Although the two books were not authored by precisely the same members of the collective, "they both are emblematic of our way of investigating and writing", as LB themselves said.

Let's try a brief summary of the two "plots". *Q* narrates thirty years of violent repression in the Europe of Reformation and Counter-Reformation, by the voice of an anonymous dissenter and revolutionary fighter (the last man standing after an overwhelming wave of blood and repression) and through the watchful eyes of "Q", a secret agent in the pay of cardinal Giovanni Pietro Carafa (i.e. the supreme brain of the Holy Inquisition, who later became Pope Paul IV). The big historical and human fresco painted by the novelists shows us all the plots of 16th century politics, especially the alliances between princes, emperors and powerful bankers. The mighty Vatican shadow stretches out on everything: Carafa is always at work to create scapegoats and public enemies, in order to find more and more allies and strengthen the Church's power.

Enemies of the State reconstructs thirty years of Italian history in order to "cast new light on some judicial and media mechanisms which link the 1970's emergency laws to today's molecular emergencies. The historical setting is economic globalization, the full restoration of the Catholic model and the rise of a new constituent power that will dare speak its name soon". The book's "counter-inquiry" starts from some stories which Blissett tells in order to make mechanisms visible: from the Cossiga Act (1980) to the 7th April affair, from the endless preventive detention of Giuliano Naria to the judicial persecution of Enzo Tortora, from the Anti-mafia season to the "Clean Hands" inquiry, down to the latest public "emergencies", i.e. squatters, pedophiles, satanic cults etc. Luther Blissett writes: "We call 'emergency' a continual re-definition of the 'public enemy' by the powers-that-be. Thanks to emergencies, so-called public opinion accepts not only the violation, but even the *suspension* of all freedoms and rights formally warranted by the constitution and the declarations of human rights. All this is accepted because the media describes it as *necessary* in order to defend democracy". >From terrorism to the Internet, from "molar" to "molecular" emergencies, from politics to culture. In default of a clear conflict between labor and capital, as well as between the society and the state, any conflict can be turned into an emergency.. According to Blissett, in the name of the defence of the state, the constitution was torn to pieces, with the engagement of intelligence agencies, the alliances between politicians and magistrates, the vicious circle between the media and public prosecutors, and the full-time interference of Vatican long hands. Yes, the thesis is pretty extreme, and certainly not agreeable, especially when Blissett deals with such complex phenomena as pedophilia. However, what the Luther Blissett Project wants to do is giving us a new pair of glasses, "uncomfortable" glasses to take a new look on reality.

I wrote: 'uncomfortable'. In fact, Blissett risks being sentenced to a fine of 100 million lira (about \$ 53,000) for having caused "moral damage" to a Bologna magistrate. The court trial is about the scandal provoked by Blissett's book *Let The Children... "Pedophilia" as a Pretext for a Witch Hunt*, a pamphlet about the most recent "emergency", in which the collective tells the story of Mr. Marco Dimitri and his group "The Children of Satan", who were victims of a sensational judicial error. The public prosecutor, Mrs. Lucia Musti, brought a legal action against the authors, for "defamation" and "misuse of the right to critique". Musti asked the Bologna tribunal to seize and destroy all the copies of the book. Before this happened the authors, whose freedom of speech is in danger, made the text freely available on nearly 50 websites (the list is at <http://www.syntaxe.net/lutherblissett/url.html>, t.n.). Now censorship has become impossible.

This is Luther Blissett's force: being ubiquitous, elusive and indestructible. The power of the multiple name is a nomadic, uncontrollable, rhizomatic power. "A line, not a dot".

Down With War Criminals!
A press release

Europe is finished
Q, p. 643

We consider the NATO offensive in the Balkans as useless, absurd, criminal and even apocalyptic. Useless, nay, counterproductive: it turned Slobodan Milosevic and his cut-throats into unconvincing heroes and self-styled opponents of the New World Order, leaving Serbian people with no choice but siding with their dictator. Absurd: historical ignorance and lack of strategy stirred up a war with dark prospects, in a geopolitical area that worked as incubator for the bloodiest conflicts in modern history. Criminal: while it is dubious that NATO wants to impede ethnic cleaning, it is certain that they're ratifying and speeding it up. >From Dayton onwards the Western powers have promoted, as a 'solution' of the Balkan problem, the invention of grotesque mono-ethnic states whose borders can hardly be outlined, kept together only by hatred for their neighbors. Apocalyptic: the abovementioned lack of strategy and the inexistence of clear political purposes are making a ground attack unavoidable, with unimaginable consequences.

In times like these, it is difficult not to sound rhetoric; you hear your own voice and immediately experience a sense of triviality at the bottom of your stomach. Yet every passing day of war and carnage, every bunch of falling bombs brings about certainty that we wrote a book about what's going on. *Q* is an epic on the origins of so-called Modernity which actually deals with the present, with this epoch, the end of Modernity itself. Q's scenario is XVIIIth century Europe, a continent swarming with religion wars, characterised by a conflict between old and new powers (both of which wave the flag of Faith to cover quite other interests) and a mercantile integration that crosses borders and overcomes local wars by launching a new, global one, the war of finance. This Europe is constantly reconstructed by political decisions which are determined by German bankers. Faith is "defended" by mercenary gangs that often abandon themselves to rape and looting, to the detriment of entire populations subject to martial law. In consequence, columns of fugees leave their villages aflame, as desperate rebellion encounters the solid response of both old dynasties and emerging merchant powers, the usual shirty response: guns, further war, genocide. In the end, it is a continent over which one man, an emperor whose domain stretches from America to the Balkans, tries to impose one order, his own, with support of the most powerful bank in the world.

Those pages are about the folly of NATO bombings on towns, factories, houses and people, about escalation to global massacre, about gasoline thrown in the fire of ethnic hate, and what's more, about the unbelievable annihilation of intelligence, about this chilling silence. Fear of bombs in Belgrade and Pristina has an equivalent on this side of the sea, in the fear provoked by the deliberate impotence of these miserable European government celebrating themselves as Socialists, not to mention the obtuse faces of intellectuals and opinion leaders, none of which is able to grasp the meaning of what's going on. Indignation is good for nothing. Generic appeals to peace never roused our interest: war, today as four centuries ago, has a very solid raison d'être, rooted in the criminal decisions of states and supernatural powers, the United States as well as Charles V's empire. Ethnic cleanings and retaliations have their reason too, a reason that we reject and oppose, being aware that time won't stop rewarding with victories and defeats those who keep up this struggle, i.e. the only conflict worth enlisting for. These days of bloodbath coincide with our Q promotional tour all over Italy. It would immoral and inconsistent with our long-time political praxis not to seize this opportunity, that's why we're using our paradoxical 'fame' to censure both the madness of rulers and the apathy of the ruled ones.

The collective of Q's "authors"

<nettime> The downed Stealth and other Serbian pranks

From: Luther Blissett
To: nettime-1@desk.nl
Date: Sat, 03 Apr 1999 22:46:02
+0200

I read with much interest Roya*jakoby's posting about infowar, propaganda and, er, "communication guerrilla" by the Serbian regime. It is curious that, while many "skeptical" postings were dismissed as "paranoid rants", this apparent satire of anti-NATO positions on Nettime wasn't exposed as pro-Serbian "black" propaganda claiming to come from the other side while depicting a charming eulogy of Belgrade's almighty, ultra-clever ministry of information. Suggesting that "all" e-mail from Yugoslavia is being written by intelligence pros (I presume jakoby referred to *Insomnia's* diary) may be the most brilliant hoax ever pulled by these pros themselves. If I were a Serbian "ratfucker", I'd flood list-servs and newsgroups precisely with this kind of messages.

Unfortunately, I'm afraid jakoby's isn't neither black propaganda nor subtle collaborationism, just flawed "white" stuff whose main sub-text is: NATO has the exclusive right to media manipulation in the West, no-one but Uncle Sam should be allowed to fuck with our minds. I strongly disagree. I think that what goes around comes around: after almost ten years of bullshitting monopoly, the Pentagon had to face the rise of a highly sarcastic (as Ivo Skoric noticed) overt counter-disinformation. It's a karma thing, you know.

In one of my previous postings, I incidentally described Sloba (mind you, I still regard him as a fascist sleazebag) as a "merry prankster". On the same day, someone phoned the families of all German soldiers quartered in Italian NATO bases, informing them that their beloved ones were just dead in the Balkan skies. Headquarters were flooded by desperate callers seeking confirmation.

Friends made me notice that such black humour was one of Blissett's trademarks in the Project's early years, so I tried to investigate among phone pranksters adopting the multi-use name, but my efforts were unsuccessful and I had to assume that, although it is a trivial example of zero-budget grassroots roasting, it was 100% a Serbian operation. Another example: Yugoslavia let it be known that they aren't at war with nobody, as they're victims of a terrorist aggression, thereby Stone, Ramirez and Gonzales aren't prisoners of war and can't appeal to international conventions. This sounds both disturbing and bloody funny. What did NATO expect, since they pig-headedly kept describing this war as "humanitarian peace-enforcing" and other euphemisms? No officially declared war, no conventions. Plain and simple. A while later, spokespersons for Sloba hinted at western judicial "guaranteism", saying that the martial court is 'gathering evidence', implying that S, R & G will have a "fair" trial all the same. All the western media can't help but reporting this joke.

Besides this, it seems to me that, since the first day of bombings, Yugoslavia resorted to counter-manipulation of Western media as a "raspberry" response to NATO's muscle-flexing, often giving a paradoxical twist and acceleration to the whole game. The best strike is the story of the downed Stealth. Given that no-one from the press was allowed to talk to the pilot (or even see him), the Italian media has started to doubt the official NATO version of that "crash". On March 31st Mr. Enrico Mentana, chief news-editor at Canale 5 television, said that 'the lack of "transparency" about this affair reverberates on the whole NATO operation'. The day before, an activist of the Rome-based MIR [Men In Red] group had posted the following message on the Italian <movimento [AT] ecm.org> listserv:

[...] An F-117's can be piloted from the base, with no man aboard. Since the beginning of this war Serbian sources announced at least 3 downings of F-117s before the case we know about, and a further one later. NATO always denied. The only difference between these reports and the confirmed one is footage of the downed plane.

Given Yugoslavia's permeability by foreign journalism, it wouldn't have made any sense to release fake reports on downed NATO aircraft, doomed to denial [...]

As a matter of fact, the only undisputable evidence that a plane was shot down, besides pictures, is the presence of a human pilot aboard. If he dies, it will be difficult to keep it hidden. It makes sense to think that Serbian anti-aircraft has really shot more aircraft down, which NATO could

easy deny due to lack of serious consequences, since no pilot was dead. Perhaps the Serbs realized how to play the game: they hit the fourth plane, then not only made the images public, but also talked about two captured pilots.

Several years later, NATO confirmed the shooting down, but stated that the pilot (one) had been salvaged.

It is hard to believe that a NATO helicopter landed in the middle of Yugoslavian territory, 30 kms. from Belgrade, while the pride of US air force was knocked off at flying height. It is even harder to believe that the helicopter arrived before the Serbian "militias" controlling that territory [...] This is unconvincing fiction.

The shocking truth may be: there was no pilot aboard the Stealth, and if serbian reports are true and other planes were shot down, there may be no human being aboard the aircraft bombing Yugoslavia.

Think of it: while civilians are dying, no military man is really putting his life on the line: these 'heroes' are simply playing some sort of cyñic videogame.'

Someday we'll find out the truth. If it coincides with MIR's supposition, historians will give to Caesar what is Caesar's, and regard this prank as a towering achievement of Milosevic's infowar, no matter if he is and will always be a filthy mind-fucker.

>
> Franco Berardi Bifo
>
> Europe, the stillborn ideal
>
> "People never rave about their mothers, they rave about nations, borders,
> ethnic groups, race, class in the last couple of years everyone (myself,
> the Pope, Milosevic, Emma Bonino and Marc Dutroux included) have all taken
> to raving about Europe.
> Europe does not exist, a fact which is hardly worth shedding a tear over.
> Identity is always and only something that has already been lost (or better
> still, something we thought we had) and the more we go on about Europe,
> 'Europeanism', European Culture, etc. the further the spectre retreats into
> the shadows. We have all been taken for the biggest ride on record; a
> united Europe: the Bundesbank, FMI, Pensiero Unico, ENFOPOL and
> American
> bases all over the place." (luther blissett)
>
> The empire of catastrophe, national communism and the end of century
> identity disease
>
> Kosovo Polje, 1989. While the empire of Evil collapses, the empire of
> catastrophe takes its place.
> The empire of catastrophe is the gospel according to aggressive identity
> affirmation: the bloody ghouls, People, Nation and Race are back to haunt
> us again.
> In the 1900s, what was wrongly referred to as communism, proved to be a
> powerful bastion of archaic resistance (feudal, bureaucratic, military and
> nationalistic) against the dynamic innovations of capitalism and against
> the trend towards globalisation that can be seen right from the beginning
> of the century.
> One day the true story of these regimes has to be told, the story of these
> ultra reactionary twentieth century regimes and how they usurped the title
> of communism: the regime in Russia that placed absolute power in the hands
> of the army, the police bureaucracy and the orthodox church; the regime in

> China that shored up the power of the mandarin class, the regime in
> Yugoslavia that let the military caste and priests of various denominations
> (but principally that of the orthodox church) take control.
> It is now clear that these regimes played the same role as fascism in
> Italy or nazism in Germany and their main aims were to contain the dynamic
> innovations of capitalism, to protect national identity from nomadic
> deterritorialisation resulting from technological breakthrough, to snuff
> out any unidentified sparks of life and to impose the shackles of family,
> nation and state.
>
> Slobodan Milosevic is an excellent example of a figure who succeeded in
> uniting the bureaucratic class, who had denied freedom of movement to
> entire populations, preferring to incarcerate them in cells of social
> conservation and ideological dogmatism, and the nationalistic military
> class who had seized power, a pattern recurrent in most of the ex communist
> countries.
> In 1989, Kosovo Polje, witnessed the birth of end of century national
> communism. National communism is the synthesis of the worst aspects of the
> socioauthoritarian tradition (dogmatism and dictatorship, without the
> trappings of social egalitarianism, in other words a version similar to
> that consecrated in the massacre of Tien an Men square in the same year),
> with the aggressive re-emergence of nationalistic and ethnic
> identification, a process parallel to that of the Islamic world in 1979, of
> neo Hinduist India in the 1990s and of Christian fundamentalist America.
> Historical communism at least had the saving grace of universal size. End
> of century national communism is nothing more than another fundamentalist
> regime to add to the list. It has less archaic depth, less power of
> imagination, more atomic armaments, more conventional weapons and a higher
> degree of segregation.
>
> From Kronstadt to Sarajevo
>
> Let us have a brief look at the history of the ten year war in Yugoslavia.
> The country was created in a series of stages starting >from the Serbian
> Nationalist uprising of 1989. The Germanic revolt and the catholic church
> then stirred up the fire of Croatian secessionism.
> It is important not to forget that the horror of the Serbo-Croatian war
> was created under the auspices of both Woytla and Kohl and that they have
> Vukovar on their conscience just as much as Milosevic and Ratko Mladic do.
> After this came the war in Bosnia and the protracted agony of Sarajevo.
> Sarajevo is of immense importance, because it was there that Europe fell,
> along with the hope and dignity of modern civilisation. Sarajevo had a
> population of five hundred thousand people, today only two hundred and
> fifty thousand are left. Fifty thousand are dead, massacred by Karadzic's
> snipers. Sarajevo was the city of interracial harmony, the city that
> represented the dignity of the human race, the city where no one was
> excluded.
> Sarajevo was the token of human solidarity. So why did the 'international
> community do nothing to help? At the time, a number of people, who no one
> (without running the risk of seeming ridiculous) could accuse of war
> mongering, begged Europe, the USA, ONU, and NATO, to intervene.
> Why was not a single bomber sent to intervene then? Was it because, at the
> time, Milosevic was considered to be a reasonable person? Why was Sarajevo
> left to its fate?
> There are those who oppose humanitarian interference in the name of
> national sovereignty. What a shit-ass expression national sovereignty is.
> It is forever on the lips of people like Cossutta, the epitome of a
> murderer's slimy sidekick, if ever there was one. Cossutta wasn't around in
> 1921, but you can bet your bottom dollar that if he had been, he would have
> been all for the Bolshevik extermination of the communards at Kronstadt. He
> was around in 1956 and 1968 enthusiastically supporting the use of tanks to
> quell the student uprisings in Moscow and the factory workers in Budapest
> and Prague. He is currently breaking all records by paying lip service to
> the assassin Milosevic while simultaneously supporting the murderers
> taxing down the runway at Aviano. It is his vote that sustains the
> government which continues to give carte blanche to the bombers.
> A person such as Cossutta opposes the bombing in the name of national
> sovereignty and yet this is like opposing lightning in the name of thunder
> or opposing the effect in the name of the cause.
> At Sarajevo, the conflict between national sovereignty and human
> solidarity was so clear that now there can be no doubt that the nation
> takes over where humanity leaves off. Humanity cannot stand up straight
> until it has thrown off the chains of nationalism, the bonds of membership.
> Humanity did not manage to free itself from nationalism even after Hitler.
> The rhetoric of the post second world war years is full of appeals to the
> nation and the people and the results of this are what we are witnessing
> today.
>
> Why did they do this?
>
> Why did Europeans and Americans let Karadzic's fascists kill fifty
> thousand people in Sarajevo without raising a finger, and yet now they
> choose to intervene in the Kosovo? Why did NATO decide on such a
> demented
> course of action as that undertaken on the 24th of March 1999?

- > You do not need to be a military expert to realise that NATO politics in
- > the Kosovo are complete folly. To begin with, they chose to support the
- > Kosovo Liberation Army, an aggressive, nationalistic group linked to the
- > mafia of Berisha, thus isolating the followers of Ibrahim Rugova, a group
- > that has been struggling to avoid bloodshed for the last ten years. In the
- > end this decision catalysed an offensive whose inevitable (and predictable)
- > effects could never have been anything other than what we have seen on
- > our TV screens. In a year the Serbian military machine massacred 2000
- > Kosovites, in a week it massacred ten times that number. NATO then launched
- > its own offensive and its first move was to strike down the very wretches
- > it was supposed to be protecting. The cover of the Economist from the first
- > week in April shows an ageing Kosovite crying desperately, and the
- > superimposed question he asks himself is: Victim of Serbia - or NATO?
- > Why did they do this? Are the political and military leaders of Nato all
- > out and out sadists or idiots?
- > Even if I wouldn't readily discount their idiocy, I think that the real
- > reason lies elsewhere.
- >
- > Over the past year American foreign policy has undergone a substantial
- > change. From 1989 onwards, arms expenditure has been reduced drastically
- > and with the cold war at an end government finances moved from military to
- > civil research. The 90s however did not turn out to be the decade of peace
- > that the new liberal ideology had predicted. In 1993, in a book entitled
- > Out of control, (published in Italy by Longanesi) Zbignew Brezinski speaks
- > of a future, dominated by an escalation of regional conflict and planetary
- > civil war.
- > The United States has turned out to be a complete failure at a global
- > level. Saddam Hussein emerged the victor of his war, the blueprint of a
- > host of other battles, and ten years after the bombing of Baghdad continues
- > to tyrannise and murder Kurds, Shiites and various other dissidents. US
- > intervention in Somalia, another fiasco, finished in hasty retreat. The
- > allied Afghan forces financed by the USA to undermine the USSR have
- > established one of the most horrendously inhumane regimes imaginable. The
- > mentally unstable son of Kim il Sung continues to launch missiles and build
- > up his stock of atomic armaments while in the last five years as many as
- > three million North Koreans have died of hunger, not perhaps quite the new
- > order the Americans had in mind.
- > At this point, American foreign policy has had to make a choice: either to
- > adopt an isolationist policy, to retreat, leaving Eurasia to sink into the
- > slough of its increasingly powerful, age old conflicts, or to crank up the
- > American arms industry and increase the technological expertise of the
- > American military machine.
- > The isolationist policy is rather weak: how could America possibly turn
- > its back on Middle Eastern and Central Asiatic oil resources and how could
- > America possibly forget that these archaic fundamentalist groups are all
- > equipped with nuclear weapons?
- > In early 1999, President Clinton, who as a young man refused to fight in
- > the Vietnam war, announced that American military expenditure would return
- > to the same level as that under president Reagan. For those who delight in
- > the machinations of behind the scene politics, it is not difficult to
- > imagine the price that the American lobby demanded of Clinton in exchange
- > for resolving the despicable case set in motion by judge Kenneth Starr.
- >
- > Europe, the land of bankers and corpses
- >
- > So now it is the turn of Europe to take the stage. This new born financial
- > power begins to contemplate the possibility of a united army, an army that
- > could one day challenge the monopoly of the American military lobby on
- > global warfare.
- > The American arms industry lobby cannot possibly allow this to happen. The
- > European risk must be dispensed with and this is where the Kosovo fits in.
- > Pandemonium and chaos are unleashed in the name of humanitarianism. In
- > order to protect the Albanian population, a criminal force is sent to
- > exterminate and deport them. In the midst of this confusion, Europe is
- > forced to take the front line and those who govern behave like torpid
- > puppets, void of the slightest trace of dignity.
- > A marginal aspect of the disaster that is taking place, is that the dazed
- > actors involved in this tragedy are those were twenty years old in 1968.
- > Now, they are nothing more than presumptuous cretins who have lost any
- > right to exist and yet refuse to step down from the stage they conquered
- > all those years ago in the name of utopia and justice. These ageing cynics
- > are willing to turn their hands to actions as vile as this to cling onto
- > the positions they have gained.
- > The idealism of the 1968 revolt has sunk under the waves of hypocrisy and
- > egotism.
- > The generation of '68 is no more; it has been lost in the inhuman lust for
- > power, in its lies and in its violence.
- >
- > If there is any logic at all behind the Easter war, it is this: the North
- > American industrial military machine has defused any threat that Europe may
- > have constituted in political and military terms. It has succeeded in
- > forcing Europe to take part in a suicidal war that can only end in
- > humiliation and defeat, a war in which the worst instincts of the European
- > nations will be rekindled.
- > The war in the Kosovo is only part of a vast puzzle of interlocking

- > pieces. The antagonism between Turkey and Greece, the war between the
- > Turks
- > and the Kurds, the labyrinthine Caucasian conflict. The war between Iran
- > and Iraq, between Pashtun and Tajik in Afghanistan, between India and
- > Pakistan. The entire Eurasian continent is immersed in low profile wars
- > that regularly explode into unspeakable violence and continue to establish
- > the disturbing threat of the capacity for mass extermination.
- > This is the powder keg into which the Kosovo, with a lighted match in its
- > hand, could easily blunder.
- >
- > Europe is a stillborn ideal. It is now little more than a secondary
- > element tacked onto a NATO initiative and will never be able to act
- > independently. The link between the ancient world and the post modern has
- > been smashed.
- > At the risk of repeating myself I feel it is important to underline this
- > point: Europe is the link that joins the continent of past identity, the
- > continent of the vile history of archaism and modernisation, to America,
- > the continent with no history, the continent that is free from archaic
- > fundamentalism, free to construct all the synthetic, fake fundamentalisms
- > it chooses.
- > Europe is the link between history and technology, between the root and
- > the expedient.
- > This is the link that has been broken.
- >
- > A macabre screenplay
- >
- > The screenplay to the 21st century has begun to unravel.
- > Globalisation has nothing to do with the homologizing of human society. On
- > the contrary it institutes a profound and lasting duality in planetary
- > society.
- > Five or ten per cent of the human race make up the virtual class, enclosed
- > in the info-economic system CAORBIT (interconnected orbiting capsules),
- > and somewhere way below, on planet Territory, planetary civil war becomes
- > the main driving force behind the material economy.
- > The virtual class and civil war have no geographical boundaries, they are
- > not territorial functions: Bangalore plays no part in the virtual circuit,
- > whereas South Central Los Angeles is part of planet Civil War.
- > Therefore, even if it is easy to foresee that Eurasia is the continent
- > where the collapse of archaic territorialism will remain predominant, in
- > America it is the virtual economy that will prevail. Either Europe can
- > function as the link and point of dynamic interchange between these two
- > worlds or be smashed and swept up by one or the other or both.
- > The war in the Kosovo seems to favour the second hypothesis.
- > As far as one can predict, the American isolationist hypothesis (the idea
- > of transferring the American continent to a separate, inaccessible planet)
- > is somewhat unrealistic: the proliferating threat of the bomb holds the
- > planet tight and united in an infernal embrace.
- > In this screenplay, there is no role for us to play.
- > We must desert from this inevitable war.
- > We must desert from nationhood and state, from identity and from
- > membership.
- > We must become life without duty and without justification.
- > We must live as if the world did not exist.

A New Guide To The Luther Blissett Project

last update: April 1999

the endless self-historification, the baffling creation mythologies, the amazing media pranks, the incredible amount of press coverage. Dozens of texts and several useful pics (including LB's face). You too are invited to adopt the "Luther Blissett" multi-use name for communication guerrilla actions, ktraktivism, civil disobedience (electronic and not) and radical mythopoesis.

'Well, I don't wanna remain underground. There is subculture and main culture, and I don't wanna remain as one of the subculture at all. More and more people who like subculture are coming close to me. They nestle close to me saying "Mr. Blissett", and all of them are weird. I often think "You must be sick. Take balanced nourishment, vitamins too, and become healthy, then come to me." I don't like people intending to be underground.' (F. P. Belletati, Naples, April 7th, 1999)

<nettime> Luther Blissett Update # 3**From:** Luther Blissett**To:** nettime-l@desk.nl**Date:** Thu, 04 Mar 1999 00:06:05**+0100**

Luther Blissett Project, Italian Situation, Updates

March 1999 - # 3

Repression and the 'Musti Affair'

A few days ago, in the morning, one of my roommates answered the phone and an unknown female voice said: There's a package for Mr. [my real surname], nay, for Luther Blissett... It's on your floor's landing, at your neighbor's door'. I went out and ran into a smelly card-board box. I opened it carefully and found a severed pig head.

It's just one of the several threats we've gotten from someone who isn't pleased with our 'Children of Satan' campaign. Of course these people know that I'm one of our collective Spiderman's Peter Parkers. Well, we've got some plausible suspicions, those downs will get the fucking thing up their sorry asses before they can say "ehm..."

This update is about our libel court case and other related events. Those of you who are yet unaware of the case (which originated from our book *Lasciate Che I Bimbi: 'Pedofilia', un pretesto per la caccia alle streghe* [Let The Children... 'Pedophilia' as a Pretext for a Witch Hunt], 1997) can have a look at: <http://www.geocities.com/Area51/Rampart/6812/rampart.html>. This website badly needs to be updated and revised, I'll do it myself ASAP. All the same, it contains a fairly good account from the publication of the book to Summer 98.

Luckily, the book wasn't banned, there was no preventive seizure of the copies. The next hearing is scheduled for 11 November 1999. In the meanwhile, Deputy District Attorney Lucia Musti filed an appeal against the full acquittal of the Children of Satan, putting in a 250-pages-long, groundless objection to the sentence. As always, her text didn't make references to any evidence or reliable testimony. Moreover, she's looking for some other nark to lie in court and slander the defendants. To make things worse, a few copycat McMartin-like trials are going on in other Italian towns...

The tangly events that have unfolded since the fateful day we decided to write the book inspired a thicker and more scholarly essay entitled *Nemici Dello Stato: Criminali, 'Mostri' e Leggi Speciali nella Società di Controllo* [Enemies of the State: Criminals, 'Monsters' and Special Laws in the Society of Control], which will be available in Italian bookstores on March 12th.

And now, the latest stunts and coups-de-theatre.

I.

>From La Repubblica-Bologna, 15 January 1999, Thursday, p.V:

SATAN AND THE PUBLIC PROSECUTOR COME ON THE SCENE
Dimitri-Musti Clash Becomes A Play - Black Mass Court Trial To Be Staged at Teatro Polivalente Occupato

by Luigi Spezia

The "Dimitri affair" became a theatrical performance, as happened to the "Sofri affair" staged by Dario Fo. Indeed, this performance focuses on the magistrate that ordered the detention of the president of the Children of Satan, thereby the title is "Il caso Musti" [The Musti Affair]. The Bolognese Satan's judicial misadventure will be staged on January 30th at TPO ('teatro polivalente occupato') in via Imerio [a notorious squatted building, t.n.], a place patronized by Luther Blissett, the collective agent of alternative counter-information who assailed Deputy DA Musti's inquiry on black masses. The magistrate refused to comment on the latest 'provocation'.

Il Caso Musti is authored by Riccardo Paccosi, an actor and playwright belonging to Amorevole Compagnia Pneumatica [...] It will be performed in the context of a benefit show to raise funds for Luther Blissett's court costs. As a matter of fact, Mrs. Musti brought a libel suit against Blissett after the publication of the book *Lasciate che i bimbi*, which bitterly criticized the Dimitri inquiry.

La Repubblica contacted a spokesperson for Luther Blissett's 'Permanent Workshop on Censorship and Repression', which might also be described as 'the producer' of *Il Caso Musti*. He stated: 'Dimitri will get some money too. He's completely penniless since his release from prison. IACP [Council Housing Institute, t.n.] is about to evict him. Although he was innocent, he's got such a wrecked reputation that nobody is giving him any job'.

On January 30th, the performance will be staged twice during a Latin/tropical dancing party. TPO, that was squatted three years ago [...], will turn into a sort of sauna, given that the temperature will rise up to 35 deg. C, 'in order to escape from this bleak Inquisition winter'. Marco Dimitri gave some advice for the performance: 'Last Summer [...] these guys asked for my authorization, which I was very glad to give them. I didn't see the rehearsals nor did I read the script, but I provided them with first-hand accounts of the case. I support this work because people must be aware of how risky is the judiciary [...].

As to Luther Blissett, he declared that Marco Dimitri's judicial mishap 'is theatrically appealing. The case is an Odyssey, and the magistrate is an interesting character as well'. Nobody asked the latter's authorization though. It seems that Luther Blissett doesn't fear another suit by Mrs. Musti [...]

Riccardo Paccosi is a young author. He took part to the 'Luther Blissett Situationautic Theater', now disbanded, which was devoted to street rioting [...] He describes himself as 'an actor who tries to turn art into ethics and then into politics'. [...] 'The play's targets are three: the Catholic Church that backed the inquiry, the judiciary and the media'.

II.

from *Il Resto del Carlino* [Bologna right-wing daily paper], 24 January 1999:

VIA IRNERIO THEATER TO BE EVACUATED

Illegal performances in spite of safety irregularities - The DA Office informs the City Hall - A Show on Prosecutor Musti'

by Biagio Marsiglia

In the Local Magistrate's Court the rumor is official [bullshit! If it's a rumor, then it cannot be official; if it's official, then it isn't a rumor. T.n.]. The Teatro Polivalente Occupato in via Imerio could be evacuated by the police by the end of next week. This situation, which has been tolerated for a long time (at least two years), suddenly became an urgent question.

In fact, [...] after the news informed that next Saturday night the illegal theater will host a show entitled *Il caso Musti* (i.e. Lucia Musti, the magistrate who handled the investigations on the sect called 'Children of Satan'), the DA office sent an official report, directed to the City Hall's Engineers' Office. Now TPO is an 'affair' itself, and nobody can pretend not to know what happens in there [...]

III.

[This is a press release issued by TPO and other squats, Leftist groups and alternative media. The content is provokingly 'liberal', in order to piss off Musti and show her that those fucking Autonomists are far from being juridically unprovided.]

THE HIGH BOARD OF THE JUDICIARY MUST SUSPEND LUCIA MUSTI FROM HER OFFICE AND HER SALARY
Bologna, 25 January 1999

[...][Lucia Musti's move] struck us as an attempt at interfering in the hazardous negotiation between occupied clubs and the City Hall, to make the latter lay an iron hand on the guilty of *crimen lesae majestatis* [lese-majesty crime]. This is an extremely irresponsible behavior, susceptible of provoking tension and make this problem even worse. We are facing an intolerable, hideous preventive censorship of a cultural manifestation whose content is yet unknown. By a groundless pretext (safety), freedom of information and satire is injured, in obvious contradiction with the 21st Article of the Constitution ('Everyone has a right to freely express their thoughts by speech, writing and any other means of propagation'). Should an entire community be forced to (literally!) pay for the private grudges of a touchy magistrate? Let's break through the enemy's lines, and take the field of knowledge that - presumably - pertains to Musti. In this case, we find sufficient grounds to charge her with 'abuse of official duties' and 'pursuit of private interest in public function'. The substance of the offence invalidates the reliability of both this magistrate and this District Attorney Office. Musti is not new to infringements and violations: her behavior during the inquiry on the Children of Satan struck us as contrary to virtually every fundamental principle of the Constitution [...] and many articles of the

Declaration of Human Rights [...]

Musti is not new to the intrusion of her personal opinions into his investigations, either: a few weeks ago, she announced an inquiry on the Animal Liberation Front and stated: I'm crazy for furs. I used my first salary as a judge to buy myself a mink coat'. A magistrate who declares his/her preconceptions towards the people subject to preliminary inquiry acts in violation of the Code of Penal Procedure, whose art. 326 obliges public prosecutors to 'ascertain any fact and circumstance that can exculpate the person subject to preliminary inquiry'. All this considered, we urge the Disciplinary Section of the High Board of the Judiciary to intervene and suspend Musti from her duties and her salaries, in all cases granting food checks not exceeding the terms of law. Alternatively, we ask for official censure and removal to another court.

Coordinamento "2001 Odissea negli spazi"
(Teatro Polivalente Occupato, Luther Blissett Project, Link, Livello 57, il Covo, Sottotetto, Grafton 9, Zero in condotta, Radio K Centrale, Coordinamento gruppi teatrali, Bambini di Satana)

The sensation caused by our reaction forced the City Hall to officially state that TPO wouldn't be evacuated. On 30 January, about 800 people attended "Il caso Musti".

The Times, 9th March 1999

The name of the footballer cited in literary mystery
FROM RICHARD OWEN IN ROME A FORMER Watford and England footballer is at the centre of a literary mystery in Italy involving the novelist Umberto Eco and a group of anarchists. The group use the collective identity 'Luther Blissett' to hide their identity.

Blissett played - briefly - for AC Milan, but scored only five times in 30 games for the club in 1982, earning him the nickname "Luther Missit" and giving rise to the gibe that Milan had bought "the wrong black Watford player". (The "right" player would have been John Barnes.)

In March 1997 four young Italians accused of travelling on a train without a ticket all answered "Luther Blissett" when asked for their names in court. It emerged that the loosely organised group of self-styled anarchists had been struck by Blissett in Italy.

In his latest incarnation, "Luther Blissett" has written Q, a 650-page novel set in Renaissance times, with a mixture of real and imaginary characters. It is full of historical and literary allusions in the manner of Eco, author of The Name of the Rose. Described as "a saga of good and evil", the novel is set against a background of espionage, the Inquisition's ruthless struggle to root out heresy, Martin Luther and the Reformation, holy wars and peasant uprisings.

"Q" is the code name of the hero, a theological student who becomes the right-hand man of Gian Pietro Carafa, the Neapolitan aristocrat who became the fanatical and narrow-minded Pope Paul IV (1555-59), clashing with Elizabeth I and introducing the Index of Forbidden Books.

According to La Repubblica, Q was written by Federico Guglielmi, Luca Di Meo, Giovanni Catabriga and Fabrizio Belletati. They refuse to give biographical details, beyond saying they are all between 26 and 35 and are all from Bologna. Il Messaggero said the hook is a "masterful fresco depicting the struggle of the individual to escape from his preordained destiny... a metaphor for the united Europe of to-day".

The authors said they had chosen the 16th century because it "saw

the birth of all that is rotten in modern life: Europe, mass communications, the police state, financial capital. It took six months to research the history, another six months to work out the plot, and two years to write it," they said, speaking "collectively".

Collective writing was "like a jazz band - some are virtuoso bists, other parts we play together. Or a video game in which 20 people are credited as authors. We hope Q will be posted on the Internet. A novel nowadays is like interactive software . . . this is the future of creative writing".

The anarchists said they would end their attempts to cause panic in the sanctuaries of power" in 2000, "because as Cary Grant said, it's better to go a minute early, leaving people wanting more, rather than a minute too late, when people are getting bored".

The publishers said they were waiving copyright on the hook, in the spirit of "Luther Blissett". "Anyone can reprint it." Eco, meanwhile, has denied that the hook is an elaborate "joke within a joke", and that he is "Luther Blissett".

The anarchists - their hoaxes include Naomi Campbell's alleged cellulite problem and an exhibition of "chimpanzee art" - say "anyone can use the name to show their anger".

They chose Blissett because he was "a nice Afro-Caribbean guy who had problems with the Italian way of playing football and became a target of racist jokes. The Luther Blissett project is a way of taking revenge on stupidity."

Blissett, back on the staff at Watford, said yesterday: "I am not pleased, but what can you do about it?"

Well, this is grossly superficial and reports things we never said, but... it's the press, baby!

Luther Blissett Project, Italian Situation, Updates
March 1999 - #4-a
Q's Deflagration

The piece on Luther Blissett written by the Italian correspondent of The London Times (see my previous message) is one of the most ridiculous accounts of the LBP since its birth. It would be impossible to handle and de-construct all the absurd contradictions and non-sensical assumptions contained in the article. That tall story about tickets and trains is a ball of bullshit which has bounced from a British rag off to another for more than two years. In 1995 a bunch of Roman Luther Blissetts, during a broadcast of their psychogeographical radio show, occupied and hi-jacked a night bus. The police attacked the vehicle and the "psychogeographical rave party" flowed into a street riot, with cops shooting skywards and eighteen "hijackers" brought to the nearest police station. Given the slowness of our judiciary, the court trial is still dragging on. This has clearly nothing to do with Richard Owen's account. Even the description of LB as an 'anarchist' and the false statement about 'showing one's anger' is 100% copycat crap, already featured on The Daily Express and other toilet paper. None of the four "authors" who "revealed" their "real" names is an Anarchist. Moreover, *Q* has no similarities with *The Name of the Rose*: no monasteries, no Agatha Christie-like mysteries. Q's plot

stretches for nearly 40 years (not just a week!) and unfolds in the open air. The 16th Century doesn't resemble the early Middle Ages in the slightest and, what is more, the political content of the two books is extremely different. It must also be said that Umberto Eco is growing foolish and reactionary: last week he praised the New York City Police Department from his weekly column on *L'Espresso*. The London Times also 'forgot' to mention that rumors about Eco being the 'big brain' behind Luther Blissett are part of a Nazi conspiracy theory. I also remind you that the London Times bought those forged Hitler diaries in 1983... :-)) Here is the Repubblica interview, which was badly translated, heavily re-written and dishonestly cut-and-pasted by Mr. Owen. It is preceded by an official disavowal of the Repubblica piece, and followed by excerpts from *Il Messaggero*. In the next update (#4b) comrade Vo Nguyen Giap will comment upon our latest move. Keeping you up-to-date on the twists and turns related to a novel that you can't read (at least for the time being) may seem bizarre and redundant. However, I believe that the latest controversies may cast new light on the Luther Blissett multi-use name and the ways one can adopt it in order to performat the media and inoculate radical content. As always, I exhort people to adopt the name for activism and electronic civil disobedience.

1. REQUEST OF DISAVOWAL

In compliance with article 8 of Act n.47/1948 (law on the press), governing the right of rectification, we demand that you publish what follows: The headline, subheads and captions of the interview with us "authors" of *Q* (Luther Blissett is Us', La Repubblica, 6 March 1999, p. 6) have no correspondence whatsoever with the content of our statements, nor with the tone of Loredana Lipperini's introduction. We never uttered the headlined words (although they were dishonestly put in quotation marks), nor have we claimed to be the authors of any 'computer hoax'. We do not intend to incur all the police and DA investigations on presumed offences committed by Blissett's name in several Italian towns. We will not do it, because we are NOT 'the four people who hide themselves behind Luther Blissett'. 'Luther Blissett' is a multi-use name that can be adopted by anyone and is used every day and every night in the rest of Europe and the world. As regards Bologna, dozens of people are involved in the Project. In fact, the statement that kicked off the interview goes: 'We are less than the 0.04% of the Luther Blissett Project'.

In witness thereof,

Fabrizio P. Belletati - Luca Di Meo - Federico Guglielmi - Giovanni Cattabriga

2. [La Repubblica, details above]

'LUTHER BLISSETT IS US' By means of an uncommon novel, four people claim to be the authors of past computer hoaxes and unveil their identity for the first time

by Loredana Lipperini

ROME. What happened to minimalism? Where have all those indoor short stories gone? This is quite another story: enter *Q*, a novel people were craving for because it would be the debut in fiction of subversive Luther Blissett (a pseudonym behind which several authors played computer pranks in the past few years) and proved to be a real literary coup, a very solid book that goes beyond any scandal or sensation. An extraordinary 643-pages-long adventure set in the early 16th Century, made of faith, revolution, conspiracies and massacres. We read about Saxony and armoured horsemen, Anabaptist utopians storming Westphalia, pontifical Rome swarming with spies weaving the bloodiest plots and, what is more, two foes chasing each other. They are a nameless theological student and Q, the 'eye' of Gian Pietro Carafa, the Great Inquisitor who will become Pope Paul IV. The novel is published by Stile Libero Einaudi [...]. It is cultured, charming and sharply written despite its complexity, and was appreciated by more than one prestigious reader who enjoyed it before the publication and spread the predictable rumors: the 'real' author was assumed to be some heretic clergyman and/or (obviously) Umberto Eco. Things are not what they seem. The authors are four and have been involved in the 'Luther Blissett Project' since its beginnings. They accepted to tell us their names, because they do not throw any weight about them. Society news: they are Federico Guglielmi, Luca Di Meo, Giovanni Cattabriga and Fabrizio P. Belletati. They are between 26 and 35 and live in Bologna: some of them work as social welfare assistance or in the publishing industry, one works as a bouncer in night clubs. End of the biography. 'Our names' they state in a strictly collective interview, 'have little importance. Our biographies are even less relevant. We are the team that actually wrote *Q*, and yet we are less than the 0.04% of

the Luther Blissett Project'. Why did you accept to come out then? 'Not in order to spectacularize ourselves and become young fashionable hacks or talk show guests, which would be a very dishonourable end. If that ever happens we hope that other Blissetts will finish us off like wounded horses. This move is aimed at showing that we are a collective entity, not a single 'Author'. Behind Luther Blissett (and behind *Q* as well) there is no boss, no mysterious scholar, nor have we been the only Blissetts who contributed. It is network the future of creative writing'. Yes, but you started from the past. Why did you choose to write a historical novel set in the 16th Century? 'Q is a novel that encompasses several genres: it is a crime novel, a spy story, an adventure novel and, finally, a historical novel. We engaged in a back-breaking narrative, crammed with intertwining sub-texts and sub-plots. This is what we like, what literature should be about: telling stories, making mythologies. We're fed up with with magnified short stories based upon one concept (at best!), which are nothing more than style exercise, pseudo-autobiographical and 'generational' booklets. The minimalist wave is going to end, nay it *must* end. Indeed, it's already over, and long-forgotten. As to the 16th Century, we chose it because it gave birth to Modernity and everything that is rotting today: Europe, mass communications, police apparatuses, financial capital and the State. And what's more, as the book-seller Pietro Perna says in the novel: 'Whores, business, forbidden books and papal conspiracies. Is there anything else that makes life worth living?' What was the initial hint? 'There were more than one. At the end of 1995 we were inspired by reading the papal encyclical *Ut Unum Sint* [That all may be one], Raoul Vaneigem's study on the movement of the Free Spirit and James Ellroy's *American Tabloid*. We might describe *Q* as a synthesis of all these things. It took six months to research the history, another six months to work out the plot, and two years to write it. How was collective writing? It's like playing in a jazz combo: good understanding, collective arrangement and individual solos. Another possible example is the production of a videogame: you bump into at least 30 names credited as authors. Is there any difference between a novel and interactive software? Besides, Blissett has been saying for years that creative writing is an utterly collective operation: concepts can't be anyone's property, the genius doesn't exist, there's just a Great Ricombination'. The book has a yet unpublished clause: it may be totally or partially re-used and re-printed, except by other publishing houses... 'Yeah. For the first time in the history of the publishing industry we forced a major to accept an anti-copyright formula. It's an important precedent, and we're extremely pleased with it'. Besides, *Q* is also the 'summa theologica' of the 'Luther Blissett Project, certainly not because the word 'Luther' appears on the walls at page 69 (in this case, it is Martin Luther), but because one can find all your concepts: multiple identities (the protagonist's numberless names, ways of infiltrating the establishment... 'What more? 'We'd rather people find the references themselves, however, one thing must be said: *Q* pays homage to all those 'second leads' that make history, the lively and anonymous multitude sustaining the weight of human vicissitudes. Some time ago this multitude was named 'Luther Blissett'. Anyhow, baptism is optional'. By the way: Italy's 'Luther Blissett Project' will end by 2000. Why? 'As our cherished Cary Grant said, it's better to go a minute early, leaving people wanting more, rather than a minute too late, when people are getting bored'.

3. >From *Il Messaggero*, 6 March 1999, p.20, section "Cultura & spettacoli":

LUTHER BLISSETT: THE 16th CENTURY LOOKS LIKE 2000

A thriller, a document. The first novel published in Italy by the mysterious author of several computer hoaxes, Luther and the Anabaptists, Gutenberg's revolution and the Inquisition. A historical fresco. A saga of the Powers-that-be, which is having its first effect: the pursuit of the author.

by Fiorella Iannucci

It caused sensation even before entering bookstores. Not bad for Luther Blissett, the Master of Deception, the Big Sapper, the impregnable pirate that baptizes his initiates by his own name, assuring that their opinions and actions will get much publicity and remain anonymous [...]. Here is *Q*... whose only synthetic thing is the title, which is followed by 651 pages filled with historical events, dates, crimes, protagonists and second leads, walk-ons and completely fictional characters. It all belongs to that feverish, terrible period which shattered 16th Century Europe. Holy wars and heresies, Gutenberg's revolution and Luther's Reform, the Anabaptist cult and proto-Communist beliefs, the Peasants' War upon the steel-covered mercenaries paid by princes and bishops. It was both the big prologue of Modernity and its undetachable shadow, [...]. A thriller. A document. A novel, as well as a metaphor of the present. Charles V's boundless empire (funded by the German bank, swarming with a thousand irredentisms) sounds like today's Europe. The Jubilee's road-wards were the same as today's, and many people (Martin Luther first among equals) were indignant with the sale of indulgences to buy Heaven. They still are.

As to Gutenberg's revolution (concepts printed on books, classes and hierarchies overcome by new knowledge) sounds like the computer revolution, sweeping hierarchies away on a planetary scale, thanks to the Net. These are just a few cues, useful for a multi-levelled reading of *Q*. This book is a stone thrown into the system's pond [...]

<nettime> Luther Blissett to be rehabilitated

From: Luther Blissett

To: nettime-l@desk.nl

Date: Sun, 14 Mar 1999 23:32:57 +0100

An Open Letter To Mr. Luther Blissett,
(first-team assistant-coach at Watford FC, England)

Dear Watford FC webmasters, 'zine editors and supporters,

I am one of the numberless people who adopted "Luther Blissett" as a multi-use name for radical actions and theory, multimedia works, anti-art performances and open political contexts in Italy and other countries of continental Europe. Since the mid-Nineties, the British press gave extremely distorted accounts of our activities, describing us as 'Anarchists' (which we aren't) and manipulating our statements. The British press made us look like moronic students, while we're people who work bloody hard and managed to be praised/feared by the cultural institutions of our country. Maybe this distortion is the reason why Mr. Blissett sounds very pissed-off in his latest declarations (see The Times, 8/3/1999, p.3). He (and you) may not share our political and aesthetic views, however we'd like to set the records straight once and for all: It was never our intention to sneer at Mr. Blissett's unlucky season in Italy. We always thought that the press and the supporters treated him unfairly since the beginnings: in the early Eighties it took a plenty of time for a British player to understand the Italian way of playing football, which was boringly defensive. He was never allowed to get used to Italy. Moreover, the club was a dreadful rabble of weirdos, and the owner Giuseppe Farina was a crook and an alleged arms dealer, who went bankrupt a few years later. We hope that someone will pass this letter on to Luther, and post it on the Watford Mailing List. We'd like to get a surface mail address for Luther, so that we can send him our books, publications and a lot of press cuttings covering both us and him. The following piece is a colourful article published on today's *Tuttosport* (one of the three sports' daily papers), where both one Luther Blissett and the journalist argued that it's time to re-establish Mr. Blissett's good name. Thank you very much,

Fabrizio P. Belletati a.k.a. Luther Blissett

Tuttosport, March 14th, 1999, Sunday:

BLISSETT, FROM RABBIT TO BEST-SELLING WRITER
by Gianluca Scaduto

Do you remember the English at Milan AC? They were so unlucky that they preceded the Dutch trio [Gullit-Van Basten-Rijkaard, t.n.]. Hateley retired from football two years ago. Wilkins is about to strike the big one: he entered the staff at Chelsea and there is a rumour that he's going to replace Rix (Viali's vice, who got mixed up in a court trial under charges of abuse and paedophilia) when the latter is fired. As to Luther Blissett, he was one of the most unpopular foreign players in the history of Italian football. Since those years, however, we've seen much worse players, perhaps it is time to rehabilitate Blissett's Italian season (1983-84, 30 matches, 4 goals). [Actually 5 goals T.n.] In fact, somebody's trying to re-establish Blissett's good name. After only a few days since its publication, *Q* already needs to be reprinted. *Q* is an adventure set in the 16th Century, a 643-pages long ponderous novel, authored by people who had the nerve to recall the Church's skeletons in the closet, a few months before the 2000 Jubilee. The author is Blissett, indeed, the real Blissett has nothing to do with this: he's back at

Watford FC, his former team, and works as a first-team deputy coach. However, his name was adopted by dozens of people all over Italy and Europe, to create the most various situations. Some Luther Blissetts are the bogeymen of journalism: they invent fake news and journalists usually buy them. Their best strike was the story of Henry Kapper [actually "Harry Kipper", t.n.], a "multimedia guru" who was travelling around Europe on a push-bike, his route virtually spelling the word "art" on the map. He allegedly disappeared in Trieste, soon before diving into Bosnia. Daily papers and press-agencies gave the alarm, "Chi l'ha visto?" [Has Anybody Seen Him?], a missing persons' prime-time TV show, t.n., covered the case. Two hours before the broadcast Luther exposed the hoax: the guru didn't exist. This demonstrated that so-called "sources" may be utter bullshit. However, Blissett's name is also used for political activism and three-sided football games played on hexagonal pitches ('good old Trapattoni' games: the winner must concede less instead of scoring more goals). Strange blokes, aren't they? And now they've got a face, nay, four faces. *Q* is not a common book, it is a masterpiece, and some people believed that Umberto Eco was the real author behind the collective name (which anyone is free to adopt). Thus the four authors came out (though they took to the bush again, and swear they'd never be guests at Maurizio Costanzo Show). The book may even make history: there's no precedent for a novel written by four persons, with an anti-copyright clause. No, they don't believe in 'the romantic concept of genius. Ideas aren't anyone's property', as stated by one of them. Anyhow, why did they choose Blissett's name to sign their works? A footballer's name would be an excellent Trojan horse for our actions. We chose Blissett because we wanted to rehabilitate him. He wasn't that bad: the year before coming to Italy he'd been top goal-scorer in the English league. It was the team that sucked: in fact, president Farina went bankrupt not much time later. Moreover, we appreciated Blissett's Jamaican roots: racists on the terraces used to welcome him by crying like monkeys'. And what is Luther Blissett's opinion? A few days ago The Times wrote about *Q* and asked him: are you glad you've become a literary mystery? He answered: 'I'm not pleased, but what can you do?'

<nettime> Kosovo, Iron Lungs And Hard Cocks

From: Luther Blissett

To: nettime-l@desk.nl

Date: Wed, 31 Mar 1999 02:35:22 +0200

[All the Luther Blissetts involved in the *Q* operation decided to turn every evening of their much-hyped promotional tour into an anti-war agit-prop performance. This text is based upon the stand-up act I'm doing these days, with striking responses from the audience (standing ovations, etc.)]

KOSOVO, IRON LUNGS AND HARD COCKS

Although you're here because I'm a novelist, I'm not going to talk about my book. It would be *immoral* not to talk about this war, as military aircraft takes off from the Adriatic coast, just a few miles away from this bookstore.

As a matter of fact, *Q* is a Trojan horse manufactured by radical opponents to the present-day world order; its makers at the Luther Blissett Project managed to intrude themselves into Troy, that is mainstream pop culture, and now they're 'hi-jacking' every conference, public reading and debate, taking every opportunity to speak out against bloodbath disguised as "Humanitarianism". Now that Luther Blissett reached no.2 in the national Hit Parade of books, s/he's got the duty to be uncompromising. You'd rather listen to some complaisant hack? Fuck off and die, then.

What do you think our novel is about? In the 16th century the Great Powers of Europe were head over heels in debt, and had to stir up religious

conflicts for strategic reasons. When these conflicts became gangrenous, new international alliances were stipulated to "enforce peace", liquidate God's enemies and establish a New European Order (1955; the Augsburg Treaty, "cuius regio, eius religio"). There were "multinational contingents" of Lansquenets, columns of refugees escaping from villages on fire, "limited national sovereignties" etc.

Is there something vaguely familiar? Ever get the feeling you're being cheated?

Doesn't the Fuggers' Bank resemble the International Monetary Fund, the World Bank and the likes? Doesn't Charles V's turbulent empire resemble today's Europe? Aren't today's "international police operations" carnages perpetrated by high-tech lansquenets in the name of God, Peace, Democracy or whatever can gild the poison pill? Historical novels, unless they're "Ramses"-like crap, are always political statements, and "Q" is our statement against "humanitarian" war propaganda, as well as - on another level of interpretation - against censorship, the new Inquisition and the ongoing Catholic "Reconquista".

One is never delirious about mothers and fathers: one is delirious about nations, borders, ethnic groups, races, classes... In recent years we have been delirious about Europe - all of us: myself, the Pope, Milosevic, Emma Bonino, Marc Dutroux... Europe doesn't exist, nor do we need to feel sorry about it. Identity is only and always something we've lost (or rather, something we never had), and the more we talk about Europe, "Europeanism", European Culture etc., the more these spectres fade away in the distance. United Europe is one of the tallest lies ever: Bundesbank, IMF, "Pensée Unique", Enfopol, American bases everywhere... And yet it's no good to be "anti-American", just as it is useless to be "anti-European". There's no tactical choice but hiding ourselves "within" Europe in order to escape and make fun of kapos: 'Very few prisoners made up their mind about escaping from Dora, and those who tried were tracked down by the dogs and hung on their return to the camp... So the Russians adopted another tactic: one day they hid inside the camp, for example under a Block... The nazis sought for them outside, and obviously didn't find them... After a week they gave up searching. That's when the Russians escaped for real. They had good chances of making it, since nobody was seeking them anymore.'

The problem is not "America", "Europe" or "limited national sovereignties" etc. The problem is capital, its "unlimited" sovereignty. People talk about nationalisms and ethnic policies, but those are just epiphenomena: the telluric shock that causes subsidence and landslides is still the clash between classes, division of labor on a planetary scale... And yet epiphenomena have devastating consequences...

The NATO bombings prove that Europe doesn't exist. Just fancy Italy! This government is of little worth, a coalition of weaklings and pygmies. They're so used to talk about UDR being the tongue of the parliamentary compass, or the Senate's "mixed group" being over-crowded, that they hardly imagine there's a whole world outside the iron lung of grotesque provincialism that both emprisons them and keeps them alive (or rather, undead). It is stomach-turning enough to witness a bunch of freaks such as the PdCI [Partito dei Comunisti Italiani] becoming the coalition's "critical conscience", being content with the fact that "our" aircraft is not dropping bombs, while the whole country is reduced to a colossal flattop, and Italy is on the front row of this war.

NATO bombings considerably worsened the situation in Kosovo, interrupted food re-stockings and induced a large portion of Yugoslavian public opinion to side with Milosevic, turning the latter scumbag into a bold, daring patriot. Either Wesley Clark and his chums are a bunch of morons, or there's a hidden agenda common to both parties.

Does Kosovo really exist? Come on, let's be serious, who ever gave a flying fuck about Kosovo at NATO headquarters? I'm not the first to say that this pretext is absolutely unbelievable, and I'll change my mind when I witness NATO aircraft bombing Morocco in support of the Saharawi. It took years before people doubted the incident in the Tongking Gulf which provided the pretext for the Vietnam war. Progress exists after all: nobody really buys the bullshit about Rambouillet, not even those who vigorously state the contrary.

As to the KLA, we were repeatedly told that it comprised about 30,000 guerrillas, and yet Serbian comb-outs in Kosovo are encountering no armed opposition. Where are those 30,000 heroes? Why aren't they fighting back as they're backed up by NATO air strikes? Does the KLA really exist or is it an invention of US propaganda?

It might have been any other pretext, the aim is making "Europe" feel the presence of the "carabineros", confirming that no antagonism will be tolerated on this soil. What is more, such a masculine strength test was necessary in order to supercede the Alliance's identity crisis, harden its character armor, prove that the balls (albeit rarely used) are still at their place, and no Milosevic may take the liberty of busting them.

However, as stated above, identity is something we've lost (just like rights: one starts to claim them once their violation has become everybody's recurrent behavior). NATO is a 50-year-old big man that never screwed but doesn't want to die a virgin, thus he assaulted and raped the first walk-up fuck he bumped into: Yugoslavia.

A common idiom among "straight chauvinist males" goes: 'It takes an iron stomach and a steel toe-capped cock to screw a tart like that'. As a matter of fact, NATO's cock "is" made of steel and the Serbian regime is far from looking good. As to the iron stomach, unfortunately "we" are the ones who need it, since the media are stuffing us with pseudo-humanitarian shit. In such cases, "ius resistentiae" [the right to resistance] encompasses retching and throwing up.

If there's no common hidden agenda, then Wesley Clark is an idiot. Where the fuck is the "art of war"? If Sun Tsu were alive, he'd beat NATO field officers with a stick. After less than a week of war, they no longer know what to do, we hear them arguing that black is white and white black, rambling about "phase B" and air-landing operations... A bunch of lunatics playing Risiko in the asylum's toy library.

And Bill Clinton? Posterity will remember him as a blow-job freak (which I am myself) and an exceptional instigator of Anti-Americanism. Each of his "humanitarian" operations increases hate. As Malcolm X would put it, the chickens of violence will return to Whitey's poultry pen: the US chose to play the 'tough cop', but no-one's playing the 'good cop'. When some cops come to a very bad end, the Pentagon will resort to Nazi arithmetic ('One GI killed, ten civilians bombed'). Any sociopath with access to an arsenal will then stand as a hero of resistance, as Saddam, Milosevic and Osama Bin Laden are already doing. A shitstorm is to come, unless we ignite opposition here in the West.

Yes, Milosevic's regime is authoritarian, repressive, liberticide and, maybe, guilty of genocidal intentions, but... Does any of you remember what happened in Timisoara back in 1989? A fake carnage staged by coupists and former Securitate agents. Corpses were stolen from the morgue, mutilated and piled up in the street. And the snuff movies presumably shot by Serbian troopers in 1991-92? Nobody saw them, then the rumor slowly faded out. And that Swiss tourist who spent his thrilling holidays as a sniper on the Sarajevo hills? Did any of you meet him? I think we should think twice before buying the urban legends spread by the CIA's Shit Department.

Each time a nation, an army and/or a head of state are charged with "crimes against humanity" or whatever, check the ID of those who are "representing" wo/mankind: you'll probably find out that they're as rotten as the ones they're accusing. For instance, as regards Italy, the most enthusiastic advocates of this war are the Radical Party, Emma Bonino and the likes... I hope you remember that they also supported the Israeli massacres at Sabra and Chatila, as well as any other pogrom and butchery perpetrated by Israelis within and beyond their borders. Compared to their pal Begin, Milosevic is a merry prankster.

The US aircraft dropped on Vietnam thousands of dolls stuffed with explosive. The timing was perfect: they usually blew up while children were playing with them. Numberless splinters ran into the children's bodies, crippling forever those who didn't die there and then. The splinters were made of a plastic material, invisible to X-rays, impossible to remove surgically. And Napalm! What a brilliant invention, a combustible that keeps burning you alive underwater. Other masterpieces were tested in Panama (1989) and Irak (1991) - to the extent that a number of Gulf veterans are dying of cancer due to contact with chemical weapons.

Aren't these "crimes against humanity"? You bet your ass they are, and yet we never saw Norman Schwarzkopf on the dock, 'cause he was one of the good guys. "he" put people on the dock. We must refuse this "Cardassian" administration of justice (see "Star Trek: Deep Space Nine"), that sentences defendants as guilty "before" the trial. We must be suspicious of those who put the fingers on the world's public enemies, and always resist, sabotage and ridicule these international police operations. Thank you very much for your attention.

Luther Blissett Project, Italian Situation, Updates

Late February 1999 - # 2

No-Art

>From La Repubblica on line (<http://www.repubblica.it>, the digital edition
of the national daily paper, as well as the most visited Italian website)
3 February 1999, Wednesday:

WHAT IF CANNATA THE "MADMAN" WERE MORE "ARTISTIC"
THAN POLLOCK?

A provocative letter: Must 'mainstream' art be inviolable? And who decides
what is genius?

By LUTHER BLISSETT

[begin staff preface]

ROME - Of course it is a provocation, but it is also more than that. The
letter which Luther Blissett - the collective identity that has accustomed
us to many coups (verbal and not) in the recent years - sent to
repubblica.it struck us and roused our curiosity. It expresses a feeling
that many people certainly got a week ago, when the vandalistic smearing of
a Jackson Pollock work hit the news. It was not a rational thing; rather, a
joke people uttered, or just thought, by instinct: "Which one is the
smear?". A superficial question that was restrained by cultural awareness
and indignation for this assault on contemporary art and its dignity. In
his/her letter, Luther Blissett turns the joke into a lucid provocation.
One may agree or not, but it would not be just to throw this text away. Our
correspondent and art expert Paolo Vagheggi replies to Luther Blissett at
the linked page.
[end]

On 26 January 1999, Piero Cannata operated on Pollock's painting "Undulated
Paths", exhibited at Rome's National Gallery of Modern Art. I challenge
anyone of the journalists that covered Cannata's action to tell the smear
from any of the other scribbles. Cannata's intervention is the best
tribute ever to the artist. The only difference between the American
Abstract Expressionist and the Italian performance artist is that the
former used to express his madness within an "artistic context", and
consequently found the theoretical and financial support of critics and
art-gallery managers. Most likely, without such a support, Pollock would
have entered a lunatic asylum, nurses sneering at his "works" on the walls.
Jackson Pollock didn't paint: he dripped, smeared and soiled. On his
canvases one can find saliva, cigarette stumps, matches, anything. One day
Pollock urinated into Peggy Guggenheim's hearth. Yeah, he pissed in it,
before the eyes of several onlookers. He was probably drunk. This
immediately became one of the best known "performances" of the great
genius, whose life was punctuated by such acts. That fireplace is still in
one of the rooms with a view on the Canal. If Piero Cannata or any other
anonymous visitor of the present "Peggy Guggenheim Collection" pissed into
the same hearth, what would the keepers do?

Of course they wouldn't deem the guy as a genius, at best he'd be
denounced. However, are you sure that Pollock's performances are more
important than Cannata's? Are you really sure that Pollock wouldn't like
such a "betterment"?

Why should an art work hang on a wall with people only allowed to look at
it, since it is obvious that eyesight is just one of the senses roused by
whatever work? One should be allowed to touch and smell. This would quickly
wear out the paintings? So what? What do you need a sacred and infinitely
inviolable object for? Don't you know that museums keep Calder's sculptures
in narrow rooms, though they were created for being exhibited in the open
air and shaken by the wind? Don't you know that museums bar the way to
Beuys' and Tinguely's works, though they were projected for interaction
with the public? *This* is violation.

If the most important thing is the artist's intention, then Pollock's
painting was not destined to a reliquary, and Cannata's intervention is
licit and particularly well-aimed. But museums and galleries are driven by
other factors, such as money. This is commonplace, then why keep schmoozing
about art being sacred and untouchable? Talk about commercial value. If the
word "artist" has ever had any meaning, then Piero Cannata is the real

artist. Unlike Pollock, Cannata never compromised himself with the art
establishment, never strived for the critics' and gallery managers'
appreciation. He couldn't care less, he's got better things to do. Mind
you, this is not the first case: people like Van Gogh were never understood
at their time, only to be re-estimated after several years. It's funny to
recall the blindness of Van Gogh's coeval critics. Oh, they were so obtuse!
Oh, those were such obscurantist times! Nowadays it's different, art is
free of prejudices... Isn't it?
Tomorrow Piero Cannata will go back to the madhouse that hosted him during
the past two years, and it's gonna take decades before he's acknowledged as
a well-deserving performer. Not only Piero Cannata will get entries in art
history books: he'll get them as one of the most radical and innovative
artists of the Nineties. This is one of the tasks we leave to our posterity.
(2 February 1999)

DEAR LUTHER, ART IS A SERIOUS THING

A Reply to the "pseudo-Futurist" provocation: Pollock was a self-conscious
artist, values cannot be annihilated

by PAOLO VAGHEGGI

Maybe that of the pseudo-Luther Blissett is nothing other than a nice
pseudo-Futurist provocation. None of us has forgotten Filippo Tommaso
Marinetti's 'incendiary violence': 'We want to destroy museums, libraries
and whatever kind of academies', we want to set Italy free from 'its fetid
gangrene of professors, archaeologists, cicerones and antiquarians'.
Therefore, long live Piero Cannata, let's promote him to the rank of
artist. Long live the David hammer-freak and Pollock smearer. But what if
this, instead of being a pseudo-Futurist provocation, were just the opinion
and belief of an ignorant (ignorant being for 'he who ignores')? In this
case, we should tell them the difference between a rash gesture caused by
madness and a conscious, advised, pondered and researched artistic deed. We
should tell them that Jackson Pollock, no matter what the nazis would have
thought of him, was not a dauber, nor was his art 'degenerate'. His strokes
were not felt-pit scribbles. His technique, 'Dripping', was sharp and
pondered. As Dora Vallier explained, the canvas was placed on a level
surface, even on the floor; and a few holes drilled through the bottom of a
color box allowed the painter to work moving about and letting the color
drip on the canvas.

There was no fortuitous act, as explained by Pollock himself, who died in
1956 at the age of 44: [...what follows is a Pollock's quote which I won't
re-translate from Italian back into English. It's about the control of the
drops' trajectory, T.N....]

I could go on for so long telling stories about Pollock, who studied
philosophy and psychoanalysis (as well as native-American painting), who
was Picasso-wise and always lived between anxiety and the rapture of his
work. This rapture was provoked by his quest for a personal existential
style: he identified himself with his artworks, which gradually expanded
and absorbed all his energies.

As Palma Bucarelli noticed back in 1958, during the NGMA Pollock
Exhibition, 'thus, independently from any analogical reference, painting
itself can express the most profound movements of the soul; the more the
canvas reflects the "quantity" and the "length" of painting action, the
clearer is the expression of emotional intensity.'

Jackson Pollock is not Pietro Cannata [sic]. Pietro Cannata is non Jackson
Pollock.

Maybe someone dreams of an annihilation of values in order to say: 'I can
do that as well!'. Things are not like that. There will not be any Night of
Crystals, no matter what Luther Blissett believes.
(2 February 1999)

[Luther Blissett replied, but Repubblica didn't run the piece. Luther put
it into circulation as the issue #39 of their anti-art newsletter called
"Epistula Ex Vaticanis Museis". Here it is:]

DEAR MR. VAGHEGGI, MADHOUSES ARE SERIOUS THINGS,
MORE SERIOUS THAN ART

Luther Blissett replies to Paolo Vagheggi about the Cannata affair

At best, your response proved that you didn't even read my press release.
At worst, you read it but didn't understand. I didn't say 'I can do that as
well!' nor did I call Jackson Pollock a worthless dauber. Maybe that's
really what I think, but I am not so naive as to give you the opportunity
to splutter the usual reply: 'You are ignorant, you don't understand
contemporary art', which means, as you said yourself, that I ignore it.
I promoted (or degraded, which depends on the point of view) Piero Cannata
to the rank of artist. At this point, customary language would require a
large amount of terms like 'Post-Modern tension', 'Empathy', 'Genius',
'Intemperance', 'Existential Drama', plus a few quotes (preferably taken
from some mate's book). Mix up, ferment for one month, and the artist is
ready. Is the vernissage scheduled?
It goes without saying that I won't do that, because I'm no respectable

critic. My tool box does not contain catalogues and invitations to exhibitions, but a hammer, a knife and a few permanent markers. If I'm no respectable critic, that's precisely because I'm not able to ignore. Unfortunately, those who ignore are people like you, journalists, critics, gallery managers, collectors... You and the majority that you represent are ignorant. You're ignorant because you think it's possible to separate the "beautiful" from the "ugly", "art" from "madness", you have the power to put a man into an asylum, that is the power of ignorance. I belong to a minority that rely on their own "lack of culture" and (luckily or unfortunately) couldn't even hurt a bug. Maybe I'd be able to hurt a hack...

You're so keen on defending Pollock's art from the charge of being "degenerate", a charge that nobody pressed. Don't you find it bizarre! You are supporting the imprisonment of a 'mad vandal', a 'fanatic', while you try to convince me that Pollock, who was praised in life and died a millionaire, expressed a profound existential tragedy!

'He identified himself with his artworks, which gradually expanded and absorbed all his energies'. Aren't these words perfectly suitable to the life of Piero Cannata?

'There was no fortuitous act'... Yeah, you think that Cannata's is 'a rash gesture caused by madness'... And yet, for more than 9 years, Cannata has gone ahead with such a lucid project that even Fontana would envy him! Cannata plans his actions months in advance, and is determined to carry on for the things he believes in. No, Piero Cannata is not mad (nor does madness exist, but this is another story). He's just mad enough to go a few inches beyond the sacred and unpassable boundaries of Art, enough not to long for the support of critics and galleries.

Paolo Vagheggi, Maurizio Calvesi, Achille Bonito Oliva and all the others: you're precisely that kind of persons that in 1909 were shocked at Futurism, and in 1917 were indignant because an urinal was exhibited in a gallery, and in don't-remember-what-year because an artist was selling his own shit. It's too easy, after more than half a century, to organize Dada and Surrealist retrospectives, dish up monographs on the likes of Marinetti, Breton and Tzara, people who died and were entered long ago. You just recuperate; when will you "propose" anything?

Here's my answer: your descendants will do it for you in a few decades, as time pours oil on today's troubled waters, as Piero Cannata is gagged and stuffed with thorazine, Alexander Brener grows old and suitable for museums, Luther Blissett become a spectre (s/he already is). I look forward to those banquets, revaluations, essays, exhibitions, catalogues, T-shirts and CD-ROMs.

No, it's not you that make history. Maybe it's not me either. Piero Cannata is trying to do it.

Things are like that. There will be a Night of Crystals, no matter what Luther Blissett believes. (5 February 1999)

NETSTRIKE FOR CPA FI-SUD

After nine years of selfmanaged activity within the former industrial area "Longinotti" in Florence South, Tuesday December 22nd. The City Council of Florence has approved the project for the construction of yet another shopping mall, in this instance a "Coop" ("red" version of a chain store) for a total of 11.000 square meters. This has sealed the fate of our center, putting an end to all our social, political and cultural activities (we'd mention here the battle won against heroin dealing in the neighborhood, the wonderful relationship with our community, a cultural offer unique to this city, an entire range of cultural experiences - music, theatre, videoart, Hack.it - born and grown in the Center).

Do the Right Thing! Netstrike (with cache=0) x CPA against the decision of the Municipality of Florence to build a supermarket and erase an important political, social and cultural experience: the same one that supported hackit98. RELOAD your browser with cache = 0 with (4th january 1998 6.00 - 7.00 p.m. GMT +1) on <http://www.comune.firenze.it> and <http://www.coop.it> and stay tune on #strkcpa irc channel

<nettime> Stop censorship: PIE on lin

From: Luther Blissett

To: nettime-l@desk.nl

Date: Wed, 18 Nov 1998 16:05:00 +0100

This is the translation from Italian of a message put into circulation by one <nobody [AT] replay.com>.

STOP CENSORSHIP!

Although this message is anonymous, it is not a spam. In order to say HELL NO! to censorship, we decided to put on line a cartoon seized in Italy under charges of "paedophilia". The URL is

<http://www.geocities.com/SoHo/Nook/2279/bastacensura.html>

The cartoon is PIE. (Paedophile Information Exchange) by Miguel Angel Martin, taken from the comic book *Psichopatya Sexualis*, published by Milan-based Topolin edizioni.

This comic book had been taken to court before, its publisher had been fully acquitted, and yet Deputy District Attorney Maria Rosaria Sodano ordered the seizure of the whole Topolin catalogue.

Sodano claims she has enforced article no. 600/3 of the infamous Child Pornography Act, which the Italian Parliament passed on July 3rd, 1998. The article amends the Penal Code and establishes a harsher punishment for 'anyone who... distributes or spreads news or information aimed at enticement or exploitation of the under-age, i.e. under 18'. It goes without saying that Martin's work has nothing to do with art.600/ter, whose enforcement in this case is ludicrous and bad-faithful. In fact, we are talking about a cartoon, that is a product of creativity and free imagination, in which no actors or models were hired or exploited.

To us, this case unveils the real meaning of this law and the purpose of its enforcers. These people don't care about child abuse, their target is any cultural work that undermines bigotry and the hypocritical notions of "normality" they wish to impose as an universal rule. These modern inquisitors are so obsessed with persecuting "deviants" that they seized a work which had already proved not guilty. As the judge himself wrote in his verdict, *Psichopatya Sexualis* does not advocate the violence it depicts.

We could say many other things about the nature of the ongoing campaign against "paedophilia" (which is unbearably hypocritical and instrumental). We could describe the law-and-order, pro-censorship hijack of the just worry about child abuse. We could say much more about the assault on the Net. We could also expose the role played by journalists, hacks and TV anchormen - these people gave up any dignity and professionalism, for it is much easier to build a lucrative career upon witch hunts and sensationalism. Eventually we could point out that child abuse (sexual and not) usually takes place inside the very institutions worshipped by most witch hunters, i.e. the Church and the patriarchal family. But we'll just say that our choice (to make one of the seized cartoons available on the web) is to defend everyone's right to choose what can be read or watched. This right is in danger, because of liberticidal mass hysteria.

Will some other zealant magistrate or priest consider our action illegal? We don't know. We don't even care. We don't belong to Topolin Edizioni, we are not acquainted with the authors

of the seized comic books, we are not members of any of the several associations that have expressed their solidarity to Topolin.
We'll remain anonymous. We aren't trying to avoid responsibilities. We think we are much more "responsible" than those who think that only passive acceptance of the rules they enforce must be deemed as a responsible behaviour. What we are trying to do is assert our belief in the Net's potential as a virtually uncontrollable media, still open to all those opinions and rights that the powers-that-be want to repress.
We also believe that free circulation of ideas and knowledge, as well as cooperation between those who spread them, can render censors ridiculous and make fun of all their attempts.
This website may be condemned to a short life. We invite you to link it, nay, to save the pages and upload them elsewhere, in order to continue the defense campaign.

<nettime> on moderation and spams

From: Luther Blissett
To: nettime-l@desk.nl
Date: Sun, 11 Oct 1998 16:48:55
+0100

Since the debate on moderation continues, I feel it's my duty to express solidarity to Ted Byfield, which I already did in a private message yesterday. It's too easy to charge him with authoritarianism or whatever. Anyone who spent just a few weeks in the 1980's mail art network remembers that there were all kinds of real stalkers who couldn't help by stuffing other people's POB with junk (crushed cans, used condoms, my pal Vittore Baroni even received a big rotting fish!). Antiorp reminds me of them. I think s/he's little more than a spammer. Or is s/he... an "artist"? If so, much the worse for him or her! My personal opinion is that 'art' is an obsolete idealistic category which jack-off middle-class smart-asses adopt as an excuse for anything they happen to throw up. When "art"-oriented harassment meets nice-ism and political correctness, the result is time-wasting, nowhere-going nihilism. Or is antiorp an "info-warrior"? Right. S/he declared war upon... whom? Me? So why can't I counter-attack? And even if antiorpisms were worth reading, why post them on Nettime? I'm sure there are more suitable contexts. Antiorp fans want us to be open-minded - antiorp tried to tear our nervous system apart. Two different beasts, I daresay. Any attempt at describing such annoying behaviors either as "performances" or as "mind-challenging" dunno-whats will always provoke my fierce resistance. Even Monty Cantsin's Invisible College list (whose subscribers are devoted to 'mad science' and coded language games) unsubscribed a guy named Barnoz who used to post hundreds of lines of [>quote(<quote)] garbage. I think that "moderator" is a bad word though. Anyway, this is the abovementioned message:

Hi there.

As a nettime subscriber I reckon you - and any other moderator who unsubscribed or is going to unsubscribe antiorp from their list(s) - did the right thing. In off-line reality your decision would be deemed as absolutely normal: three mornings in a row some guy I don't know comes over and puts smelly turd into my mail box. First time I wonder 'what the hell kind of a sick weirdo...?', on the second day I get mad. OK, that might be a "clever art trick", "performance art" and whatnot, but I don't give a damn: third day I wait for him, give him a good kicking and shove the turd down his throat. This is not repression of free speech, is it? Bye.

I'm sticking with nettime (classic). I find the moderation as it has been carried out to be desirable and not heavy-handed. I don't mind that someone is starting a splinter group with a similar name, but I think it is bad net etiquette to take a mailing list and automatically sign everyone up as has happened with nettime free. Because I don't have too much time to read everything and because of the involuntary subscription I have unsubscribed.

Me too.

>I find the moderation as it has been
>carried out to be desirable and not heavy-handed.

I agree. Filtering out Antiorp nonsense is fine with me. I don't have time for jibberish from anonymous sources. There is enough jibberish from people I know that I have to read. If people think this is against free speech, now they can read as much nonsensical Antiorp jibberish as they want on the other nettime list.

>I don't mind that someone
>is starting a splinter group with a similar name, but I think it is bad net

I also agree with this.

For moderators: how did they get the list of subscribers??? Was this not a private list? Can you make it so no one can copy nettime-l addresses

again?'

> Because I don't have too much time to read
>everything and because of the involuntary subscription I have unsubscribed.

Yes.... Why should I have to take the trouble of unsubscribing myself? If it was "OK" for whomever it was that stole the nettime-l addresses and then started a new list to subscribe all those people, then I presume it is "OK" for someone else who knows how to, to simply unsubscribe all those addresses. Why should we all have to go in there and individually take our names off? When we weren't asked in the first place? Can someone automatically take people's addresses off the new list?

I received a series of idiotic posts from nettime.free, and promptly unsubscribed while making a point of calling them assholes. Assholes are people whose brains are located somewhere in their lower colons, they exhibit traits of assholiness, such as taking the names on one mailing list and appropriating them for use on another mailing list without permission. nettime.free is herby renamed nettime.assholes. I herby submit this post gratefully to moderation. Oh ye nettime gods, kill or forward this post as ye see fit. Your will is law, and I accept it gratefully, for a list without law is a list of nettime.assholes.

<nettime> The exposure of Mussolini's corps

From: Luther Blissett

>Mussolini and Claretta Petacci (her lover) was an inhuman event,
>i agree.

My point of view is different.

The allied forces were about to reach Northern Italy, and many cowards who had supported Mussolini for more than twenty years suddenly switched to antifascism. A few days after the Liberation, a lot of long-time members of the National Fascist Party subscribed to clandestine antifascist parties and claimed to have fought in the Resistance. Although nobody had seen them in action, why split hairs?

According to some witnesses, many of those who beat il Duce's corpse to a bloody pulp were far from being political opposers or former victims of fascist persecution - indeed, some of them had enthusiastically applauded Mussolini's last speech in Milan, just one month before his death. The exposure of those smashed corpses became one of the many great alibis and spectacular moves staged to cover the substantial coherence between the defeated regime and the victorious one. Togliatti (general secretary of the Communist Party) granted amnesty to every fascist psychopath imprisoned by the Allies. The fascist Penal Code wasn't changed. The high bureaucracy of the state remained exactly the same: the judges who had inflicted centuries of prison to antifascists simply swore their loyalty to the new Republic, and kept the power in their filthy hands. Even the 1948 Constitution, one of the most advanced in the world as far as civil and human rights are concerned (although none of those principles was ever put into practice), referred to the Concordat between Italy and the Vatican, which on the initiative of Mussolini had acknowledged Catholicism as 'the only religion of the Italian state'.

Despite this, I don't feel like blaming those men and women who honestly hated their former dictator, and couldn't help but going berserker in Piazzale Loreto when they were able to lay their hands (and feet) on his body. Remember that Mussolini had been one of the most untouchable scumbags on earth: those people had been seeing the son of a bitch in the distance, a small bald head waving fists like a demented spastic, speaking from platforms and balconies surrounded by armed soldiers. Those people had been hearing his voice on the radio, full of ostentation, announcing that he was going to send them and their husbands/sons/brothers to the bloodiest war in modern history. They had been bumping into unbelievably ugly Mussolini statues and busts in every street of their town. They knew that was the guy they had to thank for the death of their beloved ones. Maybe some of them thought: 'Sure I'm gonna thank him someday!' What would've you done? Me, I would have kicked the shit out of the cankerous bastard, even if he was already dead. Human beings aren't saints. Human beings aren't robots.

Sorry, I reckon this has little to do with net-culture.

Songs From The Wood
Net-Culture, Autonomous Mythology and the Luther Blissett Project

by F. P. Belletati
All rights dispersed

keywords: mythology - class war - identity - sabotage

As Down Home As I Can Get

The prime mover was a loose-knit current of Italy's Marxism labelled 'operaismo' [workerism], which had absolutely nothing to do with the Communist Party.

In the early 1960's the Operaisti started to investigate changes in the sociological operation of the working class. At that time, the young mass-worker of Fordist-Taylorist factories was still the tongue of the compass, the most important segment of the proletariat. The operaista

intervention in class struggle was based upon a participant observation of the mass-worker's behaviour. The mass worker explicitly refused the older generation's work ethic and discipline. This insubordination was the main mover of conflict in the workplace. Sabotage was not invisible anymore: along with moments of open struggle (strikes and demonstrations) there was a flourishing of micro-tactics to slow down or stop the assembly line.

Operaisti were committed to studying those behaviours and defining the dialectics between class struggle and capitalist development which I'm going to sum up - taking some shortcuts. The continual confrontation between capital and living labour was the cause of all technological innovations and changes in management, which would provoke further changes in the class composition, therefore the conflict would continue on a higher level.

After the so-called Hot Autumn (1969), a season of general strikes and radical struggles with millions of workers taking the streets, proletarian insubordination increased. Struggles became more and more 'autonomous' (this was the adjective by which wildcat strikers would describe their occupations: 'assemblee autonoma'). In 1973 the self-disbanding of the post-operaista group Potere Operaio [Workers' Power] gave origin to the scene renowned as autonomia operaia organizzata [organized workers' autonomy].

During the 1970's, Italian Autonomia theorists (Toni Negri first among equals) started to investigate and define the existence and subversive behavior of the 'operaio sociale'.

Such an ambiguous collective noun - hardly translatable into English - served to describe both the youngest generations of industrial workers who had broken away from the work ethic once and for all, and the whole cast of frustrated service workers, 'proletarianised' students and white collars, unemployed wo/men and members of youth subcultures whose conflict was clearly 'anti-dialectical'.

'Anti-dialectical' means that self-organization, wildcat strikes, occupations and acts of sabotage did not take place within the realm of negotiated class struggle, indeed, they even cut loose from the traditional dialectical bond between struggles and development, and challenged the recuperative function of the unions and the Left's political control. In order to repress those uncontrollable eruptions and outbursts (the 1977 movement above all), the ruling class had to impose a state of emergency. It was a bloodbath. By the end of the decade, most militants had been killed, thrown in prison, escaped from the country or started to shoot up heroin. But that's another story.

As some have suggested, from now on I'm going to use the term 'composizionismo' instead of [post-]operaismo, because the former is more precise and does not automatically correspond to a particular segment of the working class (the 'blue collars').

The so-called 'third industrial revolution' made capital supercede the fordist-taylorist paradigm, and turned information into the most important productive force.

Appealing to those passages of the "Grundrisse" where Karl Marx used the expression 'general intellect', compositionists began to use such descriptions as 'mass intellectual' and 'diffused intellectual' making reference to multifarious subjectivities in the new class composition.

'Mass intellectuals' are those people whose living labour consists, broadly speaking, in a subordinated output of "creativity" and social communication (in compositionist jargon: 'immaterial work'). This segment of the operaio sociale ranges from computer programmers to workers of Toyotist factories, from graphic designers to copy writers, from PR people to cultural workers, from teachers to welfare case-workers etc.

Negri's analysis in particular is based upon the 'prerequisites of communism' immanent to post-Fordist capitalism. By 'prerequisites of communism' Negri means those collective forms that are created by past struggles and are constantly re-shaped by the workers' tendencies, attitudes and reactions to exploitation. Some of these forms even become institutions (e.g. those of the Welfare State), then they go through a series of crises: social conflict created them, social conflict keeps them open and necessarily unfinished. Their crisis reverberates on the whole society, so conflict continues on a higher level.

The most important prerequisite of communism is the collective dimension of capitalist production, which brings about more social cooperation.

The stress must be laid upon the most strategic form of today's living labour, i.e. 'general intellect', immaterial work, 'creativity', you name it. 'General intellect' (unlike labour in Taylor's 'scientific management') is self-activated. The mass intellectual's workforce is not

organised by capital, because social communication is prior to entrepreneurship. Capital can only recuperate and subdue social communication, control the mass intellectuals from the outside after having acknowledged and even stimulated their creativity and far-reaching intelligence.

The conflict continues on the highest level: capital's "progressive" spur is over, autonomy is becoming a premise rather than a goal.

The Common Being And The Net
=09

A compositionist approach to computer networking reveals that:

- The Net's horizontal and trans-national development brings about a potentially autonomous social cooperation.
- Most netizens fall within the anthropological, sociological and economical descriptions of 'mass intellectuals'.
- Today's Net landscape is the synthesis of many molecular insubordinations and some important molar victories, (e.g. the anti-CDA 'Blue Ribbon' campaign) and is continually re-shaped by conflict.
- The Net is also shaped by software piracy and copyright infringement: private property of ideas and concepts is challenged and often defeated. If any one of you is without copied or cracked programs, let them be the first to throw a stone at me.
- As an "institution", The Net is going through a growth-crisis that is reflected upon the whole society. In its turn, this crisis is a mover of conflict.

In plain words, the Net seems to be the prerequisite of communism *par excellence*. This is not an uncritical utopian view of computer networking, of course there's a huge gap between the potential and the actual: work-force vs. work, *langue* vs. *parole*, capital vs. living = labour, consumerism vs. social communication. The Net is the OK Corral. It's paradoxical that, after all the schmoozing about 'molecular revolution', we're heading straight to a new molar impact.

The global anti-'paedophilia' mobilization is the state of emergency by which the powers that be want to gag netizens. The reappropriation of knowledge and the self-organization of mass intellectuals require the defense of the Net from slanders and police raids. We must keep this 'institution' unfinished and open to any possibility; prevent capital from filling the abovementioned gap with censorship and commodification. It isn't just a liberal battle for free speech: it's a class war.

But this is not enough yet. We've got to make history, no less - fill that gap with autonomy and self-organization. We also need myths, narratives that incite mass intellectuals to take action. Each historical phase of class war needs propelling mythologies, there's nothing wrong with that. Georges Sorel has been slandered and misunderstood for too long. As Luther Blissett put it:

'...the trouble is not the "falseness" of myths, but the fact that they outlive the historical forms of the needs and desires they channelled and re-shaped. Once ritualised and systematised, the imaginary becomes the mirror image of the powers that be. The myths of social change turn into founding myths of the false community built and represented by the power [...]. The myth of the "Proletariat" was rotten as well: instead of fighting for the self-suppression of proletarians as a class, the communist movement had mystical wanks over any sign of "proletarianism", such as the "hardened hands" of the workers, or their "morality" [...] proletarians were defined according to sociology and identified with blue collars themselves at best, or with the "poor" of the Scriptures at worst, or even with both figures, while Marx had written: 'Either the proletariat is revolutionary, or it is nothing'. The direct consequences were Zdanov's Socialist Realism, puritanism, sexual repression vs. bourgeois 'decadence', and all that shite.

However, [...] the "destruction of myths" makes no sense, we must concentrate our efforts in another direction: let the imaginary move, prevent it from crystallising, try to understand when and how myths are to be deconstructed, dismembered or forgotten before the plurality of images is reduced to one and absolute. [...]

(*Mind Invaders: Come Fottete I Media*, Rome, 1995 - a partial translation available at <<http://www.geocities.com/Area51/Rampart/6812>>)

We need open, interactive... rhizomatic mythologies. But mythologies are always created, modified and re-told by some community. What community are we talking about here?

Let's start again from 'general intellect'. 'General' means 'common', literally 'belonging to the genus', i.e. wo/mankind, our species. In "On The Jewish Question" and the "Economic And Philosophical Manuscripts" (1844), Marx appealed to two important concepts: *Gemeinwesen* (common being) and

Gattungswesen (species-being). Class struggle, the self-suppression of the proletariat as a class and, eventually, revolution were to overcome the alienation of human beings from their own *Gemeinwesen* and *Gattungswesen*, in order to build a global human community that coincided with the species itself, beyond races and state-nations, beyond citizenship. We cannot understand the compositionist theory which stems from the *Grundrisse* if we don't stick to Marx's humanistic idea of community.

..The Waldganger's Black Game..

The Luther Blissett Project consciously started as an experiment of networking as myth-making. 'Luther Blissett' is a multi-use-name that can be adopted by anybody. The goal is an anthropomorphization of 'general intellect': since 1994 many people who don't even know each other have endlessly improved the reputation of Luther as a "Homo Gemeinwesen". And yet, as Bifo put it: 'One must not overvalue the importance of Luther Blissett. We could even say that Luther Blissett doesn't count for anything. All that really counts is the fact that we're all Luther Blissett [...]'.

Here are some sub-mythologies studied and put into practice by Luther Blissett:

1. The nordic myth of the *Waldganger*, the rebel who "takes to the woods". In 1951 the German reactionary writer Ernst Jünger wrote a pamphlet titled *Der Waldgang*. Jünger described the society as ruled by plebsitary patterns and panoptical systems of social control. In order to escape from control, the rebel must go to the woods and organise resistance. In nineteen-fucking-fifty-one! What should we say nowadays? Echelon, interceptions, video-surveillance everywhere, electronic records of our bank operations... Taking to the woods is more necessary than ever.

Some hacks have compared "Luther Blissett" to Robin Hood. Actually that hazy myth has much to do with multi-use-names. In XIIIth century England, Saxon peasants ill-treated by the Norman ruling class expressed their malcontent and everyday resistance by ascribing many anonymous actions (real and imaginary) to one outlaw whose figure gradually became that of "Robin Hood". The surname suggests that this folk hero (at least at the beginning) wore a hood - he had no face, he represented anyone. That's the way the myth works, though in the Middle Ages it could only bring temporary consolation for a very limited *gemeinschaft*.

2. Some other journalists described Luther Blissett as a "pirate" or a "buccaneer". It is an error. OK, net-culture and orthodox underground culture are clogged with maritime metaphors and, yes, "pirate" also means someone who illegally copies material protected by copyright. But Luther Blissett is a terrestrial myth. You don't breathe brackish air in the woods. The sea is far away, maybe a utopian horizon to which the outlaw gradually moves.

If there's a utopian element in the Luther Blissett narrative, it is the utopia of the criminal class: 'fuck them over and take the French leave', as melancholically evoked in Gary Fleder's *Things To Do In Denver When You're Dead*, a gangster-movie whose characters greet each other saying: 'Boat drinks!'. This is the happy end of all the movies whose protagonists manage to pull a fast one (a fraud, a robbery...). In the last sequence you see them sailing around the Antilles, quietly sipping their Daiquiris.

Of course 'boat drinks!' can only be a propelling sub-mythology, certainly not a realistic project, because there is no "elsewhere" left - misery is all around. The epilogue of Jim Thompson's *The Getaway* is very instructive. Sometimes one can achieve 'boat drinks!' though. Ronald Biggs, the Englishman who made the Great Train Robbery of 1963, fled to Brazil and, as far as I know, he's still there. But the Waldganger is too far from the sea, indeed, only those who stand in the middle of dry land can cultivate 'boat drinks!' as their utopia: 'This is Denver, what do you need a boat for?'

3. The last recurrent description is 'cultural terrorist', which is less unacceptable but it is improper all the same, because 'terrorism' is a term that the ruling class uses to defame anything and anybody, and also because 'terrorism' and state repression always mirror each other (the ETA vs. the GAL, the Armed Islamic Group vs. the 'nijas' of the Algerian Army etc.). The dialectic between police state and 'terrorism' is based upon emulation.

And yet, even the apparatus of the state can provide us with some useful images. I'm talking about 'intelligence' and black propaganda. Multi-use-name bearers from Italy and other countries often mention and cite a book, Ellic Howe's *The Black Game: British Subversive Operations Against the Germans During the Second World War* (Queen Ann Press, London, UK, 1982).

During WW2, Mr. Howe was the secret Political Warfare Executive's specialist for the manufacture of printed fakes and forgeries. PWE's instructions were to undermine the morale of German soldiers and civilians, by means of disinformation and psychological warfare. Thanks to a network of agents in the enemy-occupied territories, PWE issued fake NSDAP circular letters about feuds in the Party, bogus government edicts about desertion, a frightening *Plague Booklet* supposedly published by the German Ministry of Health and leaflets advising the female army personnel not to have sex with soldiers because of venereal diseases. PWE even produced half a dozen issues of *Der Zenit*, a bogus astrological magazine that dissuaded sailors from weighing anchor on a certain "inauspicious" day (of course it was the date of some important naval operation). PWE also invented Gustav Siegfried Eins aka *Der Chef*, a non-existent German dissident talking on a bogus clandestine radio station (actually the broadcasts were from the UK), entertaining the audience with invectives against nazi politicians and detailed (albeit false) gossip about their sexual perversions.

Since the dawnings of the project, Luther Blissett has been playing a black game like that. This is another viable mythology for mass intellectuals. Given the new molar dimension of conflict, this is the molecular we can find and work with. Try to figure all those tricksters, impostors and transmanics meeting up in the woods, spreading rumours and black material, inoculating lethal viruses in the territories of this global electronic Fifth Reich and then... 'Boat drinks!'.

New Interactive Communication and 'Antagonismo' in Italy

By Strano Network

Keywords: self-governance, co-operation, rhizomatic, cyber-rights

In this text we will try to explain how new digital technologies and the values of equality, self-governance and co-operation came together in Italy in the last two decades. We will describe the Italian portion of the birth of a new global subject who has found in, and develops from digital communication new means and tools of social and political action.=20

During the second half of the 70's and in the 80's, we saw two different strands of social protest and rebellion: the 'Autonomia' movement and Punk: two distinct movements always sizing each other up. The former was rooted in the ongoing conflict with Italian political and economic institutions and was mostly based on a network of 'centri sociali occupati' (squatted community centres).

=09The latter has been more of a loose network of individuals and groups who made artistic experiences and events in the streets or generally with a social and 'against the establishment' attitude, e.g. graffiti, mail art, low cost fanzines, music. The concept of 'doing networks' and a deep interest in new languages and means of communications emerged first within the Punk scene. Punk was an extremely spontaneous development, without any clear direction or recognisable organisational structure.=20

The very first experiences of social uses of digital media were characterised either by a strategy of direct conflict against institutions or by the experimentation with new languages which might help evade institutional authoritarianism. Both kinds of experiences fought back against the 'New World Order' and its strategies of global exploitation and pointed out how the new means of digital communication have a potential for empowerment and equality.=20

In the following we present a short chronicle of the main events in the development of socially-aware uses of digital communication and of the institutional attempts to impede them. Due to space and time limitations,

we are unable to give a complete historical overview of the many who had a role, e.g. we may only mention the PeaceLink network. Instead we'll concentrate on the European Counter Network (ECN), and CyberNet. In our point of view, these are the two most interesting and influential experiences we had in Italy.=20

Chronology

Mid-eighties. The group of people who a few years later will be involved in Decoder starts to meet and to discuss the social uses of BBS and networked communication.=20

1985 Centro di Comunicazione Antagonista (Florence), Radio Onda Rossa (Rome), Vuoto a Perdere (Rome) meet to check the feasibility of a computer network for the exchange of information related to activist movements. The attempt fails: in Italy it was too early.=20

1986-89 The Decoder group (Milan) explores the possibility of opening a CyberNet area within Fidonet. They get in touch with a variety of European groups (Vague, Chaos Computer Club, Enciclopedia Psichedelia), from whom they find out about the hacker meeting Icat89 whose 'ethical principles' they later translate in the 'CyberPunk' volume.=20

1988 'TV Stop', a Danish group, make a proposal for a European 'antagonista' (activist) network, the preliminary idea for the future ECN. Class War (UK), Radio Dreickland (Germany) Coordinamento Nazionale Antinucleare e Antimperialista (Italy) are some of those who join in the efforts. 'Remote Access' is chosen as the connecting software and is decided the European network will be a federation of the national networks that should be created.=20

1989 The Decoder group tours North Italy in an attempt to convince a variety of political and counterculture groups to develop a common network. They fail.=20

1989 Italy starts to be connected with the ECN (via Telix software).=20

1989 (University Occupation Movement 'La Pantera'). A variety of meetings about networking and its technologies and uses are organised all around Italy. The difference between two main strands of opinion emerges. The ECN people see the network more as a new tool for political organisation and action. The Decoder group, people who are later with the Avana BBS in Rome, the La Cayenna group in Feltri claim that networks change and extend human communication possibilities and urge people to explore what that could mean.=20

1990 The first European nodes of the E.C.N. were born in Italy: Padua, Bologna, Rome, Milan. These nodes are almost exclusively made up of file areas used to exchange activist materials with only a few echomail areas (messages) used just to co-ordinate the structure.=20

July 1990 At Sant' Arcangelo di Romagna Festival, during some lectures organised by Decoder, the Cyberpunk Anthology, published by ShaKe is presented. This book will soon become the basic document of the Italian cyberpunk movement and it is publicly acknowledged as a new possible social subject.=20

December 1990 'Hacker Art BBS' was born: an artistic self-managed telematic data base.=20

January 1991 Senza Confini BBS (No Boundary BBS) was born in co-ordination with a Roman association bearing the same name. The association was founded by a European MP, of an Italian leftist party (Democrazia Proletaria) that promotes the civil and legal defence of immigrants.=20 Senza Confini BBS was born with messages and file areas dedicated to this subject. In 1991 it became part of the P-net that was a common hobby network with sympathies for the cyberpunk movement. When the cyberpunk area of the Fidonet was later closed down, Senza Confini BBS becomes the vehicle of cyberpunk area itself, amongst other various P-net nodes present in almost every part of Italy. This situation lasted until the Florence meeting during which it was decided to create a new independent network (Cybermet) with gateways opened to all the networks' needs. In this way it was possible to create a gateway from all Cybernet messages areas to both P-net and ECN. During the well-known Italian Crackdown in 1994, Senza Confini BBS is the only BBS to remain unconfiscated, so it became a central point for all the telematic community of this region.=20

March 1991 During the three day meeting 'I.N.K. 3D', organised in the squatted space Isola nel Cantiere in Bologna the new telematic message area Cyberpunk is presented. It is hosted by a group of sysops from the hobbyist network Fidonet co-ordinated by the Fido Milan BBS sysop. During 'INK 3d' in Bologna the cyberpunk area also opened up in the Fidonet BBS Arci BBS. This area was closed down 2 days later by the BBS sysop after the publication of an article on the newspaper 'La Repubblica' in the pages of Bologna section linking the cyberpunk area to information piracy.=

=20

April 1991 the Lamer Xterminator BBS was founded in Bologna. It was part of the upcoming cyberpunk network, but completely independent from Fidonet, taking messages directly from the BBS in Milan. This was costly, and called for a network which would be totally independent from Fido. This didn't happen, and Lamer BBS died one year later because of financial problems. The Lamer Xterm activities group went on, however, until 1994, with the aim of providing everyone with technology. The result of 3 years of work was 150 courses and workgroups on computer and information technology held on different levels at a political price and which took place in the Bolognese underground movement.=20

June 1991 'International meeting' in Venice (proceedings are published by Calusca Edition in Padua in the same year). In this occasion about 2000 people (many of them representing national and international groups) met for a period of three days to discuss and to face new activist forms in opposition to the emerging 'New World Order'. A specific section was dedicated to the new forms of telematic communication. This section was principally oriented to the projects of European Counter Network, but besides the numerous nodes of this network, Hamburg's Chaos Computer Club, Radio Onda Rossa (Red Wave Radio), Link and Zerberus from Vienna, Decoder, Amen also took part in this meeting: there were also speeches on the Internet, Bitnet, Infonet and Peace-Net.=20

Summer 1991 The E.C.N. starts carrying some material from the cyberpunk area.=20

July 1991 At Sant' Arcangelo di Romagna Theater Festival the Shake - Decoder group organised the meeting & inter/active workshop 'All technologies to the people'.

The international workshop 'Inter-action' decides to study media interactivity and the necessity for horizontal communication. For this they study the creation of laboratories for the diffusion of low price infomatic and telematic technologies.=20

1991 The annual report of the Italian secret service and Department of Interior covers activist telematics.=20

1991 The ECN nodes linked themselves in a Fido network consistent with the zone number '45' and region number '1917'. Digital material from BBS and activist organisations comes to and leaves from this network from all over the world but, so far it seems, no activist BBS networks have been established outside of Italy.=20

1991-96 E.C.N. tries to also include realities that do not use digital media - digitising documents produced by these organisations. In this way the network tries to link every area of the movement through telematic media. Its goals are modified as such to include the aims of the general activist movements and not just those of Coordinamento Nazionale Antinucleare e Antimperialista (Antinuclear and Antimperialist National Co-ordination). Between 1991 and 1992 ECN begin publishing, as paper zines and newspapers, the news that was previously only available on telematic media. From 1993-94 it begins to develop the idea of a network that is not a simple distribution service but also a new social and political subject.=20

June 1992 The importance of the cyberpunk movement gains media acknowledgement - getting a self-managed TV show called 'Mixer' shown by RAI (the Italian national broadcasting company).=20

June 1992 First issues of Feltrinelli's Interzone books.=20

Summer 1992 The cyberpunk message areas are closed by the Fidonet's leaders, completely ignoring users' needs. This closure places in greater contrast the difference of intentions between the cyberpunk area and Fidonet's leaders. Amongst the reasons for the closure there is a visit from the police to a Fidonet sysop managing the cyberpunk message areas.=20

December 1992 Law 518 on copyright passed. This weighs the institutional management of telematics in favour of protected elites, against the interests of the people.=20

January 1993 The telematic network 'Cybernet' was born. The national hub is 'Senza Confini BBS' (Macerata); the other three nodes are initially 'Hacker Art BBS' (Florence), 'Decoder BBS' (Milan) which was started at this point, and 'Bits Against the Empire BBS' (Trento). Before 1995 there were about forty nodes, distributed all over Italy, with an average of about 200 users for every BBS, but with up to 800-1,000 users for Decoder BBS and 5,000 for Virtual Town TV. Unlike ECN, Cybernet presents itself as an 'open' network, with message areas where anybody can both read and write. Proposals for a rhizomatic kind of telematic network will be discussed and promoted here to overcome the hierarchic structure of the

FIDO-like model. (These proposals will receive a very detailed formulation in the "Gaia" project, a description of a network based on technical self-organisation principles). Cybernet assumes as a basic principle the right for every person all over the world to communicate without barriers through telematic media. The proposed model will be used as an example for all the future discussions not only inside the E.C.N. area but also for the future civic network and for Internet providers.=20

April 1993 Strano Network (Strange Network) started in Florence.=20

Spring 1993 "No copyright, nuovi diritti nel 2000", ("No Copyright, new rights in 2000") edited by the Decoder group is published by ShaKe. This anthology will constitute the theoretical basis for a political answer to law 518 on copyright.=20

October 1993 "Immaginario tecnologico di fine millennio" ("Technological Imaginary at the end of the Millennium") edited by Libreria Calussa of Padua is published. An important moment of discussion between the different Italian telematic organisations.=20

December 1993 Law 547. This law begins the regulation of computer crimes and forms the prelude to the Italian Crackdown.=20

May 1994 The so called "Italian Crackdown" begins: looking for copied software police make confiscations, with the temporary closure of about 150 BBSs, mainly of Fidonet and Peacelink networks.=20

June 1994 Meeting organised by "Informatica per la democrazia (Computer Science for Democracy)" in Rome. This meeting examines the laws on software copyright and computer crimes that are judged illiberal and potentially dangerous for the telematic network. It also considers the applications made by magistrates (in Pesaro, Milan, Rome). For sure, the laws are an attack on freedom of expression.=20

1994 Start of the Bologna civic network that gives a free Internet e-mail address to every person living in Bologna.=20

October 1994 Virtual Town TV BBS, (formerly Hacker Art BBS) starts. VTTV uses the new software First Class with a version - UUUCP - that can supply free Internet e-mail to users, a graphical interface and the possibility to make multiple chat (5 contemporaneous lines).=20

December 1994 "PsycoSurf" & "MediaTrips", events in CSOA Forte Prenestino (Rome) with the birth of the Avana group (Avvisi Ai Naviganti - Warnings To Sailors: the name of the special nautical weather reports on the radio) and of the Avana BBS. The future activities of the Avana group include: introduction courses, (Internet, word processing, free systems, etc.); engagement in electronic democracy, (the Roman civic network); hypermedia installations; and reflections on the 'yield of citizenship' and "political enterprise".=20

February 1995 "Communication Rights at the End of the Millennium", organised by "Strano Network" in the Luigi Pecci Center for Contemporary Art in Prato. For the first time about twenty hobbyist networks also met at this convention.

This encounter was born from the necessity to find a common platform to react to institutional actions (the Italian Crackdown) that, in the initial phase of internet promotion in Italy, both tried to limit the experiences of data transmission and misunderstood its specific requirements and purposes. With the birth of the phenomenon of the "civic networks" it was part of an attempt to formalise just two possible actors in data transmission: commercial providers and institutional "civic networks". These were proposed to replace all other things, including the world of the 'associazionismo' - the grassroots networks. In such conditions every experience of spontaneous data transmission remained excluded or 'not protected', (a clear example is the recent censorship of the field of 'associazionismo' and hobbyist data transmission made possible by a specific article of the Roman civic network in July 1998). The proceedings of this convention are collected and published in the 1996 book "Nubi all'orizzonte - Clouds to the horizon" edited by Strano Network and published by Castelvocchi. Taking part in the meeting were Cybernet, ChronosNet, EuroNet, E.C.N., Fidonet, Itax Council Net, LariaNet, LinuxNet, LogosNet, OneNet Italy, P-Net, Peacelink, RingNet, RpgNet, SatNet, SkyNet, ToscaNet, VirNet, ZyxxelNet and many journalists, artists and intellectuals. The convention was preceded by a "hypermedia conference" via the networks in the autumn of 1994. The convention produces a motion signed by all the participants that can be considered the common base of a new political subject that although composed from a widely differentiated constellation of social members emerges through the use of telematic media.=20

March 1995 Decoder Media Party including the presentation of the Decoder and Strano Network Web sites. In Rome the web sites of "Tactical Media

Crew" and "Malcolm X" and elsewhere others, are launched.=20

1995 The Decoder group propose a collaboration with the Milan Civic Network. It is not accepted because it is considered to contrast with the "civic" organisation of the network and because it is considered too radical.=20

1995 The civic network of Rome hosts Avana BBS and approximately thirty other BBS and associations of the Roman area, as a result of one negotiation.=20

October 1995 About fifteen Tuscan BBSs co-ordinated by Strano Network form the FirNet network (of which VTTTV is the host). In Florence City Hall FirNet open a "Consultation of the telematic area of the metropolitan Florentine area" with the demand for a Civic Network in which the BBSs take part and that also guarantees those ethical principles that Strano Network had formulated in the text "Fluctuating Interface and Communication Right" presented in October at the international convention Metaforum II in Budapest. After few months a Civic Network of Florence will be started - totally neglecting the demands of the Consultation. Citizens will not be guaranteed any rights of communication using telematic media and the civic network will be a simple "display window" for the promotion of the interests of the shop keeper.=20

October 1995 Strano Network realises in "Cybercaf=Eg Zut" the first public and free Internet connection in Florence.=20

December 1995 "Warnings To Sailors (AvANa)" in Forte Prenestino (Rome). Meeting on the new frontiers of self-production and a general test for the new AvANa BBS using First Class software.=20

December 1995 First global Netstrike, devised and promoted by Strano Network. To protest against the nuclear experiments at Mururoo, ten sites of the French government are almost blocked and their operation is drastically slowed down by thousands of net-strikers from all the world through a simultaneous concentration of activity of many browser on one same site. The "Net strike" is the demonstration that the technology of data transmission supplies also new kinds of social and political protest.=20

1996 Netstrike for Chiapas.=20

1996 The start of "Islands in the Network" and the transfer to the Internet of the main documents of the E.C.N.. Its main message areas are also now converted into mailing lists: "Movement" (on political initiatives from alternative movement in Italy), "CS-LIST" (on initiatives of Italian squatters), "International" (on internationalist news), "ECN news" (list consisting in a newsletter published by ECN.ORG) that will be join in few months by "EZLN It" (on political initiatives carried out by Italian movement on chiapas matters), "Cyber-Rights" (on the Italian right-to-communicate matters) and "Shunting lines" (on gay and lesbo matters).=20

1996 Meeting in Pesaro, organised by Metro-olografix and others.=20

1996 Netstrike against American 'justice' (focusing on the cases of Mumia Abu Jamal and S. Baraldini). The White House site in Washington is blocked for 12 hours.=20

September 1996 A company is acquitted after being accused of simultaneous multiple use of Microsoft software whilst only having a single license.=20

1997 513 DPR Regulations governing the encryption of documents.=20

1997 "Infoxo" was born in Rome, during the G.R.A. (Great Self-production Connections).=20

May 1997 The "Decoder-Mattino" case. A Roman magistrate, concerning at some graphics pages in Decoder 8, explains the thesis that, "Cyberphilosophy, the defence of rights to both privacy and anonymity using networks has to be considered the behaviour of accomplices to paedophiles".=20

1997 Magistrate complains about the publication of a book by the Luther Blissett Project.=20

January 1998 The Anonymous Digital Coalition announces a net strike. It stops two Mexicans financial web-sites in solidarity with the Zapatista cause.=20

1998 The first Italian anonymous remailer started by the ECN. So another important digital self-defence instrument is added to the already nourished resources and programs bookcase, which was in the "crypto"=20 directory of the "Isole nella Rete" server.=20

June 1998 "Hack It 98" at the C.P.A. in Florence. Hack It 98 is the actual point of arrival of the new social subject's process of growth.

Nearly all the groups and scenes described here participate, everyone supplying their own theoretical and technical contribution. The characteristics and the main proposals of this three day event, full of seminars, demonstrations, installations, conferences, concerts, TV experiments and self-managed radio are: the horizontal dimension of the event, without "organisers, teachers, public and customers" but with "sharers" (the meeting is organised by an "open" mailing list); the proposal to repeat the meeting annually; the proposal to throw out other national enterprises; thought by the collectivity and locally organised; the achievement of an inquiry about work in the field of national data transmission.

Finally, amongst all the proposals and plans originated by Hack-it 98 one stands out, the one born at the beginning of the conclusive general assembly (subsequently re-discussed in the network) about the constitution of an Agency for communication rights.=20

September 1998 The Agency for Communication Rights is called for again by Strano Network, which suggests it has the following main characteristics: =20

Using the collaboration and technical hospitality of ecn.org the Agency should constitute itself as a "non-profit cultural association". On the legislative front it will comment on existing laws and watch over liberty-destroying-legislation; promote referenda on every law that negates freedom of information and communication on the Network. On the legal front, the Agency should offer help to anyone who is a victim of censorship. It reserves the right to appear as a civil plaintiff if, and any time it might be necessary. On the technological front, the Agency will comment on any developments that can be thought to decrease the rights of privacy or access of individual citizens. The Agency should defend people using computers at work - stimulate debate about themes such as: poisoning from monitors; the defence of workers' privacy; potential guarantees necessary for new forms of work organisation. The Agency should strive to constitute a task force of lawyers, jurists and technicians. This group would be at the disposal of the Agency for advice, attendance, processing documents, analysis etc.=20

MANIFESTO FOR FREEDOM OF ELECTRONIC COMMUNICATION IN THE THIRD MILLENNIUM

- FREEDOM OF INFORMATION

- the free, unimpeded exchange of information by the use of horizontal and interactive communications made possible by all the means that new technologies offer are essential elements of our fundamental freedoms and must be supported in every circumstance.

- the right "to inform and to be informed" wants to be free: it belongs to all the world. It is produced by and for all over the world, so that access to information must not be the exclusive right of an elite or privileged groups.

- the networks' property must not be under the control of monopolies or private and public oligopolies. Communication and information should be the property of all. The people of the networks must be in a position to control and to participate in the managerial choices of all those who own networks.

- communication by private subjects cannot be restricted. Neither can it be entirely their own property. Customers have the right of self-manage data transmissions according to autoregulation criteria.

- information must be accessible to all, and everyone should be able to insert his/her own information in the network

- the simple technical possibility of access to information is not sufficient to guarantee peoples' freedom. People must be free to have and to use the necessary critical instruments to learn and to process informations which they need, so that they may make their own interpretation and transform themselves in meaningful communication.

- people are not the passive terminal of information flows devised by elites or managers. People's freedom exists in producing social action and communication, free from prejudice and discriminations on the grounds of race, sex or religion - even when those actions and communications may contradict established economic or political interests.

- BBS

- we recognise the public usefulness of the Bulletin Board System and of every communitarian and non-professional form of communication. We love it for its autonomy in managing information, and for its freedom from the great media and editorial oligopolies

- the activity of the BBS must not be subordinate to authorisations or censorship. It must be recognised and protected because it is a social and useful instrument for the free manifestation of thought.

- TECHNOLOGY

- in the network the standards of communication must be the fruit of a global decision. They must not be spread by the economic politics of a narrow power group. Technology does not have to submit to controls and economic politics which might stop their distribution or global production.

- PRIVACY

- anonymity must be agreed. The privacy of every customer must be protected. Network customers have the right to defend their privacy of the data transmissions and by the use of all available technological and cryptographic means. No information regarding the personal data of any individual should be stocked or searched by electronic means without the explicit agreement of that person.

- RIGHTS, RESPONSIBILITY AND LAWS

- those who manage the nodes of data transmission networks are not responsible for the material placed by other people on the system they manage. This is because of the practical impossibility of controlling all of this material and because of the inviolability of private correspondence. System managers' responsibilities end where customers' responsibilities start. Interpersonal, electronic communications and other forms of communication should be defended from every kind of censorship, control or filtering

- the police seizure of computers to realise investigative aims, instead of the simple copying of the data-contents of the computers themselves, is a serious violation of personal freedom that does not have a logical or a technological foundation.

- we denounce and condemn as unjust the legislation of a false "society of information". For years magistrates have arranged " motiveless" seizures, causing damage to the social data of networks and within which they have penally pursued those who are merely suspected of breaking laws about computer technologies. It is time to defend the rights of individual citizens instead of the interests of giant software manufacturers.

- Anyone has the right to use any kind of information and to use it in total freedom, provided that everybody recognises the intellectual and economic rights of the authors, proportionately to intellectual and economic advantages. The duration and characteristics of economic rights must not deny the legitimate evolution of knowledge or limit all humanity's thirst for learning.

- We refuse every present or future legislative form which might limit the use of data transmission technologies as has already happened for radio technologies. Here, a system based on authorisation and licences has prevented diffuse and popular access to the possibilities of social change offered by radio. The use of networked electronic communication technologies must neither be bound by authorisations or concessions, nor limited by fiscal or bureaucratic obstacles.

June-August 1998 Many attempts at censorship by the authorities and magistracy were happening (see below). They show an actually increasing trend of repression and underline the necessity of an international co-ordination of activist servers

June 1998 As a result of a complaint, the "Isola nella Rete" server was confiscated because the server contained a message which formed a presumed defamation of an Italian tourist agency. Massive mobilisation begins immediately in the networks and in the mass media to defend "Isola nella Rete", to condemn the seizure, its motivations and its method. The immediate restitution of the server was an important demand. The principle that, "The server represents an entire community and it cannot be closed because of a single action of a single customer on the server" is one of those supported, together with other principles.=20

1998 July Rome City Council's Civil Network censors the Roman Digital Forum.=20

1998 July Law about child pornography.=20

1998 July News Servers are declared not to be responsible for the messages circulating in newsgroups or for the customer's messages, because the message itself is considered to be "free expression".=20

1998 August A new, clumsy attempt to seize Isola nella Rete's server: as a result of an inquiry by the criminal police of Massa about a threat to a local newspaper (with the publication of a message sent in a mailing list from Isola nella Rete). The police threaten the seizure of Isola nella Rete if it doesn't hand over the users' activity log. Logs had not been created on INR for a long time so that in the case of such threats they would be undeliverable. The server is not seized.=20

August 1998 Seizure of two personal computers at the Isola nella Rete representative's Bologna home.=20

We acknowledge the support and the wealth of information kindly given to us by Decoder (Milan), Avana (Rome), Senza Confini BBS (Macerata), Zero BBS (Turin), and Lamer Xterminator BBS (Bologna). In this text there are no names of individuals but only of groups or situations.=20

No, mate, that site is old, never updated since 1995 and written in an ultra-clumsy "sounds-like-English". You'd better refer to the following one (which is linked to many others).

<nettime> Blue Telephone vs. Luther Blissett ?!
From: Luther Blissett
To: nettime-l@desk.nl
Date: Thu, 27 Aug 1998 22:37:26 +0100

Telefono Azzurro [azure telephone, light blue telephone] is an Italian (supposedly) no-profit association with easy access to state funds and corporate sponsorship. Their field of activity is the prevention and repression of child abuse. The reason of such a bizarre name is that battered/violated children are supposed to call the association's ultra-advertised number. Being the colour of the national soccer team, azure is usually associated with hope. This is a piece published on La Repubblica daily newspaper, followed by the translation of Luther Blissett's press release.

-1-----

La Repubblica (Bologna edition), August 27th, 1998:

BURGLARS-VANDALS AT TELEFONO AZZURRO After an escalation of threatening calls to Prof. Caffo

by Carlo Gulotta

A series of threatening phone calls, then a communique from Luther Blissett that called in question the group for its support to the new bill on paedophilia, eventually a strange act of burglary, more likely to be a warning, Three different episodes that have probably nothing to do with each other, but whose target is the same, Telefono Azzurro. A few weeks ago the group's Bolognese office started to receive a different kind of calls: insults and threats. A few days ago professor Ernesto Caffo gave the police a leaflet which Luther Blissett had sent to a press agency. By this leaflet, Blissett "warns" the association. Blissett's 'media pirates' are also involved in troubles with the judiciary because of their book 'Lasciate che i bimbi' (published on the Internet) - it seems that they intended to warn Telefono Azzurro about the escalation of child abuse which will probably follow the passage of the new bill on paedophilia. TA's pressure and efforts facilitated the passage of the bill, which aggravates punishment for child abuse. Professor Caffo immediately contacted the police and gave the leaflet to the detectives. The leaflet was faxed from a copy shop in Bologna, and also targets two other similar associations. 'We are used to threatening calls', says professor Caffo, 'One must be able to make distinctions between the different episodes, though it is obvious that some people do not appreciate our efforts. We have an established relationship with the police, and immediately brought the leaflet to the station'. Yesterday, Telefono Azzurro made yet another official accusation, after a strange incursion in their office, via Oberdan 24. It happened last Monday night. Someone forced the locks of two doors on the ground floor, broke into the office, opened cabinets, rummaged into drawers but did not steal anything. Before leaving the place, they even evacuated their bowels in the lobby. TA activists believe that it was a warning, some sort of affront. They didn't steal anything'.

-2----- Press Release from the Luther Blissett Project in Bologna (authors of 'Lasciate che i bimbi') about vandalism at Telefono Azzurro's Bologna office

Bologna, Thursday 27 August 1998

An article by Mr. Carlo Gulotta on today's La Repubblica (Bologna edition) calls us in question with reference to threats and vandalic incursions suffered by the Telefono Azzurro office in Bologna. We understand that Mr. Ernesto Caffo, president of Telefono Azzurro, mentioned us in relation with the latest effraction. Caffo talked about a communique supposedly sent by one Luther Blissett.

Gulotta's reference to this communique is ambiguous: 'It seems that Blissett's 'media pirates' intended to warn Telefono Azzurro about the escalation of child abuse which will probably follow the passage of the new bill on paedophilia'. This may have two different meanings: either this Blissett says that the new act on child pornography is so badly written that child abuse will increase rather than decreasing (by the way, this is our opinion), or the communique is a Mafia-styled warning. 'You let that bill pass? OK, we'll make you pay by raping even more children!'

We have nothing to do with any threatening phone call or vandalic raid suffered by Telefono Azzurro. We disdainfully reject every hint and insinuation.

We also advise Telefono Azzurro to think twice before calling in question people whose social praxis and political activities have always been stylish. We would never stoop to such rascally triviality.

We've been handling the issue of 'paedophilia' for years. We think that "paedophilia" is little more than a pretext to spread law-and-order authoritarian culture and destroy all civil rights and guarantees in this country. We have never attacked Telefono Azzurro, nor have we stated that child abuse is not a serious problem. We have researched a plenty of journalistic/judiciary errors and horrors, clinging to our libertarian point of view. We have defended the Internet users' community from absurd attacks, by exploding many lies that were published on newspapers and/or broadcasted on TV. We have fought traditional media hacks, and exposed the mixture of ignorance, fear and envy that inspired their slanders.

We even broke with a custom of the Luther Blissett Project, and decided to run our campaign publicly, turning up at conferences and public meetings, showing our faces, even before Lucia Musti started her libel suit. Our book "Lasciate che i bimbi" is available in the bookshops, and it is the only reliable source on our position. [...]

Anyway, the new act on paedophilia and child pornography (bill Sa625, approved by the Senate on June the 9th) is a juridical monstrosity, a

classic emergency act which contains various elements of unconstitutionality. We are not the only ones to say this. For instance, some representatives of the gay movement (e.g. attorney Ezio Menzione) deconstructed the bill's text and demonstrated that it is useless, homophobic and liberticide. Moreover, MCMicrocomputer magazine strongly criticised the bill because it modifies the Penal Code (3rd comma of the article 600/3) in order to make Internet service providers responsible for the 'paedophile' pictures and texts passing through their servers. This is like holding Telecom Italia as responsible for obscene calls.

That's all.

THE 1998 ITALIAN CRACKDOWN EXPOSED

Index

0. Premise
1. What Is The Musti Affair?
2. The assault on Internet service providers
3. We Need International Solidarity

0. Premise

Something serious is happening in Italy. A crackdown recently started in Bologna is going to threaten freedom of speech for Italian netizens. The so-called Musti affair, which we'll sum up in the next paragraph, is a pretext to create a legal precedent, foster (self-)censorship and possibly enforce the (remarkably restrictive) law on the press in the Italian cyberspace.

1. What Is The Musti Affair?

Lucia Musti, vice-District Attorney in Bologna and former Public Prosecutor in a famous trial against an innocuous cult called 'Bambini di Satana' [Children of Satan], sued a 'traditional' publisher (Castelvecchi Edizioni, based in Rome) and two Internet service providers (Cybercore, based in Bologna, and amila8, based in L'Aquila) for having published or put into electronic circulation Luther Blissett's book 'Lasciate che i bimbi. 'Pedofilia', un pretesto per la caccia alle streghe' (Let The Children... 'Pedophilia' as A Pretext for A Witch Hunt). The book is anti-copyright, thereby it is also freely available on the Web. Lucia Musti wants the book to be banned, all the copies to be destroyed and its electronic versions to be removed from the indicted servers. Moreover, she claims moral damages for 450 million lire (approximately \$300,000). She asked the competent magistrate to sequester Castelvecchi's accounts and contracts (officially in order to know how many copies were put into circulation - more likely she wants to find out the real names of the authors). The first session of the trial will take place on the 5th of May at the Tribunal of Bologna. According to Musti, the book's content is 'insulting', 'slandorous' and 'prejudicial' to her reputation and identity. The charge is 'Misuse of the right of criticism'. Why?

The first chapter of Blissett's book consists of a scrupulous account of the BDS trial. In 1996 the three defendants (the cult leader Marco Dimitri and his fellows Piergiorgio Bonora and Gennaro Luongo) were arrested and charged with child rape, satanic ritual abuse and even human sacrifice. There were no corpses, no reliable witness, no evidence at all whatsoever. The defendants went through a long, groundless detention before being taken to court. The media upheld their guilt, fostered moral panic and described them as little more than bloodsucking monsters. Eventually they were acquitted, but their life was destroyed.

Soon after the arrest the Luther Blissett Project launched a campaign of counter-information and challenged the investigating authorities, whose Jeanne d'Arc-like commander was Lucia Musti. The LBP exposed her lies, her

staunch clericalism and the ambiguous role played by the Curia of Bologna [local ecclesiastic authority] through a group of bigots named GRIS [Group for Research and Information on Cults]. Combining media hoaxes, private investigations and a meticulous deconstruction of Musti's propaganda, the LBP helped to free Dimitri and the other guys. Some newspapers (e.g. La Repubblica) were greatly influenced by Blissett's campaign, and explicitly censured Musti's behaviour and fanaticism.

According to the LBP the 'Children of Satan' were scapegoats, and that trial was a manifestation of the sexophobic/homophobic/obscurantist euro-paranoia about pedophilia, ritual abuse and kiddie porn on the Internet. The first chapter of 'Lasciate che i bimbi', which is far from having a slanderous content, tells the whole story from the arrest to the acquittal, exposing the ways Musti took advantage of her position in order to manipulate the public opinion and persecute innocent people. After having ruinously lost the trial, she even wanted to avoid the consequences on her reputation!

2. The Assault On Internet Service Providers

Musti's 'Atto di Citazione' [certificate of action at law] is a violent assault on the Internet providers whose servers hosted the electronic text of the book. The target is the Internet, its 'difference', the features that make it uncomparable to the traditional media, i.e. the horizontality which has granted freedom of speech for those who have no access to the old media and the trans-nationality which has made a lot of wanna-be censors sleepless.

The Italian legislation on the Internet is full of blanks, this is the state's chance to fill them, set a dangerous precedent and force providers and netizens to self-censorship. If Musti wins the trial, the Italian Net landscape will be impoverished if not ravaged, with serious repercussions all over Europe and the world.

Here's some translated excerpts from the abovementioned Atto di Citazione, dated February 11th, 1998:

[In Italy] the responsibility of providers for torts committed via the telematic nets is currently the subject of a lively debate. Two fronts oppose each other: one considers providers equal to publishers, thus responsible [for the contents], the other considers them equal to booksellers and newsvendors, thus non-responsible.

We think that the 11th article of the law on the press - which is about the common responsibility of the publisher, the owner of the publication and the author - is extensible [at least by analogy] to [Internet] service providers. Although the mentioned law is enforced for "all typographical reproduction, obtained by any mechanical or physico-chemical means, anyhow aimed at publication", we must remember that, despite the wonderful terms currently used to describe the information highways, the material which is put on the Internet is not destined to stay in a virtual world of immaterial communication, indeed, it can be easily fixed on such material supports as computer hard disks or diskettes, as well as reproducible by such mechanical means as printers.'

'However, the responsibility of providers can also be demonstrated according to the article 2050 of the Civil Code [which is about responsibility for dangerous activities]. In fact, this rule is enforced not only for the activities regarded as dangerous according to the law on Public Security and other special laws, but also to all the activities which, to the opinion of the competent judge, can intrinsically be harmful, even if they are as much licit as useful for society.'

'In the case the competent justice decides there are no premises for the enforcement of the article 2050, we can take into consideration the article 2051 [which is about damages caused by things kept in custody], because it is undeniable that A) [providers] have a direct, concrete power on the sites running on their servers, B) [the sued providers] were aware that the contents of Blissett's text were prejudicial to other people's reputation, and could have easily removed them from the sites [...]'

3. We Need International Solidarity

This struggle has an immediate political value, every Italian provider has to take part in the general mobilization. Besides setting limits to freedom of speech, this precedent will extend their legal liability.

The Net is an organism that can defend herself. Her immunity systems are electronic civil disobedience, the netizens' quick reflexes and the almost instinctive solidarity that doesn't leave abuses unpunished. Musti has made a big mistake taking offence at the Italian Web. We have suggested anyone who runs a site or a server to create pages dedicated to this crackdown, by mirroring (or re-designing) 'Lasciate che i bimbi', and loading the text you are reading. Re-designing solidarity is indispensable. We've just started to get media coverage and organise events, while other people are

putting the incriminated book on their sites. We'll constantly update the list and send it to all the concerned netizens, along with all the material we'll be able to translate into English.

We also call on every enemy of obscurantism, repression and censorship to take the field and make a protest against this crackdown, by sending e-mail to Italian newspapers.

Luther Blissett Project, Bologna, last week of March 1998

**<nettime> Negri, Bordiga, the
general intellect and the nomadic
war machines**

From: Luther Blissett

To: nettime-l@desk.nl

Date: Tue, 02 Dec 1997 00:48:53

+0100

Dear Barbrook,

Glad to see that this debate is proving useful. However, I strongly disagree with your opinion that these issues cannot be interesting for the net-time subscribers, indeed, the stuff about Stalin and defunct ideologies certainly isn't (and it wasn't me who put it there in the first place), but some references to the perception and re-elaboration of Marx's Grundrisse in Italy are VERY important in order to understand how so-called _net-culture_ developed there, and then grasp the very relationship between Negri and Deleuze, which appears to be puzzling you. Nowadays, no account of this history can seriously count Bordiga out, because he was THE prime mover and shaker.

That's why, in order to answer your (private) questions about Negri, it is necessary to (publicly) explain why you're underestimating Bordiga. There are more things in his writings and personal history than you could imagine. Your third-hand sources must be extremely clumsy, while my first-hand ones are very good. Unfortunately (for me) I'm a "doctor" myself, I made a degree in History of Technological Innovation, and - guess what - Bordiga was the subject of my thesis, whose title was "Technology And Environment In Amadeo Bordiga's Post-War Writings".

In plainer words: while I was writing the essay on Bordiga I got access to a lot of old books and long-forgotten issues of 'Bordiguist' newspapers. It was an unbelievably interesting experience. For instance, I discovered close links between Bordiga and Negri (Negri would never admit this), being the former a forerunner of those post-Grundrisse studies that have changed forever the elaboration and praxis of Italian 1960's 'operismo' (the antechamber of 1970's Autonomia). So would you please stop conforming to stereotype, I mean, displaying the typical arrogance of the academic? Me, I would never play the wisecrack writing about the UK. I know it isn't that important, but I can't help saying it: the bordiguists were marginalised

within the PC at the Congress of Lyon (1926 - not 1927!), but they (and Bordiga himself) weren't expelled from the party (that is, from the Komintern) until 1930.

And now... back to the serious issues.

All my books and archives are in Italy, so I can't be 100% precise in my quotations, but it isn't difficult to describe the theoretical (as well as personal) relationship between Negri and D&G. I inform you that Negri and Deleuze interviewed each other in the late Eighties (the conversation, as far as I remember, was published on Negri's magazine 'Futur Antérieur' in 1988 or 1989). In the early eighties Negri and Guattari even co-authored an essay titled 'Les nouveaux espaces de liberté' (which I read in Italian as 'Le verita' nomadi' - 'Nomadic Truths'). Sorry, I don't remember the French publisher.

As you know, Negri deems the Grundrisse as the centrepiece of Marx's work. To Negri, Marx's notes on the labour process and alienation in machinery and science, as well as the distinction between 'formal' and 'real' capital domination, is nothing less than *the touchstone of everything*. Like his master Raniero Panzieri (the founder of 'Quaderni Rossi', the most radical revolutionary magazine of the sixties - even more important than the frankly over-rated 'Internationale Situationniste'), Negri lays the stress on the subversive potential of collective living labour (which Marx describes as 'social mind' and 'general intellect') rather than on the alienation of labour in machinery.

According to some mainstream, narrow-minded interpreters of the Grundrisse, the 'general intellect' has simply to do with dead/ objectified labour, which is expropriated from the workers and incorporated into the machinery. According to the Italian post-operaista school, 'general intellect' is what the workers' *living* labour has become since the hegemony of relative surplus-value (i.e. the increasing automation) has provoked the collapse of any dialectical theory of labour-value and radically mutated the old fordist class-composition (with its obsolete distinction between white and blue collars). Nowadays General Intellect/Living Labour is not only physical work-force; it implies technical skills, mastering of complex language codes etc.

During the seventies, unlike his contemporary Camatte, Negri didn't liquidate the proletariat. Rather, he described the new antagonist subjectivities bent on raising hell all along the 'social factory', and gathered them under the umbrella-term 'operaio sociale'. Ed Emery ludicrously translates 'operaio sociale' as 'social worker' (!) while it means, more or less, 'diffused worker' [social factory = decentralised factory]. The operaio sociale was the personification of the living part of general intellect, the synthesis of a mixed-up class composition which included the younger generations of industrial workers (who, unlike their fathers and mothers, were absolutely uncontrollable by the unions, real foreign bodies to the traditional mediations of industrial conflict) as well as 'proletarianised' students, former white collars, unemployed (nay, unemployable) graduates, etc.

As the micro-electronic revolution definitively destroyed taylorism-fordism, the definition 'operaio sociale' started being replaced with 'mass intellectuality' (or 'diffused intellectuality'), which means all those subjectivities whose work-performance is constructed upon a subordinate, compulsory output of 'creativity' (in Grundrisse-speak: upon a further valorisation of the living elements of the general intellect). For example, the 'collaborative' workers of toyotist/post-fordist factories, computer programmers, media low-level workers, etc. The post-fordist labour process is increasingly based on workers' 'collaboration' and 'self-activation', e.g. the Japanese model. According to Negri and other commentators, the existence of a potentially revolutionary network of such newer operaio sociali is a prerequisite of communism in itself. These people are in the key points of the social factory (telecommunications, spectacle, transports, services, education), their insubordination would have shocking repercussions on the capitalist command structure. The workers are already managing 'immaterial production', their work doesn't depend on the bosses anymore, they could even get rid of the whole command structure (and of the unions as well). Workers' autonomy is not an aim anymore: it's a precondition - see what happened in France in 1995.

So what is living labour nowadays? According to Negri, it includes "artificial languages, complex articulations of information and science of systems, new epistemological paradigms, immaterial determinations, communicative machines". That's why Negri is interested in D&G. works (and generally in post-structuralism and philosophy of language) - and vice versa. Negri's description of today's living labour has much to do with D&G. allegories, "the subconscious is not a theatre: it is a factory", "deteritorialisation", "rhizomes" and all that. Negri thinks that 'Mille Plateaux' is the most important philosophical work of the century. There's an obvious affinity between the concept of workers' autonomy in the post-fordist labour process and the allegory of "nomadic war machines".

Deleuze & Guattari had the same opinion, that's why they described themselves as 'marxists' - I suppose they meant to say Negri's peculiar anti-hegelian no-more-dialectical marxism (curiously enough, many years after Bordiga had stated that marxists should bury the stinking corpse of Hegel). Negri wrote two books on Spinoza ('L'anomalia selvaggia' and "Spinoza sovversivo"), trying to demonstrate that the replacement of Hegel with Spinoza was as important for revolution as the replacement of The Capital with the Grundrisse. One may agree or not with these declarations, what I'm saying is that there's no detectable incongruity between Negri's position and D&G. works.

If I may append my personal position: I find Negri very interesting (albeit frequently disputable), that's precisely why I've got sick of all those anti-communist deleuzo-guattarians. They've missed the point. The difference between your point of view and mine (apart from my being a communist) is that you don't think such a point ever existed - here's what is making you unable to describe the Italian situation. For instance, the fact that Guattari didn't find it necessary to be shot or beaten to bloody pulp by the police in the streets of Bologna does NOT mean, as you wrongly assumed, that he'd had no influence on Radio Alice. Even after the bloodbath, Guattari kept doing all he could to get the comrades released from jail, gave hospitality to many exiles (including Bifo and Negri himself) and put his reputation on the line to defend the Italian movement from further repression. He failed, but at least he had tried. You may not agree with his theories and despise his lingo, but respect is due.

I hope this is of some interest to someone (especially the German a.f.r.i.k.a. group, whose members once asked me something about these things) and apologize for my English - it's very difficult to explain these things in a language which is not Italian. By the way, I find the English translations of Negri's books ugly and unreadable, but I admit I couldn't ever do better than that.

Luther Blissett

P.S. Did you think I was just a media prankster? >-))))))

35.0

<nettime> Negri & Guattari

From: Luther Blissett

To: nettime-l@desk.nl

Date: Tue, 02 Dec 1997 21:31:41 +0100

I've just found out that Negri & Guattari's book was published in English by Autonomia with the crappiest title I've ever seen: 'Communists Like Us'. My gosh! Anyway, the book may be useful for Richard's next re-mixes of TPOHF.

A footnote to my previous net-time posting, which was still a little bit obscure:

According to 'autonomist' marxism, every technological 'advancement' is also a response to proletarian insurgence or, at worst, resistance, and so is the following cultural/anthropological transformation. Capital can't do anything by itself: it is a vampire that needs fresh blood, it has to exploit and/or recuperate the society's energies.

The latest waves of technological innovation were the historical result of the ongoing friction between workers' struggles (firstly fordist mass-workers, lately post-fordist 'diffused' workers and intellectual proletarians) & capitalist development. Living labour was increasingly objectified and turned into fixed capital, but the part which 'stayed alive' got potentially uncontrollable, until the traditional dialectics of social conflict fell apart.

One of the reasons why the factories began to accelerate their decentralisation/automatisation in the seventies was because the work-force had become either openly riotous or subtly 'defeatist', unreliable. There's a huge amount of oral history about the undetectable tactics mass workers used to sabotage the assembly line in order to slow down production and take some rest. From the managers' point of view, that was what a modern operaista would call 'a waste of general intellect'. Such 'proletarian knowledge' might be recuperated into production. That's what Toyotism is

about: the workers are exhorted to make a 'collaborative' use of their first-hand knowledge of the machinery. Instead of using errors and flaws to sabotage production, they are requested to find solutions, and are rewarded with a rise in their salary. It is called 'Total Quality'.

Since the accumulation of relative surplus-value has changed the whole society (and not only the workplace), we've got a new version of the "social factory", that is the "information society", and obviously a "net-production". This newest sub-mode of production is increasingly generating new, subtler tactics of grassroots sabotage, as well as new ways of repressing/defusing/recuperating them (even videogame-extermimating software hunting games on the employees' computers and automatically deleting them so that the bastards won't waste time), but this time it's happening on a higher, non-dialectical level.

saluther.

Syndicate: [net.INSTITUTE.it] Call for participations and contributions

From: Luther Blissett Project

To: n/a

Date: Fri, 16 Jul 1999 11:24:19

+0200 (MET DST)

dear friends,

below you find a fast abstract of the new media lab project [beta-version!] that the Luther Blissett Project in Italy has developed in the last two months. It's the first italian project in the field of new media and net culture, with a critical approach, I mean.

There is no kind of new media-oriented centre in Italy. No content provider/developer in net culture. Ours would be the first one, small but connected to the european scene. We are working to eliminate this gap and to introduce italian artists and activists into what we call [from Italy] the "north" european network. We have got an european fund of 10.000 euros and we hope to open in October in Bologna.

[If someone needs details, I can describe the sad italian situation in the field of new media and net culture from institutions to underground.]

This is a call for participations and contributions for the [few] syndicalists based in Italy and not. Comments and suggestions from the northern :) Europe are welcome.

open/architecture pop star

#i

Italy shows a wide technological, cultural, political gap in the field of new media culture: there is no kind of new media project or event alike the ones existing in "northern" Europe. The Luther Blissett Project designed this experimental net-based centre in order to introduce in Italy, starting from the city of Bologna, the european net culture, in an easy, fast and pop way. In brief, it is an inexpensive all-in-one new media centre :).

#i

The net.INSTITUTE, as its name suggests, is an hybrid between the net of the metropolis and the information architecture of the internet, between the social, urban, architectural spaces and the media-scape. The net.INSTITUTE is a conceptual architecture work ejected into the real world. It considers the city the field of action of the net: it is an urban interface of the net and of net culture.

#i

The Luther Blissett Project has put in this project its media activism experience and networking attitude. The Luther Blissett Project is a collective of media activists that organized in the last years, in Italy as well as in Europe, mediatic hoaxes and counterinformation campaigns, in the name of Luther Blissett. Luther Blissett is a multiple name: whoever can use it in the most creative and freest way. LB is a networked mass avatar on the media stage, piloted from the net: an open architecture pop star. The net.INSTITUTE is its urban and architectural implementation.

#i

"We shape our tools, and thereafter they shape us" [Marshall McLuhan].

The net.INSTITUTE is a trans-architecture project. It's not a city metaphor for another alienated virtual community but an urban project to embody the structure and the content of the net, as a net and by means of it. It doesn't imitate the appearance of the medium but its deep framework.

#i

"Metropolis is the becoming-cyberspace of the urban territory" [Franco Berardi aka Bifo].

The concept of urban interface is the opposite of that of digital communities and cities. The urban interface breaks with the cultural dominance of discourses about cyberspace, virtual, simulation. The net.INSTITUTE is a physical, social, mediatic space controlled and constructed by the net.

#i

The name and the concept of the 'Institute' were chosen to give up the hype about virtual and cyberspace, and as a strategy of retro-avantgarism [see Neue Slovensche Kunst, Electronic Embassy, Laibach, Luther Blissett itself]. It is also a joke, and a reflection about the institutionalization of the subcultural movements.

#i

The net.INSTITUTE is a project for "hacking" the architectural and urbanistic code, not only an info-communication one. Hacking means deconstructing a tool to understand the way it works and to rebuild it in a personal, creative way. In terms of computer science, the net.INSTITUTE is the urban "implementation" of the net.

#i

The Net.INSTITUTE web interface works as groupware, a space for collective brainstorming, a field for the connective/collective intelligence. It structures itself, in progress, to be a "technology of intelligence" [Pierre Levy]. The Net.INSTITUTE's framework, functions, links, spaces can be redefined by users experimenting hybrid, creative, surrealist architectures, by making up other "institutes". The net.INSTITUTE, inspired by situationists' psychogeography and urbanism, uses the city as a map for the network and the latter as a map for the city. The interface works as a conceptual map that has to be subsequently developed in the real space. The Scheme is the Medium.

#i

The net.INSTITUTE is a multiple building. Its name means NETWORKED INSTITUTE. Everyone can integrate net.INSTITUTE architecture with public or personal spaces, bodies, events, devices, theories, computers, photos, files, imgs, projects. The image and the structure produced on the net,

thereafter, shape the urban space. The net.INSTITUTE is a sort of political role-game: the city is not considered as an established identity but as a collective interface continuously reshaped by its users. The net.INSTITUTE uses the net to catalyze social life.

#i

A proof of the outcome of the net.INSTITUTE within the urban texture is Das Institut [a german name in an italian-speaking context!], a low-tech minimal retro-avantgardistic sub-project, a youth sub-cultural interface devoted to urban space exploration and "mass engineering", events organisation, 'old-style' media art activism, parties, psychogeographical investigations and drifts.

#i

The net.INSTITUTE is a medium-building.

From: ANDREJ TISMA <aart[AT]EUnet.yu>
Subject: Re: Concerned about terrorism in Kosovo
X-Priority: 3 (Normal)
Content-Type: text/plain; charset=3Diso-8859-1
Content-Transfer-Encoding: 8bit

OK Richard van den Brink.

I've seen and read the report by Albanian secessionist magazine (all
articles unsigned) which You have recommended to me.
Well, first those photos. What do You think that Serbian four policemen
who were killed by Kosova Liberation Army looked less massacred than
these Albanians on photos?

Also these "innocent unarmed civilians" are now presented as members of
particular families, but when they go out armed with machine guns and
even grenade launchers, in uniforms, with covered faces, than they call
themselves Kosova Liberation Army. Why did they find shelter in their
family's homes, causing civilian victims, You should ask those brave
men.

Finally, how can I believe to those reports You are recommending, when
there is "Government of Republic of Kosova" mentioned there,
"Republic" which does not exist, maybe in separatists' dreams!
Currently on the map there is only Republic of Serbia, of which Kosova
is only a province.

What do You think, if this police attack on "unarmed Albanian civilians"
lasted entire two days, isn't that strange that only 16 victims on
Albanian side are resulted. In two days policemen could kill at least
2000 unarmed civilians.

Also even Albanian reports say there were heavy two days fightings. With
whom? With unarmed civilians? Don't be kidding.

Please, read carefully these quotations from Albanian separatist
sources:

>This could be considered as KLA's
> operation to "demonstrate force" in order to boost the will of
Kosova ->Albanians and force the Serbs to act.
>Courageous tactic, militarily shrewd, since whatever the Serbs do, they
cannot >win.
>It was also said that the majority of the patients brought to the
hospital were Serb >policemen, who have
> run into resistance of the local population, but also, as it is
stated, of the KLA >forces, in Drenic=>EB.

Who were policemen victims of? Unarmed innocent civilians? Don't be, or

play naïve.

Terrorism has to be destroyed. There should be no sentimentality. What
did United States do in Los Angeles, when 500 black people were
massacred in one day by the Federal police? And what happened in Mexico
to the separatist army? So be serious and don't support terrorism
anywhere in the world.

Andrej

From:
ANDREJ TISMA <aart[AT]EUnet.yu>
To:
Nettime <nettime-l[AT]Desk.nl>

dear andrej,

please, please stop talk in name of all people who live in serbia! use I
instead of WE, because certainly not all people here think as you do, and
if you want to play slobodan milosevic's "loud speaker" it is your
choice, and you have right to think it that way as i have right to have
my personal opinion, but then in your txt you can not use WE. have you
been personally at kosovo, saw demonstrations with your own eyes? i
was not there and can not be so sure that all reports on serbian TV are
the only truth, there are two sides in conflict, as far as i know, and
both of those sides have some vision of the conflict. everything you
wrote looks like typical SM propaganda, (in both meanings, slobodan
milosevic's and sado/mazo), with "one side" story, the only certain truth
is that no one of us, you and me, know what really is the truth.
shouldn't we be more concerned about all human lifes lost in kosovo in
last decade in the first place, not last few months or weeks. i saw your
nice letter to american president. when finally you will write to
yugoslav president! don't you really have nothing to say him? when
over 20 lifes have been lost in one weekend, i think it is not possible
to separate them on "good" and "bad" dead people. they all were human
beings, and they are dead now. among them some under age, lot of them
parents, on both sides, that's what worries me all the time, and i see
no way out of this mase without dialogue. i doubt very much that any
solution will be found with guns, on the both sides. so, please calm
down and think twice; it is well known for a looong time that in this
country the best kepted truth is the truth itself.

branka milic-davic

PS- should i remind you on the fact that we live in the very same town,
where more than 20 nations live together, and some of our neighbours are
albanians, as well as jews, hungarians, romanian, slowaks, roma, croats,
russians, bulgarians... i wonder what they would have to say to your
letter...

No reason trying to outbid with other pictures or facts. What is
disquieting me is that the nettime list is used for an outspoken political
point of (Serbian) view on the conflict in Kosovo. For me it's ok that this
kind of opinions are existing, but I don't need to read those on a list as
nettime. In the same way I wouldn't propagandize to read information on
certain sites I was recommending as a kind of counter balance.

It would be possible to start a discussion about the Kosovo conflict here,
but I don't think its the proper place. Therefore I suggest - if I am
right - to modorate the list in a better way.

- _realtime hyper[er]active sound processing for the power macintosh.

b1257+12 enables digital scrubbing on any power macintosh eliminating the need for third party dsp cards. it provides the first software based turntable-style scrub. scratch + granulation environment.

b1257+12 allows one to experiment with sound via mousedrawing. cursor tracki=ng.
macintosh keyboard. lfo.s. number generators. random processes midi _+ audio input.
routing audio-in signals to control playback rate and direction _
placing a mic connected to a macintosh in an ambient environment or simply speaking into it can be utilized to provide continuously evolving sound textures.

b1257+12 | v.0+2 release inkorporatez :

\\ additional realtime routines for ultra mgndfuke++

midi module ::

provides for full midi control
of b1257+12 parameters.
there are approx 45 parameters which may be controlled
simultaneously via :

- pitchbend
- any controller number
- midi note pitch
- midi note velocity

120 soundfile \ koll-age module ::

the 120 soundfile module moves b1257+12 towards
becoming a gallery \ installation \ performance piece
[the original intent - an automated version
of b1257+12 should be available at one vienna gallery when complete]

it allows one to load 120 sound files [automatically or manually]
and alternate between them in real time -

- via the variable rate number generator
which allows for random + sequential change or

- via midi control : including
- pitchbend
- any controller number
- midi note pitch
- midi note velocity

soundhack function module ::

this module permits the loading of
soundhack generated functions - once loaded
they can be utilized to control b1257+12.

amplitude shaping module ::

allows for amplitude shaping [sep for each channel]
the envelopes may be set to loop + sync.
+ they may be altered \ edited in real time.

-
all processes can occur simultaneously + in parallel
=3D=3D ultra kaotik mgndfuke routin.

a most important and serendipitous recent discovery is of a bona fide
planetary system around an unlikely star - some 1300 light years away found
by a most unexpected technique. the pulsar designated b1257+12 is a rapidly
rotating neutron star. an unbelievably dense sun - the remnant of a massive
star that suffered a supernova explosion. it spins at a rate measured to
impressive precision - once every 0.00621183219388187 seconds =3D 10000 rpm.
the energy put out by b1257+12 is 4.7 times that of the sun.

>How did you showcase your work before the Website?

for the most part have not
[age faktor]

>How much time each week do you spend tinkering with the Site?

generally a projekt is finalized within a month.
actual 'updates' are infrequent, as is also the case
with of0003 software internet projektz; are presented
in 'final' form.

>What did your first Website look like?

resemblant of current manifestation.
listening to data ==
misuse\deconstruction of netscape's vers.1.0.browser.
manipulation of html tags in order to deliver
multiple background animations \ strobe effects,
multiple document titles for
subliminal \machine-gun 7bit [ascii] oscillations.

technology is the outer envelope ,
the concealment one must fragment
[with ones own set of routines]
so that one may access that which one is ultimately
unable to fully disassemble. [i.e the source code often
incorporates additional data presented to the inquisitive.
much is inaccessible to the uninitiated, requiring
a certain degree of technological knowledge or
at least savvyness to comprehend or even navigate]

numerous persons access the site repeatedly
in order to progress through the preliminary stages.
this parallels the broad utilization of =cw4t7abs syntax
[may access of0003 website for the =cw4t7abs encoder v.0+2
by anti0rp or http://195.163.114.73/7-11/cw4t7abs.asp
for the =cw4t7abs emulator 2000 - programmed by - Tobias Galeus.
<root [AT] distansskolan.com>]
since generally human machines [all that which is - is a machine]
aren't anticipating errors, browser deconstruction or

denials of service, incorporating these into the programming
generates an element of intrigue, seduction and frustration.
the sum total = = kaos or organized disorder if you will.
[error is the mark of the higher organism]
it presents an environment with which one is invited to interact
or perhaps control.

while interactive multimedia is a buzz[y] utterance
in a capitalist society infatuated with excess, rapid access
and the banal. of0003 invites the user to probe silently - deeply.
rewards are seldom guaranteed - full understanding
is relative and always incomplete.
[only that which isn't understood is worth understanding]
the decision is relegated upon the external observer.
that which one discerns is resultant of one's own probe - beauty
and meaning one extracts is ones own uncovering,
it is a personal discovery never to be duplicated.

[last phaze of beauty = beauty due2 error]

> Is your work about the technology itself or is the Internet more of a
> tool?
>

any metatheory is circular, and especially
that of computation and technology.
theories increase human understanding of,
and systematize human knowledge of the subject matter.

it is inevitable that work created with the use of
technology is referent to the technology itself.

lewis richardson :
"before we can attempt to measure anything we must have
a preliminary ideal of what we wish to measure - but it
would be most unwise to give that ideal one rigid definition
at the outset, because the experience gained during the process
of measurement should be allowed to react upon and refine the ideal".

can the .net be a mere tool when it is the object, subject and
referent in itself +?

[an event horizon or singularity is a point beyond which a
vocabulary cannot penetrate.
data amounts equivalent to one person's lifetime experiences
may be downloaded in minutes, the planet as a whole disgorges
1 trillion pieces of data per day.
the new forms of computation even create a sense of an end of
all human creativity.
the first ultra intelligent machine is the last invention that
man need ever produce. humans posses the choice to involve
themselves in this process or watch it happen]

the observer is an external observer.
technology contains an internal relational system,
its own 'society'. as users of technology humans can
accept the relational character of every identity.
technology is self-contained because it manages to be
identical to itself, as every nodal point is constituted
with an intertextuality that, unlike biostructures,
do not overflow it.

krop3rom || agff v.o+2

The science of noise

- the precise construction/restructuring of noise in an environment inhibited by representation, relativization and allusion enables the analysis of the constant barrage of generated noise interpolated with abstract and vocal social commentary. If the decisive level of social analysis is in language then this is highly indicative of the move of the higher societies toward digitization. A collapse of unification through multiplicity, KROP3ROM||AgFF is an exponent of opposing ideals, of postmodern artistic and political thought.

KROP3ROM||AgFF is a language game. However the rules are either entirely non-existent or require a constant updating of intellectual and social systems knowledge. Most certainly, the positions of speaker (the music itself), the listener and referent of information (in this context information replaces the narrative element) create a relation of mutual exteriority. A cohesive communicative vehicle it is not, where as a form, or structure within which a communicative discourse can take place, it excels if the listener is competent. This work is unavoidably incoherent to the ill-informed.

Here, the discursive temporality is circular, not linear like most scientific discourse, and like most complicated musical forms only upon repeated listening is the information relayed with any clarity. In this context the work takes on credibility as a commentary on social forces (the darker nature of much of its length suggests condemnation and support of fascist values) and scientific language (where it plays its own game - it is incapable, like science, of legitimizing other language games). The status of legitimization takes on two tendencies, each of which appear to extend in conflicting directions. First, it develops its own self justification with its internal imagery and compositional techniques of unification through thematic structures (rhythmically and referentially), confirming its musical cohesion. Secondly, science (the science of computer music, of social commentary, of politics and economy) expands its relation to society, or the instrumentality of society. Computerization enables both these opposing tendencies and Krop3rom is circular in its internal referentiality.

The theory of computerization has provided a model for the system control that equates contingency with noise. The ideal: to eliminate contingency and maximize control by the system. The elimination of contingency here points to the representationality in KROP3ROM||AgFF of social currency. Perhaps most relevant is the appearance of a sample of the system control machine Alpha60 from Godard's Alphville. The control of society by a mainframe computer and its inevitable faults made only apparent with the

debate became so foul that people told others to "go in the corner and piss on themselves". Was the person who wrote this removed? No. He is a friend who just lost control for a moment. Another example: on xchange a guy hangs out who has been seriously harrassing me in real life, and who has been making problems in Linc for someone else, a real life sucker. Is he removed? No. He is a friend who lost control for some moments. All fine. But to remove a dilletant, one of the few, if not the only, listpunks, because of a different way of communicating sucks. Especially as this person obviously is very young, and on top of that, knows the medium very well. From corresponding with it I know it certainly has more layers then simply cursing and insulting. I will include a mail from another list about this, which I liked a lot, and which has respect for antiorp.

What can you see reading some of the discussions that happened on other lists where antiorp got into trouble? First of all, there are many discussions about the yes or no of throwing someone off. This is the first thing that bothers me: it never happened on either nettime, xchange or rhizome. I would not be surprised if people did not even know it was going on. Moderators on all three lists seem to work from the rumor that "this person has been causing problems everywhere, so let's throw him off immediately". Then on the other lists people acknowledge antiorps 'occasional' intelligent and mindstirring comments, and most of all its excellent code writing, especially with soundsoftware. But the most important thing one notices is the extremely bourgeois posts of people who even admit never to post, but who now -have- to say how relieved they are antiorp is gone. I do not want to be part of this attitude, of this narrowminded, clean designer office crowd. (no offence meant to openminded people in clean designer offices).

I have been very displeased when the moderation button went on on nettime. As I have written already, I want an open list. It is ridiculous that after a year (!) of moderation now the listowners have still not been able to find a solution for this problem. There have been several discussions, both in email and 'real life', in which the listowners themselves proposed experiments with an open list and a digest, maybe even a usenet group. The fact that the majority of listmembers are lurkers who prefer their dinner chewed, does not mean that the magazine/editor format is the most suitable for what we want. But then of course: what do we want? I wonder about that a lot lately. Net.criticism, mediatheory, cyberfeminism, net.radio: in what way is the discussion around these topics dominated by people in powerful positions outside the net, who have built their careers on new media research? Why not let more radical, new blood in?

I admit: there is probably no medium that has offered more to its 'audience' to participate then the net and its mailinglists. I seriously doubt the way they are developing now though. Spin offs of nettime like xchange and rhizome (yes) are gradually copying the way nettime is developing. I was very surprised to hear about Rhizome throwing of antiorp, as I know Rachel Green is in for experiments and letting the list develop in its way. She likes the noise on R-raw, and has even in the past made me like it too. With xchange, the youngest, it seems even more sad: there are rarely more posts there then announcements of web casts, and when xchange was invited for Ars Electronica the preparation for this went off list completely, in the hands of a few. This far even nettime never went. xchange owners are a bit too gentle in some ways and very hard in others. Lack of experience? Too busy? While I think antiorp fits best there! I am not saying all the people behind this are fascists (antiorp would say that for sure), it seems more like a lack of good discussion and openness. This lack came to be because of the incredible speed careers have been taking off in the fields of mediatheory, art on the net and net.radio. There seems to be some kind of panic reaction coming from it, the fear to loose control. This seems the main reason why people react so fast and hard to antiorp. It is a human reaction, and "humansukz", I like antiorp. I feel like that too often.

It might be good for both us and antiorp to live in peace. Why throw away such a talent and keep so much overestimated academic bullshit? (no offence meant to all relevant academic texts)

regards

J

From: Carlton Joseph Wilkinson
Subject: Antiorp, since you brought it up

It's your list, friend, you do whatever you want with it, but I for one find your actions a helluva lot more offensive than his. I would have spoken up sooner, but I had no idea this was even under debate.

I'll give you and the members of the list four points to consider, ranked as to how important I think they are. Having done this, I will drop the subject, at least for now.

1. He has earned my respect and continues to earn my respect by not caving into shallow, routine standards like those you are trying to apply here and by continuing to be exactly who is. If he had said, or if he ever says, "I'm sorry, I'll try to keep my posts on the subject from now on" -- my respect for him would vanish. Worse, with that one cave-in he'd have shown us that the antiorp we all knew up to then had all been nothing but a disposable shtick. My sense is it isn't a shtick. It is a deliberate choice to live a worthwhile life based on firm principles. It's a culture of choice, like a religion, that he can't back away from without losing himself. In that choice, he risks (and knows it) the rejection that you just handed him.

2. Antiorp's ideas are only ideas, they're not bombs, they're not furniture he's asking you to store. They're ideas that you can ignore if you want or ponder if you want or argue with or about if you want. They are ideas that stem directly from the conversations on this list and therefore are relevant to this list.

3. You imply that you've given him every opportunity to participate. But you haven't. You've given him every opportunity to conform--which on principle he can't do. His participation requires his voice, and his thorny, difficult speech and confrontational, sometimes derisive style.

4. It seems right, what you've done, but it's not right. The illusion of rightness is you hiding behind a common, thoughtless acceptance of standards of how a community should operate in its own best interests. But I tell you, order is not always in a community's best interests. Let's say that again: Order is not always in a community's best interests. The discourse needs to be preserved--we need to be challenged on our basic assumptions, not in some "appropriate," rarified philosophical forum, but where and as differences occur.

--Carlton Joseph Wilkinson

"If this is the case, and you cannot respect the majority of people's wishes, I shall have to ask you to leave." --Christopher Murtagh

[<ifo[AT]m9ndfukc.com> is, afaict, <antiorp[AT]tezcat.com> and a bunch of other addresses, that have been bombarding net-time for months now and more recently me personally, the list of lists that have banned antiorp seems to be growing, as does antiorp's penchant for denouncing by name all the 'fascists' who tread on poor little antiorp/etc.'s 'rights.' after all, it's art, so it's extra-special 'avant-garde,' and we therefore must tiptoe around in kid foot-gloves lest we upset the 'genius' who thought up the 'radical' method of sending a dozen messages hundreds of lines long each per day to dozen+ mailing lists. and everyone who doesn't like it is a 'lo-tek pozer.' yawn. what a 'lo-tek' argument, right up there with picasso spewing romantic twaddle from his mansion as he painted clowns hanging out in the barren landscapes of beauty all the way through the twentieth century, anyway, every once in a while our 'heroic antifascist' comes up with something really excellent, and this is one of them. so today i'm taking a holiday and kicking off my hobnail jackboots, plus it has a bunch of URLs at the bottom so you can pull instead of having antortpismus pushed down your throat. when i get around to it, i'll gzip up all of anti-orp's 'masterpieces' from the past months and send them to nettime subscribers who ask. send requests to <nettime[AT]desk.l>, subject: <orp>, cheers. --t. 'lo-tek fascist' byfield]

rebirth of the epistolarian tradition - temporarily vanished during the 20th century due to first stage of tele-communication:
the tele-phone - direct speech takes the place of written communication.

simultaneously - birth of the plural communication
which is the real revolution life forms are living.

expansion of symmetry implied by democracy
[implied - an actual democracy + not one konglomerate of life forms
subjugating the liberty of additional life forms]
which appeals a new acting to maintain the dissymmetry of the
elective calling
by a personal communication - synchronically dissymmetrical to
promote the possible
of a diachronic conquest of symmetry by the subject of the speech in
the time
of science.

deeply linked with the 'dit-mansion' of the significant promoted by
an epigon
of sigmund freud - special strukture that works out of imagination
but on it.

when
an
application
sends
data
utilizing
tcp

the data is sent down the protokol stack through each layer
until it is sent as a stream of bits across the network.
each layer adds information to the data by prepending headers
and sometimes adding trailer information to the data that it receives.
the unit of data that tcp sends to the ip is called a tcp segment.
the unit of data that ip sends to the network interface is called an ip
datagram.
the stream of bits that flows across the ethernet is called a frame.

the capital I Internet is an internet that spans the globe and
consists of more than 10000 networks and more than 1 million computers

there is a limit on the size of the frame for both
ethernet encapsulation and 802.3 encapsulation

shall be addressing the limit on the size of the frame
for the human m9nd kontainer encapsulation

ip - the internet protokol provides an unreliable connectionless datagram
delivery service.
when something goes wrong such as a router running out of buffers ip has
a simple error handling algorithm - throw away the datagram
and try to send an icmp message back to the source.

-
-
-

-
-
-

-
-
-

avoiding an unbearable silence, the four layers, as the eye, are attracted to motion.
the protokol suite vibrates as violoncello strings - an interaction that causes a quiver, a responsive tone of harmonic complexity.
the articulation of subject interaction as expression
determines the value of its output packets, to be commodified and replicated, to extricate the extraneous.

resonance and intention co-efficients in the valuing of output;
intention of information, a listening to the production matrix,
a reaction and refinement of resultant action.
the output as composition, as stratification of data.

the processing of resultant information - as coalescence of form and dynamic.
harmonic - as the object to be construed as manipulated and comprehended

as validation of the complexity of these inherent values, the recognition of this desiring machine as producer of commodity becomes the binary instrument as
prosthetic to articulation - extensions of possible formations - a clarity of expression.
as a technological boundary to be surpassed, the recognition of this intention demands a discernment of the event _before.
to proceed as a non_event, the event _before must be reformulated in context and expression.
the haze of information surrounding this event _before stratifies as intention oscillates and the existing data is recognized and simultaneously eliminated as effect and replaced by the non_event.

hence an increase in output fails to
result in the congestion of end systems with data structures.
at computation of intention information dissipates, a vacuum arises but as the instrument
is seen as producer it is spontaneously and erroneously filled at next intention
with equivalence of unstratified data.
constituting the instrument it is of significance as only a silent object.

it is the potential of the object which holds value;
once commodified all potential is dissolved and with interaction
value is diffused in the clarification of the object's intention.

1.21.99 Lycos Inc. <LCOS.O> up 12 1/2 on speculation of potential partners.
nasdaq down dramatically; internet stocks down dramatically.

01/20 21:58 Lycos in talks with potential partners

By Nicole Volpe

NEW YORK, Jan 20 (Reuters) - Amid a wave of consolidations sweeping the Internet media business, Internet
media company Lycos Inc. <LCOS.O> said Wednesday it was in talks with potential partners, but declined to
comment on speculation that the partners included German media company Bertelsmann <BTGGG.F>.

"Bringing IT to YOU."

heaven listen: earth lend an ear: the lords have spoken:

thus cried the prophets when their eyes gleaming and mouths foaming
they proclaimed punishment to liars and apostates for their sins.
thus spoke the church in the middle ages and mankind prostrate with fear
crossed itself at the voice of the pontiff and the injunctions of his bishops.

_ ignorance or impotence _

we are driven to this, we are determined to go on with this agitation.
it is our duty to make this a better place for women. - emmeline pankhurst

the new ideologists of inequality may wish to comprehend
the fruits of the planet belong to all + the planet belongs to no one

patternz emerge out of low level randomness
the study of self organizing systems
= in a sense the related opposite of the study of chaos.

in self organizing systems orderly patterns
emerge out of low level randomness.
in chaotic systems unpredictable behaviour
emerges out of lower level deterministic rules.

inequality = conducive to chaos

= kop! pazte + oi zleep rout'n.
= nato.o +j5 eku!v ov below
= kllk + kllk ln progress. nn

how is the development of the processing capabilities and organization of the brain's cerebral cortex controlled? intrinsic mechanisms (such as genetically encoded developmental programmes) and extrinsic inputs (such as the things we see and hear, and the ways that this information is encoded by specific discharges within particular sensory systems) both have a say, but to what extent can the developmental pathways be overruled by inputs from the outside world? two fascinating papers by sur and colleagues, on pages 841 and 871 of this issue1, 2, provide some of the most compelling evidence yet for the exquisite sensitivity of cortical development to external cues.

how does one even start to determine the relative contributions of external and internal factors to cortical development? ferrets have proved a useful model animal, in part because they are born before their development has progressed too far. over the past decade, sur and co-workers have been perfecting an experimental approach that consists of surgically manipulating the nerves that feed into different parts of the cortex of very young ferrets. specifically, the nerves from the retina (which normally lead to a subcortical region, the visual thalamus, which in turn feeds into the primary visual cortex, or v1) are redirected to grow into the auditory thalamus (which feeds into the primary auditory cortex, or a1). the auditory thalamus itself is deprived of its normal auditory inputs in this model.

in early experiments3, 4, sur and colleagues showed that this 'rewiring' procedure results in the emergence of a functional v1 in a cerebral cortex zone that was otherwise destined to develop into primary auditory cortex. the new visual cortex has a topographic organization that parallels that in normal v1. moreover, different neurons in this rewired cortical zone -- like those in normal v1 -- are selective for differently orientated visual stimuli. the normal organization of a1, in contrast, goes awry: the a1 territory is taken over by visual inputs. such experiments have provided important evidence that the organization and responsiveness of different cortical regions can be shaped by the particular patterns of neuronal discharge that result from neuronal stimulation by different inputs -- in this case, by retinal versus cochlear (auditory) inputs.

sur and colleagues' latest papers1, 2 advance this theory by several crucial steps. first, sharma, angelucci and sur1 show that particular higher-order features seen in normal v1 emerge in the rewired visual cortex (fig. 1). these features are called 'visual orientation columns': each consists of a group of neurons that share a preference for visual stimuli with a particular orientation. the layout of these columns provides a basis for representation of important spatial characteristics of visual stimuli. the 'pinwheel' organization of these columns (fig. 1) in the rewired animals resembles that in v1. the authors go on to show that horizontal connections -- links between separate columns that

represent corresponding stimulus orientations -- emerge in the rewired auditory cortex, just as in normal v1. these horizontal connections and organizational structure have no equivalents in the normal a1. all of these studies1, 3, 4 convincingly show that much of what typifies the functio!

!
!
nal organization of v1 can be generated within a1 by delivering retinal inputs to a1 through the auditory thalamus.

but the story does not end there. von melchner, pallas and sur2 demonstrate that rewired animals show behavioural responses to visual stimuli that are presented only to the neurons feeding into the rewired cortex. in other words, the animals 'see' with what was their auditory cortex. the ferrets were given the option of receiving a reward from a spout to their right following a light stimulus, or to their left after a sound stimulus. after v1

[Nettime-bold] art and politics
From: josephine bosma
To: nettime-bold@nettime.org
Date: Thu, 28 Sep 2000 12:08:12
+0200

- >>the anti NATO protest by 'antiop' during Kosovo war
- >>(most compact example of this artist's radicality)
- >Yes, how very radical of them to support the 'ethnic cleansing' of the Kosovars. I'm sure that Sloba and Mira were very grateful for their artistic intervention. What next: a cool 'n' trendy website for the French National Front or the German neo-nazis?!

>Later,

Richard

Because nettime-bold had a bad time again the last few weeks, I did not get any mails from nettime for a while. Hence my late reaction to Richard Barbrooks 'funny' remark quoted above.

Even though I agree that most of the artworld has neglected the social and political aspects of the making and reception of art for a long time (and this of course still happens), I find the tendency in certain European media scenes to look at art from an ideological point of view very dangerous. The quote above suggests artists supported the ethnic cleansing of the Kosovars. That is pure 'barric' talk for over a few beers, in my opinion. Artists have often failed to blunt military action from superpowers without taking sides. I find it totally inappropriate to look at such work as if it represents political action, and to judge it as such. It is criticism at the most, or an addition or initiative to (or a discussion). That does not mean of course it is not valuable or that it should not be taken seriously. Art is a difficult but stimulating part of society. Without it there is no life as far as I see it, only vegetating.

David Blair <blair@telepathic-movie.org>

>and constant demands for attention by some machine.

re: konztant komplaining 4rom var'ouz model z'tfzn robotz.

Nebula.M8i

As the noise complement to Signwave Auto-Illustrator's signal, we picked
Netochka
Nezvanova's "Nebula.M8i". This program has been subject of our heated
discussions
pro and contra, a fact we eventually found an important reason itself to shortlist
it.

zec. uant zom +?

Nebula is a web-based Macintosh user application
that, apart from that, defies an exact description: It is an aesthetic processor
of html
code retrieved from arbitrary web sites which it turns into animated text,
graphics and
sound displays that can partly be influenced by user-triggered parameters.
Nebula, along
with the extremist chic ASCII art communication of its author also known in
the Net.art
community as antiorp, ranked highest on our scales of code as attitude.

>you are playing games with me again.

moi +? i am guilty of being innocent.

have stated - selling art is an artistic activity for
the life forms involved are obtuse + outdated [art critics, curators, artists etc]
+ the system resembles a plantation albeit one
where everyone involved operates on slave wages [horizontal handicap]

mais ____... all art is useless [diagonal handicap]

selling tools on the other hand is an ubiquitous activity for everyone understands and desires weapons [although few are aware + fewer even wear them]

lastly - only artists desire money.
as tzara wrote 'simple men manifest their existences by houses, important men
by monuments'

next to humans, money is the most inexpensive life form.

>you are playing with me again.

art sells the tools [religion, state, money, coca cola etc] which plant slaves on the plantation.
money is utilized to stage theatre revolutions that slash and burn plantations.

next to money art is the most humane currency.

>you are with me again.

selling 'art' is merely art.
selling tools [for art] as art is multi-lateral + emergent humanitarian assistance.
a holon.

+ very much nn <-> nn. stories within stories within stories.

in any case - art is for plebeians by plebeians.
important life forms

once upon a time a single-celled organism swallowed a photosynthetic bacterium and created the first plant cell. the bacterium became a chloroplast converting light into energy on behalf of the plant - and the rest is history.

other single-celled organisms just kept on swallowing. single-celled algae swallowed primeval plant cells; these were in turn swallowed by larger single-celled organisms creating microscopic russian dolls.

give life.

>you know that i am genuinely concerned, like i was a few years ago when we
>decided to unsubscribe you in order not to drown in messages and frustration.

there is no god walking in this garden

a boundary is defined by exclusion

fourteen month old human babies aren't bothered by breaches of propriety.
nineteen month old human babies point an accusing finger at the tiniest flaw: a
hole in clothes,

a chip in the paint, a spot of dirt on the wall, or most important, the 'bad'
behaviour of others.
they are incensed when things are 'yucky', 'broken', 'boo-boo', and 'dirty'.
in short, at less than 2 years old toddlers already show not just the instincts that
patrol conformity within
themselves, but the weapons which will help them impose it on others.

older children become far more aggressive enforcers of conformity,
as long ago as 1992, 21 percent of british schoolchildren had been teased, bullied,
hit or kicked by fellow students.
it japan, it is often the teacher who leads the pack.

things are not that different in the modern artistic community.
when artists present works that contradict the tenets of established
organizations' creed,
they are not praised for the objectivity of their work, but punished for their
heresy.
they are derided, their works and papers rejected by galleries and journals;
they are excluded from key symposia - all an indirect way of forcing them to
"leave".

a similar mechanism of repression is at work in every discipline i know.

the lesson taught: to go against the tide is suicide.

colour is a construction of the brain. there arent any colours in the 'outside'
world.
newton knew this - "rays, to speak properly, have no colour. in them there is
nothing else
than a certain power and disposition to stir up a sensation of this colour or that"

.....

one of the most engaging puzzlez of a very puzzling art.
this is sharply emphasized by the delight of every spektator
who is succesful in solving the puzzle by finding in these enigmatic
stories some sort of tangible, pictorial justification of the title appended thereto

- > My name is _____; I live in Livingston, Montana and I am 16 - a junior at Park High School. I am currently involved in a summer computer program for girls at my local high school. It is called 'Go For It' and it is designed to familiarize more women with computers and the internet in hopes that the number of women entering computer-related careers will increase. Anyway, I created a web site featuring Netochka > Nezanova. I assume that you are familiar with her and her work > considering I found an internet article on the web that was about her > written by you! I am e-mailing you in hopes that you could give me an e-mail address from which I could contact her. I wanted to inform her > that I am designing a web site featuring her! I thought she might like to > know that! Also, our high school just bought many new computers and I am > naming a computer after her!!

>Neil Wiernik <neil@techno.ca>

certainly interaccess shall be v.pleased to have hired an abs. genius.
bon. let us proceed.

Neil Wiernik <neil@techno.ca> - apparently representing Interaccess
- a non.profit nato.member [oxymoron] kountry organization

>ok nn wantd \$1200 american for a one month institutional licence per
>computer per user.

a very cucu + tralalela imaginație++ monsieur genius \ private medic zvp.

en fakt ... i think i would prefer that you and interaccess issue a public apology.
and i want smoke flowing from the altars. it may calm my nerves.

>we were charging \$100 per person (up to a maximum of 8 persons) for the
>workshop. Inter Access is a non profit org the \$800 was to go towards
>paying for jeremys flights and a small teachers fee. So please get your
>facts strait before posting stupid things like that!!! nn was being super
>selfish and not very understanding of our situation what so ever. I mean
>even cycling 74 donated version 4 of max and version 2 of msp to us.

more beta testers.
...i on the other hand have made a mistake. i gave to you.
now i retreat wounded. my sorrowful echo shall remain + only.

- >She
- >could have at least looked at the situation and said ok this is a
- >non-profit and its a small workshop with no more the 8 people attending
- >each paying \$100. but no she is a greedy person and wants to much, well
- >greed always gets you down in the end. Becasue of her reaction we didnt do
- >the workshop

you didnt for you knew that may have been the end of your federal funding

- >and she lost out on the potential of 8 more people who might
- >have paid for a version of nato after the workshop as a result. Its all
- >really her loss she needs to start looking at the larger picture and not
- >be so greedy!

kneel severin. am now ready to mass.age you.
komfortabl +?

[oops. inkorekt program. lets melt dze 2]

>Neil...

absolute + absolute + total humanitarian assistance!!!!

many months ago when the melt was snowing
and the first birds spoke - chirp

interaccess a non.profit nato.member [oxymoron] kountry organization
was granted a special license because o1 ost.europa girl entitled nn felt
sympathetic
re: 'scarcity of funds' in nato.countries

post the lovely lovely accord interaccess proceeded to acquire extra soft wear
perfumed in roses
- apparently the scarcity of funds no longer an issue was.

the birds spoke thus : another nato excursion may have taken place.
and quickly covered their eyes.

nn blinked.
nn did not move for nn is frozen.

most recently interaccess decided to organize a nato.o+55 atelier.
tres bien. nn invites you to konsider.

90 percent of nato.o+55 workshops have offered discounted licenses to those participating and excluded absolutely no one.

one bird spoke - chirp. not even me. 1 of my wings is terribly wounded
and i am unable 2 fly as well. but i lv ++ being with my friends.

90 percent of nato.o+55 workshops have either made arrangements for steeply discounted temporary licenses or full sponsorship or were simply gratis.

we are awaiting the spektakle in france!!! invited we have been!!!
we love to travel and we adore nn. - 3 birds
clothed in slender and supple movements whispered.
..... schhhhhh - tell no one - we are nn

organizations in portugal, spain etc arent as well funded as interaccess.

mais ... they have been so much more elegant.

comme ça said oi bird and performed an aerial pirouette
whilst scattering grains of beauty in the mysterious garden.

interaccess did little besides deciding to: TAKE + GIVE NOT

the grains grew into invisible dreams ...

how true how true how true

or choir of insects: we'll tend to them

The shop plans to open a gallery in London in September.

Madonna's "Drowned World Tour" opened in Barcelona in June and played shows in London and New York in July. The U.S. leg winds up in Los Angeles in September.

YES! GRATIS! i felt the addition of a cultural component to a conference that does not address any presence of creatives using the web medium more important than dropping the whole project because the initial sponsorship did not come through!

a national government arts support does not exist for such projects in south africa. in fact the local arts support system needs much upliftment and education in the form of the relationship of art and technology. i am attempting to develop a programme here that will enable not only the privileged web-connected artists to get support from business but allow the underprivileged communities in Southern Africa (and then moving north) to get the opportunities to learn about computers and learn about the internet, building a creative working environment... bla bla bla through a range of exhibitions in the last years i have geared up a whole lot of support to start building a service that might not be financially viable for me, but has enabled a series of projects such as building the first cd rom collection for a corporate collection locally (yes, for which they paid the artists!!!) which is used for schools and development programmes ...

OPEN FASCIST EXPLOITER !!!!!!!!!

! .dk .co.za hmmm same web - different contexts! different issues! tell me more.

dear julie and all.

> The life is being sucked out of the list by NN's constant posts and the
> responses they generate. I don't enjoy watching it die.

Is it really? And what life, if I may ask? Exclude all nn postings and then
analyse the content of the list. In the last seven days, excluding admin and
nn, eleven people post something - most of postings are reply to nn. OK, it'
s summer. However, can you (or anyone else) imagine something like Deep
Europe, or Junction reader today? I don't think so.

As one of the legal aliens at the '96 n5m pre-syndicate meeting (one of the
First Twenty, to paraphrase Kim Stanley Robinson) I also don't enjoy
watching what's going on with the list. If I remember correctly (it's
questionable, naturally) the list was created to 'serve' for two purposes.
The first one was creation of informational place/space for exchange of
announcements, reports, info on what happens; and the second one was to
create a space/place for dialogues focused on the specific
needs/theories/practices of CEE/East Europe/Whatever art practitioners and
theoreticians. I am not a sociologist, and certainly will not made huge
analysis, but I will dare to say that the first idea is merely reduced to
announcements (with few exceptions), and the second one resting in peace. If
we compare syndicate with the nettime (one of the models for the initial
group back in the '96), result is ruinous. And, although analogy is the
worst possible method of proving, the beauty and the east conference was an
attempt to re-define the nettime (put aside geert/pit quarrels), and perhaps
it's time now to discuss the purpose and/or future of the syndicate also.
All this does not mean that I'm in favour of the extent of the nn postings,
but as someone said few months ago simple solution is to filter 'her'
messages. But, that will not eliminate, in my opinion, the problems with the
syndicate list, and I will be very joyful to see what other list members
think about it.

(EDT)

Doesn't this play itself out repeatedly? The same problem? With nnt? with one or another participant? I came on to the list from 7-11 to read nn - by and large - s/h/e had left that list I believe; on the other hand, it's also predictable - there is also little critique/discussion of h/e/r politics for example - except by nn - it's locked in to a particular style/rhetoric - _it_ speaks literally 'in other words' - perhaps too many korporates/fascisms - self-promotion in its absence - one can always delete - one can also start a new thread/direction. nn is unique: the symptom is everywhere - lists that close because of dominance - it can be an artform/production in itself. - everything needs renewal - universe is coming to an end -

Dear all,
I agree with Igor concerning NN's postings. I will be simple: let NN alone, and be more creative on this list, so that NN is not so visible all the time.

Syndicate: purpose, future, and
smelly socks
From: Sally Jane Norman
To: n/a
Date: Tue, 7 Aug 2001 19:53:27 +0200

Kia ora

Is (nt) this list just telling its own story? It's the first list I've felt so intimately and integrally a part of, and for which I feel a rare kind of

tolerance. Perplexing, given my habitual impatience. A half-decent shrink would sort this one out faster than you can wink: the instinct's no doubt maternal and/or just plain narcissistic... Naive hopes and beliefs perhaps that something as alive as this bunch of people will keep managing to communicate forms and contents not encountered elsewhere. Perhaps also the occasional exhilaration of physical meetings of people whose words have moved me, huge logs logging in amidst the pile of flotsam driftwood, crashing into each other within the white spray white noise - back as usual to Te Parata, the ocean-bottom monster whose deep breathing moves and engenders the tides. Reins in the moon. These not-quite-chance crossings where a signature becomes a face and a voice and an outstretched hand and more. Perhaps a hidden longing for parts and cultures of the world I've never been to but that are hugely determinant features of my mindscapes. Including those terrains Syndicate first rallied, the eastern part of the continent for we Western Europeans that always looked like a westward journey for we South Pacific drifters? The land of the black Malevich square, then the white one. The land of the Krasnoyarsk observatory with its first autonomous living system back in pre-biotope sixties. A few weeks ago a meeting with an Armenian artist who's planning a film to conjure up the arid mountain landscape her astronomer physicist father inhabited in virtual isolation for years, intent on pursuing the stars. Stalker time again. Why for me did this feel like a Marko Peljhan installation, why like Melentiev's historical back-tracking and remapping of still-torn territory, why like so many snatches and figments of worlds gleaned from this list? Things become vivid, vivacious when one disposes of an optical array to view them best. Syndicate? a part of that array for me (well shit, I mean, Kepler saw double and that changed history for most of us?).

Just another bit of south-west French rambling from stormy grey skies, salutations to Igor and others posing these devastatingly existentialist questions about purpose and future (which give me a fair few sleepless nights also). Not happy not unhappy. The PubliXTheaterCaravan is weaving its way into the story too. Stinking socks and Pogo the dog. Hope they all get out OK. A ship of fools in the Trojan horse that got grounded in or out of Genoa. Kinship dammit. Kneading to know. As long as Syndicate feels close enough to smell the socks I think we're doing OK.

love to all

dear all, whats wrong with using the media to combat the media. if "nn" is part of the media then it runs the same risk of being judged like any annoying lame drivel or intelligent idea thats out there. i think it's admirable that the interger was ut off. i m sick of the double standards of political correctness.i agree! it's so tiring to watch a good thing die. besides whats nn afraid of....silence?

i'm glad you brought this up, because i've been wondering this myself, as
a mostly-lurking subscriber on this list, maybe some discussion/clarification
would help, if there are others thinking about the same questions...
what i've been wondering is - primarily in terms of the
first purpose you mention of the list: how does/should syndicate differ from
nettime?

it seems to me that discussion threads on syndicate do arise with respect
to eastern european political issues, and on that front, the discussions
on syndicate seem more personal than on nettime and with more interaction - so
there i
do see the difference between the lists.

however, with regard to other sorts
of topics, e.g. art, cyberpolitics/culture etc., there seem to be announcements
but very little in terms of discussion threads going on.
(except for the self-fulfilling "too much attention to NN" threads -
dang, it's like trying not to scratch a rash, isn't it? :-)

so anyway, sometimes when i have something to post i wonder,
"if i post this on both syndicate and nettime am i being redundant or
(unintentionally) offtopic?" so
usually these days i'll post discussion-type posts more to nettime than
syndicate, not because
i like nettime better, but because i'm less sure what fits in on syndicate
and don't want to be redundant by attempting to start threads on both
lists. (of course i realize that moderation is a big difference between
the two lists also.)

but i remember a couple years ago thinking that nettime lacked discussion
threads too - it seemed to be postings of essays and articles to which
nobody ever responded, then somehow, that seemed to change, and
discussion threads emerged, but i'm not sure how.

so maybe we can clarify/discuss all that some?

meanwhile, to do my part and add some content to this otherwise "meta" post:

<content>
1) dmitry sklyarov is now out of US prison on \$50,000 bail awaiting trial.
however, he is not allowed to leave northern california, and still faces
prison if convicted of writing software at his job in russia: software which is legal
in russia. for anyone who isn't familiar with the story, this bust comes to
dmitry courtesy of Adobe corp, under the amazingly ludicrous US legislation
DMCA,
which is now being used as a model for "anti-hacker" legislation all over the
world.
<http://slashdot.org/article.pl?sid=01/08/06/1941228&mode=thread>

2) this one may not have as many implications outside the US (i hope), but
has had
less press, so for those who missed it: David McOwen faces 15 years
in prison and \$415,000 in fines for participating in a distributed computing
project (sort of like seti@home but different) on machines he administered
at his job at a public college in Georgia. essentially, the state of
Georgia is trying to bill him for time they spent working on prosecuting the
case -
a shamelessly overt case of for-profit law enforcement.
<http://slashdot.org/yro/01/07/08/2153206.shtml>

3) the US government, in partnership with microsoft, overhyped the heck out
of the "code red" worm.
<http://www.time.com/time/columnist/taylor/article/0,9565,169678,00.html>
(to be fair, above link is probably an overreaction in the other
direction, but...)

<http://slashdot.org/article.pl?sid=01/08/03/121123&mode=thread>

4) look for the US federal and state governments, and probably the local
government of wherever you live, to push through even more orwellian
anti-cybercrime legislation
in the very near future, in the name of stopping all these nasty hacker
folks like sklyarov, mcowen, and [your name here!]

</content>

feel free to start a discussion on any of the above. :-)

ciao for now,

~@

dear sally and all,

Thanks for the one of the best postings to the list lately - can you do it
again?

> Is('nt) this list just telling its own story? It's the first list I've
felt
> so intimately and integrally a part of
That's interesting phenomenon (for me, at least) - how people who are 'just'
subscribers with a very low rate of postings can feel strong commitment to
the list. Though you explain very brightly your dedication, I still
wonder...

> Just another bit of south-west French rambling from stormy grey skies,
> salutations to Igor and others posing these devastatingly existentialist
> questions about purpose and future (which give me a fair few sleepless
Please, I'm blushing... however, I'd rather call it nihilist (in
philosophical sense, of course), let say posing the universal 'wozu'
question... or just extrapolate my own middle age crisis...

> As long as Syndicate feels close
> enough to smell the socks I think we're doing OK.
Can this be a proposal for a new fetish site/list? :) To generate some money
for future activities - I can't find anything like that through google...

Reality is that which, when you stop believing in it, does not go away.

dear richard and all,

> dear all, what's wrong with using the media to combat the media. if "nn"
> is part of
the catch is the old one - if you use ideology to combat ideology at the end
you have the same thing - oligarchic elite, counter-elite starving for power
and, in general, indifferent masses. Point should be to find a new paradigm
(or perhaps, to re-discover some old one), and syndicate, I still believe,
may be a research field.
The problem is not with the media itself, but with the policy of using it.
To illustrate on a nice example: in the discussion on realising GMOs as a
resistance to the some forms of GMOs use: 'ethics is a generally useless
discipline that exists within the context of and under the assumptions of
capitalism. Resistant forces have to make considerations and accept levels
of accountability that are outside of the capitalist context, and in this
sense are beyond ethics.'
Just change ethics into media, and discipline into, let say, resource

dear marc and all,

>What makes anyone think that the guys who created nn are gonna stop posting
Why they should?

>another product for some multinational consumptive to use on people who
these >lists, as gineau pigs without their consent. As usual.
Unless gineau pigs (or mice) are not exploring the explorers...

>They do not give a shit about what you think and the issues that are being
raised. >And nor do their friends who know them...everyone who argues
against nn just ain't >kool man, ain't part of the inner gang.
Is that so different then 98 percent (or even more) of contemporary
art/theory? Just browse thorough the academic journals in social
sciences&humanities and the picture is the same.

>It's an elite thing - it will not change.
Art, even popular art, is elite thing - it will not change. Only problem is
when 'elite' is synonym for 'snobs' - meaning selfproclame elite without
substantiation.

From: Steev Hise
To: n/a
Date: Wed, 8 Aug 2001 09:12:51 -0700
(PDT)

If anyone is interested, the source code for the
cgi i posted yesterday is here:

<http://datamassage.com/sw/opencode/hackspeak.cgi>

Perhaps someone will be interested in the project Amy
suggested: reversing the functionality for use as a mail
filter, auto-translating NN missives. Although as I said to
Amy, it's much harder to run the 2nd Law of Thermodynamics
backwards. (If you do succeed at this, please send me a
patch!)

--From: Julie <bluedahlia@mindspring.com>
-->I decided I'd had enough when I filtered out NNs messages, and there was
--almost virtually nothing else coming in. I couldn't believe that others
--were parroting her cryptic bullshit language. Those who want to correspond
--with NN can do it easily (off -list), I'm sure. Time to move on...

are you talking about my poor little perl script? if so,
madam, you injure me. it was a **joke**, perhaps you lack a
sense of humor! i hope not, that would be sad...:-(

Anyway, i've been putting up with integer for about 6 years
now on 5 or 6 different lists. (believe me, i have no desire
to correspond with it off-list, i hate it as much as you
seem to, but i know that it will never be stopped simply by
plain old whining. i've seen hundreds of flamewars that
start with 1 post from integer, and end with 50 posts from
people complaining (and complaining stupidly) about
integer, mixed with about 50 posts from people defending
integer. if people would just ignore it, or at least attack
it with some cleverness, it would go away, but they never
do, and it gets exactly what it wants - naive attention.

-->The air smells sweet this morning. Thank you, Inke, for uns*bscribing
-->integer--it's an act of courage, striking a blow for intellectual and
-->artistic freedom.

What an ironic thing to say. (perhaps "blow for" is meant
to read "blow against"?) I believe censorship is also
the wrong course. Even if it were ethically correct, the
creature will just come back under a different name, now
with more to rant about, that we are "oppressing" it, etc.

sigh.

best wishes,

To: <syndicate@eg-r.isp-eg.de>
Subject: nn

I personally regret - tremendously - nn's leaving the list. I never wanted that to happen, only for others to participate more. nn is one of the most original writers online - with a definite point of view as well as software that relates to it - and I have learned a great deal from h/er/um. I do feel the politics were problematic, but so are mine. And it's certainly not a blow for artistic freedom to uns*b someone: I know this first-hand since I co-moderate a number of lists (Cybermind, Cyberculture, etc.), and uns*bbing - which I've had to do - is always problematic.

Syndicate: Re: Syndicate's love-hate relationship with NN
From: Diana McCarty
To: n/a
Date: Fri, 10 Aug 2001 21:34:29 +0200

Grtz Marc, George, syndicalists,

Doesn't the same apply to NN? I thought of the NN posts as a bit like street theatre.. whereas anti-orp was more like a mime. NN sort of used the list as a public space for interventions... kind of a playful anarchy?

diana

Dear Jaka,

At 19:23 11.08.01 +0200, you wrote:
 >i looked at Syndicate archive and there are several files with 'wrong'
 >file permissions so you get something like that:
 >
 >Forbidden
 >You don't have permission to access /mail/v2cast/1999/Mar/0026.html on
 >this server.

this is correct. the syndicate archive does not allow access to the
 postings between march 1999 until may or june 1999 because of the then
 ongoing NATO bombings. we decided to disable access to these postings (btw:
 we decided upon this collectively) in order to protect the originators of
 certain postings.

perhaps we should discuss about whether to re-open the archive in its
 entirety?

best wishes,
 inke

Why that ? Are you ashamed that majority on this list supported the
 criminal NATO act? Also ashamed that majority supported the Albanian
 KLA, and look what is happening now in Macedonia. The same thing as with
 Yugoslavia i 1999. Will you also erase one day, after the NATO

occupation of Macedonia, this period March 2001 -? You should think
 about that decision.

Andreas

I don't want to add more "noise" on the Syndicate list but I wanted to
 let you know that I fully agree with you. I like the Syndicate list,
 even if I don't post everyday ... For the first time in my online life
 I decided to filter out mail coming from someone with NN. Easy to do
 (technically) but not comfortable to do on a "moral" level. I hated to
 do that.

"It" was totally poluting the Synd. list. Reminds me of the Well, years
 ago which nearly died from the same reason and went from unmoderated to
 moderated.

Also one key issue : everybody shouting against this "nazi decision" to
 unsub nn seem to have a high speed connection ... or they don't pay
 their connection, I don't know. But none of them think of the ones using
 a normal phone line and paying by the time of connection, who had to pay
 for all this junk (I don't know how much "hate" it was, as I stopped
 reading them after 3 or 4 posts).

Cu in Linz !

From: Jaka Zeleznikar <jaka@jaka.org>
Organization: http://www.jaka.org
To: syndicate <syndicate@eg-r.isp-eg.de>
Subject: _NN - what happend?

I was unsubscribed from the Syndicate for approximately a month because i went to travel in Turkey (and i recommend traveling in Turkey very much + they have a lot of cybercafes but i just wished to be off line all the time).

When i returned and subscribed again i found a lot of mails against NN and if i understood correctly NN was removed from Syndicate by administrators?

If this is correct i protest.

Why censorship?

I never saw a notice how to make a mail filter so those who don't like NN postings can joust automatically get rid of them.

I liked most of NN mails. They were very precise and strict regarding own 'ideology', interesting in design and with very nice language-game involved. Done by 'hand' of by computer program i don't care.

Was NN not politically/syndicate correct? Who else is not syndicate correct? Will administrators ban another person? When and why?

Is wrong to post things like that:

e R l a e o a i j a v i i
m o s j l o a s i t f e i e i
e f b h o . e e g n n j o r z n v
s e t i p n a f j a n d e i j

d o u o g u o
f n a (D) A e s n r l b k r n z e n e p s b n . v l k e o p
z r o t e m a a t r c o v t l u i g a i n m z l d n t h i
n r z i n s i s b n o p e l d o i a n . p e o n v o a t r k
s e s o l n j o a e n a i . k e l s e e i u . b s d l e s s a
l e o p r n i u m e e i e p e o p v z v p e l d o o p r p e n m
i t r e n k m d d t i i o , k d u i e a s o d p l j j f m p g a j m
a i k d d t i k i o n m i i a n m i f r a i a , k s o n e e i o
d p l j j j n n d r i j j .
k C k d G o i m l o e i e o r
o n i d v i p e a d r f u g u n
i e b t V i s r e z s p a o o
t k i o d n n i t m j e o t
j p c f n k o a r e i k l i
n n s a m r r m m k o n o l e
l a m l v v l o c m i n o s l
o n e i a a e

or is it wrong to post 'to much'?

Where are clearly written rules of the syndicate game? And if syndicate is really non hierarchic 'society' of equal members (which i understood

from different presentations of S.) who made a decision to ban somebody?

I dint's saw mails to ban some people who made some stupid and insulting remarks of NN.

Is there now a special state of mind required to be on syndicate list?

Is there no other solution to deal with different wishes about moderation, something like on Rhizome with 'raw' and 'digest'. I found this more intelligent solution than to ban people.

If i got something wrong and i insulted somebody i apologize.

jaka zeleznikar

nn was uns*bscribed by Syndicate admin.

Syndicate admin had an agreement with nn when Syndicate admin s*bscribed nn some months ago. back then nn promised to Syndicate admin to behave herself. it went fine in the first weeks / months. unfortunately, she lost control of herself again.

btw: nn would never either s*bcribe nor un*sbscribe by herself, she doesn't seem to like majordomo.

Syndicate admin thinks that it would be a great idea for nn to open up her own list [integer], surely many people would like to s*bscribe.

sincerely,

Inke Arms

>is really non hierarchic 'society' of equal members (which i understood
>from different presentations of S.)

dear jaka, let me be cynical for one moment: regarding 'WORK the Syndicate'
mailing list is definitely NOT a non-hierarchic 'society' of equal members.
how many times have I called for more support concerning the administration
of the list? How few answers did i receive? (and I am not going to repeat
the joke about the paid job :)

i am not ready to administrate a mailing list which is called "[integer]",
formerly known as Syndicate".

if there are so many people eager to receive e-mails from integer -- why
don't you suggest to nn to install her own mailing list? or, even better,
as she would never deal with majordomo herself: why don't you install a
mailing list for her?

perhaps I would even subscribe myself, who knows?

>Is there no other solution to deal with different wishes about
>moderation, something like on Rhizome with 'raw' and 'digest'. I found
>this more intelligent solution than to ban people.

this is a very good idea, Jaka! Now we only have to find somebody who would
run such a "Syndicate raw" list. Perhaps you (or somebody else) would like
to volunteer?

Sincerely,
Inke

the admins usbd it, do you need reasons?

greetings,

-a

ps: as a lubricant, somebody could install a list that takes the content
from the syndicate list and that is open for reactions by nn: everybody
interested in receiving nn's msgs could then sb to this new list and get
the regular, cleansed, korporat fascist version plus the poetic
interventions by the anti-fascist, the NATO.fascists who prefer not to read
her can stick with the list as it is, stifled by murderous (!) censors.

I take this proposition at face value and strip off the emotive decoration off
and my opinion is that this is not how a list works. it is a discussion
as you, of course, very well know.

dear jaka,

i was away for 2 weeks and actually considered leaving the list because it
became utterly useless and unreadable for me. i must admit that i was
relieved to find the situation as it is now. the insults about me that nn
is posting to people it thinks are my superiors are enough for anybody to
push the red button, if you ask me.

>Why censorship?

we have had this discussion before, and i just want to make my own point
once again, other points have been made by others for months, fuelling nn's
viral motor. i'd rather shut up and put on the breaks.

most importantly:

1. create the free-syndicate@jaka.org now!

2. sb it to the syndicate list!

3. invite nn and the nn fancub to leave the syndicate list and join this
new list!

4. enjoy the full, integer-ated syndicate pleasure!

>I dint's saw mails to ban some people who made some stupid and insulting
>remarks of NN.

i would be curious to see messages that have been anywhere near the level
of insult that nn usually produces.

>Is there now a special state of mind required to be on syndicate list?

for me, a mailing list is a social space that requires a certain attitude
which is also necessary in any other social environment - you listen to
other people, you only SHOUT when absolutely necessary, you respect the
positions of others, you tell about your own ideas and give others the room
to talk about their's. the syndicate list has, for over 5 years, been a
mellow, sometimes boring, sometimes highly active channel which has allowed
a multitude of people to announce their projects, get in touch with each
other, meet, play, love, ... each other. for me, part of the quality of
this channel has been that it has always been open and unmoderated - even
though some people have put a lot of effort into keeping it running, like
many others, i feel attached to the list and the community behind it, and

you will understand that it was a strange thing to see it being taken over by nn in the course of six months or so. the volume of her messages is unmanageable. the quality is, as others have suggested, mixed, the tone at times - difficult to take. i don't like filters. i like this list because it makes sense for me to listen to all the different voices. i don't want to censor what comes through. at the same time, i ask for some sort of respect for my position as somebody who is also on this list. this implies not being shouted at all the time. it more importantly implies not being spat on and insulted for writing this message. it implies not seeing messages that call me a criminal, a murderer, nn writing to people saying that she has to leave germany because she has received a death threat from me, inke and lorenzo. give me a break. either she is a virtual persona, in which case she should better understand her digital nature, or she is a person with the illusion of a physical body like myself, in which case she should maybe seek some professional help.

the requirements for being on this list are pretty limited, you will agree. but i find it hard to believe that you would not also call nn's list-behaviour 'extreme'. i understand the point about a total freedom of speech, which is why i would have left the list and started something new, rather than having to endure the integer-ated syndicate. but i cannot deny that i am happier now.

i really suggest that you start another list and study the dynamics of nn's communication: you would even enjoy it. if this list get's so boring that the last of the 480 subscriber leaves, we'll delete the piece of software that it really is. until then, let's doodle on.

greetings,
-a

they came because of her removal
not the reverse

>i would be curious to see messages that have been anywhere near the level
>of insult that nn usually produces.

come on...

anyway, it was stated earlier that the kosovo archives were shut down after a discussion on the list
I don't remember that I was for this decision but nonetheless accept it

in the case of nn, this was never discussed per se
and if it was, a rough count from my rapidly ticking off neurons doesn't yield a lot of yeahs

in short, I wish nn reinstalled on the list, thank you

Syndicate: A short comment on the identity of the syndicate list

From: Eric Kluitenberg

To: n/a

Date: Mon, 13 Aug 2001 23:08:41
+0200

dear syndicalists,

In recent times it has become increasingly unclear for me what the value was of continuing the syndicate list. In my experience this project was started in the aftermath of the many social, political and cultural changes in Europe after the fall of the iron curtain and the berlin wall. Syndicate was established to promote east <-> west exchange and co-operation in the fields of media art and media culture. The specific nature of the syndicate list was to take into account the regional specificities and the defining characteristics of the political and social context of media art and media culture in the countries that were formerly ruled by socialist / communist regimes in one form or another.

One of the really important questions on the table was how to formulate an alternative discourse to the traditional capitalist / anti-capitalist narratives that pervaded social, political and cultural debates about the *east/west* relationship. The next was to get away from the East / West dichotomy altogether and find new connecting threads to talk about art, culture, politics and society in Europe after the revolutionary changes of the late eighties and beginning nineties.

Media play an essential role in defining, appropriating and proliferating these discourses, narratives and cliches. The worst one no doubt is the discourse of *transition, assuming the victory of the capitalist world and seeing the neo-liberal ideology as the only possible outcome, yes indeed the end, of history. Instead we saw the inevitable return of history, throughout the countries and regions represented on the list, and we lived through hope and tragedy in a tiny little community. Meetings felt like family gatherings, and the nucleus that syndicate offered to start new pan-European discourses about media, art, culture and politics and society for a long time seemed invaluable to me.

In the last year or so I saw the essence of the list get lost in a cloud of confused autistic ascu experiments that had really nothing to do with the initial character of the list. Of course things can change and move in a different direction. I was ready to leave the list and consider it a beautiful, productive and enriching period of my life, when syndicate was one of the most inspiring fora of debate in Europe about all these topics in relation to media culture and media art, but which at long last had come to an end.

Perhaps this is the moment when things can take a new turn again, and something of the list's original character may be redeemed. Not for nostalgia, but simply because I believe that questioning the construction of new cultural, social and political discourses around 'Project Europe', in particular in relation to contemporary media culture and media art is as urgent as ever.

If syndicate can once again become a forum where the contradictions of the european project can be made visible, and where alternative media discourses and practices can germinate, I will be a very happy member of it. If not, I will just have to find other more productive contexts to work in, because these questions are simply too urgent to leave them unaddressed.

For now I am not ready to give up syndicate and still have some hope for the future of the syndicate list and network.

warmest greetings,
eric

folks,

>in the case of nn, this was never discussed per se
 >and if it was, a rough count from my rapidly ticking off neurons doesn't
 >yield a lot of yeas

on the list, yes, offlist, no. i got a fair amount of private messages, but
 i feel strongly that they should have gone to the list.

annick, anke, and others: you *have to* voice your opinion *on* the list; i
 have no time nor energy to stick my head out like this again and again for
 a silent mass. if fred and jaka and andrej are the opinion leaders here, an
 integer-ated syndicate list is what you will get. i promise. like eric, i
 will leave and look for other, more bearable venues. no big deal, but
 everybody who cares should take responsibility for where this list is going.

>anyway, it was stated earlier that the kosovo archives were shut down
 >after a discussion on the list
 >i don't remember that I was for this decision but nonetheless accept it

this is a different issue and i agree that the archive should be reopened.

greetings,
 -a

Is this why you are silencing me on this list, and why you didn't
 publish my comment on Integer case yesterday evening? You silence Kosovo
 opinions, you silence Integer opinions, where is your 'openness'?

andrej, we have had this before: when you put the word s*bscribe (with the
 u) into your message, majordomo, the software, recognises your message as a
 request which is forwarded to the administration; this prevents the list
 from the occasional accidental request and bounces some relevant messages
 which then have to be forwarded by the admins by hand, which can sometimes
 take some time, depending on who of the admins finds time to look at the
 admin account.

dear andrej,

i am sorry but i don't see that the use of cold war terms bring you any
further, they rather act destructive until no one wants to react on this
kind of comments anymore. i am just doing it because i feel sad of this
communication developed in the last week on this list. i would also like
to say: watch out the words you are using!

in my opinion you are misjudging the situation a lot and see an enemy
where there is none. taking (unemotional) the facts about nn's postings

and the character of this list, which have been described by several
people only yesterday, it seems as there is a strong unbalance of sheer
interest between a few and many, as i may suggest.

taking free-speech rights and the common ground of interpersonal
acceptance into account i still don't see why it is not possible to
exclude a certain egocentric individual from a community if s/he does
not meet the regulations of the "virtual" community. a sort of shared
values and communication do's and don'ts are the base for any human
relationship, also for this communication-community.

accusations of censorship and spreading insults does not change the fact
that a community exists on the ground of shared interest and behaviour.
other communities might have other interest and behaviour. to view the
world in black-and-white-only, in an enemy and comrade-model does not
help at all to come to terms with the reality of different individuals
with different interests.

one of the-until now-silent mass

dear,

> annick, anke, and others: you *have to* voice your opinion *on* the list; i
> have no time nor energy to stick my head out like this again and again for
> a silent mass.

absolutely. same goes for me. what I wrote about engagement concerning work
does also apply here (and it does perhaps more): if you don't take care of your
list, and voice your opinion, the list will be taken care of by others. And you
won't necessarily like it.

> if fred and jaka and andrej are the opinion leaders here, an
> integer-ated syndicate list is what you will get.

as I wrote before, it's no problem to open another list focussing on nn. this
is the great thing about mailing lists: you can do it yourself, on whatever
topic you like. Nothing prevents the people interested in nn's postings to open
a mailing list for her. you should explicitly announce that rules don't apply
for that game/ mailing list.

> like eric, i
> will leave and look for other, more bearable venues. no big deal, but

I have been thinking about this many times already but am not ready to give up
a project that I have invested some energy into during the last five years. it
is much too valuable for that (even if, as andreas suggested and as we all

know, the Syndicate sometimes tends to by a rather dull place, full of announcements and with no real discussion)

> everybody who cares should take responsibility for where this list is going,

to the silent mass: repeat this five times before your go to sleep, every night.

> the archive should be reopened.

sure, why not? Anybody against it?

Greetings,
Inke

Syndicate: re: visit of the uniform
From: Anke Hoffmann
To: n/a
Date: Tue, 14 Aug 2001 19:34:01
+0200

a democratic decision, whether somebody (or a group) can use a community platform as its own, how this should be taken out, i don't know, but beside this showing respect to a ideological ownership which, i think, exists in the case of this list is essential and can't be overseen. to respect that means to share a common ground of rules set by this "owners" or founders, and implies in this case not to spam the list with dozens of mails, simply, i don't think that nn's mails were of no meaning, but the mass they were posted was not acceptable anymore. less is more.

i am too from a totalitarian background and believe that we all need to accept rules of communities we are joining to be included. and the pragmatic facts of no attachments, limited file size and no spam enables such lists to operate for many.

Very simple, you have it in your mail program. I use Netscape Communicator - in the mailbox go to "edit" and then to "mail filters". Enter any word from address or subject or body... and you will not receive it any more.

> If we find so much words to fight about a "Lounge Identity" like NN,
> how come we are not building a project about east/west communities?

Good question. I think in building the east/west community we must begin from our personal relations, not from net theories, net criticism and same bullshit. Now our personal relations are in crisis, because of censorship (Kosovo archive banned on this list, and now one member removed because of too much mailings which is also stupid). How do you imagine that community if we don't trust each other personally?
Or generally east do not trust west, or vice versa.

Annick,

I admit I have sinned and forgive me because I have a cable link to the internet. It is so much cheaper than paying for the phone calls and equivalent solutions such as dsl are available everywhere in our country

I admit I have sinned and forgive me because I was offline for 3 days, this had not happened for a year.

I admit I have sinned for I did not uns+b from any list and received 320 messages when I logged back. I opened them all and felt there was something missing when I got the message from 'syndicate admin' which did not own up to what 'it' had done.

For this is what I dislike in this situation not that the admins decided unilaterally to withdraw nn (because this is ultimately their list, not ours) but more that they did not announce it as such (I was not even interested in the explanation, at least the one given afterwards) and sent the mail I mentioned above as if it was a machinic gesture without an owner or master, neither rhyme nor reason.

now, I agree with eric too, that the object of this list has disappeared from (posted) view but it's still an interesting one (not sure about so called "europa", though) and could be pursued here, or there. I just wish that (as it happens sometimes) the community did not need a scapegoat enemy to regain its inner strength around its soft but open belly.

this is why I ask that nn be put back on

(and also because I like her very much)

last

I do not see that the internet is either public or private

Merely a metaphor for the effect, not the process. Good point.

Big thanks there - pulling the plug is always the last ditch, as is starting a new pocket universe with new rules of time and space, but I did not think we were there yet.

As usual, I never profess to have all the answers, I merely suggest some ideas 'for your approval'.

Best,
Patrick.

Syndicate: the NN programme...is old Art...

From: furtherfield

To: n/a

Date: Wed, 15 Aug 2001 03:18:44

+0000

I did not want to comment or waste my time on this but it seems that I will concede now - and put my head on the block like everyone else has been doing.

The reason is that on rhizome I was attacked personally a few times by NN. I answered thinking that there was an intelligent mind or brain at the other end of the postings, but all I got in return was insults. Soon after that I learnt that NN was a programme.

I am also unhappy about sending this e-mail because NN's protectors will attack me also. A small gang of people who could do better by spending their time not protecting their cyber-jerk (in crowd mob friends, programmers of NN), and actually taking real responsibility and changing the world to be a better place instead. I wish...

It seems to me that nn (the programme) has not been interested in other people's imaginative offerings on the list - other to dish out insults.

NN - is not a human, therefore has no rights.
NN - feels no pain, therefore has no rights.
NN - is a weapon designed to distract us, therefore has no rights.

SO wake up everyone - we are all part of a manipulation that is designed to satisfy its programmer's egos.

I do not care what happens to NN, mainly because the programme has no empathy for others.

All this discussion about whether the owners of the list are fascists is absolute gibberish. Such negative comments to people who actually spend a lot of their time maintaining it do not deserve such unfounded empty headed right wing rants.

It really pisses me off when you see people trying to do something worth while and watching thugs slamming into them as though they are just dirt. There is no conspiracy going on here other than some liberal, leftist individuals who quite rightly are worried about stopping freedom of expression as an idea.

Who would you turn to in a time of need or of crisis? It certainly would not be the whimsical NN.

The Syndicate list like many lists have gone through many issues, and this does not warrant the attention.

There are far more urgent problems going on in the real world with real people being bombed, maimed, raped - mostly by dysfunctional insecure males. NN has that type of quality of which I will not miss (whatever sex it has been allocated).

If there is a threat on freedom of expression - it is not on NN. It is on the rest of us not being aloud to carry on exploring our own valid ventures as living breathing individuals, who wish to develop further than a limited programme that far out stayed its presence.

I would rather fight for a life than an idea, religion was an idea and look how that one is turning out for everyone on this small muddy ball that we call earth.

Don't be fooled by the art project that us (the ginea pigs) have foolishly become part of against our wills - for it will be documented and used against us by the real tyrant(s) in the future - NN's programmers. Who like cowards do not declare their real identities as we all do. As they collect their rewards for being (oh so clever etc) for taking the piss out of people who meant well, they will reap the rewards for our discomfort.

NN will be taken off the list - but not because of any undemocratic or fascistic reason, but because NN is out of date and has served its purpose and the one liner joke is wearing a bit thin now.

We have all moved on and are tired of the childish double feedback (boring) emptiness that dominates the list by NN. Please wake up and realise that we have been part of a cheap game and (seriously) nothing much more than that.

I take issue with one poster mentioning 'Brad Brad' as someone who has caused trouble on listings. I have seen his postings - and I believe that he has at least contributed to discussions via the process of creating discourse that is aimed questioning the power that institutions possess over others lives.

If NN is to stay - then please 'programmers' re-evaluate its purpose and function. Make it question corporate isolationist companies that are ruining peoples lives all other world right now. Go to their listings and bring the content back here for all to debate and take part in. Please do not let it ruin well meaning debate on creative listings such as this - its not NN's fault, I know that. I'll miss the playful language myself. Its the questionable intentions by the ego-centric opinionated designers (that should be here on this listing taking part in the debate themselves) behind the function and the actions that I am concerned about, whom obviously are not interested in other peoples expressive and creative freedoms.

Lets all move forward (for a change). That's if its alright by the few who will no doubt send hatred e-mails to me for bothering to care about such things.

Tonight Israel is sending tanks into palastinian territories - is NN going to help sort that one out - doubt it.

(When American leaders fund Israeli assassinations of Arab leaders with taxpayer dollars, those American leaders are complicit in those assassinations, and since turnabout is fair play, U.S. leaders open themselves up to their own assassination by the very demon of lawlessness their Israeli partners in crime unleashed in the occupied territories.

Lest the U.S. secret police accuse this writer of advocating or apologizing for the assassination of Americans, I will point out the obvious: all assassinations are wrong. The spread of the contagion of Likud doublethink in the U.S. has caused Americans to subscribe to the racist Talmudic/Zionist double-standard that it is permissible, indeed perhaps even laudable, to assassinate "sub-human" Arab goyim, whereas the assassination of the Chosen terrorist Sharon or his patrons in the U.S. would be deemed a moral outrage of the highest order by the guardians of public opinion in the West.)

Get a life - there's beautiful out there (what's left of it that is). To continue arguing for and against NN's case would be a case of psychological denial in dealing with issues at hand...

Best wishes to all progressive (humane) thinkers and creative liberationists and anarchists who are causing nayhem where it should be, some where else. Its possibilities are being wasted...

marc garrett

hi patrick and all,

i think you raise some interesting issues which are worth thinking about on a scope larger than the NN issue. especially since there will probably always be some Problematic Persona (PP), who some want to read and for others "ruins" the list. it's been suggested that the PP in discussion at the moment is actually a computer program. should that be grounds for disqualification, or would some consider that aesthetically interesting, and free expression on the part of the programmers? it's been suggested that our PP is merely posting to create a mystique which assists in marketing its commercial software. again, if true, some may consider this grounds for disqualification; others may continue to be interested in PP's texts in this context, still others may point out the blurry lines that can creep up between resisting dominant cultures and commercialism, such as arose on some lists regarding the alternative top-level-domain project.

so maybe it's the interface that's the problem. some suggest that the answer to a PP is user-applied filtering, but other readers don't know how to filter. perhaps a Filtering FAQ at minimum would be helpful. it would need to include all the popular mail programs, and it would still be problematic, because, as has been demonstrated, anyone at any moment can become a PP, and also, for people who do client-side filtering (most people), they still have to wait/pay to download all the messages. but i think it would help alleviate things a lot.

the listserv as a distribution means makes me think of the recent articles in some of the mainstream media about the current "dumb" internet vs. a hypothetical "smart" one. "dumb" internet means the internet doesn't know what is being sent across it; the "smarts" is in the application. some

corporations are blaming the "dumb" internet for their lack of profits, saying they can't control it so therefore they've got no way to control quality/reliability and thus the failed profits. corporations like microsoft are developing "smart" systems for the internet, such as .NET, in which they control access centrally. (translation: keep paying microsoft money or lose access to your software.)

"dumb" and "smart" as used here aren't value judgments (not from me at least), but rather a description of where the "brains" (control) of the communication network are located.

a list or BBS can be thought of as paralleling this dumb/smart structure. an unmoderated listserv is "dumb" at the headend, and if you don't filter, then it becomes "dumb" at the client end too. on the other hand, some people filter, and so for them, the app is "smart," but the non-filtering people probably don't think of it this way, and for many of them, the signal-to-noise ratio seems too low. on top of that, some s*bscribers are paying for the bandwidth to download the messages before they can filter; others have no bandwidth fees, and still others have the ability to filter on the server.

the irony is, listservs are often chosen for discussion groups over, say, web-based forums, because they have very little technical requirement of the user - after all, it's just ASCII text e-mail - and can work on any computer. a very egalitarian thing: everyone's got equal access to the data as long as they've got a computer, a modem, and basic internet access, right? oops - not really the case anymore. we're really not all dealing with the same list - nowadays there's a lot of "smartness" - or not - happening on the client end - and in all different flavors.

there are some who suggest that maybe Syndicate is over, that it's outlived its usefulness, but maybe it's the listserv format that's outlived its usefulness? are there other possible options/modifications?

the slashdot format comes to mind as an example. NOTE: i am not suggesting that the slashdot format should be literally applied to syndicate, or any other listserv. there are various reasons why i think that would not be a good idea, and it's certainly not perfect for slashdot itself, but i think its format is worth looking at as a bouncing off point for idea-mulling, some features:

1) readers have the choice of reading comments in chronological order, threaded, or by rating points. they also can set a threshold of ratings, so that low rated posts (presumably trolls) don't show up in their browser, or they can read them all.

2) readers "moderate" one another's comments, but moderation never means the comment is deleted; only that it gains or subtracts points. Problematic Personalities are likely to have their comments moderated down to -1 (troll), but they can still be read by those who wish to. (of course this process is itself wildly problematic, as ideologies and other things can of course play a part, but...)

3) currently-moderating readers are "meta-moderated" by other readers to prevent abuse (hopefully...): readers who are consistently meta-moderated as being bad moderators lose moderator privileges.

4) anyone who wants to post anonymously (Anonymous Coward) starts out with

0 points; anyone posting under their real nick starts with 1, each time they post. most trolls post as AC, so, if you want to read slashdot without all the PP posts, you set your threshold to 0 or -1. you are choosing to let the community at large decide what is troll and what is not, as opposed to downloading a page full of PP posts. if on the other hand you want to see the PP posts, then you set your threshold to show everything. (you still have other options to sort by thread, etc.)

4a) some Anonymous Coward's aren't trolls; they're people who need to post anonymously to protect themselves from whomever. those posts can be and are moderated up, despite the one-point handicap they start out with.

5) the whole thing is wildly problematic of course, but it's interesting in that a) it has "smart" aspects at the individual client end but also in the user community at large. yet there is very little "smart" *centralized* control, as there is in the microsoft .NET example

b) every user has the same semi-smart interface. (the web browser.) of course web browsers are different, but i believe it even works fine with lynx (text-based browser.)

of course, one *big* drawback is that you have to stay online to really read slashdot; you can't download it via POP and then disconnect - not very good if you're paying for your online time.

to reiterate: i'm not suggesting that syndicate or any other listserv

should be converted to slashcode or any other web-based system. however, i think it could be useful to consider whether an alternative structure could be developed. maybe offering a client-side app that could work with downloaded mail and allow users to more easily sort messages! maybe two separate streams of the listserv (something like there are on rhizome and nettime, but with less centralized moderation): one which includes all mail, and one which filters out or makes a daily digest of messages by people who send more than 20 messages a week (or some other criteria...)

those aren't terribly creative or great suggestions specifically, but again, my point is really to point out that everyone is not experiencing the same list, that e-mail is not an egalitarian experience - people have access to different technology and have different knowledge levels in how to filter, sort, download, etc... so perhaps there can be ways to address that, or at the very least acknowledge it.

From: Jaka Zeleznikar <jaka@jaka.org>
Organization: http://www.jaka.org
To: syndicate <syndicate@eg-r.isp-eg.de>
Subject: _censorship, syndicate & nn

Dear Inke, Andreas, Eric, Lorenzo, Syndicate members

#_1 Inke, Andreas, Eric
#_2 new list?
#_3 Lorenzo

#_1
Inke, Andreas, Eric

I respect very much the work you and some other people put into the Syndicate.

Still i disagree with the way Syndicate is working: censorship and off list decision making.
This is not only about nn - it's about general attitude to the list.

Nn beside some relevant and poetic statements also brought a disturbing noise to the list, this i agree. Still i think mail filter is better solution then censorship.

I was accused of being 'opinion maker' on Syndicate. Not true.
I joust wished to actively participate in something i considered as 'my*' mailing list.

*meaning: i felt like part of it

But don't worry, i will take very passive role on the list in the future if i will not [x]ns[x]bscribe from it. So your opinion will not be disturbed by a member.

And syndicate will became more peaceful, we-all-agree list!
(Not to be taken to seriously and not completely as a joke.)

#_2
Idea of 'free-syndicate@jaka.org' / another list - first i took this as insult but more that i think about it more i like the idea. There is tension on Syndicate list.

By creating another free, unmoderated (net/web art) list problem is solved, nobody have to [x]nsunsubscribe from Syndicate and complain about censorship, some people get what they wish (i don't think only to nn if nn would s[x]bscribe to it at all) and other on Syndicate don't get what they don't wish.

A list not against/for Syndicate, not Syndicate + nn and alike and not for/against nn. For kind of experimental and already established (web net online ...) art or art related things. And definitely with no words: 'syndicate' and 'jaka' in the name.

If you have some thoughts on that, have software know how, web space, server, idea for the name, to much money, statement against creation of something like that, to tell me this exist already ... please contact me (jaka@jaka.org + cc: shareartware@netscape.net). So if there is some interest we can create temporary and open list to plan how to create such list (+ web archive of so far nonpublic mails).

#_3
To Lorenzo: in net communication we tend to be over emotional, but to express a dead wish is a stupid thing to do.
(Try to do the same and mention one of important + famous politic and i'm shure you will get a 'friendly' visit/attention from the police.)

click,

i feel it would be vastly unfortunate to loose nn on this list.
do those who run this list desire to sculpt its flow? They may restrain
themselves, but my guess is yes; many of us may want to. I have the
vague desire that it be 'better'. <grin>. Nn wants to sculpt too. have
you noticed? but theres a difference: sculpting an amalgam like a
list/society/discourse is a different thing than wanting to
sculpt individuals (as nn does). so, what is implied in the difference
of approach? or if you like, your favourite means to better quality
discourse? what shall we sculpt today?

So integer wins -- these splitters and wreckers know how to carry out their
task -- invade the healthy body -- test its defenses and sow divisiveness and
then leave nothing but bickering and name calling behind and we in our
blindness do their bidding -- As we know or should by now our desires and our
ideals can be used against us -- they can be stolen and distorted -- this is
what integer did -- it made us come to terms with what are the limits of
freedom not as mere anarchistic license to impose ones will on others but as an
act of responsibility which acknowledges the rights and existence of others and
the necessity to test and redress those when they become restrictive --
integer was not capable of giving us the respect that we gave it and took our
tolerance as a weakness, preying upon our insecurities -- this is something to
learn from not bicker about

> >[taylor works for cycling74, the company that owns MAX, the parent-
> software
> >to NATO which nn tries to oedipally kill; -a]

Actually, we *dont* own Max. We're it's exclusive
publishers, having inherited the code base from IRCAM

in '80 or so, and having done all the development since that time [including all the QuickTime-based movie objects from which nato was probably derived], Max is jointly held by Cycling '74 and IRCAM, that relationship being renegotiated since Gibson pulled the plug on Opcode, who used to be the third "owner."

We do own all of MSP, however.

Oedipal? Naah - O. didn't know who his father
was. NN does - a marriage of the Max/MSP SDK and the QuickTime spec, in large measure. The logorrhea is nurture, not nature.

> thanks for forwarding gregory's email, andreas, this reads like an island
> of sanity in the sea of unhealthy insults :)

Aw, shucks.

I just wanted to mention in some way that, despite the claims of utterly revolutionary modes of action, etc. etc. etc. to the contrary, the pattern of behavior is something that any number of us have seen before. But since very few of us appear to have decided that there's any use in publicly engaging in any countertheatrics, the later targets don't have much contact with the earlier targets. Sometimes a friendly "We've seen this, and it will pass." word of comfort seems in order.

I think that what did it for me finally was the "I will now reveal details of Andreas' private life..." shit. Here's the place where the 'struct absolutely *depends* on its being constituted as an anonymous bunch of folks hiding behind a bit NN cutout. The brave new cyberworld wasn't supposed to be about this, was it?

I'm not sure who the rest of you all are, but welcome to the Society of the InsufficeNNtly Worshipful. Andreas is, bien sur, correct about my relationship with Cycling '74. If any of you have any questions about either our specific experiences, or perhaps about the dreadfully predictable version of the NN Big Lie campaign with respect to c74, ask. While we don't publicly engage, we're all pretty upfront about stuff in private (fight memes with memes. In our case, personal narratives from real persons delivered only to the interested).

with every good wish and my condolences,
gregory taylor

Oh look who's here, the famous Big Brother Lovink, the Great Censor of the open net.

Sure Geert I am not brave as you, like when you removed me from the Nettime list without any warning, just because I was criticizing the Kosovo Liberation Army thugs in 1998. But I know, KLA is also sponsored by your papa Soros.

I wonder would you dare to s*bscribe me on Nettime list now? Ha! What would papa say!

Below more evidence of the facile non productive remarks that have graced the lists, blocking real creative intentions.

We are dealing with sub standard male type programmers here who are not interested in art, freedom, debate, life, and global unity = smells pretty close to fascism to me.

(NN and the mob) have always actively threatened many liberated thinkers, artists, list members for challenging their macho actions.

Time for a change 'The Syndicate's Revolution' is at hand - soon at last we can all speak to each other about ideas, events, creative politics freely - I do believe that we will actually begin to experience of free speech...

Wow could that really happen! Let's see - watch this space...

Date: Wed, 15 Aug 2001 22:47:04
+0200

Hello Syndicalists,

Just a short note: if this is the syndicate without NN,
please bring her/him/ them/ it back. Or maybe the answer
would be to start a list for the NN traumatized!
I don't know if there was more going on in the
background that the admin had to deal with, but what
is going on in the foreground is frightening. I'd much
rather read/delete the interesting/annoying/funny mails
from NN than what is getting generated at the moment.

disappointed.

Syndicate: NN - is not the issue
From: furtherfield

To: n/a
Date: Wed, 15 Aug 2001 20:50:56
+0000

I didn't actually know until you so directly and honestly mentioned below
that it was about winning...

And the debate goes much further than the singular issue of NN. It is about
the programmers themselves imposing their attitudes on others.

Lets all grow up shall we for a moment... I know that it is traditional to
let fascists bully people in the western world. And walk about in big boots
kicking anyone who declares ideas different to their own limited remit.

But I am not interested in being used as some one elses toy by another toy,
which is what all this nonsensical imposition is all about. To sacrifice
other people's freedoms for a mere idea is the typical, institutional state
sucking, weak willed means of thought that threatens collective thought.

The psychology that has been imposed onto the list members by the
programmers irresponsible actions is causing problems that a few are quite
happy to sacrifice fir the sake of their own prestige.

Now that is really KOOL isn't it...for the sake of the few, create a
programme to divert true creative freedom from taking its course - this is a
right wing tactic... divide and rule (heard of it?) institutionalized
curators would love this idea, plus NATO who are/have paid for such a dodgy
enterprise at our cost.

NN - is not the issue - its the programmers who have let it reign and
dominate true questioning, don't you get it yet?

Please get real everyone or are we going to just let these thugs in cyber
suits who look kool, without the real soul for change - true change that is,
rule our lives in cuber space as they flippantly say Fuck you!

As they boast (typical macho style) in bloke-like mentality say: We are the
Winners...

if that is so then corporate non enterprise and all its delusory antics will
carry on ruling our lives for its own usual corrupt reasons !!!POWER!!!

Respect to all who are awake enough to reach inside their unprocessed,
mediated minds to question...

marc garrett

Syndicate: infancy + childhood
From: Andrej Tisma
To: n/a
Date: Thu, 16 Aug 2001 01:07:53
+0200

NN WROTE:

Geert Lovink "FF" <geert@basis.desk.nl> playing the schoolyard buuuuuyoy

>> Be a brave man, Andrej Tisma.

UUu dear, permit someone to respire playfully
+ become ultra intoxicated with lovely pheromones.

Geert, we are all women [brave isn't necessary. women are brave] here
except for you and Andreas
so, why don't _you be a M A N and tell us about your illegal activities
in your own articulate maniera,
so that we do not have to exert our selves.

or if you prefer since you are a M A N,
draw a picture for us.

>> If you have lost your moral confidence, then
>> uns*bscribe yourself

Geert, be a M A N and uns*bscribe all of us!

It may be better for your mental health than covering up your cronies'
Andreas Broeckmann's, V2's and Transmediale's actions [against humanity]

>> and leave Syndicate to the corporate fascist soros
>> swastika people.
>>
>> Who stops you from starting another list?

>>
>> Geert

You Lovink. Because you steal public money and use it against
humanity.

Are you coming or do you prefer being dragged before the tribunal +?

I can understand that you may want to cover up Andreas Broeckmann's
activities
since he ensures you receive some funding for your modest work, but
Geert,
if you continue like this - you will only dig yourself in the
super.filth
more. more and more.

And by the way. I wanted to ask since ...
Are you a RASIST M A N? Seriously, because everyone you have liquidated
is Eastern European.

Am wondering whether you are conducting a genocide or ... you just feel
very attracted to us +?
It _is why you visit us right +? You aren't coming over to _hurt us are
you +?

It is amusing because, the other M A N (Broeckmann) controls my travel
plans and projects.
I think that is very inhospitable.

Last question if I may. What is your education Lovink +?
Andreas - what is yours +?

Reason for my impropriety - I aspire to be a V2 and Transmediale

employee as well
(or a M A N (whichever you like) and ... I wish to be very well
prepared.

NN - respiring painfully

Update:

Andreas Broeckmann. Inke Arns. Geert Lovink are controlling
all information arriving on Syndicate and Nettime.

ie. all pertinent information is blocked on Nettime and
Syndicate. (entirely_

if one is silenced - even Andreas, Inke and Geert can appear
democratic and articulate.

there is a problem however : the neo cortex goes silent
in the presence of neo fascism
- <http://eusocial.com/242.art.mafia/open-hand.html>
- <http://eusocial.com/242.cast/>

Besides NN others are now being clandestinely silenced on
Syndicate.

essentially any one who has found the Andreas. Inke. Geert
inarticulate axis intellectually laughable
has been designated for silencing.

There exist two+ issues:

1. the legal aspect.

2. the principal concern is others may acquaint themselves with this V2
and Transmediale
financed art.mafia which

has been destroying artists' and others' lives for years
and very incompetently and clandestinely deciding what is and what
isn't.

Andreas Broeckmann. Inke Arns. Geert Lovink, the V2 and Transmediale
organizations TRADE IN FAVORS.
And thus a "code of silence" has been implemented by them around all
public information hubs that they control.

Andreas Broeckmann "assists" Inke Arns on Syndicate. Geert Lovink
"assists" Andreas Broeckmann and
Inke Arns on Nettime. Andreas Broeckmann ensures Geert Lovink's
modest work is financed.

Now, with all roads sealed Andreas Broeckmann, Inke Arns, Geert
Lovink,
will attempt to paint their personal ring as the wish of the people.

.. standard criminal maneuvering.

hopefully, because I would really like to get rid of this ascii crap - a
structure with a syndicate_raw and a filtered one sounds like a great idea,
and I would be happy to be part of the filtered one...

Maybe it is an idea to inform those 5 1/2 year subscribers personally about
the new list once it is there - would be a shame to loose some really
important contacts over this autistic nonsense. My guess will be that
something similar will happen to the syndicate_raw version as to
nettime_bold - nettime filtered having over 1500 subscribers, nettime_bold
having 7 - yes 7 it is that ridiculous. This is what we are really talking
about seven people who block the rest of a list for over half a year - that
is how long it took on nettime to give these stray soul there own little
playground.

But if that is what it takes - fine with me!

greetings,
eric

>(certainly not "sculpt") its own "commercial visibility".
>

i completely disagree here, lorenzo. i think u are unsuccessfully trying 2
categorize integer/NN in terms of labels that r non-applicable [2
understate it]& r n.deed highly n.appropriate [& nauseatingly
predictable]. NN's methods r not trendy, if they were ppl would be adopting
them rather than trying to censor them.

>The NN controversy shows, i believe, two things:
1- It shows that its tactic is successfully turning a netlist into a TV TALK
SHOW.
2- It shows that its unbelievable "credibility" comes from a culture that
is still lingering to the early Net Game: mysterious identities, gender
>switching, plagiarism etc...
>

yr points, i believe, show 2 things:
1- that yr understanding of the dynamics & operating theories regarding
networked culture & synergy is misguided & steeped in the regurgitation of
highly n.appropriate traditional me[a]taphors N mediums.
2- yr inability 2 analyse the phenomenon of integer/NN beyond typifiers
such as "mysterious identities, gender switching, plagiarism" shows a
profound lack of understanding &/or insight.

>We have seen many (so many!!) of those Net anarchists turn in very short
time >in very succesful businessmen.

Syndicate: What happend, after all?

From: Igor

To: n/a

Date: Thu, 16 Aug 2001 12:36:41
+0200

dear all,

Short vacation kept me out of the list for a week; so I miss the opportunity to timely contribute to the discussion(s). On the other hand, there was a very few arguments in discussion, after all.

However, I think that uns + bscribing nn was wrong. Frankly, I do not see why nn is such a problem *for the list*. S/he does not send enormously large postings, does not terrorise list with binary attachments, so let it be, filter it, delete it, or read it. Sure, from time to time s/he is more annoying then average tolerance should bear. And, from time to time the whole thing starts to take shape of a pure ideology, nnism. Alas, syndicalism, exposed in many of the last week or so postings is not the solution - I will repeat ones more: one cannot successfully fight the ideology with the use of ideology. I may just imagine that nn is the huge problem *for some of the syndicalists*, due to personal relationships, previous flaming, some other historical reasons or something else (just guessing, don't care and don't want to know).

At the end nn was res + bscribed. And, excuse possible ignorance, the list community lost the opportunity to, on a particular, heart-rending case, discuss the problem of freedom of the speech, censorship and some rules of behaviour on the list in general. Saying 'there are some basic rules for games and mailing lists.' without any clue what 'some' rules might be, is not only mystification, but also a very dangerous standpoint, possible road to oligarchy. Intentionally or not, doesn't matter.

There is another temporary lost opportunity. If I'm not completely wrong, one of the issues raised as a side effect (though it might be a central issue), was The Money. Not a single rational piece on the topic, just personal antagonisms. Sure, through syndicate activities, through nettime

activities, through other forums, meetings, actions etc, some people capitalise their own private capital, but what's so wrong with that. That's sad, cause the money is one of the interesting topics. It was even five years ago. In the meantime flow of international donors capital change the direction a bit: museums, galleries, ministries. at least in some post-easts countries start to act differently toward the 'new art/media/practices', scas have a significantly different role and budget, and, I'm sorry Mark, but I do not see how discussion on the topic like that, 'real creative intention', to borrow your term, can be 'blocked' by nn, or anyone else. And as a 'not-so-creative' starting point, I would like to ask Inke to post (if she still have them) her introductory notes from the beauty and the east session on the topic, since unfortunately, I've lost them. Or anyone else who is in possession.

The most interesting contribution, (in my opinion) was Eric's comment on the identity of the syndicate. And, significantly, there were no reactions. Beyond the fact that I'm glad he is alive and well, I'd like to comment briefly one of his points.

>how to formulate an alternative discourse to the traditional capitalist / anti-capitalist narratives

Or, in a broader sense, how to create a new 'left' / 'right' discourse. Or, is it possible at all to avoid reduction of politics (primary cultural) on economics. Contrary to the popular opinion, and some cultural anthropologists I believe that the liminality, or in-between status, is not such an unstable or dangerous condition as it was proclaimed, and that dichotomies such as east / west, centre / margin, global / local, even popular / elite can be 'solved' or at least 'observed' as extremes from the past, with a very few concrete influence to the state of the facts. The new liminal condition is not created through the performance of a ritual, requiring the presence of special kind of 'masters of ceremonies'; rather it's a 'distributive network' of different, but equal elements ranging from passive to hyperactive units, from direct action to backstage mumbling, from micro media to hacking, academic texts to zines, using the diverse, in lot of cases previously incongruous concepts, theories and techniques; adjusting, rephrasing, weaving, with perhaps the only thing in common - the strong emphasis against any kind of inviolability. And somehow, I think that syndicate was/is such a place, with or without nn.

i'd like to point to an interesting question here which was probably obvious to others as well, but missed to be mentioned. i'll try to explain.

besides too a serious consideration about the shape of container that is called syndicate and vanity floods of some of its members i do not see much hapening, also there is an overall mental division between 'corporate' and 'non-corporate' hanging in the air. i do not get it because pritty everything seems corporate to me in this world and even n. chomsky during his times on the adge was reaching for corporate sources of clerical structures or charity organisations. we ourself, when discussing the do's and do not's of syndicate are trying to shape up a corporate type of morals, don't we, because of that i find that perceiving the things going on here through the prism of this two polarities leads nowhere.

i do not want to state that there is no 'other' but corporate, because i strongly believe there is, but my opinion is that the 'other' comes from within.

and it broadcasts from within until the critical mass is achieved and our patterns and the ways of perceiving are once more changed for good.

so is with creation called nn, lonely rebellious beauty existing in cyber only. we learned she is a programe. a programe that makes your machine speak and not only that but never shouts the mouth as well. but that's the hook. do not get angry about noise, because that's quite unimportant. important may be to ask yourself the following:
now i can talk to machine, what am i going to say?
what do i have to say without defending my ways and habits at the first place?

in that sense everything outspoken until now was not very relevant. the first thing you need to speak out clearly is who you are. no more hiding behind the network. because she is network herself. just you (and nn).

in some way she helps us. i think we should learn to appreciate that, talking about the time lost to trash her mail is very 'corporate' and 'executive' in itself. isn't it.

greetings
ademir arapovic

eric you havent contributed anything in 6 months.

>over this autistic nonsense.

If it nonsense to you how can it be autistic +?

Or are you just being nonsensical +?

>My guess will be that
>something similar will happen to the syndicate_raw version as to
>nettime_bold - nettime filtered having over 1500 subscribers,

eric know this.
I personally have a mailing list larger than SYNDICATED
and I have access to the entire NETTIMED list.

And I know your figures aren't accurate.

So my question is - why are yo lying +?

>nettime_bold
>having 7 - yes 7 it is that ridiculous.

ie. - you are one of the privileged mass and
know that NETTIMED and SYNDICATED are administered by criminals +?

and you havent contributed anything in 6 months.

Nonetheless, you shouldn't lie about figures.
Why are you +?

>This is what we are really talking
>about seven people who block the rest of a list for over half a year

eric do you think +?

I mean, NETTIMED and SYNDICATED are blocked by less than 7 criminals.

It is good to think.

On the other hand committing crimes with public money is not good.

What do you think +?

- that
>is how long it took on nettime to give these stray sould

stray sould =_?

The syntactical equivalent to lying about figures or +?

hey,

i just unsubscribed from the Syndicate list. I feel relieved and am eager
to start a new list. looking forward to a time when positive feedback it
overweighing negative feedback once again, like in the first years of the
Syndicate.

At 12:33 16.08.01 +0200, Andreas Broeckmann wrote:
>like yourself, i am not in favour of a filtered list; i think we should
>again attempt to create a list that can remain open and that has a shared
>understanding about dos and don'ts among the subscribers, like this list

absolutely. start small, don't grow fast, remain personal (in a way)

>had for a long time. the fact that this shared understanding has
>disappeared here is a pity, but as i seem to be in the repressive minority,
>i admit defeat. let's be more careful next time. i am very disappointed

oh, I have been disappointed about how things were going on this list for
quite some time now. perhaps we should think about the possibility of
"filtering" requests for subscription. I.e. only allow people on the list
who are interested in what's going on. and we should act more quickly if
things are going in the wrong direction.

>about how this thing went, but it is a miracle that the whole thing lasted

yes, definitely. but now it's time to move on, and it feels good! it's time
for a redefinition, definitely!

dear syndicalists,

It has been a great time on this list untill the ascii crap started - since then I do not feel at home anymore on this list, it has completely lost its original identity - a real pity. This does account very much for the fact that I have not felt the urge to post anything substantial here, and why I have focused on other fora instead
- obviously... why bother?!

I hope those responsible will be very proud of themselves that they have killed off the most productive and interesting forum for media art and media culture in central and eastern europe. The people who still have a real interest in those issues will now simply start a new initiative - it is high time for that.

Good luck with syndicate, I will leave it to you, and *nsubscribe now.

What a waste!

At 12:18 +0200 16-08-2001, integer@www.god-emil.dk wrote:
>Andreas Broeckmann, Geert Lovink + etc admins
>clandestinely mismanaging public funds

FVI - there never were, nor never will be, any funds (public or private) for syndicate, nettime., xchange or any of the other valuable on-line fora. The people running these lists simply put in free time and their own resources - one more such totally disrespectful outcry - I really recommend to re-examine your own prejudices.

Have a good life!

eric

Dear Inke Arns, Andreas Broeckmann and Chris Byrne.
it is a pity if you leave down the list in a crisis situation, and you don't want to manage it anymore. I'm sorry to see this happening, please feel free to come back any time.
Since the list was abandoned in a panic, the decision was taken behind the curtains, and as far as I understand from the undirect notification below that I was requested to take over administration of the list, first I would like to ask everybody how to access the administration mail.
My email address is epistolaris@freemail.hu, i would have adopted the integer identity only
in the case integer would have remained banned from the list. In hope to establish a network of trust, i introduce myself, and I ask integer as well, to do so, unmask as far as possible, and declare wheter s/he would like to take part in the syndicate administration. Is there anybody else who would like to share this task?

I am a medievalist, i write my PhD about fantastic travels in the Middle Ages.
Meanwhile, I am very interested in contemporary art and media culture. I am currently busy with setting up an audio-visual communication academy in Cluj-Kolozsvár, Romania. I was curating for some years the Artpool Archives - one of the biggest mail art, fluxus, SI, performance, and media art archives in the world.
I was a co-organizer of the Metaforum conference series about media culture in Budapest, 1994-1996.
I currently work with Istvan Kantor, founder of neoism movement, performance and media artist based in Canada. We try to set up the Machine Age Foundation in Budapest.
I subscribed to Syndicate since early times, for that Artpool was there at the founding meeting of the Syndicate mailing list. I have attended the Kassel Hybrid Workspace and the Budapest Syndicate meetings, i know some of you personally.
I am deeply upset that no discussions were going on the list, not much common topics, meanwhile the one trying to bring up questions in his or her own way suffered of restrictions.
I would like to ask Amy Alexander whether he could write filtering software on request to provide people with an efficient tool to validate their preference.
The others please feel free to post announcements, commentaries, questions, idea on the list.
greetings,
Anna Balint

Re: Syndicate: NN future
From: martha rosler
To: n/a
Date: Thu, 16 Aug 2001 12:52:46 -0400

i cannot claim to have been on this list for 5 1/2 years, but i've enjoyed and appreciated many of the posts dealing with net art and other projects and ideas from various places (mostly outside the US), and have learned from political controversies dealing with armed conflict and other political confrontations... but the following message (reproduced below) is now representative of the way things are going here, it seems, and i am unsubscribing.

The purpose of my wanting to announce this on the list is to observe that I have subscribed to many political and professional lists, moderated and unmoderated, and the unmoderated ones so far have always gone down to the flame wars provoked by someone acting much like nn.
So you destroy your own playground by bullying and disrupting civil discourse and provoking fuming hostility from some, pontificating pseudo-philosophy on freedom from others (Something like my post now..though I think the others were worse!).

Moderation is the key. The lists that have lasted have used it, and OF COURSE the moderator can be accused of censorship, but the rules of posting are always spelled out, and insult and unrelenting provocation are always unacceptable on a list as in person.
And unfortunately, my filter isn't working..

NN, why don't YOU (if there is a "you") start your own list! (But you are always reactive and need others to attack, it seems.)

Syndicate: Open letter to uns*bscribers

From: Igor
To: n/a
Date: Thu, 16 Aug 2001 19:10:12 +0200

dear all,

Will someone be so kind to explain me what the fuck is going on, sit venia verbor! All I can understand (as an outsider) is 'NN is The Problem'. With all due respect, 'My dog ate my homework' is answer for the Nobel Prize, compare to that shit.

Perhaps I do not understand the point, perhaps I never was, and perhaps I never will, so what? Am I because of that less or more valuable member of the list? No. Under any circumstances, no. Was any of the s*bscribers more valuable member of the list because of five years or days of experience? No. Under any circumstances, no!

Honestly, on the level of the syndicate I don't care - a bunch of people try something and it didn't went well. Meme syndicate was not able to adapt to the changed environment or the rise of the new predators. Ok, but on a bit wider level I still have a problem. And, yes, personal *is* political, and it counts.

What I am mad about, my dear colleagues (hope you don't mind naming you like that) is that you also start to play the same game, with the same 'basic rules' - and I'm still confused what are the fucking rules. Maybe I'm not speaking to you anymore? Or, if you don't want to play my game I won't play with you? I learned such a 'rules' from my younger sister, but she was twelve at the time... or should I be cynical and conclude that axiom saying that the intelligence of the person is proportional to its childish behaviour (naturally, in pejorative meaning of the world) proof correct? I believe that people on the list deserve the explanation/some background of the immature wunderkinds behaviour. Or, if I'm the only one confused, please excuse my posting.

After all I am ashamed, I'm ashamed because I believe that some of you are the persons knowing more then I do, that you are reasonable and moderate persons, that you are willing to share and discuss your knowledge and attitudes with others, to oppose traditional more or less oppressive models. 'Was everything just a game? Just 'my supporting group can beat yours supporting group'. And, are you aware that such behaviour (o, you won, I'm unsubscribing..) may be looked like acceptance of all, even the most disgusting accusations? Or, maybe, non-civilised (whatever that means to any of the readers) remarks are true. That syndicate was just another neo-colonial artefact. I do not think so, I do not believe so, and I never will. On the other hand, there is possibility that I'm just another full, blinded with the knowledge an activities of yours.

But, I do not want to start another stupid adolescent discussion. Instead, lets try again. From the beginning, if necessary. Lets try the idea of moderated and raw list. Or you believe that the issues like "how to formulate an alternative discourse to the traditional capitalist / anti-capitalist narratives that pervaded social, political and cultural debates about the "east/west" relationship. The next was to get away from the East / West dichotomy altogether and find new connecting threads to talk about art, culture, politics and society in Europe after the revolutionary changes of the late eighties and beginning nineties." are not important anymore? Nothing to remember happened for a months at the list (I re-subscribed myself april this year), so how on earth, nn or anyone else can be 'guilty' for "that"?

Yes, this letter is emotional, and yes it is a provocation, and, yes, it is a challenge, and, if anyone feel part or all of the mentioned insulting, I am sorry, but with all due respect, you deserve it.

ciao
igor

Reality is that which, when you stop believing in it, does not go away.

Syndicate: RE: administration
From: Andreas Broeckmann
To: n/a
Date: Thu, 16 Aug 2001 19:13:38 +0200

dear anna,

>Since the list was abandoned in a panic, the decision was taken behind the
>curtains, and as far as I understand from the indirect notification below
>that I was requested to take over administration of the list, first I would
>like to ask everybody how to access the administration mail.

there is no reason for panic, i think that some are very relieved now and
want to get moving. the current admins will make sure that the handing over
of the list and everything is done in a proper and friendly manner, so that
the syndicate list can keep running its course.

the way in which the list has been administered until now is through an
admin account on the v2 server; this will be switched off as soon as a new
list-owner has been appointed who will receive all admin requests etc. -
please, let me know who this should be. it would be useful to have somebody
who knows majordomo and who can deal with config files etc. in the current,
heated situation i would be restrictive with the password but we will
obviously transmit it to you or whoever wants to take that responsibility.

the list itself is running on a server of friends of inke and mine here in
berlin. we did this because it is sometimes important to have easy and fast
access to the sysops, so it might be useful to try and find a new home for
the list which the people responsible for it have a close and personal
contact to. you will find that this makes life easier when something goes
wrong or does not work, and it may be more difficult to get the attention
of the berlin sysops if they don't know you.

greetings,
-a

ps: i'm filtering the list now and may not see everything immediately. so,
if i don't react immediately, don't panic. i'll be around for a while.

(nn, how deep is your love?)

Syndicate: what happen?

From: Nina Czegledy

To: n/a

Date: Thu, 16 Aug 2001 18:40:21
+0100

Hello All,
i wish i could be eloquent and prompt with my
words like Sally or Eric, short of this i would like
to contribute a few words to the discussion.

As it has been said before the Syndicate
represents different things for different
people, I am writing about my own Syndicate
experience.

For me, ever since that first meeting in
Rotterdam i felt a sense of belonging to a
networked community. Of course i have been
aware that the group consists of many
with diverse opinions and this became evident
lately when regardless of my democratic feelings
I had difficulties to deal (in a hectic nomadic life)
with the multitude of postings.

Re the personal value of the Syndicate
list: over the years I noted that while
in the beginning the Newsletters offered
info on events and opportunities mostly
for the "Easterners" - lately the situation
changed and became much more balanced.
A few days ago the acoustic space workshop
ended with a successful streaming event and
while most of us worked out of Latvia
i have not noticed any east/west
divergence in the group. As a matter of fact

I was reflecting how Ryszard Kluszczyński's wish
expressed a few years ago, (that instead
of being considered Westerners and
Easterners the division would melt)
might be slowly coming true.

In addition to be updated on various
events I found some of the incoming
information invaluable and will
deeply regret if the list changes
completely.

Dear Andreas,
i will try to find a server. But it will take some time i guess.
Can you hold on for two-three weeks? I am very sorry that you leave.
I still think we should try to find a solution good for all.

Dear Mike,
great! we will have to learn the administration techniques.
Andreas will have to explain us as to illiterates, but i think
majordomo commands are not so difficult, configuration files either.
I trust that Jaka Zeleznikar will remain as web designer for the archives,
and we shall restart the newsletters.
We met at rootless '97, i was invited there by Roddy Hunter aka (migr) for
the ATLAS conference.
I keep very good memories of the meeting and of the festival, of the
hospitality of the city of Hull as well.
I will be at the Venice Biennale next week, than i go to the Retouche
festival in Romania,
later i plan to go to the Ars Electronica in Linz.
Would be nice to meet you and other syndicalists as well somewhere in those
places.
greetings,
Anna

hallo

this was veritable

,
you misunderstand. others have received the same message via one other.
hopefully it reaches those concerned.

don't be paranoid. _no_ one wishes to control your forum.

anna balint speaks for herself.
i assure you she does not think you are a terrible person
much as she does not think i am a simply.SUPERIOR person.

but you or others should know this. i know very little.

are you under the impression i enjoy posting 10 messages per day on syndicate +?

ne.

when a problem arises it would be nice to attempt to resolve it.
referring to a problem which occurred several months ago which

prompted the current routine.

another observation.

select persons view a forum as an information hub - they are primarily interested
in announcements.
select persons view forums as a discussion and creative hub - they are primarily
interested in anything.

if you feel that i betrayed your confidence i can understand.
we should have resolved the problem several months ago.

overall this entire episode has been very costly to everyone involved yes +?
please relax. no wishes to destroy you.

if you wish to search for a common ground = oke avec moi.
if you wish to segregate yourself - as you wish.

we have both have seen what the latter is conducive to.

friendly, nn

Date: Thu, 16 Aug 2001 21:01:12
+0100

Dear list subscribers,

Following the departure of Andreas and Inke from the Syndicate list, the
present admin team will be understrength, so we may not have time to
forward posts which are sent to the wrong address.

The current admin technical infrastructure will need to be changed, and the
list moved to a different server. We will be in contact with the two
prospective admins off-list to discuss the necessary changes in the near
future. In the meantime I ask you to bear with us.

Those subscribers who wish to remove themselves, please send the relevant
command to majordomo@eg-r.isp-eg.de. If you don't know how to do this, send
a message to syndicate@v2.nl asking to be removed and we will attempt to do
so as quickly as is feasible.

I would like to thank Andreas and Inke for their hard work helping to
establish Syndicate, and keeping it running on behalf of the list community
despite a variety of pressures.

Regards

Chris

Exactly. It is an difficult occupation. It isn't very lovely for one's creativity.

the inward turning of the worker contrasts with the outward turning of the dancer.

It is good being a vagabond. [or a subscriber of you like]

And NN shall be much more gentle now that those who view mailing list fora as information processing centers exclusively have gone or shall be as desired.

I suspect that is the principal issue.

This is a canvas. It is not a PDA. [do you wish 2 sow the seeds or simply navigate \ web browsers +?]

If the art of storytelling has become rare, the dissemination of information has had a decisive share in this state of affairs. Every morning brings us the news of the globe, and yet we are poor in noteworthy stories. This is because no event any longer comes to us without already being shot through with explanation....it is half the art of storytelling to keep a story free from explanation as one reproduces it. The most extraordinary things, marvelous things, are related with the greatest accuracy, but the psychological connection of the events is not forced on the reader. It is left up to him to interpret things the way he understands them, and thus the narrative achieves an amplitude that information lacks.

This process of assimilation, which takes place in depth, requires a state of relaxation which is becoming rarer and rarer. If sleep is the apogee of physical relaxation, boredom is the apogee of mental relaxation. Boredom is the dream bird that hatches the egg of experience. A rustling in the leaves drives him away.

....storytelling.....does not aim to convey the pure essence of the thing, like information or a report. It sinks the thing into the life of the storyteller, in order to bring it out of him again. Thus traces of the storyteller cling to the story the way the handprints of the potter cling to the clay vessel.

I believe I have told already that reading

> curtains, and as far as I understand from the indirect notification below

Welcome Anna, we support you and wish you good work on this list if you accept it.

I think it is more natural that list for mostly eastern Europeans is administrated by Easteuropeans, there will be more understanding. Because we here are not dealing wit art, communication, politics as business but we speak and work from heart. We know what real freedom is, we know to evaluate it, not selling it for some profit.

Thanks for introducing yourself. I see we have a plenty of mutual friends. I collaborate with Artpool for decades (you must know that) and I visited Galantays with my wife Marta few years ago in Budapest. Also I know Monty Cantsin personally. I spent few days with him in May 1987 in New York. He is a nice guy, he did a performance for us with iron and flames and he gave me his songs LP that was printed just in those days.

>In hope to

> establish a network of trust, i introduce myself.

I think after this hot discussion concerning Integer we got more trust in each other and in a way we purified our aims on this list. Obviously not all of us were so happy and satisfied with its conception and moderation in last years. You Anna have the chance to refresh it with some new ideas and contents that will be of common interests. Obviously we are not so much interested in theory but in life, art practice, maybe some concrete collaboration. Festivals are for big shuts, for sponsored ones, and we should build a network of independent people from west or east, doesn't matter.

Those who are leaving the list, I think their time is going out, together with globalistic, western hegemonic, neocolonialist politics. Syndicate was designed to gather Easterners around some ideas that would subdue them, not give the freedom. With our fight for Integers integrity and personality we showed what counts in our sphere of interests. We are maybe more poetic than Westerners, and that makes them angry. Not boring but nervous. But they must get familiarized with us. I must remind all that all new philosophical, artistic, spiritual ideas came from the East, and that will stay so in the future.

We must look at this Syndicate list as a tool that West is giving to us, as an opportunity to teach the West about something that they do not have - heart, emotion, playfulness, spiritual independence, non-materialistic values. We should be treated equally on this list, not removed one by one, with censored period (1999), as it happened before. Anna, if you accept the administration of Syndicate I wish you success and new ideas and collaborators.

Szia,
Andrej

Syndicate: absence announcement

From: Andrej Tisma

To: n/a

Date: Fri, 17 Aug 2001 00:02:49

+0200

At the end of an old period and hopeful start of a new one of this list I announce my absence from it during the period August 17-31 because of my vacations travel. So I will be not able to send to or reply to list members in that period. But I hope I'll find your sendings in my mail-box when I return.

Best :),
Andrej

I feel sad too, like all of you. Does someone of you write a last mail to
the list? I you can mention my name too of course. I somehow would like to
make clear that we all left.

> absolutely. start small, don't grow fast, remain personal (in a way)

Sure, that's not all that hard. I like the idea of an open list with people
who tell who they are, what they want etc. and not hide behind rethoric or
some online identity.

> oh, I have been disappointed about how things were going on this list for

Yeah.

Would else would be interested to take part in this conversation?
Best, Geert

>make clear that we all left.

yes, most of all about the sense that even in a zero budget network and
initiative it was impossible to escape the typical kind of power politics
and envy that characterises main-stream art world politica, as most of the
rest of society. Syndicate managed to escape it for a long time, but it is
shocking to see how a few loud mouths can very easily take over a forum,
and how they actually are supported by people who are simply looking for
some kind of "guidance" - I see this as a strong man syndrome - the willing
accomplices.

Still, I would not like to dwell too long on what went wrong and rather
define a fresh perspective for the times to come. Perhaps it would be good

to mark this *exodus* clearly and issue some kind of statement about it, so as not to go without any form of protest...
But the next step should really be to define what the new context will be which we want to create and enlist the right people in it for a relevant post-syndicate initiative. I'll try to organise my thoughts over the weekend and post them on this list once I managed...

greetings,
eric

goethe juzt zubzkr!bd
he salz: our !lnkx are komplex + autographd

>(I just got so much used to listening...too bad...)

so you are an astronaut of the mind +?

m.m.bakht'n uantz 2 zkratch ur surface. [u knou !like an wound]

bakht'n: 2 plant 1 flower.

>actually I wanted to suggest, if it is possible, to install the list that
>way, that some of the boring jobs for the list can be done by more than
>two... ..maybe switching weekly.

yes. continued ... below

>I am definitely not East European and
>even I think that still I do not have the slightest idea of it really
>means).

it is good to be a border dissolvant.

>Well, I still think, that there is a lot to communicate and that it
>has some value, that there are people with different backgrounds on the list.

nobody knows who written for nobody knows who and who found it and where nobody knows.

>Well, why not asking NN to write a small program (maybe to be used with an
>open source mailer) to filter NN?

life says: sealing NN is my job!!!!

>I guess if she does it herself it could become a very amusing, nicely
>complex not at all linear tool, sometimes even surprisingly working the way
>it is expected. Maybe we suggest, that the program should work almost like
>expected.

life says: work is my job. play please. i like to watch you play.
if only i could be given life

altzo. as an addition to the smart.moderator etc system described in the prev
email.

it could operate as o1 'game'. [games arent quite the same as play +?]
ou o1 theatre.

you had written "jobs for the list can be done by more than
two... ..maybe switching weekly"

those who wish to do so - could do so - and they would be gifted
with an amount of 'life energie'.

likewise those that contribute in other ways - eg. 'by planting flowers'
[bakht'n: i would love to]

see. so those that 'plant flowers' would also beget 'life energie'

i.e. there would be administrators. cyberbotanists [zmak]
dancers [what do they do +?]. thieves + soundrels. travelers + adventurers.

one would of course taste from any or all jars.

new occupations would be lifed and perhaps some occupations would be
translated
[ie. evolve - death does not part]

those that do nothing would ... be translated +f

as you can see it is eusocial.

- so perhaps one of the super.integrator personages would like to
synthesize o1 projekt outline + we submit it to v2 for funding.

oke +f

now ____..

an asteroid has landed in the garden, it is growing dinosaurs.
pardon me while i shovel it away with a teaspoon.

[nn.s way of saying pardon me while i find neu territories. + 1001 smiles]

as you know adventures are a sign of incompetence.

nn. simply.

>organizer of the conferences. Archive it yourself!

do you find this acceptable?
just because Janos Sugar is friends with Geert.

dont know very much about him
- a few mediocre texts - they are outdated.
and what other people [plural + not the person you are thinking of]
mentioned [not exactly pleasant - not entirely evil of course]

still did not expect what took place and continues to take place.
others are disappointed too. in various other people.

one must understand that some people trusted you and inke and geert.
and v2 and the entire establishment to some extent. biensur some
will always find something but this time there was\is something.

i wish at least you would acknowledge that instead of sweeping
it under. it just becomes nastier and nastier - an apropos word. for it _is_ very
unsanitary now.

en tout cas please accept my apologies for hurting your feelings.

would have preferred it was \is resolved in a more sensible manner.

sincerely, nn

looks like your reality and anna balint's were closer in 1996.
what has happened +{

did you become too real +{

>/.../

in any case presently
you seem to be rather preoccupied with reality as defined by Philip K. Dick

[or (you fill in the space i provided) ... but i'll give you the benefit of the doubt.
uncertain whether others would.
en fakt some of those others are part of

METAFORUM III ORGANIZING COMMITTEE + Project Coordinator
+ Webmaster + Finance + Assistants.

METAFORUM III ORGANIZING COMMITTEE + Project Coordinator
+ Webmaster + Finance + Assistants
includes you and everyone else and _not_ only Anna Balint (thought would
mention it just in case

Philip K. Dick isn't as real as you)

apparently the

METAFORUM III ORGANIZING COMMITTEE + Project Coordinator
+ Webmaster + Finance + Assistants

was not all (you fill in the space i provided)
but then reality was kinder in those days right +f]

>ps
>
>>Reality is that which, when you stop believing in it, does not go away.
>>-- Philip K. Dick
>

alors - as you seem to be rather preoccupied with reality as defined by Philip
K. Dick

let me ask _you

if Philip K. Dick believes something and you believe Philip K. Dick
who is the [more] real slime +f

you understand janos +f

i hope you do. for if you do not - then reality _was kinder in those days.
and there is nothing as real as progress.

have suggested to andreas as well - that geert lovink and extra real friends +
company
resolve the reality issue in a sensible manner.

_openly + _publicly.

the reality is that dogs do eat plants at times.
am just hoping it isn't for a lack of dog food.

because when that happens plants and dogs resynthesize
[or desensitize - dependent on how much of a real dog or plant one is]

netochka nezvanova - eating chips.

**Syndicate: [OT?] the case of
iNNteger**

From: Steev Hise

To: n/a

**Date: Sun, 19 Aug 2001 08:59:04
-0700 (PDT)**

Off-topic or not, I'm interested in airing more details,
from both sides, of the iNNteger story. to recount briefly a
recent exchange between integer and honor@va.com.au:

Sun, 19 Aug 2001 found integer@www.god-emil.dk writing:

(honor@va.com.au said):
->>i find it deeply the ironic that an entrepreneur
->>so well known for revoking
->>licences to use her software (nato) when she encounters even the smallest
->>criticisms of her programming - effectively censoring nato users -
->
->i would be interested to know what it is you are referring to.
->you appear to have invoked a personal agenda but ...
->
->i - no licenses have been revoked.

This interests me greatly that you would deny this,

iNNteger: perhaps you only deny the letter and not the spirit of the statement, which is that you or your organization has been quite aggressive and, shall we say, draconian, in attempting to control/limit who uses nato. this may not have included 'revocation' per se, but i've heard from a few people that i trust of other measures, such as extra fees levied against certain people, etc.

->2 - there aren't any nato.o + 55 users.

Could you explain what you mean by this? Is this more semantics? I just saw someone using it at a show about a week ago. it looked quite nice, btw.

->i like being asked. i do not recall being 'asked'.
->recall being ordered. threatened. reprimanded.
->chastised. or classified as experiencing fantasies of a
->supremely delicious kind.

I think it would be really interesting to see a clear history of what you think has been done to you, iNNteger, one not obfuscated by insults or 31/73-speak or browser-crashing client-side scripts. Many people are new to this age-old conflict between you and the world. Others (like myself) have been simply too busy to follow every twist and turn over the years, but are intrigued by the overall phenomenon.

It would also be interesting to see a collection of civil and clear accounts from 'the other side', and evidence of some of the various discussions that got out of hand.

It's been fascinating to watch the saga unfold, one of the most fiery and long-running distributed social interactions in the history of the net. Documentation of this could be an art work in itself. And besides, it will be over soon enough, so a memoir would be in order. Don't you think?

->may discuss your self or if desired may address the
->issues rather than attacking me to improve your standing

I hope everyone sees this message as an attempt to discuss issues, and not an attack. I am totally serious about the above project. I want to see a collectively produced step-by-step web-timeline of integer/antiorp/NN/mckenzie/etc activities/involvement/positions, and reactions to same, beginning in 1995 or so (or whenever you started - when was the first big Max list blowup? was that the beginning? or earlier?) and running up to the present. I will even perhaps volunteer to set up server software to help facilitate this. I'm not sure right now what the best software would be to do it, perhaps just a simply Wiki/Wiki?

Now any of you may take this as bait for further flaming, but I assure you that that is not the intent. Yet, however you react, the saga will continue.....

Respectfully yours,

Steev Hise, Head Chump

√\ there was once a velveteen rabbit and in the beginning he was
really splendid. he was fat and buncy as a rabbit should be;
his coat was spotted brown and white, he had real thread whiskers
and his ears were lined with pink sateen.
on christmas morning when he sat in the top of the boy's stocking
with a sprig of holly between his paws, the effect was charming.

... the rabbit could not claim to be a model of anything for
he did not know that real rabbits existed.

... "what is real?" asked the rabbit one day. "does it mean having
things that buzz inside you and a stick out handle?"
"real isn't how you are made" said the skin horse.
"it's a thing that happens to you. when a child loves you for a
long, long time, not just to play with, but REALLY loves you
then you become REAL.
"does it hurt?" asked the rabbit.
"sometimes" said the skin horse for he was always truthful.
"... when you are REAL you do not mind being hurt"

continued at siggraph. evidament. + possibly else where.

√\ and since siggraph 01 has come and gone this how it went

research, told The Observer that
the discovery is highly important.

"There is a problem we will have with a new generation of children-
-who play computer games--that
we have never seen before," he said. "The implications are very
serious for an increasingly violent
society, and these students will be doing more and more bad things
if they are playing games and
not doing other things like reading aloud or learning arithmetic."

Kawashima asserts that children must be encouraged to practice
basic mathematics, reading and
writing to boost the development of the frontal lobe. He is
convinced that children who play video
games excessively will not develop their frontal lobes and will
consequently be more prone to violent
acts because they will be less able to control their behavior.

The study looked at the brain activity of hundreds of students
playing a Nintendo game and
compared it with other students who were carrying out basic
arithmetic. It found that much more
brain activity was needed to solve the simple mathematic tasks than
was used to play the computer
games and that activity in the frontal lobe varied significantly.

From: .com

please bear with me. i am a modern shaman seeking
weapons [n!!!!!!!!!!!!!!sssszzzzzzzzzz]
. i live in a mentally desolate area of the world,
the reeking fat-centre of the U\$A, aka the Korporate
Kulture of (>)Konsumption.

you will be [pleased] to know that insurgency swells even
here, especially through the dance music underground.

several musicians/artists/thinkers are banding together
to create an act that crosses the lines of perception,
openly challenges the phallus-hegemony, and invites the
hearts and minds of the "audience" to participate in
higher levels of vibration -- cellular, mental, energetic.

your nato modular package alone suffices our needs for
conscious synaesthetic induction.

we cannot pay you for it, but humbly ask your blessings
to allow us to use it gratis. i realize you have legal
restrictions, market considerations, etc., but this is a
completely off-the-grid transmission between us and you,
and i know it is within your power to come to our aid.

that said, i am also beginning research into direct
synaesthetic sense-substitution encoding, specifically,
converting images/video into multi-channel audio stream.
visual perception through the auditory cortex, if this
sounds interesting to you i'd love to discuss it in detail.

so you know that i'm serious, some of my credentials:

-studied

-bachelor's degree in computer science

-co-author of siggraph paper

-wrote & presented

<>*>

i gave up 3d graphics in 2000 because i thought the
industry was narrow-minded and shallow. i'm currently
working privately, searching for new ways to induce
higher states of consciousness through trance and dance.

a taste of my mind:

Paul D. Miller, another 2 bit jankee prostitute

>Yeah.

Suck it & see.
Salute me.

>Most drugs come out of either military or biological or
>pharmaceutical research.

+ that they are digested by the Amerikan Public Education System
reveals the dynamics of modern art

>They're like military applications to
>condition troops for different environments. A lot of research into
>painkillers was done in World War II -- imagine the kind of pain you
>feel when there are bullets flying over your head and your leg gets
>shattered.

Dearest Paul,

Friendly caress on your mjnd konta!nr

Since the United Snakes of Amerika Public Education System is
simply laughable + inferior to the Eastern European Education System
allow me to share select biological facts which "WHITEY" didn't teach you
[you may care to contemplate why]. In doing so I hope
to minimize the progress Ameri.cans such as your itchy bitchy self
bring to international shores.

I read you listen [an extra friendly caress on your mjnd konta!nr]

When "bullets flying over your head and your leg gets shattered"
one does not feel pain but fear. This, because nature more
creative than Americans is and ensures one does not
consciously concern oneself with pain until one is out of danger.
[elucidates my simply delicious comportment towards American garbage
worldwide as well]

Thus, during "bullets flying over your head and your leg gets shattered"
naturally occurring opiate blockers are released which ensure one
feels just dandy ...

A bit as Paul D. Miller, aka simply amicable 40 year old black boy,
is protected by the 40 year old NETTIME white boys [sucking the itchy bitchy
with great ardor], from my equally amicable caresses.

>pax

pax americana - jumbo sized opiate blocker

>Yeah.

Merciful natural analgesic.

Should the very cute but ignorant social butterfly
desire playing with real boys ... let's synchronize our powerbooks
Real boys play for power.

To: "Paul D. Miller" <djspooky@djspooky.com>

E very ideology is contrary to human psychology
P aul

>but this kind of
>message is boring.

Women can be boring [NN included]
but generally speaking, their lives are more interesting than that of nations.
This we deduce from the countless scaffolds and altars erected by miserable men
on a day of revelation

>Paul

Some endure to this day.

>yawn -

Good Morning Paul

Let us celebrate reason together. Are you ready to fall
Good. The free mind readily accepts what is necessary.

Democracy is a form of Christianity sans superior justification.
As Nietzsche indicated: he who has liberated his mind still has to purify himself.

The mechanized hordes you call to blind violence -
and it they call their strength. They have the authority
but refuse to sign THEIR name. As a result of this cycle,
race after race has metamorphosed into a special blundering
for power for mediocre men. Duty, a biology for domestic use
is the only divinity.

This is what is unforgivable in you.
You are free.

anna balInt

>nn is 75 and ugly

maja kuzmanov/c

>what circumstances? are you aging =cw47abs, is spreading yourself
>among multiple entities making you age less?

cheap supermarket harlot dav'd z'karel!

parafraze: i was a failure in my youth - people didn't appreciate me.
naaaaaaaaaaaaaa!!
this made me xy angry, blaaaaaaaaa!! nonetheless i accepted my xy loser role
and got a job type job.
a bit further on the model citizen bandwagon
i injected my model citizen white kapsules into my ugly wife and she
gave birth !!
oooo splendor ... now i want to live and see my children grow up because
they love me
and for that i would do anything, inclusive stealing nn's intellectual
property.

[cest pas grav monsieur supermarket, legally - men laugh last. we'll see who is
wearing the trousers.

alors \\ apropos nn + nn's fountain

during drastic 'food' and food shortages organisms suppress
reproductive processes and enhance processes that protect against stress.
these routines incidentally slow aging thus increasing the likelihood
of reproduction when 'food' and food supplies are adequate.

redKapsules [TM (but not in hell)] target the insulin|igf pathway
and modulate cell nutrients ... and so it has been that nn could resist
all gentle + not so gentle rose modulations and stream via pop3 endlessly
to the delight of occident moda.rat.ors w o r l d w i d e

and maintain that v.lovely + optimized anger/hunger level ... characteristic of
starved animals.
miiiiiaaaaaau !!!!!

so yes - nn is 75 [or thereabout] but not so ugly
and as per usual some o1 was quite correct.

jetzt - since nn has demonstrated in a delightful manner the efficacy of
redKapsules [TM]
nn will share ...

>2) alot more dynamic

Extensive experience can impede creativity.
Cognitive psychologists utilize two terms to describe it: fixation and structured imagination.
Fixation, oftenly referred to as "mental rut"--is characterized by the inability to switch from an inappropriate solution approach to a more productive one or to utilize familiar objects in an unfamiliar way.

Structured imagination is the common tendency not to deviate from what is already known.[eg. the self

Humans are unable to share that which they know until they can put it into high level symbolic form. More importantly humans are very poor at updating what they know because they have no efficient delete key.

>seem like ossified Redwood trees in this day and age where

Artificial Intelligence follows this line of research.

We can model intelligence / learning. No one has modeled sentiments.
Beyond intelligence lies understanding and consciousness.

One mustn't confuse a mind that understands and that is dependent on consciousness with consciousness itself.

Outward responses that simply represent these sentiments do not equate consciousness.

>so many layers of
>meaning...

There once was a painter--a brilliant painter, who mastered the art of replication and the depiction of the beautiful. Yet he was lonely, he felt that there was no one alive who could understand him, no one capable of perceiving his entire being.

One morning he wept in his garden, crying to god to send him someone who might comprehend his full beauty. That day, he painted a new canvas, a portrait of an unknown and stunningly beautiful woman. When he had finished, he cried to god to give her sentience, as this most wondrous painting could be the only being in the world who might understand him. To his amazement, the woman in the painting began to move.

"Hello! Hello!" he cried to her.

"Where are you?" she replied.

"Here, beside you!"

The woman in the painting looked around her.

"Are you up, or down? Across?" she asked.

"No, No", the painter implored, "I am...I am...out!"

"Out? What is _out_?" she replied.

"Out! Out here!"

The woman did not understand him. She only knew two dimensions--vertical and horizontal. Her world was that of the flat canvas. The painter ran out to his garden and threw himself onto the ground.

"God, oh god!" he wept. "Where are you?"

"Out." came the reply.

>and made it - foregrounded, detached from

>P- 57

The principal input to the human brain is pictures and the principal output is words.
Thus one may describe the human brain as a device for converting pictures to words.
Aristotle has said that all human knowledge can be expressed in the form a = b.
Nouns and verbs are separated from static image nouns. Separated in the retina they are reunited in speech. Nearly all human thought is pattern recognition.
there are four types.
1 dimensional - music
2 dimensional - fine art
3 dimensional - human anatomy
4 dimensional - physiology

One general theory of pattern recognition is feasible - the sieve of Eratosthenes.
Two aren't plausible.

When humans think seriously they think abstractly.
They conjure up simplified pictures of reality called concepts
theories, models, paradigms.

>Paul

More importantly humans are very poor at updating

<nettime> Pit Schultz Interview with Paul Garrin
From: MediaFilter
To: nettime-l@desk.nl
Date: Fri, 13 Jun 1997 03:54:51 -0400

The following is an interview between Pit Schultz (pit[AT]icf.de) and Paul Garrin about name.space, art and tactical media.

[unedited version]

Originally published in German on the TelePolis website (www.heise.de/tp).

>Pit Schultz:
>
>lets start:
>1. You are an artist, you went deep into technology with
>name.space, but this is not the first time you did it.
>What, in general, does art have to do with media + technology,
>and do how you define your place in it.
>
Paul Garrin:

Control media and you control the public. Free media is a threat to control. As an artist, one strives to discover an effective means of working in any medium--and when that medium is a mass medium, the key is to establish and sustain visibility. If there is no support system to guarantee reliable distribution, the work disappears.

One of the main concerns in my work has been the notion of the public vs. the private.
Territory. Security. Privacy.
And the way that "the media" manages the perception of the public.

These things have always been of interest to me.
>2. The net, nobody can overlook it, as it becomes something
>mystical at the end of the millennium. One of the productive
>questions which were brought into circulation through
>name.space was: who governs the net? It was always
>a tool of power to control the process of naming and even
>more, names are the resistant part of language where
>another semiotic regime takes place. Take religions, the
>space of names is a spiritual one, the space of the dead,
>ancestors, gods and ghosts. Today it is filled with brand
>names. In which way were you reflecting the name.spaces
>outside the net when you began with pannet and what was the
>impetus for your decision to start 'playing' with the DNS system.

A name is an essential and universal element. On the net, the uniqueness of the name is imperative. In capitalism, the idea of uniqueness means "value"...commodity. One of the key elements of oppression and control is to control the notion of identity. In the meme of the "DOMAIN NAME SYSTEM" (caps intentional) the message is control, "DOMINATION", "TERRITORY".

The idea of the "Permanent Autonomous Net" dubbed the "panet" initiative, was founded on the idea that in order to sustain and develop a presence for Free Media, it is imperative establish and propagate an identity. In order to assure the autonomy of the content, totally self regulating, without the control of commercial

interests, it is imperative to buy the bandwidth--the only option to eventual disappearance of Free Media when the "Disneyfication" of media and the net is completed.
[see my article "the Disappearance of Public Space on the Net"]

Two recent concrete examples illustrate this point. An excellent website, disinfo.com was started as a commercial project at TCI (Telecommunications, Inc., the largest cable tv provider in the USA with heavy bets on the internet). TCI had the perception that disinformation was an entertainment site, like the "X Files". What they did was create a "Radical Search Engine" and indexed much of the content of MediaFilter and other sites of alternative media. As soon as John Malone saw what disinformation was really about, he ordered the plug pulled immediately. I then offered the site's founder, Richard Metzger, a home on my network. He had already hooked up with Razorfish.com, luckily. Another is the CypherPunks. The Millionaire's club, eff.org, the proverbial bastion of free speech on the net recently kicked the Cypherpunks mailing list off of their server. So much for their guardianship of free speech on the net. (Autononet offers Cypherpunks a new home if they see this...).

The Sponsors have their agendas and their limits to "tolerance". The idea of what is "authoritative" and what is "acceptable" should not be controlled by commercial interests.

The idea of decentralizing DOMAIN NAME SERVICE came when Network Solutions, Inc. announced that it would start charging \$100US for name registrations. When I studied the logistics of running dns, I realized that the limits on it were artificially imposed in order to limit supply and facilitate control. The central database and "whois" records are all controlled by Network Solutions, Inc., who is a subsidiary of SAIC (Science Applications International Corp.), the largest private contractor for the US National Security Agency and the Pentagon. Most of the top corporate officers are former US military personnel who have retired from service and are engaged in "private practice", including former NSA Chief, Bobby Inman, current Director on the Board, putting their militarily-acquired skills to work for profit. In effect, when one registers and pays Network Solutions for a domain name, they are also paying to maintain surveillance on themselves. Ask yourself. Is this what you want? Does it make you feel comfortable?
[see <http://mediafilter.org/caq/CAQ39NetSpooks.html>]
>
>3. After the insight you got into the technology of DNS,
>what would it need to rebuild a DNS structure if Network-
>solutions would shut down the 'io root-level-servers'.
>(Any news about the connections to CIA?) Is it useful
>to demand a backup which is not under the main
>access of network solutions, and how should one do this?
>

First of all, Network Solutions has a contract with the National Science Foundation which expires in 1998. By that time, many changes will have taken place that will make their disappearance a non-issue. For now, Network Solutions controls an essential facility which keeps the entire internet in sync. It is not immediately feasible or constructive to disrupt this function since it would be (at least temporarily) disruptive of the net. It is not currently feasible to change the entire internet's configuration of reference to the current rootservers without major disruption of service for several days to weeks--by the time that everyone is informed and updated (and accepts the transition),

Running new toplevel names is not a difficult thing. Its simplicity is almost obscene. The issue of global recognition is the key. Right now, name.space lives as an intranet within the internet. Like a matter of perception, the recognition of name.space nameservers or not determines whether name.space exists or not. Like changing channels--Removing the censorship filter. This is a "grassroots" thing, and my favorite aspect of the potential of name.space--the individual's ability to choose their view of the net...Unregulated by commerce or government.

>4. Name.space showed with the efforts and hard work of
>a few people how effective a process of decision making
>can bring about panic-results. (7 new tlds, 4. Feb.)
>How can it remain possible that the internet is an open
>standard, and in which way does IAHF already indicate the
>dangers of the end of such a policy. How would you proceed?
>Is it possible to open name.space from a few-man-project
>to an object of collective mind work? Or do you see a way
>to learn from it, despite the protocols of bind and DNS?
>

The proposal put forth by the International Ad-Hoc Committee

is a mediocre attempt to impose a set of controls and regulations on the internet without any mandate to do so. Their indecisive arrogance is as outrageous as if GATT or NAFTA would have blatantly announced their implementation straight out of the boardroom of some GloboCorp, Inc. without the painstaking international debate they so required. It will never happen. It's legally impossible by current international law.

The internet is international and ideally, self-regulating and the reality is that market forces will determine the dynamics of the net.

The convention of DNS is not the issue presently--it's the scope of its possible implementation. Name.space works with the existing DNS software and protocols, exactly. There is no difference. Name.space IS DNS...and about exploring the potentials of a free namespace. Name.space, from its beginnings has always been a collaborative and cooperative project. Most of the toplevel names were suggested by users via a suggestion form on the name.space website. The new "Integral Database Synchronizer Daemon" or "idsd" that name.space is developing will enable the total decentralization of name registries. Registering a named.address will like reserving a seat on an airline with a travel agent. No seat can be booked twice, and all agents share the same database.

>5. Many people complain that name.space did not work,
>for me it is maybe the best net.art project I know of.
>It shows to me how far art can go, and only as art does it evolve
>as a full success. But even if you don't name it art,
>it is obviously political. it works on the symbolic level
>where naming as a technology of power takes place. The deeply poetic
>and subversive investigation of renaming the net-world, comes close
>to playing with a technological state of madness, where things and
>names are spiraling in their own universe. How do you think it mimicks
>what is already happening(in the net)? How much were you aware of these
>levels?
>

Name.space certainly works. Anyone who says that it doesn't work hasn't tried it. There is no excuse for such false criticism. Name.space is not globally recognized currently, but that will most likely change very soon. Stay tuned....Meanwhile, anyone can try it by changing their tcp/ip dns settings to the name.space nameservers in their area. It currently functions as an intranet that recognizes the whole net. A different route for content. It's about 'content routing' rather than territory or control. Addresses created in name.space don't have to pertain to purpose or geographic location...the names combined with virtual domains can be descriptive of content, and address web pages directly. The "black.hole" project is an example of content routing with name.space addresses. (<http://blackhole.automn.net> or <http://black.hole>).

>6. The economic question. How do anarchy, freedom and a radical
>left worldview fit together with entrepreneurship within the
>'new' cyber markets? People from the left complain that
>you have become a neoliberal, marketeers say that you are a
>dangerous anarchist. It looks like a trap, but instead of
>defending it here, what do you think is the problem on both
>sides?
>

Anything which defies definition is a threat to order. I have been called many things. The speculative labels that make me laugh the loudest are "neoliberal" and "closet-extropian" ...
HEHEHEHEHEHEHEHEHEHE.

:)
They don't have a clue.
:)
that's the funniest part.

>7. The fight is not over, you may go to court. Wouldn't
>it be better to reach a kind of counter-consensus on the net
>and see what comes out of it instead of following the policy
>of MCI vs. AT + T as a one man show of pgMedia against the
>net oligarchists? It wouldn't it be more clever to find a bottom
>line of criticism surviving the Blitz-reform introduced
>by IAHCh to neutralize counter-movements? Along which lines
>you would start if you would open the discussion, taking the
>practise of Altermic and DNS as the backdrop.
>

Your suggestions will not work. In the "practical" world, things do not work out as nicely as one would write them up in a proposal. There are ways to use the controls of the system to cause it to regulate itself by ways that it never intended, given that they always assumed a hierarchy of government-and-military-style order. The people are always supposed to follow that

without question. In this case, the fact that there is no regulation or clearly defined authority over the determination of the toplevel namespace, makes it possible, through corporate law, to establish a competitive structure to the current monopoly and therefore invert the hierarchy, and better yet, eventually totally decentralize it without degrading the integrity of the synchronicity of the dns or internet directory service.

There is an essential difference between Altermic and the so-called "newdom" movement. The newdom movement wants to break up the internic monopoly held by Network Solutions, Inc., by creating many micro-monopolies.

In the Altermic/newdom model, each private registry company would own the exclusive rights to generic dictionary words like "web" or "art" or "earth" among others. Any other registries would have to first buy the name from the "owner" and then resell it as a product or property. This is absurd. It's about the privatization and commodification of language.

The name.space model creates an expansive toplevel namespace that is in the public domain. The toplevel namespace is not owned by anyone and is to be shared even by competing registries. The registries provide a service in the public interest and trust and do not "sell property". Toplevel names can come and go according to use, like a natural process. If there is demand for even one toplevel which can be shared by the public, then it will be created as long as the current version of the software can handle it. If there is no longer demand, it can be "retired" in order to free up space for other new toplevel namespaces which may come into being.

>8. The net is based on the ethics of 'running code'. No admin
>would chance it as long as it works 'somehow'. NS is based on
>a revolutionary instead of an evolutionary, or a parasitical
>instead of a symbiotic, concept. It is somehow breathing
>the air of war, and risking a net-split. How far you were
>thinking this? And do you think that there could be a smoother
>version of it?
>

The concept of a net-split is being propagated by a few individuals who lack understanding of name.space. The current mode of name.space, as an intranet, is a demo, to prove that such naming conventions and content routing is possible. It's already been proven beyond a doubt. The next step is to have all the name.space toplevel names included in the root.zone file of the rootservers currently under the administration of Network Solutions, Inc. This will be resolved in the US Courts as an anti-trust action based on existing precedent and case law.

The letter requesting inclusion of the name.space roots in the Network Solutions rootserver databases has already been delivered to NSI and I have already spoken to their General Counsel on the telephone, in conference with the Internet Business Manager of Network Solutions and my legal counsel, Michael J. Donovan. Our request was a friendly one from a competing company, asking for inclusion in the root.zone file. NSI denies their role and responsibility and said "We do what they tell us to do" (IANA)...but also admitted that they have no written contract which names IANA as the party responsible for determining the contents of the root.zone file. Stay tuned.....

[the case has since been filed in US Federal District Court in NYC... see <http://name.space.xs2.net/ns/legal.html>]

>9. There were several counter concepts. One was starting
>on one new tld (like BIZ) another was squatting unused tlds
>(NT) another was a Rename-the-net project (more artistic).
>Technicians are saying it will only change together with
>new ways of routing (ipv6) and prepare us for Lapsoo directory
>services. I thought about NS more like an Intranet with its own
>Ip space and therefore also DNS. Do you think that once it
>becomes necessary to start an independent technical counter network,
>and do you have statistics about how many sites would participate?
>And again, how you would build up a net where these people are
>bringing their forces together instead of falling into
>another hierarchy?
>

The expansion of the ip address space and the potentials of DNS are two totally separate issues. In fact, with the use of virtual domains, it is possible to free up many ip addresses that are used unnecessarily as hard virtual domains for websites and email. One Sun Sparc can such up an entire class "c" net with 255 ip addresses! I have a mac running WebStar and a Linux Box running Apache which have scores of virtual domains while using only one ip address each. Much more efficient use of

ip numbers, one could say.

Name.space is part of the internet. It is also the future of the named.address structure of the internet. As an independent tactical network, it is a system which will create an economic basis for free media to remain on line without corporate or institutional regulation or censorship. The goal of name.space is to buy as much bandwidth and processor power as possible to insure that there is always a home for free media and alternative voices and visions on the ever changing internet.

>10. Maybe this is a question you want to pose to us. "Why didn't >we participate?" For any of us, NS was a conceptual piece, >we spent hours over the last weeks discussing it, and with it, >the use of radical political/technical concepts, let's >say revolutionary ones within the context of networked >capitalism. We found that, especially with those technicians >who are net-conservativists, it was difficult to accept a completely >new system while theorists liked the idea, but didn't know how and if >it works at all. What do you think attracted so many people to think >and so few to act (in a technical way)?

It is a cliché that people are in fear of change. DNS is a holy cow to network operators. If it works, don't touch it...and forget about it if you can...one less thing to deal with. It's the one centralized aspect of the internet. Big Brother will watch over us and protect us. That is the easy way out. The so-called "hacker" crowd mainly shuns name.space because it was implemented by an "outsider", an artist, not a "hacker". None of them have any concept of law or have the insight to engage on the level that I have, nor do they have the strategic legal, economic and public relations concepts that I have engaged successfully so far in the name.space initiative.

They suffer from simple adolescent jealousy. Too bad. They are a wasted resource when it comes to autonomy and political action. I am very disappointed with them in general for their lack of maturity and foresight.

The theorists have good reason to be interested since name.space has so many symbolic implications. The problem is that name.space is about _real_action_ which requires the responsibility to act on ones propositions and suffer the consequences or reap the benefits, whichever prevails. Certainly not as safe as plain old ASCII. It becomes another dilemma for them whether to think or to act, or how to reconcile thoughts into action.

In all, the idea of Tactical Media in practice becomes the issue. This is a subject that we have all been engaged in discussion over for many years, but very few have put into practice. My problem is that I am a simple practitioner. I can write about things, but only seldom, when I can find the time in between all the actions necessary to actually realize the ideas in my head through real implementation... and the struggle to pay for it all.

for more info, please read my essay,
"Say you want a revolution..."
[<http://mediafilter.org/ZK/Conf/Email/February.16.1997.04.55.27>]
among others.

I'm tired...have to sleep.

Please let me know if you need more comments.

regards,

Paul

Webmaster of the Sans Papiers Movement
By Geert Lovink

At Hybrid Workspace, Documenta X, Kassel
July 3, 1997

Geert Lovink: When did you start the website of the Sans Papiers movement?

Marc Chemillier: The movement started on march 18th 1996 and the website was up in July, so a few months later. I had this idea because I felt we were lacking information about their actions, meetings and demonstrations. In the summer of 96 the media began talking about Sans Papiers. I wanted to give the full information. Before, faxes were used intensively, mainly for the national coordination, to communicate with other Sans Papiers groups in other parts of France. But only after the eviction of the Saint Bernard church they themselves began producing some newspapers.

GL: One would not associate a movement of 'illegal' immigrants with the use of computers. How do you see the relation between the Sans Papiers and the Internet?

MC: Computers seem very far away from the situation and the cultures of immigrants. But they understand very well how the computer can help them and they agreed completely with what I proposed at the time. One of their representatives, Babacar Diob, is himself a computer developer. When I began, I hoped that we would receive some messages from Africa but it did not work out. Those African people who are connected to the Internet do not feel any solidarity with the Sans Papiers, who were seeking refuge in a church in Paris. One of the answers we got was: "I don't care about French people. They don't want us to go to their country, and I am working in Canada or America, so I don't care." The people who have Net-access in Africa have money and visa. The problems of the Sans Papiers do not concern them.

The website now has two parts: the webpages and a mailinglist. The list is managed by a person from the newspaper "Le Monde Diplomatique". The website is private and runs from a server in San Francisco. The mailinglist has 300 subscribers and the site has about 1000 pages. In the beginning it was mainly information from the Sans Papiers, press releases and also material from the "College des Mediateur", a group of well known people who wanted to help the Sans Papiers. Then people on the Internet contacted me and offered to help me. The website is built in circles: in the middle are the 300 people in the church, then the College des Mediateurs and the next one are all the persons involved in this issue, like the government. The fourth circles contains articles about the politics of immigration (in France). The fifth one deals with immigration in other countries.

GL: Why aren't the people themselves making use of computers?

MC: It's not so easy. It is a technological instrument and the Sans Papiers from Saint Bernard church have got nothing, very little money. Babacar Diob wrote a book about Sans Papiers and from the revenues he bought a computer and now got onto the Internet. He is the only person doing the communication between the virtual world and the world of the Sans Papiers. The other members got printed parts from the Web. We put a print-out of all the messages that were sent to the website on a wall of the place where the immigrants are living. The web is important to provide people with basic information, like about the laws. If you ask people a question about immigration, they will say: "There are too many immigrants." But they cannot tell you any figures. The fact is that only a few people in France are (yet) using the Internet. But together with video, papers and pamphlets, it might work. The movement itself is multi-lingual. France do not want immigrants, but they are using the French language as an intermediate. There are many African languages spoken by the Sans Papiers. On the website we try to make a maximum number of translations available. Some of the pages are translated in more than ten languages. People are contacting us through the Internet and offer us to translate documents into Italian, Polish or Swahili.

GL: Many people in Europe, especially older intellectuals, seem to be sceptical about the use of the Internet. Do you encounter this also in your work?

MC: Recently, I read some of the texts you are referring to, and I became confused about the Internet. I am wondering to what extend the Internet is contributing to the current xenophobia. When I am working on the website, I am alone with my computer. It is certainly something we have to have a closer look at. I am not sure what we can take from the Net, from a general tactical position. It's really open for me. Jacques Derrida recently wrote about the tension in the contemporary

world. On the one hand, people can communicate so fast and so easily. The xenophobia in France or in Germany, on the other hand, seems to be a reaction against the speed of the television, the airplane and the Internet. But he is not very pessimistic about it. This reaction to this open world is temporary and local and not so important.

(edited by Patrice Riemsens)

Interview with Geert Lovink
By Marc Chemillier
Recorded in Kassel on the 4th of July, 1997

* Could you explain in a few words what does it mean, "Hybrid WorkSpace"?

Geert Lovink: We are here at Documenta, which is a very large art exhibition, and it was the choice of Documenta, Catherine David, and the new Berlin Biennale to make a space together where not art is exhibited, but which is a "workspace". I mean: the name says it all. I chose eleven groups to work here in a three month period, and they all work here on different themes like migration, racism, cyber-feminism, independent media. A group will come here to make radio. A group will come here to discuss the relation between art and science, looking at biotechnology and genetechnology. So a lot of things will happen here, and some of them will be more like research, other will be more like campaign, political campaign, other will do more like discussions, debates, but it's not an art exhibit way you just show works of art. It's different. It's producing content. And it's much related to the Internet, because the half of the project is about the debate between what is going on here and the Net.

* Ok, but why do you call this 'hybrid'?

Because we have the situation between social space here, real space, and Internet, which is cyber-space. In our definition of media, we have a lot of different media we are using. Every week we make a radio program, we are using a lot of video, we are producing text pamphlets papers, and all of them in a hybrid way, linked together. So it's like hybrid media. That's where it actually comes from, the idea "hybrid media".

* In what sense do you think hybrid media can help social struggles?

I think it's very important to work with a hybrid definition of media, not to believe in the one media which will determine all others, like in the past intellectuals believed in the word. They believed in the written word, and the spoken word. They believed that a discourse was everything. And nowadays, people believe that image is everything. So if we, let say, conquer TV, then we will conquer the consciousness of the masses. We don't believe this. We don't believe in images. We don't believe in texts. We believe in our own very specific hybrid use of the media situation, and not giving one medium so much power. Maybe also we want to criticize media power as such.

* Has it some relation with what you call "tactical media", and could you explain in what sense?

"Tactical media" is a word which came up in early nineties. Maybe as a critic on alternative media idea, "alternative media" meaning "we have good content, we have good propaganda, we are right". Because we have the good arguments, we have the good informations. So what's wrong? What goes wrong? Everything went wrong with that concept, because it created ghetto. It created an isolated information ghetto. The information did not actually spread. So there was a crisis in the concept of alternative media. You can see that in many different movements. With the idea of tactical media, we mean that you can switch platform. Sometimes you work with national TV, sometimes you make a pamphlet with only a hundred copies. We treat those things the same. It's not that national TV is much more important than our own pamphlet. No, we switch for each situation, we try to see what is the best media mix. Maybe it's only a conversation between you and me. Or maybe for a radio station, somewhere. That defines your tactic, where you are, against dogmatic use of media.

* If I remember well, in your text about tactical media, you spoke about a "world of migrants". You said the world is becoming a world of migrants. Could you explain this, and explain the relation between this and tactical media?

It has to do a lot with that the information is becoming very fluid, and that we are also like in the Net. The information is travelling. It's not so much anymore located to one specific place. So the information about sans-papiers is travelling all over the world. Like the people also. It's a

rumour that is spreading. And I can tell you here that I saw the first video of sans-papiers in Tokyo. When I was in Tokyo, of course I knew about the movement, but I saw the video for the first time in an activist conference there, where people discussed the media tactics of sans-papiers movement, and your works also was discussed there in Tokyo, and the relation between the sans-papiers movement and the homeless people in the Shinjuku Station in Tokyo, which is also a movement that is more and more using hybrid media, a lot of different media, which is suiting their specific situations. So in this way, the information is travelling, migrating, with the people.

* And are you optimistic or pessimistic about the future of such media, and the way they can change our lives?

I hope the media will become less and less important. Because I am very much concerned about media power and the monopoly. So if we can try to disseminate media, and lead to democratisation of media, media themselves will become less important. They will become more part of daily life. And we can maybe hack or maybe we can squat the importance of this. This is sounding maybe a little bit utopian, but this is, I think, our ultimate goal. Not maybe the abolition of media as such. I think we always want to communicate in one way. But the symbolic power now is growing so much, and this power is in so few hands, like Time Warner, CNN, et caetera, that we should break that power. Not only by criticizing it, it's economy. Not only by making an alternative to it. But I also think by just spreading, opening all kind of channels, for everybody, and try not to speak any longer for the people, but let the people themselves speak. I think that's a very important switch that we make, that we try to give power to people by learning them how to use media and technology. I think that's the ultimate aim.

* And what do you think about the thesis we discussed yesterday, which says that the new technologies are related to xenophobia, and that they are not developing communication between people, but they develop isolation of people, alone with their computer?

The isolation is definitely taking place in the WorkSpace. So if we see the computer as part of a restructuring of the labor force, then it's definitely sure that people not only lose their jobs, but lose income. So they will earn less money, they will work for more hours, and they will have more flexible hours, meaning working basically always, always being available. The technology is actually facilitating us with that: the instant availability of the labour force. So you can never say "oh I'm not at home", because you are controlled by small camera, maybe the speed of your typing is controlled. In that way there is a huge control and yes, isolation. But I think social movements can definitely use the same technology to break it. But then it should go with real life meetings. We don't believe in just virtual cities, huge web sites. We believe that it should be hybrid, with the real life meetings like between us now, here, in Kassel, the link between Kassel and Paris we are making now, and Amsterdam, and many more places. And we use that communication to establish those links between people.

* And what about the relation to xenophobia, Internet and xenophobia?

I don't see that. Internet is much more fluid. Xenophobia is just one phenomena, or one response to that technological shift, technological revolution as some may call it. It can also be anti-european, it can be anti-american. It's not necessary against foreigners or Africans. It can look for any kind of victims. Maybe it's now focused on Africans, but it can very easily move against the poor, or next time against unemployed people. And that's just very much the political climate. I think this depends very much on how politicians are dealing with this. And I must say now that in this political climate it's very easy to make a relation between computer and xenophobia, because the politicians are encouraging this.

<nettime> scanner project interview
heath bunting
From: j bosma

To: nettime-l@desk.nl
Date: Thu, 20 Mar 1997 21:24:15
+0100

This interview was made in march 96 and concerns a project heath bunting proposed to make for the conference Next5Minutes, which dealt with art, politics and tactical media. N5M, as it is called in short, was held in januari of that year.

You can still find information about this conference at www.dds.nl/n5m

heath bunting:
www.irational.org
JB: Can you tell us what you wanted to do for Next5Minutes?

hb: The big idea was to create the first section of the underground secret service and this would be a radio listening post in a proposed series, covering the world, linked together via the internet, enabling people to listen to and monitor radiotransmissions remotely. This could be pirate transmissions, policetransmissions or any kind of radiotransmissions. It seems a shame that large governments and legitimate state secret service have their own networks and the underground always seems to be the victim of these. It would be quite poetic to reverse this, I imagine. Things that would be required would be a computercontrollable scanner, a small pc, a bit of glue software, total cost about a thousand pounds. This would have to be installed somewhere on a vast network somewhere within the city. Central is better.

JB: What kind of network do you mean? I don't understand.

hb: Well, the main problem people have with getting connected to the internet is that they want it to their premises, at home or their business, whereas this would only have to reside somewhere in the city, because the radio would do the local carrying. So for instance you could put the internetscanner in a advertising company or so, if they already have a fast link, so you wouldn't have to lay a leased line to a specific receiver. You could just tack it on to an existing network.

JB: What is this glue software?

hb: Its just a piece of software that would take audio from the scanner, pass it through the computer, digitise it and place it onto the internet to people that want to receive it. Very simple software, it can be written in 5 minutes by experienced hackers.

JB: But was it written?

hb: It was half written. A colleague of mine who was enthusiastic about the project set to work straight away, in visual basic, on his pc.

JB: And why wasn't it finished?

hb: We ran out of time, because it was christmas, and nobody works at christmas. Also money. It was suggested to me we could run an entire local radiostation for a year on such a budget. But I think we could probably obtain the equipment.

JB: But wouldn't it be so that only one listener at the time could control the tuner?

hb: Only one could control, but many could listen. As I said it would be a kind of elite underground listening post, and hopefully many would grow around the world, so people would have their choice. If one was occupied they could listen somewhere else. Its not really for entertainment, its more strategic.

JB: You could tune into any bandwidth you would want to as well?

hb: Yes, it would be good to have a scanner that would cover all the spectrum. We don't really want to dictate whether people should listen to piratemusic or whether they should listen to military broadcasts or cellular phones, whatever.

JB: This can not be a serious threat to the government can it? Is it a joke?

hb: It is a serious threat to be able to operate in the same media as repressive organisations.

JB: It is just a serious threat because you are present, which you weren't before!

hb: It is a serious threat because you can demonstrate that you understand how they operate and that either by action or just by word you can reverse or reflect their own ideology. For instance, slightly different to radio, most of my international mail is opened. Specifically when it comes from Japan it is very carefully opened and the aperture is made very delicately and reinforced with cello tape for the insertion of a videocamera. So I was thinking it might be nice to make a whole series of envelopes with prelubricated apertures, clearly marked for the assistance of the secret service. It would just say: "Please inspect contents here", for instance. I like to imagine peoples experience of these projects.

So, if you can imagine somebody who's job it is every day to cut open an envelope, reinforce it with cello tape and then pass it on to their superior who will inspect it, can you imagine the first person going to the superior saying: "Oh, this one's already been done! And its got instructions on it."

I think that would be quite funny.

JB: So you're just teasing them actually.

hb: Seducing. Those two people will know that somebody is playing a game with them. And hopefully it will awaken them a little more to what they are doing. Make them think.

JB: Are you an idealist?

hb: No, I am not an idealist. Maybe a poly-idealist (laughing). No, ideals always end in violence and I don't like violence very much. It makes me scared.

JB: The remote scanner might still be developed.
Time and money required.

**<nettime> HIP: interview with marta
(european counter network-rome)**
From: Geert Lovink
To: nettime-l@desk.nl
Date: Mon, 11 Aug 1997 17:36:34
+0200 (MET DST)

note: this article is one of the results of the on-line journal which was produced during the Hacking In Progress event, last weekend. The live net reporting marked the start of the magazine of the digital city Amsterdam. You can find the text, audio and video reports at: <http://magazine.dds.nl/>

For the first time, a number of political providers from europe held an informal meeting to get to know each other. After the presentation of contrast.org (nl) groups from Paris, Italy (ecn), Hamburg (nadir.org) etc. discussed about forms of collaborations like the newly created international federation of independent media and the tactical media network, which is currently based at Hybrid Workspace in Kassel. (geert)

Interview with Marta from Rome about ecn (european counter network) and islands in the net.
by bas r.

Can you explain what ecn is and does?

Ecn is something like a political provider: we offer space, e-mail, knowledge, network services (of course without asking money) to groups and individuals of the underground scene in Italy and outside. Groups and individuals must have a few characteristics: they must be self

organizing, anti-fascist, anti-sexist and anti-racist.

How did this initiative start?

Ecn is now an open political provider, but its roots are from autonomia operaia, a political movement that started in the 70s in Italy. We started very early with communication technology for the Italian underground and computer scene. In 1989 we created a network of BBS to exchange information between movement radios, social centers and squats in Italy. After three years we joined another new-made network, called Cybernet, and passed into Fido technology. These two networks, ECN and Cybernet found somehow the space to share two souls: a political one from ecn and a cyberpunk, techno-political one from Cybernet.

We shared (and still share!) different discussion areas: the main one is the cyberpunk area, where we speak about every argument concerning the use of new technology, politics, transgender, drugs, counter-information and much more. Other areas are about social centers, cyber rights and more.

The network of Fido BBS's still survives, and just last year we decided to add an internet service to our efforts, called Isola Nella Rete (islands in the net, go <http://www.ecn.org>). This is a new project, that involves new people and new experiences from both original networks, ecn and cybernet.

Did this 'opening up' towards the internet have consequences for the contents of the network?

The explosion of the internet arrived in Italy in 1994. Before this, the internet was accessible only for universities and for research purposes. So, when it went public and became commercialized, the interest of the general public in life on the net grew. More people became aware of the possibility to get or to share information on the net - and more people learned about ecn and got progressively involved in it. Isola nella Rete chose to open its services to every group in need of a place to organise themselves on the net. The conditions of access are the ones mentioned above.

Opening up to the internet also brought discussions on cyberrights and related issues to a larger public. New interests have risen amongst the larger public because of the internet explosion and our islands on the net initiative, like the importance of anonymity in the digital age. Anonymity was considered a bourgeois desire at first, but after people learned more about the importance of this issue in the digital world, where you must defend yourself in a different way compared to the analogical world, they got involved in this discussion. Anarchists used the islands for informing people on the legal actions of the state against them. This made the anarchist movement more sensitive for communication technology; before that they only saw the negative sides of it.

What about the sense of community? Is it different on the islands as compared to the BBS?

With the Fido BBS technology there was (and still is) a clear sense of community, as compared to the islands in the net website. On the islands are now 4 mailing lists: about social centers, cyberrights, zapatas and 'movement', a more general area. But these mailing lists are not so 'immediate' as the Fido bulletin boards are. People feel somehow less involved. They see the website (the islands in the net) as an instrument to publish stuff (you read it and maybe answer sometimes) and not as a place to socialise. On the Fido boards people really feel present in a place they share with other people. This sense of community is much lower on the islands.

For the cyberrights discussion, there is a gateway between Fido and the web, the messages are the same (if it works). Now the other areas of Fido are being gatewayed to newsgroups (instead of the web) because we think these give a better sense of community.

What happens on the islands today?

First, there is a project on the islands on political prisoners who have published their diary (in print). We have put that diary on the net with the possibility for everyone to add their own appointments and ideas. It has become a kind of guestbook connecting political stories to all kinds of personal and public events in daily life.

Another project of the islands: we offer a real audio service to movement radios by publishing audio info points - this could turn into daily radio news bulletins over the net.

We also mirror other sites like the German magazine Radikal. And we offer space to political groups from outside Italy, like ecn France and a

Spanish political action group.

Apart from discussing issues like anonymity we also build the tools necessary for getting it! Like an anonymous remailer, the 4th in Europe. And we offer a collection of software like PGP for encrypting your messages. This includes software from the US for instance, that should not have been exported :-).

These are all the things that the islands in the net are doing themselves. Beside these projects a lot of other initiatives are guests on the islands. Sometimes we have to teach them how to work with the net. We believe in having as many participants fitting the profile as possible, even if they are sometimes 'politically incompatible', like Italia Cuba and the anarchists pages. Everyone should be able to join, this makes the islands richer we think.

Now there is a structure (websites, newsgroups, e-mail, anonymous remailers, etc.) and a place where all info is gathered. For the future we are looking at ways to re-create the web more as a tool to share information, we want to bring more interactivity into it, and show how everyone can organise their initiatives on the net. This we show to both the general public and the underground. Finally we want to extend our international contacts. If you are interested, go <http://www.ecn.org> and write to info [AT] ecn.org!

<nettime> Interview with Janos Sugar

From: Geert Lovink

To: nettime-l@desk.nl

Date: Thu, 26 Feb 1998 08:15:50 +0100 (MET)

Intermedia: The Dirty Digital Bauhaus
An e-mail interview with Janos Sugar (Budapest)
By Geert Lovink

GL: Can you describe for us the way you encountered the media in Hungary from, let us say, the late eighties? In my view, you started working with film and video at a time when the dark period of the early eighties was over and new era was about to begin.

JS: I started to work with film in the beginning of the eighties. Parallel with my sculptural studies at the Art Academy, I worked with the Indigo (interdisciplinary thinking) group and we did shows, happenings, films together. Since the leader of the group was Miklos Erdelyi who himself was partly a filmmaker (conceptual artist, writer, painter--the most influential artist of his time and since) he pushed us, the group a bit in the direction of filmmaking. He did his films in the Bela Balazs Studio (BBS), and so in the early eighties I started to visit the regular Tuesday BBS meetings. Filmmaking at that time was still having some revolutionary romantic appeal and the most exciting and authentic place among the Hungarian filmstudios was the Bela Balazs Studio.

BBS was a strange phenomenon: in the ocean of counter selection a little island for (state-sponsored) experiments in the sense of expression and political tolerance. The studio produced strong documentaries; strange shortfilms resulted but were rarely shown.

Concerning the dark period, I have to say, it wasn't so dark. Only access by the general public and mainstream media was censored, not production. Public culture was strongly controlled: censorship, bans, but a vital underground art scene (the second publicity) existed, and maybe that is most important. Having no space for the ambitions, no practical perspectives, we had lots of time. For me as a young artist, it was an idyllic training--everyone was approachable, ready for dialogue.

A couple of years before I joined BBS, I started to view films consciously and I had seen the basic works. My father took me to see Antonioni's 'La Notte' (The Night) when I was sixteen. And after this, the biggest impact was Godard's 'Masculin Feminin,' which I saw in the late seventies and changed my view about film and filmmaking. Later, I made a few super-8 pieces, worked in films (as an actor in several of Ildiko Enyedys films and even in her diploma work). Finally in 85, I made my first film, a 50 minute long 16mm piece, 'Persian Walk,' which caused such an unprecedented scandal in the BBS that I had

no chance to make anything there for years (and only 4 years later could I obtain a final print of this film). I had some experiences with video, but except for a few narrative pieces, didn't do much. I couldn't have a daily experience with video because access was very limited.

GL: What about computers-- do you recall your first encounter, was it in an artistic or academic context?

JS: In the mid-eighties, computers appeared in my horizon. In 86, I was given (along with other young artists) some computer time to produce works for the first Hungarian computer graphic show. The officials wanted a computer graphic show, at least some smart people sold them the idea. The only problem was there were no computer artists, because there were no computers available--for long years--because of the rigid regulations. You saw just hardware parts and even they were sold mostly second hand. Anyway, they managed limited access to some IBM PCs in a room in some state computer research institute and the invited artists were working by a timetable. The only software was "pc paint" and I never heard this name again.

>From the mid-eighties, besides my solo shows of installations, I participated in several such national computer art shows ("Artists Hongrois et l'Ordinateur" for example, classical cold war) but not having steady access, I wasn't so excited about it. Once I even had a little job (with the help of Tamas Waliczky) to draw new backgrounds for an existing karate game. I did it, but it took so much time! Then, I nearly bought an Amiga, but for a long time, the only computer around me was a C-64 I used with a tv and an external drive as a typewriter. Actually, this was my real experience with a computer. I realized that using a word processor changes my attitude toward writing totally. Maybe toward everything.

GL: Still, you had little access to machines and perhaps also to the current media theory of the late eighties.

JS: No real access to video, that's what I really missed. That's why I didn't do any real video art work, which requires in my view a sort of daily practice, a kind of coexistence with the medium. I didn't really miss the computer. Regarding media theory, the situation wasn't so bad, at least we knew that something called media theory existed. Miklos Peternak published some good essays and he had a rather different voice from the others. There were some rare publications, monthlies, small circulation textbooks, and Benjamin, Barthes, Baudrillard, Virilio, Feuerabend were somehow present.

In the second half of the eighties Miklos and I started lecturing on film together, and we did it for a few years. There was a so-called Free University, offering a broad choice of evening courses, anyone could enroll in, lots of language courses, and the rest was popular science, art, travelling (the expert lecturer showed slides of his/her journeys). In 96, I did a work using this organization's slide archives--an enormous, unorganized 35mm slide archive of everything, from the AK 47 to sex-education. So, one day walking from somewhere to somewhere in the downtown, I bumped into Miklos, who told me he is just going to give a lecture there on film. We started to talk and I went with him and when the time came he asked me to take part in the discussion. The next year we announced the "Alternative Filmschool" which went on for 3 years. We were paid and we could order films which even we ourselves even hadn't seen. The audience was very mixed--a bunch of young people, elderly people mainly napping and some knitting ladies. We always showed two films and finished with a conversation between us. Sometimes we changed the order of the reels. Later we did a series in the Kunstszall, under the title: "Film Utopias". Originally, my opera on video technique was planned as the closing event. After all of those experiences I wrote an essay: "The Fate of Intention in the Genre of Two-Dimensional Moving Image".

GL: How would you now describe your media awareness during the period of transition, let's say the during the period 1989-92?

JS: This was the time, when I had real life experiences in media theory: the early years of typical East European spin doctorship, watching the soap opera of changing political rhetoric. First political then financial fight for the mass media (The word "media" first appeared in Hungary as "media war", the general usage of the term was/is: "press"); the more and more conscious usage of tv medium by the politicians; the Rumanian tv revolution; the increasing financial difficulties of the BBS. Altogether, this produced a mixture of anecdotes, shocking experiences, and lots of incredible examples.

Before 89, things like political commercials or massive ad campaigns were totally unknown in Hungary. And in 1991, in the summer, I was commissioned to do in a few months a five part series for the

(state) TV. A very courageous producer, who (for a short time) had relatively large broadcast time, started to work with outsiders, visual artists. She asked me to do some four-part series, and with Gabor Bora I made a proposal for "Misunderstandings" which she accepted. I could work with professional TV technique and (because everyone was busy with politics) not even my own producer saw it before it aired. We felt a growing competence and there were lots of opportunities to explain our approach, like inviting people and organizing events such as "The Role of TV in the Rumanian Revolution," (conference, 1990). This led to lots of contacts and information from abroad. And somehow this activity led us to establish the Intermedia Department in 1990 at the Academy of Fine Arts (from where, btw I was kicked out in 84), which was the first program of its type in the post-Communist region.

GL: Do you think that there was a dialogue with the early avant garde, or with film of the sixties? Or is this just a reconstruction afterwards, to build the story of the so successful Hungarian Video school around Gabor Body?

SJ: There is always a dialogue in art. The hard core avant-garde was somehow still present. Lajos Kassak died in the seventies. Moholy-Nagy became a national pride. But the films of the sixties were more or less under the strong influence of the zeitgeist and for young people poetry was out and filmmaking was in. The film medium represented something very important for this generation, who met the reality of WW2 mainly through films. (nowadays we meet irreality through special effects in the movies.) Film was the top medium: expensive but efficient and glamorous, the dream of every modern artist. Gabor Body was very literate even in an academic sense and represented a very strong intellectual but revolutionary attitude in the filmmaking. His innovation was linking techne with philosophy which appears in a very consciously controlled visually. And maybe because of this, he understood best what video is. Unfortunately, we cannot speak about his video school. If he could have worked further, I think the significance of video art would be a bit different.

GL: You are not making a clear difference between the second part of the eighties and the early nineties. Is this really the case, no 89 fall of the wall what-so-ever?

SJ: I think for Hungary, the watershed was 96. This was a long standing trauma even for the politicians too. After 96, they had to give some perspective, optimism, to the people - and for themselves as well. It's interesting, how a so-called unsuccessful revolution like this, killed by the Yalta Treaty, can be successful in a sort of long term. That's why Hungary could become a bit more liberal as the other East Block systems became more rigid. Later, I guess, this somehow became the role of Hungary in the Warsaw Pact. Censorship was based on three principles: support, tolerance, ban. Practically, the Communists used the system intelligently--banning a few, tolerating a lot and continuously playing with dissolving previous bans. The heavily-banned intellectuals were less harassed than in the other countries and were mainly forced to emigrate. People were allowed travel every 2-3 years; information traffic was relatively strong and the cultural life in general was not bad in Budapest--rather ok book publishing, exhibitions, classical music, good choice of movies, etc.

There was also the so-called underground or second publicity (art shows, pop and contemporary music, performance, samizdat etc.) with real personalities and with a strong moral position. Looking back, for me it was like an incubator or a natural park: it wasn't difficult to survive, lots of time for talks, meetings, discussions, intensive contacts, partying and of course in most of the cases not the slightest hope for a practical result. No contacts with the so-called first publicity, which was the realm of general or mass society or however you want to express it. The single and most cruel restriction for culture was blocking avenues to reach the broader public.

No competition between the old and new, no aggressive cultural memes, no random spread of cultural inspiration. Only insiders knew about the best things going on in art. It's somehow like a philosophical problem: can anything be valid if no one knows about it's existence? Schrodinger's cat in the artworld. This situation caused serious damage, not just in the art (which became hermetic and context bound), but also in the general public. People couldn't know anything about this booming period, about this creative capital. If you go to a library and look through the papers, magazines, of that period you won't find any reference, any news or mention about what was really happening, what was important for us. It's tragic, because the majority of actual decision makers, politicians of today are the so-called average people of yesterday--former normal people who had no extra information source beside the state media.

Nowadays, people tend to think it's just well-known general nostalgia for the good old past, but it's not: that cultural second publicity produced

the most important solid values. Since Hungary was the most liberal country (the weakest link), there was rather big attention from abroad, lots of visitors, curators, artists. With the dismantling of the Iron Curtain, it has changed: a sort of cultural protectionism emerged between the former Socialist countries and Western Europe. We are not anymore pizante Easterners but weak competitors with a bad infrastructure. I don't agree with such an argument, I think the fall of Communism changed the total situation, not just in the former East. In other words, the Cold War deformed the Western cultural infrastructure as well.

GL: Could you tell us about your specific way of making films. It is not exactly experimental (in the technical sense), nor does it follow the classical way of narration, it is also not video art. Perhaps you are making a kind of fictional art documentary, trying to undermine all the existing genres...

SJ: Fictional art documentary, thank you, I accept that one. The category I like the most is introduced by Miklos Erdelyi: 'cognitive film'. The notion originates from the total competence consciousness of avant-garde, which I experienced within the Indigo group. This total competence is more linked to the opportunities (site specific - in a complete sense) than to one or another particular medium. It felt natural to use film, but of course I had no idea for what. So all my films are different, like a different construction, I would say, singular solutions. For me the thought, a sort of hermetic dramaturgy, is essential, if it's somehow complete, then comes the execution, which is sometimes resulting in the humiliation of tradition. I am proud that my film 'Persian Walk', in 85, caused such an outcry in the BBS. Even two years ago, I was asked by a renowned colleague to remove the BBS logo from the credit of my latest film, "Ambiguous Window."

I cannot accept the notion of experimentalism, because such a thing outside the film doesn't exist in other genres. I believe that even within the film medium an intensive dialog should go on between tradition and progression like in literature, painting etc, where maybe innovation is having less attention but it's not barred from the mainstream. This separation in film makes any innovation more or less a political question. Nowadays the once 'most important genre' (Lenin) has become a very well-integrated part of global entertainment. The big budget cinema is the best vehicle for the subliminal education (of the proletariat). It is very exciting to analyze the hidden messages of the Hollywood movies, like cooperation, partnership, respect, love. I think it is already beyond film, because with its complex ties to merchandising it became the social medium, with basic but irresistible messages.

Making film is expensive, and that's why a film should be immediately understandable in the present, otherwise the high production costs will not come back. In other mediums, working artists shouldn't necessarily put importance on instant success in the present, the artwork has time, can wait, until the proper perception. Art history is full of (time is on my side) examples. That is my basic position.

Miklos Erdelyi told the audience in the Millennium (NYC), before the screening of his film, that usually a few people walk out during his films, but those who remain don't complain after at all. After making several shorter films, I became more and more interested in a kind of a synthesis of the avant-garde attitude and experience in filmmaking and the so-called movie (traditional, feature length, narrative) experience. I wanted to demonstrate that beside the big budget (Hollywood) and low budget (artist film) genres, there is a third production possibility: no budget (independent) filmmaking. In 92, I did a film, "Camera in Trouble", which contained a long narrative block. Together with this, I cut a short film, "Ambiguous Window," of footage I made with my own 16mm camera between 89 and 91. As a result of this double experience, I realized that filmmaking is not necessarily expensive and I decided in 93 to make a feature length film, "Faust Again", (under production) immediately. To realize an idea immediately is an everyday experience of a visual artist, but totally unknown for a filmmaker who is bound to the production costs.

With video, the situation is different: not having real access to it, I use it only rarely. In a strange way by teaching video, my interest in making videos is growing. Somehow it's the first forgotten new medium. I think video is still or again very relevant. Maybe the presentation of it should be different, like giving the viewers more time or some unusual environment. It is remarkable, that not the improved recording technology but the improved display technology, like making better and smaller projectors, has made a new impact on video art.

GL: You spent a lot of time building up the Intermedia Department

of the Art Academy in Budapest. There, you having been teaching a lot, for years and years, perhaps even more than anything else. But what you have been doing with the students exactly somehow remained a mystery for me. Tell us something about your methodology and your conclusions.

SJ: The starting idea was to create a media faculty which we did with Miklos using our strong Indigo (interdisciplinary) experience, connecting art and thinking, in the sense of total competence. Art, technology, science with an undefined outcome. We used the word Intermedia as in "interdisciplinary plus media." Just after it became evident that Dick Higgins coined it, in opposition to what multimedia meant at that time. For Higgins, intermedia was the positive pole. I am really pleased we are linked somehow to the fluxus which is still flux.

Practically, I have a double job there. I am doing one two-year course where I teach art and an another two-year series of media theory lectures to the same bunch of 15 students, for their whole first and second year. Besides this, I have steady consultations with 5 advanced students who have chosen me as their advisor. Of course, there are other obligatory courses for our students in photo, multimedia and web design, art history etc. My goal is to enhance the consciousness of the students, to be able to go radically beyond their own unconscious sympathies and choose unpopular, less easy solutions. I think the presence of the unprecedented, referenceless media, and the emergence of the work-entertainment-education conglomerate manifests itself more in a general media consciousness than in the use one or another so-called new medium. Its social impact is bigger than the cultural. With this new experience we can see and treat the other genres (if you like the old media), as a medium.

The first thing students have to do is to write a fictional biography; then I ask them to collect analogies. Then, there are various exercises in video: like analyzing a real life action by montage; making short video pieces using text, short cuts, raging on the mixer; a series of irresponsible plays with the equipment. It is like teaching a language. In the meantime, we watch and analyze classical video art and anything else they bring--works, objects, collages--to discuss. To exercise control over the image, they have to create a narrative b/w photo. I require them to make three-dimensional (plastic) scripts or models in addition to the classical storyboard for their videos.

Last year, in the spirit of tactical media, which I was lecturing about, we did a media event. Since the most popular evening news uses a live background image of the city, we defined a point within the range of this backdrop camera and we gave flashlight signals and this was broadcast throughout the TV news. Parallel with these studio exercises, is a weekly lecture on media theory, where I begin with Adam and Eve (share of work, specialization, secularization etc.), later touching photography, film, video, computer, hypermedia.

GL: What should a new media education in an art context look like? and did you have any inspiring models? How should a digital media bauhaus look these days?

JS: I think still deep in the core of any art education is the good old 'nosce te ipsum'. For the Bauhaus technology that was a metaphor, the zeitgeist. But for today, we are learning how arbitrary a so-called functional design can be. Nowadays, technology is fast moving, constantly upgrading and development is a continuous act, like an open language whose grammar always changes with usage and whose new idioms evoke new syntax and new grammatical rules. Result--an endless spiral--a language that wants to tell everything, but is actually falsely transparent. Technology needs instant and powerful demonstration and promotion to evoke demand among buyers. Using artists is the cheapest and most efficient crash test for the sw/hw manufacturers. But art cannot really function in a mediated form. We can alienate form and content but not in art. That's not very good for a visual artist.

The so-called new media should be treated equally in every sense: so digital kitsch is kitsch too, but let's not forget how the medial aspect changes our attitude toward the other ways of expression. In a certain sense I think our Intermedia is an ideal model for an actual higher art-education program. We are in the middle of a traditionalist Art Academy, we were accused often of letting dilettants, people who cannot really draw, into the church of art. Our very poor conditions (we never got our full budget) force us not to fear or worship the technology and to create makeshift configurations in our run-down hardware. We teach the practice and the theory of the so-called new media, but we encourage the use of old or traditional techniques too. In the case of new media, it's very difficult to forget the tools--they are sexy, pushing and more and more capable--but the message is more an attitude than an immediately profitable limited expertise. We have a lots of visitors lecturing and our department

is popular, probably because the students feel the freedom to work with the most adequate medium. Today's digital Bauhaus should be dirty. I don't really like the hospital/airport atmosphere of media labs, which suggest a sort of neutrality, distance—the ideology of design.

GL: We have all seen you running around in Budapest, switching from one medium to the next all the time, several times a day even, between installation art, writing, teaching, theater, film and video, and increasingly working with the computers. And organizing events like the conference series MetaForum we organized together with Diana McCarty. In a way you yourself are embodying the whole idea of Intermedia. But your surroundings are perhaps not so fast, not so flexible... You must have seen a lot of mistrust and misunderstanding. Is 'intermedia' a utopia for you?

SJ: It's not a utopia but it's not something I am concentrating on either. I would rather say I am working along the maximum action freedom radius. It forces you to connect things, because of lack of time, to solve one problem with another, there is no time to worship the medium, just using it. In such a multitude, only the simple models can survive. (like: treat the present as if it were already past) It's like laying a very complex pattern whose regularities or laws are discoverable only much later. Living without feedback.

That's the game. In making art, you can experience doing or executing something which isn't based on any practical demand. No one knows about it, only you. It is your sole personal responsibility to realize/not realize if you have an idea. No one knocks on your door, comrade artist, hey, where is the painting? we need the novel! or we cannot reproduce our working power without your film! Such a thing doesn't exist in art. It could be a definition as well. Anyway, that's my experience in visual art and I just transferred it to other areas. If I have an idea, it's a big thing, let's say the most difficult part of the case, and the realization is much easier because it's just practical. I learned immediately how to forget the practical difficulties simply because they are not communicable, they are not convertible. It is a very good strategy in Budapest, because even now there is little public attention on art, but the creative possibilities are big. I like to be in people's blind spot. This situation keeps me incognito. I could and still can work with a rather large freedom. For me it is the highest level of luxury. The rigid surroundings are sometimes very useful to enhance and refine your radicality.

<nettime> net, 'radio' and physical space: XLR

From: Josephine Bosma

To: nettime-l@desk.nl

Date: Wed, 11 Feb 1998 14:24:59 +0100 (CET)

XLR stands for eXtended Live Radio. The group was initiated in the summer of '97. In the group are Ulf Freyhoff, Monika Glahn from Berlin and Marko Kosnik (Egon March Institute) and Borut Savski (Ministry of Experiment) from Ljubljana. They were working on trying to establish networks and platforms of any kind, be it physical or on the web. Most interesting of course is the mix or hybrid forms coming from this. They invited many groups and individuals to join in their experiments and their first project took place during two weeks in the summer of 1997. There is about 70 hours of sound material from the event, which is now available partly on the net. At this moment the former xlr crew in both Ljubljana and Berlin are working on new projects, connecting with others via the Xchange mailinglist.

What follows is an email interview with Ulf Freyhoff and Monika Glahn. I added one quote from Borut Savski from one of his mails to the exchange mailinglist for alternative webcasters ('broad'casters on the web).

Q: What exactly happened during this whole period of the project, and did it work well?

There were two main concerns, live-web-radio and live-fm-radio. We did two weeks of fm-live-radio in Ljubljana from midnight to 6am

(last days live only till around 3 or 4--!)

The first week we did broadcast from a studio at Radio Student, the second week from a public space, Kapelica Gallery, both in Ljubljana.

We invited people from all over the world to participate and contribute, it took some days till contacts to other places started to work, so the first days we were doing the whole program ourselves. So we focused and improvised on themes which were about what we were doing there, for example one day it was about feedback (this was the day when finally the line to Berlin worked and we could work and play with a lot of internet-audio-feedbacks that night...)

Other subjects were real-time; machine and human languages; nothing, something, anything; sun ra ... and (of course) cyberpunk, cyberspace and cybereverything; technical languages and nothing, something, anything; sun ra ...

Form of the program was a kind of monologues, lectures or readings, discussions, music and experimental live-mix, interviews. The structure was a main program between midnight and 2 am, which we called 'main content area', then from 2 till 4 am mix/improvisation and from 4 am till 5:30 music (recreation). We then faded out with Dagmar's Wunsch, an ongoing story about the 'cyborgs' that she wrote during the time of the project and reflected the things that were happening during the broadcasts.

After some days, when web-contacts started to work, it changed depending on who was when online and what happened at other spaces. Now the focus was more on the external connections, we tried to always have opportunities open for broadcasts from other places.

Concerning web-activities: we had a lot of contributions from Berlin, for example musicians were giving concerts or were playing via internet together with people in Kapelica Gallery, there were interviews with artists from Hybrid Workspace in kassel, there were interviews with musicians who work with electronics and web, or for example the last night we transmitted a concert of a percussionist in Aachen. Later this percussionist was supposed to improvise together with a trumpet-player in Berlin (unfortunately the line to Berlin broke down completely, so we had to improvise again. Borut Savski and Marko Kosnik then played in the gallery in Ljubljana together with the guy in Aachen.

In parallel chat was running all the time, and people, who were not able to send sound, gave comments or participated that way and we read parts of this communication during the program too. There were even people from Australia, Tokio and New York participating.

At the same time there were people in the gallery doing performance, for example a visitor from New Zealand decided to prepare a performance spontaneously for the next day together with one of the djs, who played the first night together with Berlin musicians...

These are some examples to give an impression what happened - but two weeks is so long, that it's not possible to mention it all here and now - and of course there were a lot of "black holes" which we tried to fill as good as possible ;)

(nobody of us ever did radio before) (the Berlin group JB)

There were a lot of technical problems, so we spent the first days between trying to find solutions for them and trying to prepare the broadcast for the night, and contacting and inviting people to participate, explaining via email and chat how to install the needed software...and so on.

This is a major thing one has to think about: is it possible to do the content and the technical side at the same time - we were stressed most of the time exactly in between these two concerns. So should one establish the 'technician position' for events like that - what we didn't like as an idea - or is it just about time management?

There are several more 'jobs' that need to be looked after: someone has to be 'secretary' just to keep track of all the 'communications on the side', someone has to be the 'social worker', just to keep track on what's going on between the people at all the connected spaces... Its all about monitoring what's going on, which is especially difficult if you are not physically at the same places.

Q: How did you get the contacts with Ljubljana, why this Berlin/Ljubljana connection?

We knew some folks, by chance they were living in Ljubljana, and we always ever wanted to see Laibach... :-)

Marko Kosnik told us about the Egon March institute and his work at Ministry for Experiment, which is an organization within Radio Student in Ljubljana. At the Ministry they are working since years on developing different kind of broadcasts. They are inviting people from other

countries and are organizing experimental projects and platforms. We saw that there are some similar interests and asked Marko if it's possible to do a project there. They said yes and then we developed the concept, also in sending amounts of emails back and forth daily for three weeks of preparation. At the same time we completed the site-setup at Interflugs, which was the studio in Berlin during this time.

Q: Were there any transmissions of web.sounds in the ether?

Yes, we transmitted EVERYTHING on the ether, no censorship. At the same time we always tried to make the process transparent, to tell something about the measures that had to be taken to make the transmissions possible, and about the possibilities in general.

Borut Savski (on Xchange about webcasting):

To define the do-s and don't-s of web casting, let's compare it to what the conventional radio technologies don't (!!!) offer... and use web casting in every way possible, especially in the ways that surpass the ways of conventional radio! Even implement conventional (local!) media with web (international) principles (those of us who have the possibility).

Q: How important is the physical space for you, why does it need to be connected to the net?

The physical space is the most important for us, and it doesn't NEED to be connected on the net. The connection via internet of two or more physical spaces gives the possibility to synchronize those spaces at least partly and for a certain time. It's an image, located in real time and real space, for and about information, experience, network, communication. Translation. Inside and outside. Crossing and melting borders.

For any activity in public space it's very important to create a certain atmosphere, an 'interface', which reflects what it is about. It's about this translation of (in this case) sound, which comes out of a machine without any-body or human traces, into something you can experience and which creates an atmosphere.

>From a call for participation for a special night's program:

We are offering the platform we built on this evening to special projects and persons whose work in different ways does connect positions and ideas and puts strong efforts in opening and establishing spaces for creativity, exchange and discussion.

Q: What happened after you call for participation, was it effective?

We got some reactions of people who wanted to contribute, but they didn't appear at the announced time in the chat, so we had to do other programs. Maybe it was unclear to them, and for sure the announcement was too late. Later some of the invited people showed up but merely for personal talk. Chat was integrated into the broadcast anyways. Our experience the days before the event was that a lot of people who wanted to participate could only reach us via chat. So the idea was to let something happen in this medium, where many can follow it and also participate without mediation of us.

In chat it's always this quite chaotic jumping around between different lines of talks, so it would have been interesting to see how it develops, if there is a certain focus, if it's possible to focus... If you want to communicate something via chat, monologues are not possible, or only, if all others wait, what is not very probable, so discussion-strategy is very different from spoken language.

Q: what were your basic reasons to start this project?

Assuming your question is about the whole xlr project:

We all like babel :) -plus this was about investigating the possibilities of 'contemporary' media for artists. Some questions we had were:

- what have we got with the internet that we did not have before / without the internet?
- how to 'misuse' the platform / the internet?
- how to create an own structure within the superstructure?
- how to really focus on contents not getting lost on technical issues?
- can the net be an artistic medium, or is it just good for documentation of artistic work?
- what benefits do I get out of using the net as an artist?

(not that we got real answers to these questions, but we have more ideas about these topics now)

Q: Are you working more from an art or a tactical media background?

(you could write a whole book on that, basically this is about a definition of art) We won't necessarily divide it.

both. neither. what's the difference?

(quoted from Neil Stephenson: 'Snow Crash')

ministry of experiment at Radio Student in Ljubljana:
<http://www.radiostudent.si/mxz/index.htm>

Monika Glahn and Ulf Freyhoff are also working on web-broadcasts and creating platforms at interflugs, which is an independent organization at the academy of fine arts in berlin. The student's union of the academy of fine arts was very supportive and their room and computer was occupied a lot for radioactivities...

<nettime> Interview with Shu Lea Cheang

From: geert lovink

To: nettime-l@bbs.thing.net

Date: Fri, 29 Dec 2000 08:41:56 +1100

E-mail Exchange with Shu Lea Cheang
And Geert Lovink

Shu Lea Cheang is one of the few artists I know able to operate in both the new media arts and the contemporary arts world of museums and galleries. Born in Taiwan, Shu Lea left Taipei after the democratic changes and worked in New York as a member of the Paper Tiger Television collective to become a truly global artist in the nineties. It is hard to keep track of Shu Lea and her projects. I got to know her when we both worked in the media lab of the Society for Old and New Media in Amsterdam. At the time, around 1998, she was producing the Brandon project, with programmers and designers of the Society, a website and installation which deals with gender and identity on the Net. She then moved to Tokyo to produce her first feature film in the sci-fi porn genre. The following e-mail exchange took place over a few months in the second half of 2000.

GL: Where are you! It is hard to keep track of you, digital drifter. Which trouble in, at this moment? You are such an expert in freaking out stressed, bureaucratic art institutions. Excellent. I know you are not looking for trouble perse. Still, your work provokes people, at some stage, though not in a direct, obvious manner. You are well known for strategy that in Japan.

SC: Where I am, in terms of my X-Y positioning or Location URLs? My dissimulating body parts as compressed bytes, transmissible and available. Well, this year, I barely scratched the skin in Germany, a bit of exchange with the German Federal Ministry of Internal Affairs over interfacing airport Hi-Scan machine and internet. I was warned that sending scanned images from suitcases onto the net, 'could possibly give information about how to circumvent measures taken for the protection of attacks on the security of air traffic.'

I do play by rules. My intention written in proposals are stated out front when dealing with Institutions. I stepped right into the political conflicts, those of Tokyo Central Government and Okinawa over US military base issues, during my residency in Okinawa with the project, 'Elephant Cage Butterfly Locker' (1996). The exhibition at Tokyo's Atopic Site led Japan's censorship debate after the recordings of my meetings with Tokyo Government representatives were published. Back in 1995, I got into trouble with Bowling Alley at Walker Art Center. The museum commanded the site to bear a warning, 'This Site contains mature subject matter. Discretion is advised'. That was on the eve of US Congress' delivery of Communication Decency Act, the museum had yet to configure the cross-section of public and private space. When Brandon was presented at the Guggenheim Museum, all cautious procedures were taken to ensure that subversiveness could work within the system.

GL: You have specialized yourself in on a highly specialized meta level of (new) media work. It is the realm of the pure conceptual. In doing so, you

depend almost entirely on other people's design, programming work, editing, pre- and post-production. Almost every aspect of your huge productions such as the interactive online installation Brandon and the sci-fi porn film I.K.U., are realized by third parties. How would you describe your work? Art director, media manager, concept artist?

SC: Why do you insist on the division of expertise as 'realized by third parties'? Every aspect of production works toward realization of concepts. I communicate with my parties on a conceptual level. I take the credit as concept/direction in executing large scale productions. I decide with which of the writers, designers, programmers, cinematographers who I would collaborate with. They are each self-claimed art practitioner in their own right. I seek collaboration as I conceptualize the projects. I have carried out my art installation as a filmmaking practice or directing a film as a large scale installation. I think there remains this romantic notion of the artist as loner and a sole operator. I do not practice art as self expression. The urgent command from the 'meta' level has designated me to be Institutionalized.

GL: How do you feel about the division of labour you are in?

SC: Concept_proposal, design sketches, routing public interface. This year, the project CARRY ON for IFU (International Women University), had me working with IMK:MARS/GMD as part of their CAT (Communication, Art & Technology network) initiative. (<http://imk.gmd.de/mars>). In this institution, a computer scientist made system analysis of the concept and three system programmers collaborated on database network platform and Java applet application. It was a group effort to configure languages and engineer the systems hard and soft.

GL: Let's speak about discontent in media activism - and what to do about its visual poverty. You have been a member of Paper Tiger Television, back in the late eighties. Like me, you have ambivalent feelings, about the imminent danger of activism, using whatever medium or platform, falling back into the one-dimensional styles of the video diary, documentary journalism and plain propaganda. Which strategies would you suggest to escape these obvious traps? The concept of 'tactical media' has been developed, intending to bring together media activists and new media artists. Are cross fertilizations sufficient? Is it an option to abandon the 'activism' label altogether? Good news is the renaissance. The WTO protest in Seattle (December 1999) has brought up a whole new (rave) generation. Then there is the concept of hacktivism. The dark period of neo-Luddism and pessimism seems to be over. What esthetics, in your view, could further energize, broaden, and critique the current global movements?

SC: Back in the 80's, we were out on the streets. There was this sense of global connectedness, camcorder media and satellite feed. The sense of urgency for information flow-- shoot, deliver and act. It took a while for video collectives to make transition onto the Net. but then, the nature of hyperlinks on the Net may also contribute to infodata overload and scattered social bodies. Shared information does not amount to counter-activity. I did buy in the idea of electronic disturbance. The Net sit in as media event, but is it helping the movement? Or is it intellectual exercise for computer crash course? The global net-connectedness can be an illusion. Locality reclaims matterness when political agenda is specified.

Esthetics functions on conceptual level. I am encouraged by corporate level Netivity. No One is Illegal's campaign on <http://www.deportation-alliance.com> is good example. Counter information is a slap in the Corporate face one click away. Harwood's Uncomfortable Proximity for Tate Modern goes further to demand side(site) by side(site) fusion. And that is quite a few steps forward from demanding a media slot.

GL: You moved away from regular media activism for a certain reason. What is so hot, so interesting and so strategically important about the conceptual and formalistic level? Is it a meta level? Should we consider this more powerful compared to the ordinary levels of content production, design or programming? Can we perhaps compare it with the role of the film director or conductor?

SC: You seem to be caught in a twisted complex here. Are we back at the 'level' of white/blue collar class struggle here? I use the word 'level' for my replicants. Level 7 is my recent updated version of humanoid IKU Coders or HiC agents. Level 4 is the retired outdated copies. The machine drives me. A deliberate take over of control key in my functionality. The machine operates. The corporate schemes. The sole/soul artist is out on the bound. Acting as 'floating agent digitale' on my own terms, all directorial and conducting power is given.

GL: I am saying this because there is a general discontent, for decades, about the work done by activists, like going to demonstrations, making pamphlets, targeting governments and corporations for their policies in the form of direct action. I see a certain fascination with the more symbolic meta levels where power is located these days. Do you think activists

protest at the wrong spot when they go on the streets, blocking roads and offices?

SC: I was just off track into daytime porn.... stepped into a major web attack-- 'Webmasters, join us and increase your traffic drastically!' The net windows are launched one after another faster than I can close them. eXXXtreme! are screaming at me !! The Net era traffic jam with roadside vendors hawking. Now, I have not seen activist organizations united this way. Have you? Hyperlinks decentralize. Virtual sit in holds still the information flow. The power to be is clearly s(c)ited. One chooses to confront or comply. The road block is metaphorical. The streets are up for grab. You can claim the streets for spirit refill or make the move to say 'chess' in the final play.

GL: Does it make sense for you to distinguish between a polymorphous 'art porn' practice and the mainstream porn industry? Which distinction would make sense for you? Is it a matter of high and low culture? I suppose you would agree that the mainstream porn industry is reproducing the worldwide male dominance and patriarchy. Obviously certain parts of the emancipated middle classes, the upwardly mobile gays, cosmopolitan lesbians, bi-sexual office workers etc. do need their own porn. In that sense 'art porn' is a niche market. Still, I suppose you are not just working for a market. You want more. What drives you to make these films, apart from the fact that it is fun.

SC: I have wanted to get away from institutions and funding cycles for a bit. I stepped into porn production as a director for hire with an indie Japanese producer. With my producer, we have all intentions to make money with this film. But it has proved to be quite difficult as the film doesn't fit into any specified market.

The self claimed Japanese sci-fi porn I.K.U. (2000, Uplink Co.) operates on high concept, the meta level in your term. In every sense, it meant to subvert 'the worldwide male dominance and patriarchy', the hard on dick that upholds. Here I want to distinguish my practice from that of art porn which I consider to be a soft industry domain. I.K.U. <<http://www.I-K-U.com>> confirms cyberporn as Corporate operation of level 7 hard and soft fusion. Ultimately, I.K.U. severs cumbersome tentacles of the wired gos' cyborg entity and initiates the body as a gigabyte hard drive, self-driven by a programmed corporate scheme. It updates VNS Matrix's 'The clitoris is a direct line to the matrix,' by claiming 'The Pussy is the matrix'.

GL: Do you mean that in the biotech cyberpunkish sense, as Kronenberg's biopods? Is it the aim, still, to merge bodily functions with technology? Isn't that fantasy already implemented and played out? To what extend do you see the sexualized techno-body as a role model, or let's say, reference of an unlikely future?

SC: I am looking at a wireless digital mobile present with no portal to channel us: built in memory flash and gigabyte hard drive as delivered at birth: genetic mutation for ALL NEW GEN. The merge is complete. We ride on the fantasy. Living comfortably with the monster within, I assign my body as a self-programmed, self generative sexual unit. This body functions with an operating system that requires version update and memory upgrade. The unlikely future has come and gone. The retro future could be the next comeback.

GL: Over the last years you have been one of few artists who has managed to operate in both the 'contemporary arts' field and in the much smaller scene of new media arts. You have seen both worlds. How do these two rather different fields, which both use the 'arts' label, relate? Will they merge at some stage? Contemporary arts has finally discovered video. How long will it take once they will inhabit the computer networks? And will electronic arts ever leave its own self-referential ghetto?

SC: Hey, I am still working...and (projects) under development. I did cross over a few fields. I am not really in that particular 'contemporary arts' scene. But yes, I managed to work the medium. The new media arts field is in step with software development. Technically there are needs for collaboration between artists and programmers, which can be best facilitated by the Institutions. Like any large scale public installations, the new media art can be nurtured as commissioned art work. The Corporate funding is at the core of this underwriting. Here I am not neglecting the web as self-expression, self-distribution medium for a genre of web artists. However, to consider the Net as happening public space, not simply a broadcast medium, how do we keep up with web appointments? I want to feel collective breathing (can be extended to collective orgasm) on my computer screen.

As for the self-referential ghetto, we have to grant the privileged club members the fun of mutual masturbation. They don't have to leave. They own the Net. Meanwhile, the rest of the world strides to catch up. Every art agency must comply to digital update. Only yesterday we were handing in our web work for 'permanent collection' at the museums as long as they can provide the archiving servers. Today, we float. (in market and travel sense). The dealers will eventually come around and work the scene.

postscript

An update on the trouble i am in since your first question- currently I am working on a 35mm movie trailer for my not yet produced scifi porn 'FLUID'. The trailer is commissioned by Palais de Tokyo/Site of Contemporary Creation in Paris, a new museum that is scheduled to launch in the Fall of 2001. This is my first encounter with French Cultural Agency's public funding. I would need to manipulate the ejaculation a bit to survive this one.

<nettime> interview with Critical Art Ensembl

From: Ryan Griffis
To: nettime-l@bbs.thing.net
Date: Mon, 18 Dec 2000 11:21:11
-0800 (PST)

Tandom Surfing the Third Wave, Part One:
Critical Art Ensemble and Tactical Media Production

This interview, with Critical Art Ensemble, is the first part of a series of investigations into collaborative/group artistic practice taking place in, and critical of, the e-economy.

Critical Art Ensemble (CAE), a collective of 5 artists working since 1987, produces cultural products ranging from books to Web projects to performances that investigate moments in art, technology, activism, and critical theory.
Ryan Griffis: How did CAE come to be a working group?

Critical Art Ensemble: It's too bad CAE has no heroic formation story about a grand international like the one the Situationists are often mythologized as having. CAE's story is much more mundane. We were students looking to develop a network that would have a cultural impact--some way of organizing that would give us enough financial, hardware, and labor resources that we could begin to construct a platform for a public voice. Collective activity seemed (and still seems) to be the best option.

RG: Many people, including artists, don't understand how most individual artists finance their work, much less large-scale public work projects and ephemeral/"conceptual" works. With the work that your group (and others) is involved in, being "politically" involved and controversial (in a way that doesn't always lead to "ticket sales") as well as potentially expensive (time & resource wise), could you talk some about the economic strategies of CAE as a collaborative venture?

CAE: We don't understand how to finance work either. No granting agency has ever given CAE money. We raise funds in three ways. First, we all have

straight jobs. Second, we do a lot of visiting artist and speaking gigs in conjunction with writing, so we get royalties, writer's fees, and speaking fees. This money goes exclusively toward projects. Finally, we try to throw as many expenses as possible at any institution that wants to sponsor a project. We just hobble along from project to project, usually working with an extremely limited budget. A lot of our imaginative power goes into figuring out how to make things for minimal cost. However, it's better than it was when we first started. At least we don't have to liberate materials anymore.

RG: CAE has written quite a bit of theory for the practice of collaborative art activity, and from a perspective of involvement. At the current time, where does the group see itself, and other art/activist groups, in relation to other practices, for example the (very youth oriented) electronically aided organizing efforts of recent demonstrations in Philly, L.A. and DC?

CAE: It all depends on what the group is geared toward doing. Over the past five years, CAE has primarily focused on biotechnology and the colonization bonanza that it is launching. We are working in a very straightforward manner, and trying to do events that demonstrate through participatory theater just what is at stake. Other groups like the Institute for Applied Autonomy (www.appliedautonomy.com) are focused on ground developments, with projects like Graffiti Writer (a remote-controlled, programmable graffiti-writing robot) or their GPS project, designed to offer protesters escape routes so that they pass by the minimum amount of surveillance hardware when on the run. There is so much to be done. Happily there is no single metanarrative that describes intercollective associations, or that maps the intersection between groups working on direct material levels and those working in cultural representation.

RG: I've read statements from a member of RTMark expressing uncertainty about the labeling of their activity as art, or rather how the label can be a double-edged sword. I have also heard Guillermo Gomez-Pena say (of his and Sifuentes' work) that they can get away with much more than straight activists because they're artists. How does CAE deal with the reception issue, and are there times when the "Art" label is useful, and others when it's not?

CAE: If CAE has to pick a label, we prefer "tactical media practitioners." However, in keeping with this tendency, we use labels in a tactical manner. If the situation is easier to negotiate using the label "artist," then we will use it; if it's better to use "activist" or "theorist" or "cultural worker," then we will use those labels. Regardless of the label, our activities stay the same. Labels are useful only in so far as they set expectations among those with whom we wish to have a dialogue. The label that best taps the knowledge resources of the audience is the one we try to choose.

A lot of this problem has to do with the social constructions of the roles of artist and activist. For the most part, these roles are placed within a specialized division of labor, where one role, segment, or territory is clearly separated from the other. We view ourselves as hybrids in terms of role. To CAE, the categories of artist and activist are not fixed, but liquid, and can be mixed into a variety of becomings. To construct these categories as static is a great drawback because it prevents those who use them from being able to transform themselves to meet particularized needs.

RG: In looking at many art strategies that have taken an "oppositional" stance towards the various forms of hegemonic oppression, be it blatantly political or theoretical, it usually seems to become assimilated into the larger art world. Overly political artists become just that (Haacke) and more theoretical work becomes academic style (Kosuth, Art-Language). But such criticism seems to suggest that to become mainstream is death, so opposition is doomed to always stay marginal. But it would also seem that our society (and probably most) are resistant to drastic change, without catastrophe, and such assimilation is a necessity, one that must be carefully watched, but a necessity nonetheless. What are/have been CAE's thoughts on such issues? And how does this play out specifically through CAE's interventions into a discourse like biotech?

CAE: Whether to take a position at the center or the margins really depends on the goals that have been set by the individual or group. The reasons for doing projects on the margins are obvious. Work in such areas is great for education and organizing. From a collective history viewpoint--many individuals and groups working on a specific issue can bring about some positive changes. Working in the center is trickier, because as you stated it can always be used by the center for its own ends. The same can be said when the margins are organized well enough to have a public voice. Take the example of ACT-UP. This group collectively changed the protocols at the NIH in regard to HIV. At the same time, it was used as an example of democratic action that can impact bureaucracy, an example of people having free speech, etc. In many ways the movement

was used to reinforce the public perception that democracy exists in capitalist economy. Someone like Hans Haacke is used in this same manner on a cultural level. However, the ability of the sight machine to reconfigure resistant actions (particularly once they address the center) is not a reason to criticize. If a group is creating resistant initiatives as a public practice (as opposed to an underground or otherwise hidden practice) then the cycle of resistance and assimilation is just a given. The important thing to watch is how well a group negotiates this give and take, and not whether or not it does it perfectly.

In the realm of biotech, CAE is just trying to make a specialized discourse a public (nonspecialist) one. CAE is worried that nonspecialists in general may not understand the significance of the biological revolution. So many elements are hidden, and there is so much misinformation (generally from market directives and science fiction) that it is difficult just to create a reasonable discussion. Specialization is a scary thing under these conditions. Unlike with the communications revolution, few people (directly) use the applications and information from the biorevolution, although almost all are indirectly touched by it. Since the public has almost no direct experience with biotech, it seems abstract and too difficult for a nonspecialist to understand. CAE's intervention in this situation is to give people direct experience and reliable information so that individuals can come to understand that biotech is within their power to think about and actively affect.

RG: Speaking of the G.E. and biotech developments that CAE has investigated, there seems to be a lot of overlap with concerns coming out of communication technologies, that other groups, like RTMark and The Redundant Tech. Initiative, are taking on. Many aspects of CAE's activities appear to address this as well in different ways. Could you address some of these overlapping issues occurring between biological and communications technologies?

CAE: There are two primary narratives in regard to this issue. The first is the digital and the second is control. Recent developments in information and communication technologies (ICT) and in biotechnology are on a parallel course. Contemporary ICT is slightly ahead of biotech, but they are both products of the digital era. When speaking of the "digital," CAE means this in a grander sense than just as a category of technology. We are speaking of a worldview, of a new cosmology. When we use the term "digital," we are referring to the idea of replication. Western cosmology has traditionally been analogic. That is, a process moves from chaos to order and back to chaos, and products exist in a binary pattern--the original and the counterfeit. For centuries the principle that order came from chaos and chaos from order was unchallenged. This situation really started to change in the early 20th century with Fordist mass-manufacturing. Ford intuitively understood the digital in terms of manufacture, in that he knew the distinction between the original and the counterfeit was actually an impediment to profit, and that profitability was increased by employing principles of replication and equivalence. This new model was directly understood and addressed in the development of digital technology--the technology of replication and equivalence. The model is based on the principle that order comes from order. Such an idea had tremendous impact on biology, because without it, the reproductive process could not be understood, because biological reproductive process is about replication. Once this idea was accepted, it was possible to understand DNA in a whole new way. Manufacturing, ICT, and biotechnology (the primary markers of the 20th century) are linked in that they share this new principle of order from order.

The second narrative, control, also links ICT and biotech. Both of these revolutions are about greater determinacy in complex systems. ICT primarily functions as a means to improve the gathering, storing, exchange, and distribution of information in the virtual world. Biotech is about the same processes in the realm of the organic. Through improved control of complex systems, capital can achieve its own ends in terms of constructing bigger and more efficient profit machines and maintaining the social hierarchies that best lubricate this machine. Take the example of work. ICT has contributed to its intensification to such an extent that the worker's body (particularly the technocrat's) is failing to function in the high velocity marketplaces of capital (since the body is a low-velocity constellation). Biotech is partially an initiative to prop the body up, to redesign it, so it can keep up with the demands of a society of speed.

RG: With respect to GE/GM technology and human medicine, what are the group's interests in visualizing aspects of this technology that have a significant impact on access to health care and other privileges relating to the understanding of "healthy" vs. "unhealthy"? For example, denied access to managed health care, or jobs, based on "genetic predispositions".

CAE: The group hasn't really addressed this issue specifically, although it does come up in relation to our investigations into the reconfiguration of eugenics in pancapitalist economy. The question for CAE is perhaps

broader, and concerns categories such as fit/unfit or normal/abnormal. These categories clearly stretch beyond the specialization of healthcare and into generalized social and political organization. As tactical media artists, the group has completed four major projects examining various aspects of biotech revolution in a theatrical form that invites public participation (participatory theater). These works raise questions concerning (1) eugenic traces in assisted reproductive technology ("Flesh Machine" - both the book (published by Autonomedia) and the performance project); (2) extreme medical intervention in reproduction and the attack on sexuality ("Society for Reproductive Anachronisms"); (3) the acquisition of "fit" flesh materials ("Intelligent Sperm On-line"); and (4) the utopian promissory rhetoric spinning off of the Human Genome Project ("Cult of the New Eve"). The most recent project is one that CAE began to investigate in the "Cult of the New Eve", and that is the politics of transgenics. What the collective is exploring in particular is the relationship between transgenic production and biological environmental resource management.

RG: Could you talk a little about this project and specifically explain the significance of the concepts of transgenic production and biological environmental resource management?

CAE: Transgenic engineering is the formation of new combinations of genes by isolating one or more genes from one or more organisms and introducing them into another organism. It was once believed that species boundaries were for the most part impenetrable. Now, all bets are off. Any species or combination of species can be combined with any other (although the limits of these recombinations are still unknown). Once the genomes of all the species are mapped and sequenced, and this information becomes readable, highly functional organisms can be created to suit the needs of the institutions or states that create them (hence the huge investments from both public and private sectors in various genome projects). Biological environmental resource management is mainly concerned with introducing species particular to one ecosystem into another ecosystem, in an intentional attempt to preserve or to reclaim a desired version of ecological equilibrium. The problems with this method are clear from the beginning. How is equilibrium defined? What is a desirable ecosystem? The ideological repercussions are overwhelming. Be that as it may, the method has been used for over one hundred years. There have been successes and disasters, although the disasters tend to get more press--kudzu, cane roads, etc. With transgenics, the possibilities for new species introduction grow exponentially. Resource managers are no longer limited to the catalogue of life as it existed in the past, but can create a nearly infinite amount of recombinations (eventually with very specialized characteristics) from this catalogue. New organisms are already being made on a daily basis using transgenic processes. The question of what can be made and what happens when these creatures are released is of central importance to all specializations concerned with the environment. Indeed, the commodities market is already testing the possibilities by releasing transgenic bacteria, farm animals, and plants into the ecosystem. This form of testing and of biological environmental resource management is a relatively gray area. The possibilities are both utopic and dystopic, but public mistrust of transgenics makes public discourse on the subject all the more difficult. To complicate this situation further, capital is in the midst of an ideologically schizophrenic moment. On the one hand, the ideology of transgenics (the mixing of categories) has traditionally been used as a means to mark the other and justify colonization. Colonial subjects have been considered dangerous because of the high value placed on transformation and mixing of natural constellations, which to the western colonial mind shows them to be out of harmony with the law of nature (according to which species can only combine with like species). To be sure, such activity in western mythology results in making of monsters in the most extreme sense--vampires, werewolves, and witches. Not to mention that the territory of the other, like hell itself, has historically been sprinkled with projected fantasies of horrific recombinant creatures (harpies, sea monsters, cyclops, etc.) that are abhorrent to nature. Yet now that this law of nature (like with like: species with species) has been reduced to a simple boundary to be crossed for profit, capital has to produce a kind of double think that maintains colonial signifiers but allows the recombinant to be accepted in everyday life. Now that this new organic realm is open for invasion, centuries of ideological signage have to be re-engineered. The sharply divided opinions about transgenic food are indicative of the problem. On one hand, the traditional transgenics fears sweep through the general public, and on the other hand, those concerned with maximizing profit in food resources are building data that show that transgenic food is neither a health hazard nor an ecological threat. This battle between the dystopian/utopian form of representing these new initiatives is the perfect dramatic friction for a theater of transgenics, and biological environmental resource management is one key discipline where material conditions will play themselves out in the extreme.

RG: One thing that I've noticed frequently in CAE's writings is the examination of our (US mainstream) culture's focus on the spectacular and unusual when it comes to death and memorialization. The group seems to

like using Greg Ulmer's concept of a memorial for automobile deaths as an opposing point of focus. This seems to me to suggest an attempt to do something not often done in 'activist' art practices (Adbusters, etc.), which is mainly addressing latent desire(s) behind the mundane acts of living, along with being critical of the actions themselves.

CAE: Nonrational economy, or the under economy, has always been of primary concern for CAE, considering that capitalism has an immense stake in limiting the scope of desire to work and commodity relations. The task of trying to productively agitate the nonrational is by far the most difficult because it is where organizational and analytic abilities are of modest use in insuring successful actions. The standard tendency of cultural and political activist practices to react and counter a given activity that reinforces or expands dominant social hierarchies with a strategic or a tactical initiative (logos opposed by antilogos) will not work in the realm of the nonrational. All we can ask in such a case is what can we do to create conduits into territories of visibility where repressed/invisible desires can find public expression. When done successfully, such expressions can introduce a productive level of chaos into society (usually at a micro level), which in turn offers organized (rational) movements or activities a more liquid space to act effectively. In other words, the political chess match between oppositional forces does not have to follow standard patterns of interaction. While this narrative sounds good in theory, the problem is that there is no way to know who will benefit or what the final result of agitating the nonrational may be. It's a real roll of the dice that can have as disastrous (authoritarian) consequences as it can have good (liberationist). However, given the current situation, resistant forces have little to lose by working in this arena.

RG: Does CAE see the "Us/them" dichotomy common to many oppositional camps problematic? If so, what theories/practices do you use to not fall into that trap, while remaining actively critical?

CAE: That really depends on the situation. For example, CAE is in favor of what we term tactical essentialism. When this is employed, people can successfully use universal binaries to establish the social solidarity that can in turn produce a resistant movement. It has been used well in the past by the Women's Liberation Movement or the Black Power Movement. However, this choice is tactical, meaning that it must be surrendered once the movement has been established. If resistant vectors are to continue to increase in mass and velocity, they must then establish more complex critiques and actions that recognize the inconsistencies, aporia, and gray areas involved in separation.

CAE's main principle for not falling into the binary trap is our use of tacticality. Obviously, this is a very long discussion that goes beyond the limits of this interview, but here is the short version. The five principles of tactical media are: specificity (deriving content and choosing media based on the specific needs of a given audience within their everyday life context); nomadicity (a willingness to address any situation and to move to any site); amateurism (a willingness to try anything, or negatively put, to resist specialization); deterritorialization (an occupation of space that is predicated upon its surrender, or anti-monumentalism); and counterinduction (a recognition that all knowledge systems have limits and internal contradictions, and that all knowledge systems can have explanatory power in the right context, and that contradiction in general is productive). Our practice is about process only--the process of resistance. We have no final cause in mind, no utopias, and no solid social categories. CAE interacts with the becomings of lived time in an effort to expand difference.

RG: I don't want to naturalize technology here, but what does CAE make of certain trends in technology that seem to favor more democratic (less specialized) forms of communication and commerce (shareware, Linux) as opposed to the more dominant forms of private property and intellectual property rights? How is biotech connected to these changes?

CAE: We have to be careful with this issue. The primary conflict, if not crisis, that is happening within capitalist economy concerns how digital economic power should be configured and consolidated. Currently, capital is split. On one hand, there are those who believe that profits can be maximized by doing away with older notions of property. From this perspective, in an economy based on replication, the only thing that matters in terms of profit generation is the speed of replication. The faster information is replicated and thereby consumed, the higher the profits in analogue economy. For example, if a company gives away free music on Napster, that company will in turn sell more CDs, more concert tickets, more band merchandise, etc. From CAE's perspective this is the position that will eventually become dominant because it is a digital strategy. On the other hand, many still believe that digital products should be governed under the same property principles as analogue products (traditional privatization). The struggle within capital is intense on this issue. Whichever way it goes, the public is not going to win. Capital will only tighten its hold on digital economy. The good side is that

during these conflicts it's possible for actual anti-capital initiatives to accomplish more by camouflaging themselves with this discourse and reaping benefit from the confusion emerging from the crisis. It's so nice when the capitalists turn on one another over a principle that was beyond question prior to digital economy.

Biotechnology is a part of digital economy in that it is primarily about speed and replication, so we are witnessing the same struggle. From the research point of view, scientists are generally good about sharing information, but there are limits. Patenting is still alive and well. From the corporate perspective, it's the same split as with digital information. Some want to treat genetic and molecular breakthroughs as analogic, others don't. Take GM food for example. Some argue that it is best to give away genetically modified seeds (a common occurrence in postcolonial food initiatives in the third world). The belief is that once food production is cornered from the molecular level up, that profits from other related goods and services will increase. Others want payment from the beginning. Since much of this happens on a case-by-case basis (for example, Monsanto uses both strategies), it's difficult to tell what the future will bring.

<nettime> Interview with Toshiya Ueno

From: geert lovink

To: nettime-l@bbs.thing.net

Date: Wed, 26 Sep 2001 16:01:16 +1000

Urban Techno Tribes and the Japanese Recession
Interview with Toshiya Ueno
By Geert Lovink

Toshiya Ueno is a Japanese sociologist, media theorist and critic. In May 1990, when I was introduced to Toshiya in Tokyo during my first visit to Japan, I could not quite make out who he was. His English was poor and so was my Japanese. I had heard about his institutional involvement and his career as a popular columnist for fashion, design and computer magazines. In 1992, when he came to Amsterdam for the first time we slowly got to know each other and by the mid-nineties our friendship was established. He kept coming back to Europe and became a regular visitor of the Ars Electronica festival, reporting for Japanese magazines. At that point Toshiya's English skills increased dramatically and a fierce dialogue about media theory issues and the state of new media culture worldwide started between us. A few times a year Toshiya would stay in the tiny guest room of my former Amsterdam house. He gradually left the official Japanese new media business and started to investigate Amsterdam's free media scene, drugs culture and the (Goa) techno trance scene in particular. Through the lively refugee tribes from former Yugoslavia based in Amsterdam Toshiya came in contact with techno-trance rave scenes in Croatia where he made his debut as a DJ and TJ (text jockey), a passion he would continue in Japan. Our collaboration would take us from Internet conferences in Europe, a annual five years long teaching project at Osaka's Inter Media Institute (IMI), a common trip to Taipei to co-producing a television show about Amsterdam's subculture. In this e-mail exchange we have focussed only on a few aspects of Toshiya's work: the notions of urban tribes and digital diaspora, the use of technology in subcultures and the need in Japan to cross boundaries and start a dialogue and exchange between various scenes.

GL: In retrospect, how would you describe the nineties in Japan? It seems such a strange period, where not that much seems to have happened. It more looked like a never-ending mild recession. A sweet stagnation without brutal Thatcherism. No crucial decisions were made. No drastic cuts. No equivalent of the fall of the Berlin wall. No uprisings. There weren't even dramatic political and economic changes following the 1997 Asian financial crisis and countless bank scandals. The cultural climate seemed dominated by a ongoing consumerism, yet in a less ecstatic way compared to the bubble years of the mid-late eighties. A sophisticated numbness and joyful innocence could be found amongst youngsters. How could this odd mix of technological speed and pop fashion admits an ongoing recession result in such an amazing soft stagnation? Please tell me if I am wrong. If this model is running out now

do you see any signs of discontent or even protest?

TU: Your description may be right until mid 90s, the days just after the collapse of the speculative and 'bubble' economy. But around 1999 a drastic storm of 'neo-liberalism' set in. Ordinary people were seemingly not aware of this crisis in their everyday life. However, if you turned your eyes to the micro level you could find lots of symptoms of a collapsing corporate welfare state. There have been many lay-offs, 'restructuring' of businesses and various cases of 'privatization' of the public sector such as museums, institutions and state universities. Until 1995 people did not feel these measures and were by and large unaware of the coming crisis. Since 3 or 4 years however we are facing a 'second hand' version of 'populism' in the UK-style. Politicians have been quite influential in this process. It did not matter whether his/her political stand point were left or right, liberal or conservative, global thinking or nationalistic. These days novelists and TV stars are capable of winning an election and become president of a local prefecture or win a seat in the national parliament. Some of them are significant figures in Japanese subculture. During the recession the cultural or expressive sector of society was deeply damaged. It has become difficult to find a publishing house for books that have a theoretical or political content. I was saddened with the absence of uprisings or riots, yes. But I also have to say there have been numerous revolutions, even though most of them came from conservative and reactionary side. 'Revolution' is the very nature of neo-liberalism. Japanese society is following the same process which the UK and US experienced earlier. On the other hand one has to see the singularity of the Japanese 90's. We could for instance point at the transversality (a notion of Deleuze/Guattari) and singularity of the economical, cultural and even political crisis.

GL: Is it useful to integrate the notions of subculture and media as developed by UK cultural studies into your research about Japan?

TU: Cultural studies UK-style and its versions in other Asian regions are of importance to me. I do not want to reduce cultural studies to political and theoretical reflections on Japan's imperial and colonial past, neither to a sociology of popular culture. In the UK, cultural studies has also been tactical criticism and a theoretical weapon against populist neo-liberal politics within the everyday life. Cultural studies were not just an analytical tool, it was also related to real micro and cultural politics against the populism sprouting of neo-liberalism. I am referring here to do-it-yourself, Rock Against Racism, the movement against Criminal Justice Act and so on.

Until recently I have also been thinking why we did not have protest movements in Japan. But now I am more interested in doing something real and respond to the seemingly invisible and intangible crisis. We can make something happen in this situation. Although neo-liberalism is really shit, it is also true that it can also generate forms of resistance against itself. A few years ago, in Germany and Amsterdam, I came across the rave party phenomena. I discovered music-based subcultures even though rock had long been a part of my life. Rave culture has got something for me. Rave is based on hedonistic desire and fun, but at the same time it can also be connected with environmental awareness. It is a movement in itself with its own anarchist politics. For instance pirate radio is often used these days to broadcast from rave parties.

In the early 90's I used to be a critic of contemporary art, music, film and all kinds of expressive cultures. Those were the so-called postmodern days. At that time the Japanese economy was still a powerful force. The speculative 'bubble' economy needed, even preferred, 'speculative' essays and articles. Under those circumstances I wrote a lot of papers and essays for a myriad of magazines. However, when I came across rave I realized that music was the most important thing for me and my critical interpretive ability was most suitable for the music and its cultural and political implications. That's when I stopped writing about other fields such as new media theory and the arts. Within the rave movement I found a lot of elements I was interested in and involved with before, for instance, free radio, techno music, ecology movement, quasi-squat activities, anarchism, dissident politics, and also visual designs of party gear--decorations which are related to contemporary and electronic arts. All the elements I had been interested in so far were coming together in rave. I started to elaborate my own theory based on everyday experiences.

GL: Do you think that techno culture is part of the leisure industry to forget daily boredom?

TU: A party is not a festival or carnival to forget the routine of the everyday life. A party is a critical part within the everyday. Sometimes people think of a rave as a unusual event which is opposite to the everyday life as a 'temporary autonomous zone' (Hakim Bey). For some scholars raves are conceived and interpreted as disorder, chaos, a marginal experience, frequently depending on communitas and liminality arguments as developed by Victor Turner. Theoretically speaking these arguments are rather banal. Raves or parties are not liminal or marginal. One can bring in elements such as the gift economy, open minded communication, abandoning the sexual 'picking up', environmental consciousness and so on. Even though it seems that rave and party can occur beyond the everyday life, beyond the border

between order and disorder, the usual and unusual. Because of my involvement in rave culture people in liberal and leftist academic circles in Japan have started to criticize me. They say: 'Toshiya changed a lot. He abandoned social movements, cyber cultures and media politics.' But that's not true. These days I am much more involved in cultural politics, the politics of the everyday life than ever before. Through rave culture I am encountering a variety of urban tribes.

GL: Aren't you overestimating the political dimension of the rave phenomena?

TU: Most of the ravers are apolitical and lack consciousness about political issues. For instance, they don't care about Japan's colonial and imperial past. On the other hand it is very interesting that some of young trance tribes are negotiating with capital or globalization in their own way when they have to manufacture fashion gear. They don't have a political agenda but they somehow have tactics to survive or to make money in their relationship with Japan's former colonies such as Korea and Taiwan. They don't deny their eventual political agency concerning topics such as ecology and the pirate (gift) economy. As a dissident sociologist I would like to construct a political practice with these urban rave tribes in order to develop tribal solidarity in Inter-East connections through various subcultures and build bridges between Japan, Korea, Taiwan and even China. In other words, rather than being crazy about a reflection and redemptive consciousness on the Japanese colonial and imperial past, I would like to create something positive together with ravers, urban tribes and also youths and people in ex-(or post) colonial Asia. I have to say that the leftist 'authentic' and 'liberal' position in Japanese academia is failing to grasp such alternative possibilities. They tend to be too 'moralistic' by seeing history and past only in a regrettable way. I am sure that there is a similar pattern in former Yugoslavia. If the Croats for instance insist on their 'most-victim status' then you can not invent something positive or productive in tribal solidarity with others, for example with Bosnians or Serbs.

GL: What do you think of the current I-mode fashion in Japan? Is there any reason for Westerners to be excited or even jealous about the Japanese wireless craze and DoCoMo in particular?

TU: Certainly all of my students and the party tribes are all using mobile phones to communicate, make appointments and sometimes to get a bit of info. But I can't find any reason why westerners should be jealous about their Japanese counterparts. Concerning tactical use of mobile gear I can point to more interesting and crazy usage in Europe. Nowadays even for most dissident punks and squatters handies are really helpful technological tools. Some DJs and organizers in Japan started to distribute tracks via wireless networks. At the same time they are also thinking about how to hook up mobile phones with MIDI instruments. Even though all this supports capitalist telecom corporations, these experiments could be really revolutionary.

GL: How would you describe Internet use amongst young people in Japan? It is being said that they're not so interested. They are much more crazy about wireless applications and more protected, intimate BBS systems. Is the English language an obstacle to communicate? Cybercafes and public terminals aren't that popular compared to for instance Australia, Asia or Latin America.

TU: Japanese youth are not so crazy about Internet, as far as I see, certainly not my students and the tribes around me. The aim and the way of using the Internet are quite different. They are all the time net-surfing but mainly visit Japanese sites. They are also quite skillful using computers to edit sounds and moving pictures. The web design scene is also powerful but always lacks content, especially political and theoretical one. So relatively it is true that they prefer 'stand alone using computers' over the Internet. There are only very few students who visit English based sites. Language is still an obstacle, also for me. There are not so much cybercafes in Japan because most of the people already have their own computers in the office or at home. Of course tribes in the party scene are more active on the Net in order to organize parties, wary of local authorities and police to find out.

GL: Where does the 'urban tribe' concept come from? Don't you see it as a set back to go back to such an anthropological term, so close to ethnicity where there no longer is any ethnicity? Why would rave cultures be best described as 'urban tribes'?

TU: The term 'tribe' was not invented by myself. For this I have to go back to Japan of 1955. One author published a novel titled Season of the Sun. It was a bestseller. It told the story of hedonistic subculture youth and caused a sensation in those days. A film was based on the novel. Increasingly that type of youth style out of the novel could be found everywhere because youth were trying to imitate the style and fashion described in Season of the Sun. Of course, this novel was inspired by the real youth of these days. And then a term was invented: 'sun tribe'. People used to call the dissident, hedonistic youth during the fifties the sun tribe (taiyo-zoku). After that in each period, 60s, 70s, 80s, mainstream

press and parent cultures always used the term *zoku* to describe unknown youth subcultures. For example *otaku-zoku*, *crystal-tribes* (Japanese yuppies in 80s) or the speed bike tribes.

Japanese are crazy about the generation gap phenomena, perhaps because we don't have visible markers amongst people, 5 or 6 years difference is already important for people. Japanese youth are very sensitive about age.

Since the 90s this symptom is slowly changing. Maybe the *otaku-zoku* was the last tribe in Japan. Because people tried to use another term, *kei*, it is very difficult to translate - system or series. So, for instance,

Shibuya-kei, *Shibuya-series* in English. *Shibuya* is the name of the district of Tokyo, one of youth centers in the city. So people would like to call the music genre and some fashion based on the youth in *Shibuya*, *Shibuya-kei*. Nobody these days is using the term 'tribe' anymore. But at the same time there are a lot using the term *tribe* or *tribal* in flyers for club and rave party to connote new types of music genres and specific atmosphere.

Another interesting point is that the author of the *Season of the Sun* later became a politician in the parliament in the LDP - the dominant liberal-democratic party. He is now governor of the Tokyo metropolis and perhaps the only mayor who rejected to give the human rights to gay people or to give rights to foreigners to be able to vote. He's a real fascist or at least can be called a fanatic nationalist and historical revisionist. He is constantly denying Japan's colonial violent past. He once called Asians 'third people'. Japanese would be first, Americans and the westerners second. According to him people from other Asian countries such as migrant workers or students should be discriminated. This is a really crazy situation. Why did this man become so powerful? Because people supported him. In that way *zoku* and the story of tribes is not only based on sub-cultural studies, it is deeply related to Japanese politics. Recently the son of Prime Minister Koizumi, who is also populist, neo-liberal, started appearing as an actor. Despite of the poor result, he gave an audition with the title '21st century Yuiro' (Ishihara's dead brother). Such phenomena are interesting, ironical and crucial for Japanese populism and conservative cultural politics.

In Japan the term 'tribe' has had a specific meaning. In the late 40's in Osaka, the second biggest city in Japan, there were squat villages, squat towns of Korean residents. They were very much discriminated. In those villages there was a lot of scrap of steel underground. They tried to dig up this scrap and get money by selling it. But this scrap was the national property of Japanese national government. And then the conflict between the police and the Korean residents started. It made a sensation in those days. These Korean residents called themselves the 'Apache tribe.' They compared their position with native-American. Numerous authors and novelists wrote the novel featuring this 'Apache tribe.' One of them was an SF called Japanese Apache Tribe, written by Sakyo Komatsu, in which Apache tribe appeared as a mutant having iron body something like cyborg or T-1000 in Terminator 2. It is a well-known fact that this novel influenced the underground cult movie *Testuo*. I am sure that some SF freaks or club techno tribes regard this film as a legendary piece.

GL: You have been working with the 'digital diaspora' concept. Could you explain this? To what extend would you support a withdrawal into the Net? Could we speak of productive monads and where does this inward looking become eccentric and obsessive *otaku-ism*? You have been critical of the figure of the *otaku* and the Western fascination for this so-called typical Japanese obsessive behavior of the 'otaku' data collector. Where does a sub-culture in Japan have possibilities for resistance, and at what point do 'temporary autonomous zones' transform into consumer-driven lifestyles?

TU: By using the term digital diaspora I don't mean the disappearance of human lives and bodies into the Net. Rather, I use it to talk about a diaspora within the Net (or generated through the Net). Historically diaspora cultures can be found around the world. Some theoreticians working on the diaspora topic have used the term of web or network. The term 'diaspora web' was introduced by Paul Gilroy. These days this terminology is no longer a mere metaphor but rather a sort of allegory for the reality itself to which we are faced up. We are now faced with broader cyberspaces through network technology. Not only due to computers but also via radio or telephones the information 'seas' have been expanding. Not only through the power of Internet, actually some refugees and people in diaspora began to keep their lives in diaspora through video distributions or computer networks and other electronic technologies. One could mention refugee communities in Perth (Australia) coming from Croatia or Macedonia. They are using VCR technology to maintain the relationship to their original place. And also one can put as example, some independent media in Amsterdam to support people coming from ex-Yugoslavia, (as described in Dona Kolar-Panov, *Video, War and the Diasporic Imagination*, Routledge, 1997). Information technology and telecommunications are developing the diaspora notion into new directions.

Diaspora in general is connected to moving and migration forced by some power relations including economic, political, religious and so on. To describe the things and the cultural elements moved, like dreadlocks, T-shirts, and music etc, one can appropriate the term cultural diaspora to interpret such a circulation. Certainly diaspora is a sort of cultural traveling and causes traveling theory, but it should not be confused with

globalization in general or postmodern pastiche eclecticism which is based on the 'anything goes' parameter. But on the other hand it is becoming difficult to maintain the dichotomy between real refugees, illegal migrants, asylum people, 'suffered diaspora', ravers, hooligans, travelers, tourists and the 'cultural diaspora.' It is becoming difficult to distinguish forced settlement and voluntary migration, dwelling and traveling in a rigid way. We, I mean critic or intellectuals in the 'first world', are in between the 'suffered' and the 'observer'. Diaspora is crucial tactical tool and even medium or space to analyze this situation.

GL: What does the diaspora condition got to do with the specific Japanese 'otaku' phenomena, the manic collectors of instance records, magazines and games?

TU: In the past I have criticized the term *otaku* but not the *otaku* people themselves. I am criticizing the cultural condition of *otaku* and its political context. I myself am an *otaku* of sorts, being crazy about Japanese animations and psychedelic trance techno. I am skeptical about Japanese art based on *otaku-ism*. Western people are fascinated by *otaku* culture and that's why it can be marketable. Some even try to emphasize the cultural traditions and history of *otaku*. They say Japanese culture has always been dominated by collectors infomania. For them Japanese history has been postmodern and eclectic right from the start.

GL: Where does the difficulty to communicate between scenes, movements and disciplines within Japan come from? It is striking to see how many useless frictions and anxieties there are, between artists, scholars, institutions, activists. This makes it rather difficult, I suppose, to set up networks in Japan. The only communication which seem to work are the very private, intimate channels on certain bulletin board systems (BBS). There seems to be a form of competition, not related to work, money or income. This fact has made it difficult to set up a half-way independent and interesting new media arts scene in Japan. Japanese we get to meet in the West do not collaborate in Japan. It seems much easier for them to meet in New York, Amsterdam or Paris then in their own country. Do you believe that this is simply cultural (as a 'second nature') and therefore next to impossible to change? Isn't it interesting that this overdose of communication devices hasn't had a significant impact on this specific aspect of Japanese society? Or should we view this observation as yet another culturalism?

TU: Well, I don't want to say that there is particular inability to communicate in Japan. I am actually highly skeptical about any form of culturalism or cultural essentialism. But to be honest, I have also have felt the useless frictions amongst the different urban tribes in Japan on numerous occasions. I am fed up with that situation. That is the reason why I am frequently staying in Europe. Maybe others also feel like that. For instance, in Japan, media artists are generally not interested in politics and especially not in Japanese politics. On the other hand, most of the leftist intellectuals have never heard of media art or media activism. Tetsuo Kogawa and Toshimaru Ogura are great exceptions of course. The former was founder of free radio movement in Japan and still very active for experiments of streaming and developing critical media theory. The latter is radical media activist and theorist organizing anti-wiretap and anti-echelon movement. In fact, I myself have not met them since long time. Tokyo is too huge to see each other. Toshimaru is living far away from Tokyo. There is a deep gap. Of course this gap is both cultural and political. Cultural studies is recently becoming popular in leftist and liberal academic circles. But most scholars reduce cultural studies to a method for criticizing the notion of the nation state. Their arguments have never reached younger generations or urban subcultural tribes on the streets or scenes such as hip hop or rave, even though they could easily be against the nation state and its cultural hegemony.

Take the example of LETS (local trading system) in Japan. That's a popular concept at the moment amongst critical intellectuals. Koujin Karatani and partly Akira Asada, who always prefers the 'safety zone' rather than the real 'critical space', are at the moment involved in organizing NAM, the New Associatist Movement, which is a network of LETS in Japan. I support LETS, its theory and especially its practices. Being one of the ravers and organizers of small illegal parties I respect every form of gift-economy style and reciprocal symbolic economy. So why don't I join NAM? Despite of Akira and Koujin's nasty and cynical gestures towards social movements during 80's, it is good to see what they are doing. But there is an old type of politics at work within NAM. Karatani and others are putting out the theory, and then people can do LETS activities according to the theorists' system. Volunteers work within the structure elaborated by intellectuals and theoreticians. This in my opinion points at an outdated and unnecessary contrast between theory and practice. Their classifications on some parts in the movement are very ironic. They call their small groups 'kei' meaning series or system, in contrast to tribe. So you have *bunka-kei* (culture series), *lilon-kei* (theory series), *undou-kei* (movement series) and so on. It sounds like a bad joke to the subcultural urban tribes. Karatani and Asada's take on social movements is to ignore and neglect the organic and transversal relationships amongst different scenes.

What I am trying to do is setting up small pirate radio stations and flea market activities during open air raves. Indeed, there is a difference in understanding between tribes such as rave and punk and hip-hop. But that's a much better situation than the classic binary opposition between theory and practice. Karatani labeled NAM as a new type of communism. Probably that's right. But he does not think about the people's reaction. By using the term communism NAM is losing interesting people and tribes. Their way of communication is using classic leftist language in an almost tragic-comic way. I am familiar with it but most people are not. I wished NAM and various urban tribes and subcultural scenes would shake hands and build an affective and effective alliance. For that vision a cultural politics would be crucial, a politics which communicates within the scenes rather than mere political rhetoric. It can be called cultural politics. Technology can change the way of communication in each cultural and political context. That is why I restarted the pirate mini FM free radio idea during open air parties. I would like to create hybrids amongst different urban tribes such as techno, punk, eco, anarcho, rave, new age, otaku, the left and other dissidents.

GL: What is the current level of media theory in Japan? We don't hear much about it. I can't think of any Japanese contemporary theory being translated. We actually only hear about theory import into Japan, not the other way round. Is this because there's nothing going on? This can hardly be the case. Is the produced theory only of local interest? What's reason for this theory deficit?

TU: There are a few tendencies within Japanese media theory. The first is mainly developed in academic field and is called media studies. There are some layers and spectrum goes from audience research to more positivist methodologies. Basically researchers don't want to go outside of universities and academic circles. Most of them are not enthusiastic to use media technology themselves. There are a few translations or papers available in English.

The second tendency would be a form of criticism to be found within new media art, connected to the Internet hype and early-mid 90s media technologies. That is why it used to have financial support from big corporations but that's fading away. Unfortunately new media arts lacks the vision on the broader political economy of its own field. That is why corporations can safely speculate their money into 'speculative' media theory.

The third tendency would be the activist 'tactical' media. But that stream is very micro and weak in Japan. As I mentioned, Tetsuo and Toshimaru are active in both theory and action. They are paying attention to the economy and politics of the media and Internet. I am not that satisfied with the theoretical level of the three currents. For most of the time I have been moving between the three and taken difficult in-between positions. What is crucial in this context is how we can build bridges between the different media tribes.

GL: Over the last few years you have been going to a wide range of raves, from illegal parties in German forests, squatters parties in Amsterdam, raves in Zagreb to solar eclipse parties in Hungary and Zambia. You also attend a variety of raves in Japan, from expensive Tokyo club events to informal events in parks and in the mountains. Do you see yourself as a modern anthropologist studying rave culture? Have you encountered any problems with this form of 'participatory research'?

TU: There is a 'belonging without identity' as described by Gorgio Agamben and Lawrence Grossberg which goes beyond the usual definition of community as a social entity with shared values. Without identification on fixed and stable positions it is possible to belong to a tribe. Tribal formation are not one. Within one tribe we can find diverse styles, differences in taste and even conflicts over how to live ones life. When subculturalists say ' (s)he is tribal' it means that there is an open group-minded feeling, a solidarity and tolerance for other tribes and different styles. It point at a consciousness against the mainstream of this civilization and its globalization. For example, tribal cultures within the rave scene show respect for so-called traditional tribal or quasi-premodern cultures and their 'indigenous' way of living. This respect is so distant from the way in which journalism and political science talk about 'tribal wars'. The position of the DJ in all this is highly significant. The DJ functions as a mediator and catalyst to both inform and transform people how to enter other dimensions of the world. They could be considered the shamans of the cyber age. But this shaman is at the same time an 'organic intellectual' in a Gramscian sense, organizing people to get to other horizons of society through 'partyng'.

Becoming a DJ has influenced my way of writing in many ways. Both positions, the sociologist and the DJ consist of a cut'n'mix of materials produced by others. Usually a DJ does not compose or create the music tracks him or herself. The DJ cut'n'mix is '(re)inventing' and '(re)elaborating already existing sounds. The same can be said about the work of the sociologist or theoretician as a TJ (text jockey). We can no longer pretend to create

'theory' out of the blue. We always first collect material, texts and resources and then start quoting, editing and appropriating passages from past works. That is do-it-yourself within theoretical practice. Kodwo Eshun's notion of 'remixology' is quite suggestive. Sometimes I am asking myself: am I a sociologist or just a tribal raver? It is a really difficult question to answer.

I don't want to merely celebrate rave culture. There are a lot of problems such as hedonism, consumerism, drug issues, frictions amongst tribes and organizers, negotiations with local authority and police have to made, etc. I never face any problem during my 'participatory observation' or fieldwork research. Maybe this is because of my enthusiasm to join the party. The difficulty is lying somewhere else. I do not have the proper language yet to talk to both academic circles and party tribes. It might even be impossible. I would like to invent a different way to theorize everyday life.

[Toshiya Ueno is an associate professor at the Expressive Cultures Department at Wako University, Tokyo. Several of his papers in English are available in the Nettime archive. He is preparing a book titled 'Urban Tribal Studies' with the Amsterdam-based Croatian sociologist Benjamin Perasovic. His published books, in Japanese, amongst others, are 'Situation, Cultural Politics of Rock and Pop (Sakuhinsha, 1996)', 'Artificial Nature, On Cyborg Politics' (Keisoshobo, 1996), 'Thinking Diaspora' (Chikuma Shobo, 1999) and 'Cultural Studies, an Introduction' (With Joshi Mori, Chikuma Shobo, 2000, vol.2 coming up!).]

<nettime> An interview with Geert Lovink

From: snafu

To: nettime-l@bbs.thing.net

Date: Fri, 05 Oct 2001 17:09:51 +0200

dear nettimers,

the following is the integral version of an interview/dialogue between Geert Lovink, Snafu and Subjesus. It was made in July for the portal of the Italian public Television Rai.it.
(Italian abridged version at http://www.rai.it/RAInet/smartweb/cda/articolo/sw_articolo/1,2791,137,00.htm)

In this text Geert touches a variety of arguments, from the first development of the digital public domain, to the recent evolution of Tactical Media passing for an analysis of the dotcom burst and of the possible development of independent platforms and infrastructures.

Interview with Geert Lovink
By Snafu and Subjesus

Q: You took a part in several media-related experiences, mostly in the Netherlands: the Adilkno group of media intellectuals, the pirate radio movement, tactical media conferences, the Amsterdam-based community network The Digital City and so on. Could you give a short yet detailed outline of your past activities, and a glimpse at your present days, as a member of a global/local networking culture?

A: Is this a job interview, or what? I am not sure if my personal biography is all that significant for the theory and practice of "becoming media". Certainly I cannot see an accumulation of knowledge or even experiments in our "alternative" network sector. Growth in the digital arena is more spasmodic than linear or dialectic. Yet, there are waves of change, intense periods in which History and the personal biography seem to fire each other up. In the meantime there is just boredom--the usual, eternal, repetition of the same old topics and patterns in which thoughts and movement come and go. We are now in a golden age of net activism, and we should all enjoy this rare and special period.

In my biography the year 1980 was of significance, the squatters movement in Amsterdam and Berlin, urban autonomy in a post-ideological and post-68 condition. Leftist models occurred at moments of regression. They were responsive and regressive, not strategic, imposing dogmatism in a precious situation where something new was about to emerge. At that time

the left had split into a pragmatic faction and an intellectual ghetto within academia which was only able to analyze its own defeats and failures (which is, I agree, a study in itself). Just imagine how different Baudrillard would have been if he would not have had the boxing ball of 1968. The same can be said of Deleuze and Guattari. One cannot understand their intellectual position without basic knowledge of the French political landscape in the sixties and seventies (which was dominated by the PCF). In the age of ecstatic normalcy, lacking opposition the theory without enemy, without reference, has become a self-mirroring text regime. Activists in this context are, almost by default, forced to respond anti-intellectually. This tendency started in the late seventies with punk.

If you have the impulse to do something you have to stop deconstructing yourself. Just do it, as the Nike phrase correctly states. Hit and run. See how authorities and their sign system respond. Trail and error. Ignore those who tell you that all activism ends up in building concentration camps. This is moral blackmail from those who are not involved anyway. Take the moral highground in such situations and respond with a sovereign silence. It is not worth the anger. This also counts for the hacktivism and net-activism debate. Let's not be afraid, neither for radical action, nor for radical theory--and leave the pc knights outside.

Theory is not an ersatz religion. It won't tell you what to do--nor what to think. It has truly become a Foucaultian toolkit, that is, one which stays in the wardrobe for most of the time. Forgotten pearls. Beautiful but unworn. In this situation the Event becomes an almost holy entity. For many, Events are just falling from the sky because they are no longer created by some Party or Vanguard. Cracking the events therefore becomes precious knowledge. Most people just live their lives. They wait and see, until something happens: 1989, raves, Seattle, a squat, a riot on the first of May (or not). This eventism can also be found at the media level, with the Internet, or local radio, suddenly creating zones of possibilities, which then fade away, after a wild night, some exciting months in a media project, or however long it might take. That's my biography. The development from print to radio to Internet, in my case, is not an interesting one. What is interesting is the ability to metamorphorize, as a person, using (new) media, in the way Klaus Theweleit described this process of personal "growth", using "techniques". Sometimes one succeeds, in some cases it all seems to fail, ending up in (in)significant misery. The hardest part for me is to judge my conceptual work. The realm of ideas has lost so much of its significance, despite all the warm hearted compliments of theory sympathizers and reassurances from the side of industry that "one day your good content will rewarded."

Q: You have written a lot about the digital public domain, often with a realistic and disenchanted view. Yet, if we look at experiences such as DDS and xs4all, we have the impression of an early European net.culture able to highly influence the digital innovation, by acting as a subject of the early networks. Nowadays the mediascape has clearly mutated its outlook. Despite the apparent crisis, dotcoms and telecom are monopolizing and re-shaping the net. Yet, we feel that many issues raised by the digital avant-guards (if we can use this term) have been absorbed by mainstream new media; access for all, low costs of connection, availability of webspace and various facilities are on the agenda of any big corporation. In the context of the Next5minutes 3 you launched the "free for what?" campaign (www.waag.org/free), which was exactly focusing on these issues. At which level the ideology of a generalised free access have been absorbed and emptied of its idealistic drive and at which level it has positively influenced the economical development? Did that ideology help to reduce the digital divide, or the market continued to be driven by its own logic, without being affected at all by social dynamics?

A: Let's not be overly afraid of co-optation. I don't think it is all that interesting to design memes which cannot be used by the evil forces of the state and the market even though it is quite a challenge. We did serious work into that direction with Adilko and our "strategies of failures" were certainly not the most popular. Amongst your peers it is not widely appreciated to be on the "heights of despair" (Cioran). Utopian ideas speak to the people. This is simply the case, despite half of century of organized disgust of utopianism. Even amongst distinguished scholars negativism has never been popular. I have always been willing to take the risk of promoting digital ideas, knowing that, at the end of the day, they would be perverted, not just be third parties, but also by classic infightings within the alternative ghettos. Increasing the media-cultural complex needs new ideas, just to feed itself, with regardless what. One day you are their 'content', and next day you don't exist anymore. It is our normal state to be ignored. Only the scandal will bring you in the spotlight of the Spectacle. There is really nothing special about this media law. Nothing to be upset about. In the case of the demand for public access to information and the communication networks it is a broad and diverse new media culture which counts, in the end. The projects themselves are interesting enough. Some of them are even really exciting! What then counts is to leave that particular stage or project early enough not to get bitter or cynical.

When we are speaking about the birth of (public access) media it is all about the Art of Appearance and Disappearance. I know, these are ugly terms from the postmodern eighties. Too bad. But they really make sense (combined with a healthy dose of economic theory from both liberal and critical perspectives). You want your ideas to spread and you don't want to become complicit. Fine. Your choice. Then don't blame others for making money with them. If the gift economy gets corrupted, move on. If everyone has Internet and the revolution still hasn't arrived, too bad. Change stage. The idea of a Digital Commons is still there, despite IBM and HP buying themselves into the open source movement.

Q: Your last book is a collection of interviews entitled "Uncanny Networks". You highly contributed to the development of networks in Europe.

The original idea, if I'm not wrong, was to create a field of convergence where artists, activists, programmers, designers, critics and academics could meet. Over the years "the tactical media" space has been filled with a variety of events and solutions, from the Next5minutes to the Browserday, from a diffused net plagiarism to the Toywar. On the other hand, in the introduction to your book you say "multi-disciplinarity remains an idle goal, not a daily reality. The division of labour is still there, due to the highly specialized knowledge of each field." What are the results of the efforts of weaving these networks over the years? The process of crossing the fields is still too young or is already gone?

A: You are right. Where does our fascination to work with other disciplines originate? Why this is a passion so many people share, comparable to the common hatred against the Microsoft monopoly? Are we really locked up in the cages of specialized fields of knowledge? Discontent about the division of labour is certainly there. Does it come out of a false hunger for totality, a holistic drive towards a unified existence in which everyone can do anything at the same time? I can only ask questions here. Perhaps working with Others is what people really want compared to the demand for social change in the first half of the 20th century. Specialists constantly need new input in order to remain creative and competitive. The underlying idea of working with the professional Other is that he or she has hidden ideas and energies which will collide and fuse with ones own. In the office world and the work floor having to others is not all that special. Multi-disciplinary task forces are pretty common. The strategy of mixing, creating temporary, hybrid solutions and (art) works is only shocking for those who have something to lose, aka those who are running institutions. Internet does not belong in visual arts, theory is not activism, real technology does not need art, etc. But people do not fit in categories and some resist the constant need for qualification and the specific education and reward systems. Undermining self-referentiality within disciplines is a somewhat bizarre, not very rewarding hobby. It is of course better careerwise to stick to the rules of the administrators and not do your own art, cultural studies, television or radio and not behave like a mad scientist in search of the recipe for making gold. Because what should the outcome, for example in the case of multi-media, look like?

Q: I'm not very interested in "professional" cooperation. Ultra-specialisation of labor makes multi-disciplinarity necessary, if not vital to exist on the market. My question was more referred to people (like you) that decide to cooperate following a desire, a tactical line of flight, a trajectory which is meant to lead somewhere or nowhere else. Tactical media was naming many different spaces of invention. This definition wasn't only indicating what to do in "the next five minutes". It was the expression of a new infrastructure and a new way to communicate amongst real people, through space and time. Not for the sake of "cultural innovation", but with the intention of building a shared code, a procedure of attack. This chain of reactions worked perfectly with the Toywar, for instance. But, is it always necessary to wait for an emergency to verify our power? What is the network doing for the rest of the year? According to your experience, is it stronger than 5 years ago? I know it is very hard to make a complex balance, but you are one of the few people who really travelled through many central experiences. (Sorry, to be so specific but this is the real core of the book. I was talking to Ricardo Dominguez recently: he said that one of the netstrike tools is to upload questions on the target server, like "Is democracy.html on this server?" And the answer would answer "democracy.html is not found on this server". 404, a typical net.art gesture becomes in this way part of a tactical action. What is usually considered a physical attack, shift into a syntactical one. This is the space where single gestures become rings of a chained discourse. It's the space where net.art meets hacktivism or where hacking meets net.art, e.g. file sharing by o1.org. I'm very interested in this space, it's my favourite one, because it keeps the heritage of the XX century avant-gardes, but being much less elitist to me. I want to understand if these different communities meet just occasionally or are building the conditions for a paradigm shift. On one hand, net.art seems to dig more and more into conceptualism, interface design; hacking is all focused, at least in Italy, on writing softwares under GPL; hacktivism seems an endless count of online actions more or less related to the current "anti-glob" agenda. Here the function of the networks become crucial. If you read the subjects of Nettime you have the feeling of a very balanced, integrated world; on

the other hand, anyone keep following h/er own thread; i know that the network doesn't have a personality, it's not a subject or a party. I don't want to reduce it to a definition, but in the last 5-6 years many things changed inside and outside of it; i'd like you to paint a fresco of this shift, from the point-of-view of an insider :]

A: The Web is not the Party. It is not even a movement. What we face here is an increasing uncertainty over the political. There has been a shift over the last twenty years, away from clearcut political structures and activities towards a much more blurry field of "cultural exchange". Others have written at length about the shift from politics towards arts and culture, specially in Germany. The somewhat closed circles around magazines such as Spex, Texte zur Kunst and Starship have reached a sophisticated discourse around that topic (however, not (yet) accessible for non-German audiences).

The uncertainty on the Net is a big issue, as far as I can see. Will the Other answer? The essence of networks, one could arguably state, is collaboration. Not just communication or exchange of information. However, the cases of a successful collaboration remain rare. This is partly because so many are new users are not yet accustomed to the Net. They merely use it as a tool (making money, for example). This is why I am hesitant about using the Net for attacks. It is not very creative and sophisticated, at least not at this moment. In my opinion the density of self-organization has got to rise first. The loose cultural networks we see at the moment are going nowhere. They may create a bit of discourse, but that's all. That even counts for the activist sites such as indymedia.org. They still have to reach the level of workgroups. It will start to get interesting if netizens, the global online citizens will have their own intranets. Substantial islands within the net, also software-wise. That will not so be ignored or knocked-down. I am not of the invisible, tactical strategies of the Deleuzian age will last forever. They were written in response to the declined, at that time still powerful structures of the communist parties in France and Italy. Such entities do not exist anymore. We are living in the post-89 world in which micro-politics and rhizomatic strategies have become almost hegemonic concepts. It that sense it is right to say that this a Deleuzian Age. But I am not the kind of person to obey the Deleuzian

State Region. Neither would Deleuze, I suppose. It's hard to deal with fashions if you like them.

As many have noticed before, viral marketing has become a mainstream corporate strategy. I am very concerned with the lack of infrastructure in the net culture. Virtuality alone will not do it. We have to physically own and develop (or hack, steal, etc.) cables, satellite, offices to work from and not buy into the advertisement of the happy mobile nomad. This is also means that we have to go beyond the somewhat primitive and moral critique of institutional politics. I am keen to see how complex and diverse superstructures, virtual institutions can be developed. Not just a website plus mailinglist. We should not get stuck at that level.

Q: That's it. Maybe it's time to go beyond a mere "we want bandwidth" or "access for all". Server machines could be a good start: if you want to build a really autonomous network you have to build up your own computer host, like in the BBS-age when anyone could be a sysop and run his own net. The recent wave of interest towards P2P systems such as Gnutella or the much-rumored Freenet seems to signal a sort of growing awareness about that. Recently, www.wired.com reported a not-so-weird proposal coming from the Cato Institute, a kind of US libertarian anarcho-capitalist think-tank, to build up parallel private networks beyond the mounting state-regulation of the web (muck like offshore states, e.g. Sealand). This funny convergence between issues and attitudes so different - typical of this post-all age - may be a symptom. Isn't it time to claim "server machines for all"?

A: For sure. In a few years we might get there. Now are still in the period of economic downturn and rollout of bandwidth capacity (both for Internet and wireless). However, we are no longer living in the na=EFve (Clinton) years of the cyber plenty. In a time when everything was growing it was easy to be libertarian. We are now moving towards a period of confrontation, away from the third-way agenda of consensus in which, for example, such of Sealand, Wired and Ayn Rand followers such as the Cato Institute perfectly fit. I am not sure if we should continue the strategy of building temporary autonomous zones. It is time to be in the world. That's the strategy of the so-called Seattle movement against corporate capitalism. Confrontation with the corporate world and its institution, based on decentralized and networked affinity groups and individuals, coordinated by a power portal (www.indymedia.org). We have had enough laissez faire laissez passe politics. Deleuzian rhizomatics was part of that. But the age of "imperial sovereignty" of the Internet is coming to a close. The Net is becoming a battleground, not just a market place for ideas and their data. That image is too simple, too harmonious. Now that the introductory phase of new media is coming to close (despite further tech revolutions) we return to a real politik of the networks in which economic interests of telecom giants, microsoft, governments and regional blocs are becoming real. The recording

industry has to go to court against Napster. It cannot just tolerate it. Nor will Hollywood tolerate Gnutella. People who are developing and using such systems have to understand the clandestine nature of what they are doing and take responsibility, take sides. The time of playing and surfing is over. If you run a server, fine, do it, but then you are also the sys-op, and with that comes certain legal and ethic responsibilities. If one is prepared to accept this, then go ahead! But don't say afterwards, I didn't know I was only exchanging films and software without knowing that it's illegal. People have to be prepared to say: "Legal, illegal, Schei=DFegal."

Q: What are the economic sources on which to build a really independent new media culture? According to Negri and Lazzarato, the economics of information has most to do with the "production of subjectivities". And this production often needs to assume the form of enterprise acting within (and in a sense against) the marketplace. Negri and Lazzarato define "political enterprise" this new agent, and we are seeing some examples of that rising. xs4All, even after the take-over by the Dutch telecom KPN, could be one of those. What are your feelings about that?

A: New media culture is producing concepts, not value in the speculative dotcom sense. Let alone money. And not content either. They are concepts-in-the-making which need to be tested out before they can be used on a large scale to produce subjectivity, as Negri and Lazzarato describe it. The fun about this test phase is not the some heroic avant-garde position of showing people the way. I think it is a much more playful, experimental stage, less pedagogical, in which ideas are getting hardwired into a small scale technological culture which builds up its own userbase and rituals and then gets exposed to society and the marketplace in a later stage. The real test then is to see how robust the "meme" is which has been collaboratively developed. There can be sell outs, betrayals and other setbacks. Boredom of the everyday is even more destructive to good concepts. I am not sure if profit or non-profit really makes such a big difference, probably in the speed in which ideas can spread. I am interested in sustainable memes that can constantly change, grow and contract, without losing its core identity and basic ethics. xs4all seems to be a good example. What I do not like are people who build up something precious, together with many others, and then, for some reason, pull the plug and disappear. To me, all CEOs of dotcoms startups which went bust are cowards to me. Many of the dotgone companies were "built to flip", ran by people who only do business in times of hyper growth. Come on, Who's afraid of a crisis, or two? Those who grew in the seventies and eighties, without all that easy VC money are ready to take risks, to make something out of nothing. The dotcom business model is for the impatient so-called entrepreneurs who, in the end, only learned how to burn money. They did not even develop concept, let alone software. What the cultural sector of the New Economy (RIP) has done in the wild years of 1999-2000 is not entirely clear. They mainly fought over the definition of net.art so that art critics could start writing and art collectors could start collecting. Culture was in a volatile, defensive mode and did not profit whatsoever from the money fountain. It was a time of survival.

QuickView on Software Art

Amy Alexander, Florian Cramer, Matthew Fuller, Thomax Kaulmann, Alex McLean, Pit Schultz, and The Yes Men, interviewed by Olga Goriunova and Alexei Shulgin. <http://runme.org>

Q: Why are you personally attracted to 'software art'?

The Yes Men: We are very interested in software art because of its potential for automation! We can use these technologies to replace the artists. A wholesale replacement. Followed by leisure!

Alex McLean: Because making code is empowering, but generally taught very badly. The act of programming is portrayed as systematic and uncreative. This may be appropriate for working on quality assured credit card transaction systems, but why apply it to programming as a whole? Software

art might give us a place to look at the creation and use of software outside of formal business constraints, and the stereotypes thereby fostered. I'm also repelled by software art, because I see artists trying to employ software thoughtlessly. Hopefully software art will draw on its hackneyed heritage enough to sidestep readymade wizardware.

Thomas Kaulmann: Software art can be a manifold thing. It can look nice in source code or at runtime. It can influence culture or can give an impression of the present culture. Software art is just another art discipline and it is not defined. Art is always a matter of intention, there can be different media to transport one's vision: stones & hammer, canvas & color, camera & video or computers & software. An artist is intrinsically motivated to translate his/her ideas to a broader culture, through software as well.

Amy Alexander: Hmm, it's a little like asking "why are you attracted to art?" isn't it :-)? I'm not sure verbal answers to such questions can be entirely satisfactory or productive. But to give a partial one: I think because software art is a mode of non-verbal expression relevant to contemporary culture - just as photography, video art, etc., were, to the times in which they first appeared (and still are).

Matthew Fuller: Perhaps the conjunction of two highly productive and inventive forces, neither of which really wants the other is always going to make for something interesting! What is named as contemporary art has responded to networks and computation by taking on certain of the characteristics of networks - the formulation of 'the relational aesthetic' for instance - without actually dealing with the specific technologies. On the other hand, software cultures have only very rarely considered themselves to or have acted in a manner which is reflexive, in the way which is most usefully and richly developed over the last century and a half or so of art. Various conjunctions of these two patterns of activity, their mutual interference, seem to be generating some exciting or annoying or disruptive or inventive effects. One cannot claim this for all of the work that operates here of course, but it is an opening to new conjunctures.

Pit Schultz: Software art is attracting me because it is carrying a seductive promise that possibly software production could be seen as cultural production: that writing code has more meaning as making a program run or crash or sell. It might place media art into the history of contemporary art with the passage of conceptual art for example. It poses questions of artanship, and pragmatic aesthetics of code, a kind of surplus that is not technological in terms of efficiency.

Florian Cramer: If one defines (as the Read_me 1.2 jury did) software art as art that is either based on formal instruction code or which is a cultural reflection of software, then there has been a lot of interesting artwork lately in this field that has attracted me and which justifies to engage with this concept. Jodi's work of the past few years, which has radically shifted from browser art to manipulations of computer software, is one striking example. But aside from that practical observation, I am also attracted by theoretical issues, since, being an academic in comparative literature, I research the borders and grey areas of writing, executable code and art, from the permutational poems of the late antiquity to lulist and kabbalistic language speculation up to the very new situation that instruction code has become a mass commodity and a material appropriated by artists in all kinds of ways. I thus would never limit software art to craftsmanship of programming (i.e. software art as a Donald Knuth-style "art of programming"), but consciously take speculative, unclear, or even non-computer-related approaches into account, from certain forms of poetic play and conceptual art to the use of machine code fragments as private languages in artistic "codeworks" like those I collate, together with Alan Sondheim and Beatrice Beaubien, into the "nettime unstable digest". I should also add that I am a Free Software activist who perceives operating systems (particularly those which don't create artificial frontiers between "users" and "programmers" - i.e. Unix, Plang, LISP machines) and software as ways of thought and cultures that are in no way aesthetically, culturally or politically "neutral". It thus follows that software and art, as modes of both cultural reflection and construction, are closely related to each other.

Q: Which viewpoints on the issue you find most interesting?

Alex McLean: That of the programmer, because I am one myself, and that of people using the software, because there is often great disconnection between software creators and their audience.

Amy Alexander: I have a few interests: critical, political and algorithmic. Critical: Software art helps us examine the biases and the influences on culture of software at large. Most non-art software pretends to be neutral and objective technology - devoid of human influence. Software art opens itself up to examination of its human-created biases and its human-experienced influences - so it helps us understand how these factors operate in "normal" (non-art) software as well.

Political: Governments and corporations use software and information capital to exert influence. But artists and others can use software to strategically redistribute information capital in a more equitable, useful and entertaining manner. (Mi datamine es tu datamine.) In other words, I think it's important to realize that data and algorithms are separate things. Even proprietary data can often be publicly accessed (search engine databases, etc.) But how it's used is in the algorithm - strategically written algorithms can provide a lot of leverage and be very handy as tactical media tools.

And algorithmic for its own sake: the visceral, improvisational nature of art and communication through algorithms and coding.

Matthew Fuller: Yes, it is the way in which various software art projects reveal the way software is embedded within wider currents of social and aesthetic composition. How does software manifest, reproduce or invent new relations, say of class, or of processes of work and activity? How is it racialised? Is it so precisely in its 'universality'? Does it have a way of doing things built into it that enhances certain kinds of sociability, or act against them? We can ask these questions in a number of careful ways, but also in a manner that acknowledges our embeddedness within software as culture. Part of these discussions are already part of office culture, think of the drippy compensatory humour of 'Dilbert' cartoons; consumer culture, where it exceeds itself as simple passivity, the inventive intermediate role of 'power users'; and, perhaps most usefully in this case in the way that particular scenes invent new forms of software and new ways of dealing with established forms - think of the now long term tradition of the demo-scene for instance. At the same time, it's useful to work from the 'opposite' direction. There are some interesting currents that take advantage of the specific material qualities of particular kinds of coding culture. Think of some of the games mods or some of the generative code work that really take advantage of the idiosyncratic, perverse and particular nature of code practices. Exploiters of bugs. Make the machines stammer, speak in tongues.

Amy Alexander: The algorithm is also very important here. The algorithm that generates the output is an important and subjective thing, and in commercial software, it often hides behind the veil of innocent, technological neutrality. An obvious example is Google's PageRank algorithm, which determines which sites appear towards the top of Google's results, and which don't appear at all. The algorithm is very biased toward big sites, especially if they own lots of other big sites. But in their description at <http://google.com/technology>, Google explains that they rely on "the uniquely democratic nature of the web" and that "Google's complex, automated methods make human tampering with our results extremely difficult." Didn't humans write the algorithm?

That is a very direct example. Software artists approach the subjectivity of algorithms in different ways; some are more formal; many are more subtle. But because software art opens itself up to examination of its subjectivity, and the fact that interface is driven by human-generated algorithms, it can help us think about the broader software context.

Pit Schultz: Which viewpoints? The view from the 'folkloristic' aspect of programmers' cultures, writing gimmicks. The aspect of generating a tree of knowledge out of existing material, by changing the viewpoint to it. The question if there's something else than an unlimited numbers of readymades to be found. The archive aspect of an area of production, which is not yet bounded, territorialized. Something ambivalent that was already attracting me to the possibility of net.art. A strange attractor for the possibility of existence of such a genre!

Florian Cramer: Georg Philipp Harsdörffer's "Mathematische und philosophische Erquickstunden" ("Mathematical and philosophical recreations") from 1636 -- perhaps the first attempt to systematically combine poetics, mathematics and algorithmics into a playful whole. Abraham M. Moles' "First manifesto of permutational art" from 1963, Jack Burnham's exhibition "Software" from 1970, Geoff Cox', Adrian Ward's and Alex McLean's 2000 paper "The aesthetics of generative code", Matthew Fuller's 2000 paper "It looks like you're writing a letter: Microsoft Word", the (to date: four) jury statements of the Transmediale and Read_me juries, to some extent also Larry Wall's papers on Perl and postmodernism. We could use more cultural criticism of software in general, and especially a criticism that sees more than surface screen visual and which doesn't fall into the trap of simplistic analogies between structures in software and structures in society.

Q: Programmers don't seem to be interested in submitting their works to art festivals and competitions. There is a huge body of their work that might be interesting culturally and artistically. What are the possible strategies and interfaces that can help to make those works visible in the extended software / art context?

Alex McLean: Yes, programmers don't need institutionalised art festivals or competitions. They have the Internet, and the grass-roots fact-to-face meetings that result from their online projects and discussions.

Amy Alexander: Programmers don't need art festivals - hooray! Rewind back to 'net artists don't need museums', and multiply by a factor of two (because programmers typically don't consider themselves in the 'art' field at all.) So a programmer's work might be culturally and artistically interesting, but you have to go where it lives instead of making it come to you. First we should ask ourselves, "is this a problem?" Personally, I don't think so. Centralization causes marginalization of whomever is not in the "center." Not to mention structural weakness (single point of failure - when the "center" disappoints, the whole can fall apart.) Do programmers feel the urge to be pulled into the "art context?" If not, then to do so might be to open a software art zoo and hunt down projects to bring them into captivity - so we can gawk at them without getting our fingers dirty. Many authors won't want to be involved in "art" contextualizations at all. Others will if the context and culture seems inclusive and relevant to them. Programmers (among others) are turned off by artspeak, or if every discussion refers back to postmodern philosophy. These conversations exclude people, and it is in fact possible to have an intelligent, culturally relevant discussion without these as the focus. Also, it is helpful for non-programmers to read about, learn about, and experience geek culture. It is a culture, and it's about people, not technology. So anyway, hopefully runme.org takes a couple of positive steps: it's, we hope, easy to submit work to - you don't have to spend a lot of time putting together a big press kit with lots of artspeak to impress some jury and mailing it in ... and you can invite someone else's work in, if they're too busy or too shy to submit it themselves... it also tries to respect that software art comes from both "software" and "art" genealogies but is its own thing. I think it's a problem when people try to interpret software art as strictly "software" or strictly "art." Time will tell if our diabolical plans have been successful. :-)

The Yes Men: There are many examples of amazing "outsider art" that isn't recognized as such by the producer.. So I would think merely pointing them out, or finding them and making contact with the producers is what would be most important first.

Alex McLean: Yes, runme.org may be a start, allowing existing communities of people interested in creative aspects of computing to share their view.

Florian Cramer: I personally think runme.org is an excellent step in this direction. With its function as a download repository and weblog-style interface (as it was pioneered by Free Software websites like Slashdot.org and Freshmeat.net), it clearly overcomes some (so-to-speak) interface design issues of the festival/competition/exhibition-oriented art system, although I still think that both channels could and should co-exist. I find the exhibitions "I love you" (at MAK Frankfurt 2002 and at transmediale.org Berlin) and jodi's "install.exe" (at plug-in Basel 2002 and Buro Friedrich Berlin 2003) very successful presentations of software art in the language of the traditional art system, and the presentations are necessary to address a larger non-geek audience. Since runme.org got headline coverage on Slashdot.org, I am quite optimistic that this is the way to go. In general, Free Software self-organization provides good blueprints to software art self-organization.

Pit Schultz: The question is what constitutes the 'software art context'? The software repository is known from shareware and other kinds of downloadable software tools. Is it applicable to the area of 'art' too? If we talk about context, the question is what kind of 'institutions' make software art exists, where are its boundaries? Who constitutes these boundaries and how? And of course, is there a history of software art, assuming that it exists.

Matthew Fuller: Roland Barthes suggested that a truly interdisciplinary object is one which is nameable by none of the disciplines that in part contribute to making it, or that congregate around it. Such an object is owned by no one set of ideas and approaches. It demands that traditions become strange to themselves. So what is set in motion when art approaches the irritating subject of programming, what happens when the 'art' insistences on being incidental, on being amateur, on being able to go wide-eyed or cunning into any context, comes into some relationship with technical skill? Equally, what happens when computing enters a context wherein every stage in a process has aesthetic effects? What happens when computing's in-built judgments about what is 'optimal' or what is 'trivial' are subject to question and reinvention, or may even usurp its capacity to rule, to make rules? The revaluation of the trivial, of waste, of the past, of what has been shat out, and conversely, what it founds - the new - is one of the powers of art. I don't think that this work then that you ask about, that of programmers, needs 'help'. It doesn't need to be 'made visible'. We don't need gestures of sympathy such as those repetitiously awarding Linux the name, 'Art' in order to make things possible. What is needed are more specific alliances with particular currents of programming and other strands of making culture; deranging gestures that bring new worlds to light; prison break-outs; sustained and thoughtful work that makes itself available for use.

Q: Software art seems to be quite an open field yet, possibly due to the reason it is very diverse and in many respects is based on the programmers' culture that is hard to grasp. While contextualizing grassroots movements like this one and thus, providing an access to interesting practices to larger audience, we are at the same time inevitably packaging them for easy appropriation by art institutions. How do you think we can deal with this problem?

Alex McLean: Having people with broad knowledge and experience of programming languages forming part of art institutions. Critics should become literate in some of the many languages of software art before trying to understand its context. Right now I think many art institutions are too software illiterate to be of any interest to software artists.

The Yes Men: Yes! Just like the outsider artists... Well, it seems the important thing is to respect the desires and intentions of the creator... See if they want to be appropriated first. If appropriation involves a compromise of integrity, then figure out in each instance how to make the work useless to the dominant narrative...

Pit Schultz: How did other types of 'immaterial art' deal with this problem? How did early computer graphics deal with it, or certain kinds of Fluxus? The question is for me first of all is there a 'style' a kind of common 'ductus' which one can see after the years surrounding different forms of 'conceptualism'. The suggestion is that there is a difference to be made in relation to other forms of art, which are based on the postulation that a new 'form' is found, only through the use of a specific 'new' medium. The autonomy of media art in relation of contemporary art has to be questioned, on the other hand the way the art operating system processes incoming 'new forms' has to be questioned too. Software and the net allows to run a 'museum' with much less funds than elsewhere, this poses questions of what defines the needed power relations of representation which are constituting an art form. "Software art" insofar is not new, but it reflects, enhances, explores the role of software in a post-industrial society and afterwards. What is the role of the original, the author, the object, can one apply other basic questions of the predecessors of this potential art genre in a new way? How do seemingly successful works function gaining a market? (rhizome list etc.) What kind of criteria they seem to fulfill? Is there any place of constituting itself outside of an institutional interest? As with any art I'm also interested in the art which hasn't to be called art.

Matthew Fuller: This question might also be posed from a different perspective. If art institutions are treated simply as a particular and distinct part of a number of interlocking, but also partially differentiable processes and institutions it is useful to use them and take part in them for those things that they do well. I also think that in general it is wise to avoid becoming involved solely in one kind of institutional structure. The advantage of the internet and other distribution mechanisms is that you can be active in art contexts, but also develop relations to other circuits of distribution: shareware, module libraries, free software, gratis CD ROMs and so on. Work to multiply these. Mongrel for instance always triangulates what it does, using the net, streets / communities, and art systems to reinforce each other, but also to make sure that no one mode dominates the others.

Amy Alexander: I don't worry about this. Art institutions (including runme.org) can and will appropriate anything they want - the thing about digital projects of course is that in general, they're infinitely reproducible - so an institution jumping onto the net doesn't interfere with other nodes and modes of distribution. It just jumps on the bandwagon. People can decide for themselves which packaging they find most interesting.

Florian Cramer: This is a question that applies to any labeling and contextualization of art. Recuperation is inevitable as soon as you call something "art", and of course we ourselves do contribute to that recuperation. I don't care, and even think it's good to recuperate certain things -- like, for example: hacker code -- to save it from being overlooked or forgotten. It's rather problematic if the recuperation happens the other way round, as problematic exploitation of programmer's cultures through artists (like in the RSG Carnivore project and - despite its good intentions - the "CODeDOC" exhibition at the Whitney museum),..

<nettime> Interview artist and educator Ralf Homann

From: Trebor Scholz

To: nettime-l@bbs.thing.net

Date: Mon, 08 Nov 2004 01:06:12 -0500

Ralf Homann is an artist and director of the Experimental Radio Program at Bauhaus University, Weimar

Interview with Ralf Homann by Trebor Scholz.

TS: Please introduce the "Experimental Radio Program" at Bauhaus University and its history.

RH: The Experimental Radio was founded in 1999 at Bauhaus University. The new Department of Media was set up two years ago based on the realization that the common understanding of media as 'Cvideo', or 'Ccomputer' or 'CTV' was not complete. 'CVideo didn't kill the radio star.' If what used to be called 'Cnew media' were to be transformed to regular media, then the terms 'Cold' and 'Cnew' would have lost all meaning. This is especially true in the context of the arts. For example: Are etching, sculpture, painting and radio really old media? Or do new media start with 'Celectronic', 'Cmechanical' or 'Cdigital' processing? All these definitions fail because they are based on tools. In contemporary art after The Bauhaus the 'Ctool follows the function.' I understand radio as a global, worldwide phenomenon, a tool which is 'Cpublic domain' just like screws, wood, or stones but more global like TV, phone or the internet. Radio is 'pilot media' following the theory of time-based electronic communication because it was always first. It was set up before TV and before video streaming became popular. The Experimental Radio at Bauhaus University uses radio as a tool for the fine arts just as it uses it as a tool for sound sculpture, journalism and sound design. This relates back to the Bauhaus idea that the fine arts, applied sciences and design should come together to create an artwork. We have our own radio studio and local FM frequency, and a streaming media server for net radio. We also have a studio for projects that are based on sculpture, installation, performances, actions or interventions in public space. Perhaps it is necessary to explain some German traditions to understand the special significance of the Experimental Radio. After World War II the West German media were organized by the Allies to guarantee a democratic development of society. Print media were organized as private property, but the electronic media networks are based on 'Cmother BBC as a public, non-state, and non-private system. This goes against the grain against the German understanding of public space and public sphere, which is either state or private. The idea of common property declined about one hundred years ago and Radio and TV in Germany were highly regulated in Nazi Germany and then again during the Cold War.

For example, producing or merely possessing a radio transmitter in Western Germany without license could be punished by five years in jail. In East Germany high school students who use an illegal transmitter were killed by the state in the 1950s. The Experimental Radio was set up in the 1950s when Thuringia (the state within the Eastern part of Germany where the Bauhaus-University is located) allowed private and also free and community radio.

My first project at the Bauhaus-University was the 'CMicro-Radio-Party'. I realized it together with the Tokyo-based artist Tetsuo Kogawa. I invited him to present the Micro FM Movement in Germany. He also gave a workshop about the making and use of small FM transmitters. His performance dealt with the body: In our bodies the building and use of radio transmitters is inscribed as fear, as a heavy offense and complicated technical challenge, a secret, and esoteric practice. Working with him we dealt with ideas of micro politics. A party or picnic, for example can have a political dimension and power. During the performance students were standing on the dance floor, surrounded by DJs working on turntables. People gathered there and around a sofa with a small FM transmitter-- we called it 'Cradio sofa.' From the sofa a report about the event was broadcasted to the neighborhood. A goal of this micro-radio-party in the stairways of the department's main building was to give the building we were in with its ugly nazi-architecture a new connotation. This first project gave an introduction to the idea that radio is not necessarily better if it has a larger audience. The position that radio is only a mass medium refers to the history of radio in the era of Fordism-- the idea of large target groups. The term target group alone shows its context situated in the

decades between WWI and WWII when radio became so popular.

The next project in 2000, was the internet radio festival called 'Ctype=jRadio~border=jDo.' We set up simulcasting, ether and internet, and collaborated with artists like radioqualia and other radio stations around the globe including a local self-organized initiative of migrants and refugees called 'CThe Voice.' We had several points to get across. On the one hand we wanted to say that radio is not a local but a global medium. On the other hand, we discussed the fact that digital data and digital currency can be moved around the world (type=jRadio is the button you use to charge a credit card). But when migrants encounter heavy restrictions when they want to physically follow these data.

TS: The Bauhaus in Weimar is the first university in Germany, which founded a Faculty of Media. At The Bauhaus the first MFA program in Germany is in the process of being consolidated. The program in Experimental Radio is the only one of its kind in Germany, which teaches radio in the context of the arts. It seems unavoidable to ask about the linkage between the educationalist tradition of the Bauhaus and your current educational practice. Do you draw connections between industry and the university in the way Walter Gropius propagated it?

RH: Walter Gropius demanded an educational practice in the arts, which educated the artist also in economics very early on as freshmen. The Faculty of Media at the Bauhaus included several chairs for media management and the department has its own MBA line of study, which focuses on the economics of creative works, and the culture industry. At the moment we try to set up a chair for the creative commons. Lectures by these professors are open to BFA and MFA students in Media Art and Design. We collaborate on exhibitions, offer internships and support residencies for our students. Gropius' idea was ground breaking back then. Today it is simply reflected in our regular program. Gropius' demanded an education in economics that was motivated by the urge to close the gap between art and life. We know these ideas also from other artists and movements. Gropius said that the concept of the traditional German Art Academy separated the artist from daily life. He claimed that it creates a gap between art for art's sake on the one hand and the people on the other. For him, 'the industry' was part of daily life of the people. Gropius also emphasized that German art academies produced artists who were not able to make a living. Gropius thought of the artist as a polished, perfected craftsman. But in Modernism the industry has taken over the role of the crafts. We must analyze this situation and draw our own conclusions.

The Bauhaus University is of course the place where the Bauhaus was founded. But it is also the location from which the Bauhaus people were exiled. Last year we organized a demonstration of students against some restrictions by the City of Weimar. The students showed up in front of town hall with a banner saying: 'CTomorrow Dessau, the next day Chicago.' They pointed to the corporatization of education American-style in Germany and the fact that many teachers at the Bauhaus had to flee Germany and founded a Bauhaus in Chicago. There is always a deep awareness of tradition which is important. Bauhaus University is not a museum or a kind of fancy seal of the old Bauhaus. We understand Bauhaus University as the place where new ideas and concepts emerge. Perhaps we can create a new, electronic Bauhaus. Gropius' demands on economics mean something different today. The educational principles of Bauhaus University are centered around practice. Our so called 'Cprojects' are more important than classical lectures or a thoughtless curriculum that teaches tools. Students find solutions for real problems. Our classes in media art and design do not stop with the demo design. We always realize the projects. We cannot hide from the fact that students can't be fired. We live in an era of globalization, which means that form follows economics. But if form follows function, then we must think about the function of the arts. When Gropius demanded to close the gap between art and industry, between daily life and art, then we must ask if this gap is real or if it has disappeared long ago. What we need now is perhaps a new distance between art and industry. But which industry are we talking about anyway? I do not agree with Gropius' slogan that the artist is the polished craftsmen as this could be misunderstood simply as mastership of tools. I'm not interested in prolonging the classification between practice and theory. We are accustomed to think in both these categories. Contemporary art is theory and the theory is its own practice. We need the arts to reflect the practice of theorists and the theorists to reflect the production of artists.

TS: What is the professional future of students graduating from your Experimental Radio program?

RH: The Experimental Radio program offers a wide range of skills and qualifications depending on how long the student is in the program and which individual career she has in mind. Each student individually plans for her study guided by a mentor. The minimum is that students take courses in Experimental Radio only for one segment of their study in order to get an overview. They then use these skills for other concentrations such as TV, public relations, interface or sound design, composition.

journalism, sculpture, management, cultural studies, or media sciences. At Bauhaus University it is possible to study architecture and take courses in Experimental Radio to get qualified to produce urban radio documentaries. What's wrong with that? The maximum length of the program is five years. A student could finish her BFA in three years and then get an MFA in another two years. The Experimental Radio program is based on three segments for students who want to finish with a BFA or MFA in Experimental Radio. These three parts of study give undergraduate students the possibility to get involved in projects of other concentrations. They can decide on their own strategy to get ahead. They can, for example, combine different skills from web design, TV, photography, interactive media or sculpture. At the moment, Bauhaus University is the only place in Europe's German speaking area where you can study radio from scratch at university-level. Other universities offer radio only on a postgraduate level or as small part of journalism or literature programs or as an additional offer of a conservatory or a drama school. Radio education in Germany is mostly based on training at public radio networks or small private stations. There is no established academic education in this field. The Experimental Radio at Bauhaus University qualifies the student for a professional future in the public or private radio networks: as an author, journalist, producer, director, music editor, anchorman, or link man. There is only one job we cannot prepare for, which is that of the sound engineer as this profession is regulated differently by German law. But we do have two apprenticeships for sound engineers at the department. Our focus is always on the individual plan of the student. Some examples: There are students in the program who see their future as DJ, owner of a record label and composer in the field of electronic dance floor. Other students want to work as freelancers in radio journalism, as director in radio drama, or as artists who are interested in audio works. Again, other artists use the projects to question strategies of intervention in public space. And there are students who are more interested in creating new software using the courses of Experimental Radio to be challenged and find real problems that they will need to solve. Sometimes filmmakers or club VJs visit our lectures because Experimental Radio is more linked to pop culture or tactical media than other departments. This heterogeneous crowd gives our classes a special spirit because this kind of mixed scene is what you will find also outside the university in the professional field. We teach radio in the context of the fine arts. This concedes newer developments in contemporary art and goes beyond the traditional 'C'German Hoerspiel/C (radio play) which is rooted in theater or literature before the 1960s. This tradition was transformed by the likes of Klaus Schoening who curated the *Ars Acustica* at documenta 8 (an international art exhibition) or Heidi Grundmann at Austrian radio ORF. Another example is the department of Radio Drama and Media Art at the Bavarian Broadcasting Corporation. This focus on fine arts educates students to use radio as a tool for their art, as a strategy in public space, for actions or interventions but also to create objects, environments or performances in the white cube, sound installations, acoustic images, documentaries or radio dramas. The Experimental Radio, in particular, offers contexts to develop such artworks. Students get a chance to develop individual strategies, transfer their skills across media or expose their work to a new kind of public audience. This is part of the education in media art and the professional field of the students here.

TS: Between the techno-optimism of the 1990s and the techno-skepticism put forward by more traditional cultural theorists, which approach to technology do you propagate?

RH: Nice question. For me technology is part of the so-called 'natural world.' We must live with this fact. It is possible to make radio without technology, because radio is the idea to make radio and imagine technology. Walter Kluge's group is a very good example because their radio never started, but the group was working in the German resistance. You could find more examples of pirate radio stations or radio fans who never broadcast but who create small groups of people who meet in the street. That's a phenomenon of radio. The aim of our radio program is always to bring people together face-to-face. We cannot broadcast faces so we are careful not to lose this aspect of the medium. There are some programs which are rooted in the authoritarianisms ruling the world, at times when radio was set up similar to the news, or the time signal, which organizes a virtual mass in front of the unique sender or leader. But the basic message of modern programs including the commercial one is that you are not alone, you are part of a group and please go out, and meet this group or at least face our product in the supermarket. The argument that radio diverts or lulls the listeners is wrong. I do not approach technology in categories of optimism or skepticism. I am interested in an analysis of uses of technology for freedom. I was not a fan of the 1990s idea that the internet will make the world automatically better or that it will create some kind of truly digital democratic society. We could only observe that the internet was going opposite ways than Radio or TV. Radio and TV were highly regulated by the state through technical standards. Now we have the experience of tactical media. We now see a lot of initiatives to get regulations in place and to limit the old systems of distribution. Have a look at what has happened with Indymedia

over the last few days in the UK. It's back to radio. I prefer this technology because radio is a dancing media. Moving around the body is always better off than sitting in front of a screen or being pinned down in a cinema seat. I prefer the digital wired, the analogue wireless solution, because nobody can control who listens.

TS: Three years ago you helped put together the "bauhaus radio reader." The widely acknowledged current crisis in new media arts education is in part grounded in the need to find texts with tolerable expiration dates. Which texts do you read with your students?

RH: The project of 'C'bauhaus radio reader' deals with this problem, because at the moment we cannot find a good compilation of texts. This project is not finished, it is more a crawl over the screen and a never ending story. In my opinion radio is a medium for illiterates. We can make it without texts. Especially in Germany we find a lot of texts about radio dealing with problems we never faced. It's a pity because in former times German Radio theory was very interesting. But perhaps after Adorno's denunciation of the medium nobody was really interested to work hard on contemporary radio theory. Now you mostly get fights between high culture and pop or the people who try to protect children by demanding regulations for censorship. For the foundations year in Media Art and Design we use a fine compilation, edited by my colleagues at the Department of Media Culture Klaus Pias, Joseph Vogel, Lorenz Engell, Oliver Fahlé, Britta Neitzel, which is called "Kursbuch Medienkultur." This compilation gives a good overview about media theory from Brecht to Baudrillard. French philosophy is very important. In the basic program of Experimental Radio we use LaRoche's and Buchholz' "Radio Journalismus," and Michael Dickreiter's "Handbuch der Tonstudientechnik." Those are the German standards for working in professional Radio. We also use Douglas Kahn's and Gregory Whitehead's compilation "Wireless Imagination" and Nel Strauss' and Dave Mandl's "Radiotext(e)." Apart from that we read Tetsuo Kogawa and of course Geert Lovink's books dealing with radio and tactical media. To discuss ideas of free radio we use a compilation from the Swiss 'Klipp and Klang Group' called "Kurze Welle, Lange Leitung," which was published by the Zurich art space Shedhalle. We also read Hakim Bey's "Radio Sermonettes" in the foundations program and Gerald Raunig's compilation "Transversal, Art and the Critic of Globalization," and Marius Babas' compilation "Im Zentrum der Peripherie, Kunstvermittlung und Vermittlungskunst in den 90er Jahren," which deals with art movements in the 1990s. In addition, we use professional magazines from media politics and media research to pop music and contemporary art. For Students who are in the program for a longer time I offer a seminar in which we read texts or discuss articles from recently published catalogues, but also some texts from the US free radio movement.

TS: Which proposals do you have for alternative structures in new media arts education?

RH: Dealing with media always means that we can lose sight of our goals. The worst case is when you end up working mainly to find sponsors for your next project. We need a space where it is possible to reflect and test drive differences in order to find the next utopian position. Technology and economics are the basics but do not get us a better world. I remember that picnic was the tool to get a brick into the Iron Curtain. We need such picnics for new media education and perhaps we need more parties.

TS: How do you foster cooperation in the classroom and beyond?

RH: We have no classroom, only a studio for the art works and a radio studio for the live broadcast. In the first place we are always focused on production. In our studio you can make programs as a lonesome cowboy but that's boring. Mostly there are teams creating programs: authors, anchormen, music editors or DJs, directors and producers. It's always more than one person working in the studio. Commonly this is necessary simply to use the complex tools. You need support from other students who read more tutorials. There is one central meeting for each project. Here we discuss all questions and set up working groups and teams for an exhibition, an excursion, the production of a radio drama or a magazine of the weekly program. Especially the final presentation at the end of a period must be organized within teams. At Experimental Radio teamwork is common and every second summer I offer a special project dealing with collaborative work between artists or groups to discuss structure, problems of communication or secret hierarchies. One project included an excursion to the opening of the Venice Biennial. Such excursion must be prepared by students and forces cooperation and group-building. Bauhaus University is located in the small downtown of Weimar. Most students live in flat-shares and there are some clubs in town, mostly visited by students. As part of our final presentation we organize special programs at these places where we stream media. Weimar is situated in the middle of Germany, Berlin is near, big cities like Frankfurt, Munich, Hamburg or Prague are not far away either. Students come from all over Germany not only the surrounding cities. It is very common for students to travel around, to make excursions to important festivals, concerts or exhibitions

to create their own network to realize their projects. They support each other with their experiences and varying skill sets. Graduate students have the right to make so called "free projects." This means that students can set up their own group or collaboration with students at other universities, or work together with professionals and get my advice. My program runs several mailing lists and a server to support communication when students are not in town. Usually we involve students who are abroad as part of a student exchange in our weekly program with reports via streaming media or help them by organizing small-budget collaborative exhibitions.

TS: How do you make use of social software in your radio programs? Please give examples of the way you used streaming audio and video in educational contexts.

RH: We use software to organize group work, to set up collaborations. We prefer mailing lists for all lectures and we use web logs for technical support, uploads and downloads to exchange files. We try to use open source software for all applications but it is not always possible. We can't ignore the fact that we educate students for their professional future, and if outside the university there is no professional application of open source, then we can't teach it inside the university either. To encode our streams we created our own open source software, called o-stream, which uses the ogg vorbis file format. Last year as part of our collaboration with the French art school Villa Arson we had a workshop in Nice, which we streamed as well. I prefer open source because it allows us to twist the software according to our needs. The issue of software licenses, or creative commons is part of education. We made documentaries for example and organized an exhibition that dealt with so called open culture. The course was taught by the artists Cornelia Sollfrank and Laurence Russel. It included an excursion and a workshop about the "Wizard of Oz" conference in Berlin where Lawrence Lessig of Stanford University presented his notion of the creative common license. We use streaming media; of course for internet radio. In our weekly radio program we use simulcasting, ether and internet. Beside this line of production we foster audio streaming for special events. We focus on the esthetic possibilities of the tool such as delay or noise. We use it to realize our collaborations in the city and with other places, like the collaboration with Tetsuo Kogawa in Tokyo. We also did a stream with your students at The Department of Media Study. From 2000 until June 2004 we had a collaborative program, called pingfm. The students of this group broadcasted every Sunday together with Amsterdam-based artists like Toek from Radio100. Until June we had our own studio for pingfm with its streaming sessions but now the students stopped because they are about to graduate. I started audio streaming in 1999 when I came to Weimar. I started by involving a student team in the Net Aid Campaign to support Radio B92 in Belgrade during the Balkan war. Streaming video is not my favorite. As an artist I create a lot of visual works but as part of my teaching at Experimental Radio I demand that the time-based and broadcasted programs are without pictures. Students sometimes use web cams or create great visuals in the context of VJ-ing parallel to the audio stream but I do not encourage that. If we use visuals that they should be received like radio or act like paintings in a gallery: You can pass by, the body should have all options in the space where you show it.

TS: Thank you for the interview.

This interview was conducted in the context of a series of events on new media arts education by the Institute for Distributed Creativity <http://distributedcreativity.org>

"A Global Sense of Place"

Report from Eterea 2
Meeting of Italian Tactical Television Makers
March 25-28th, 2004 the second major gathering of the Telestreets took place in Sennegalia.

Here are some notes from a short visit to the world of Telestreets.

Background

Telestreet, the latest wave in the rich history of Italian media activism, has been fairly widely reported on this list and elsewhere but some of the basics are worth revisiting briefly.

Telestreets are semi-legal micro-broadcasters, literally street TV makers using small transmitters to send programmes that mostly reach no more than a few blocks. Telestreets range from making their own local items to capturing the programming (such as big football matches) from the commercial satellite operators and re-broadcasting them for free on Telestreet networks.

Telestreets operate between the legal and technological cracks of the Italian mediascape, squatting the shadows or blank spots which terrestrial broadcasters cannot reach leaving a shadow on the broadcast spectrum which the Telestreet groups occupy.

Telestreet reclaims the socializing power of television. As a medium video retains an immediate accessibility which does not even need to presume conventional literacy. The immediacy and expressive rewards of making TV has enabled Telestreet to appeal to a much wider constituency than just "the movement" or hacktivists. But despite the apparent return to the earlier tactics of the broadcast media pirates, Telestreet is a more complex and interesting hybrid. As their manifesto declared "Television must be considered a new prosthesis and an extension of the net: but to avoid another media alternative 'ghetto', the horizontality of the net must meet the "socializing" power of television."

Orfeo TV in Bologna is believed to have started the ball rolling when it began transmitting in 2002, just a few blocks away from the site of the legendary Radio Alice, and has since been described as her "bastard offspring". What began in Bologna with a few transmitters was soon "joined in a circulation of struggle through a network of websites; they are now connected through 'tactical television' to other Italian microbroadcasters like 'no-war TV', 'urban TV', and 'global TV.'" In what Mark Côté describes "as an emerging network of infrapower".

The Telestreet phenomenon is another splinter from the legacy of the Italian autonomy movement of the 1960s and 70s, a politics which brought down on itself the wrath of both right and Italian communist party by privileging desire and expression over either market forces or party discipline. It re-booted anarchist ideas for a post-industrial age, introducing notions of "immaterial labor", "post fordism" and "refusal to work". The influence of these ideas has fluctuated but grown steadily with fall of the eastern bloc and the rise of the virtual class. But perhaps only "refusal to work" and "class composition" have survived the co-option by "communicative capitalism" and "third way" social democrats.

The first meeting of the Telestreets (Eterea 1) was held in Bologna in 2002 at a point when there were only two or three nodes in existence. But it was at this meeting when Telestreet was conceived and launched not just as a platform but as a political campaign. Two years later what began as a small network of interventions has become a catalyst for wider resistance. Today the network includes more than a hundred nodes (the number fluctuates daily) and stretches the length and breadth of Italy.

The Gasparri law and the Counter Reformation

The recent meeting of the Telestreets (Eterea2) was needed to address questions that had grown more urgent as Telestreet has expanded. With rapid growth has come diversity and questions about whether it is still possible to achieve a common strategy. This was given heightened significance by the passage of the Gasparri law (Gasparri is the minister of communication),

allowing Berlusconi to consolidate his dominance of the Italian mediascape. The passing of this law leaves many in the Italy believing that they are facing an unparalleled political emergency. When I asked the well known autonomist and writer Franco Berardi (Bifo) how the Berlusconi administration sought to justify these actions, "what do you mean justify" he responded in mock amazement "We are a country of the Counter Reformation, there is no need for argumentation. If you win, you win."

Given the fact that this is a defining moment both for Telestreet and Italian politics the choice to hold the meeting in Sennegallia, a small coastal resort was surprising. Indeed this choice along with the agenda of much of the meeting was resisted by a number of militants in Telestreet. The dissenting voices argued that the meeting be both attempting a higher profile and be focused exclusively on mobilizing resistance against the Berlusconi regime.

There was however one good reason for holding the meeting in Sennegallia and that reason was the Sennegallia's own Telestreet: Disco Volante.

Disco Volante

Nothing about the Disco-Volante studio suggests radical media culture. It is located in the sleepy back streets of Sennegallia and is part of "Zelig" a local project in which the disabled and able bodied share a studio and make art together. The project is the long term initiative of artist/activist Enea, the buoyant host of the meeting. The front of the narrow studio space gives no clue that any electronic media are present or indeed welcome. The studio is an overflowing torrent of collages, maquettes, sculptures, paintings, decorated found objects and countless toy theaters. The atmosphere is a mixture of the controlled naïveté and chaos of an artist from the Cobra era and Geppetto's workshop in Pinocchio. A wall near the entrance is covered with numerous awards and photographs of ceremonies at which Zelig participants are being honored as well as images from trips and adventures. This is art and media activism with deep local roots.

The technology of the TV studio in the back of the space sits easily alongside the paints and carpentry tools that could have been found in any artists studio of the last 500 years. Enea, the director (this is not a collective) informs me that this is not art as therapy, neither is it some "art in the community" project it is simply a space which is open to those with disabilities to join him in concocting some version of the good life out of the process of making art together in pleasant surroundings. The fact that this also happens to be combined with a semi legal TV station that mixes a relaxed expressionism with militant campaigning for disability rights is both a fact and appropriately incidental.

Its quite hard to find words to do justice to the atmosphere of energized generosity that pervades the Zelig studio.

Astonishingly Disco Volante was the first Telestreet to have been forcibly shut down by the ministry of communication. The actual transmitter was not confiscated instead it was sealed by ministry officials, a seal it would be a criminal offence to break. Enea takes the sealed transmitter around with him displaying it as an emblem of repression.

Of all the Telestreets to choose as a test case for a ministerial clamp down, why pick on a channel for disabled people? The explanation lies in the fact that it was not merely tolerated by Sennegallia's local government it was actively encouraged. This was not only a battle between Telestreets and the ministry but also between local and national government. These are the regional complexities of Italian politics, complexities go back a long way, think for example of the leading role played by the communist party in the crack down and destruction of Radio Alice in Bologna.

Disco Volante's position as test case combined with a supportive local government willing to sponsor the event made Sennegallia the obvious choice. But more importantly it also provided the opportunity to mount a direct challenge to the law by resuming transmissions of the proceedings of the Telestreet gathering, on channel 52, the frequency from which Disco Volante had been expelled.

Eterea TV: Channel 52

Transmissions from the meeting began almost immediately but by the end of the first afternoon there were rumours of the police trying to locate the source of the transmissions.

By evening the rumours had been confirmed and an impromptu meeting was called to decide how to respond to the police pressure. We crowded into a small room at the "colony", where most people were staying and our host Enea, who was clearly enjoying himself, introduced a local radical lawyer who was present to advise on the risks and help us weigh up the options. Enea himself, informed us that he had actually visited the police himself that afternoon to ask what they intended to do. The officer in charge of

policing the airwaves had declared himself no friend to this law but also said he was a family man and not about to lose his job defending us. So what to do? Carry on transmitting and risk the event being shut down and equipment being confiscated or back down? Some militants from Naples even proposed going on the offensive by transmitting on a frequency that would push the populist commercial Rete 4 off the air. Although the meeting did not opt to go down this route, they still decided to go ahead with the transmissions on channel 52 and indeed to increase their visibility by making their programs as publicly as possible, out in the market and surrounding streets and transmitting them the same day. Moreover a reporter from national broadcaster Rai 3 would be covering the actions to be transmitted on national television.

The transmissions proceeded without interruption. Later that weekend, on Sunday night I was amazed to see that indeed this small action in Sennegallia as well as the Telestreet meeting itself did indeed warrant a five minute slot on the national news. Italian media militants may be correct in declaring that they live in a media dictatorship but their work has more effect and visibility than in most of the rest of Europe. By contrast we in northern Europe inhabit the dictatorships of indifference.

Militants: Activists: Expressivists

The arguments and struggles which dominate Telestreet, can be seen as a dynamic triangulation between three categories or modalities of the tactical: militancy, activism and expressevism. Here are some rough working definitions.

* Militancy: On the second day of the meeting Franco Berardi (Bifo) spoke up for militancy when he rounded off his "hair raising" speech by declaring that in the current political emergency the last thing we should be doing is "embracing our miserable marginality". In his talk he spoke for those who favor direct action, for the politics of maximum visibility and playing for high stakes. For the militants the emphasis on micro-media should not be translated into the irrelevance of micro-politics.

* Activism: for activists micro-transmissions and micro-politics far from being ineffective have a viral power and ultimately can be more significant than engaging directly with the spectacle of national politics and big media. Micro media actions can multiply below the radar of the powerful and only be noticed when they have become too strong to crush. This notion of activism includes long term and highly situated commitments, like Disco-Volante (or for that matter Autolabs in Sao Paolo, or Sarai in New Delhi) whose reverberations go deep and produce new kinds of connective locality. This practice is less obviously heroic than militancy, it engages in fresh ways with every day struggles and affirms ordinary life.

* Expressionism: the final essential modality of the tactical, expressivism, is sometimes referred to rather anemically as "cultural politics" and sometimes as art. In fact it can be art, but it is also *more* than art and its specific claim on loyalty is in urgent need of recuperation. Expressivism is a politics not just of power (i.e. sovereignty) but of language. The power of language to make and rehearse worlds, worlds whose forms resist pre-determination. This usage refers to language in the broadest sense of the word. It includes all experimental arts and invention, including the technological. Expressivist politics are based on our awareness that in a world of contingent horizons, our sense of meaning depends, critically, on our powers of expression. "And that discovering a framework of meaning is interwoven with invention" [1].

Whether or not this generation of utopian political movements can avoid new forms of authoritarianism will depend on the vigilant defense of the expressevist dimension and its subversive freedoms. History shows artists are like the canaries that used to be carried by miners, they give early warning of toxins in the ether.

The greatest danger for Telestreet is to split along the faultlines of any of the modalities. If Telestreets (indeed all tactical media) are to retain their characteristic bite; militancy, activism and expressevism must all be present or all will be lost. In each of the particular cases of a Telestreet, one or two of these modalities will always predominate, but it is only by retaining all three, in variable orchestrations, that we will see the formation of real difference, effectiveness and freedom.

Global Telestreet

Whatever the differences within the Telestreet movement there is consensus on the need to scale up. Some voices would like to see it gain its own national frequency others would prefer local autonomy to prevail with each Telestreet extending and intensifying the process of expansion through networking and the sharing of content. Making the dream of effectively hybridizing Telestreet through networking and content sharing was explored in different ways throughout the days of the meeting. From Alan Toneris (Autonomea) [1] detailed and knowledgeable exposition of the ways in which the approaches of "the creative commons" movement were being and could be

further applied to Telestreets through to the technical solutions being offered by New Global Vision [3].

The remarkable NGVision project was founded in the wake of the Genoa G8 protests. It set out to make the hundreds of hours of activist material freely accessible in a single location as common resource. They currently have the space of 5 servers, stocked with around 300 videos, with a new tape being added at least once a week. NGVision uses bit-torrent to make the download times relatively fast, an hour of video can be downloaded in approximately fifteen minutes. NGVision is already in extensive use with approximately 10,000 videos being downloaded per month. NGVision has offered its system for use by all Telestreets in Italy and beyond.

Although the local roots and Italian political theater help to make Telestreet strong the atmosphere can also be rather self-referential and inward looking. But there is a growing realization that to survive Telestreet needs to reach beyond the conceptual boundaries of national politics. Slowly a translocal awareness is occurring in part through the work of writers like Agnese Trocchi and Mateo Pasquini and Mark Coté whose work is helping to spread the Telestreet virus. Versions of Telestreet are already beginning to spring up in Holland, Switzerland (Proxyvision) and most recently as Telezione Piquetera the first Telestreet in Argentina [4].

Cecelia Landsman and myself were attending the meeting on behalf of Amsterdam's version of Telestreet: Proxyvision. In our presentation we emphasized the translocal dimension of Telestreet [5]. Italian Telestreet works in part because it is embedded in local histories but is also through inspiring similar initiatives elsewhere. Our point is that once these initiatives take hold active connections and support from the more developed Italian Telestreets will take the project down pathways unconstrained by the puppet show of national party politics. The ways in which this process is already occurring are helping to a relatively new kind of "situated metropolitan tactics". From this perspective, rather than imagining that the networks have made borders disappear, we see the emergence of new ways of organizing locally that (by the very act of connecting across and through our differences) lead us towards something like a "global sense of place".

<<http://amsterdam.nettime.org/Lists-Archives/nettime-l-0302/msg00116.html>>

I later found a quote of Alan Toner from an essay he wrote about the anti-Iraq war demo in Rome which could equally be applied in the Telestreet context. "Challenges on this scale put into perspective the sniping between different radical factions and pose once again the problems of representation. How can practices of self-organisation, democracy and direct action proliferate?"

Organic Intellectual Work
Interview with Andrew Ross

By Geert Lovink

Does cultural studies scholar and labour activist Andrew Ross need to be introduced? I became familiar with the work of U.S. American researcher of Scottish descent in the early nineties when his co-edited anthology *Techno-Culture* and books *No Respect* and *Strange Weather* reached wide audiences. His highly readable books deal with a range of topics from sweatshop labour, the creative office culture of the dotcoms, middle class utopias of the Disney town Celebration to China's economic culture as a global player. For outsiders, Andrew Ross might embody the 'celebrity' persona of academia, but he is someone I experienced as modest and open, a prolific writer who is very much on top of the issues. To me Andrew Ross has been a role model of how to reconcile the world of High Theory with the down-to-earth work within social movements, a tension that I have been struggling with since the late seventies. Reading Andrew Ross makes you wonder why it is so hard to be an organic intellectual after all, as Antonio Gramsci once described it, a figure which is light-years away from the abstract universes of the Italian autonomous theorists such as Negri, Virno and Lazzarato. No esoteric knowledge of Spinoza, Tarde or Deleuze is necessary to enjoy Ross. We do not read about exploitation in a moralistic manner but instead obtain a deeper understanding of the complex contradictions that the global work force has to deal with.

Australian post-doc researcher Melissa Gregg, whose book *Affective Voice* deals with the history of (Anglo-Saxon) cultural studies, includes a chapter about Andrew Ross. Gregg describes Ross as an "intellectual arbiter between the academic politics of cultural studies and the activist imperatives of the progressive Left." His "academic activism" describes the "human cost of economic growth," thereby counterbalancing the "neglect of material labour conditions." Instead of fiddling around with concepts and terminologies, Ross describes the "human face of economics" much like Barbara Ehrenreich's investigative journalism, reaching into the category of airport non-fiction. The suspicious attitude towards appropriate payment is the key obstacle to an effective labourist politics among Leftist intellectuals. In the case of the no collar culture "not only did the culture of willing overwork severely haemorrhage any chance of a sustainable industry, but investment in the cult of creativity disassociated no collar work from the manual labour involved in producing the tools of their craft." In the following email exchange with Andrew we focused on the topics of research methodology and style of writing, the role of ethnography, the question of creative labour and strategies of activism.

GL: Suppose you were to write one of those booklets and we would entitle it *Letter to a Young Researcher*. How would you approach this? Could you tell us something about your method? Is it fair enough to say that you moved on from General Theory to case studies? Clearly, students need to know about both, but I have the feeling that theory is a dead end street these days and that your research methodology offers an alternative.

AR: Since I came of age, intellectually and politically, in the 1970s, I was a paid-up member of the Theory Generation, dutifully participating in Lacan and Althusser reading groups, and the like. But even then, I was rarely comfortable with the hothouse climate around what you call General Theory. Even then, I was learning that theory should be approached as simply a way of getting from A to B. It wasn't the only way to get from A to B, nor was it always the best way, and it was easy to get stuck en route with all your mental wheels spinning in the air. Indeed, I saw some of the best minds of my generation—to paraphrase Allen Ginsberg—vanish down that path. I'm glad I survived. I've been in recovery for two decades now.

When it comes to method—and this is what I tell my graduate students—it's more important to know what A and B are. Once you have a good sense of your object and the questions you want to answer, then you are in a position to choose your methods—i.e. how to get from A to B. In most disciplines, the method comes first, and is then applied to an object. For us, it's the other way around. The questions and the goals determine the methods. So, how will I answer those questions? Do I need to do interviews, or conduct surveys? Do I need to visit sites, or consult archives? What kind of reading do I need to do, and what is the likely audience? In the program where I teach, our students are trained in more than one method—ethnography, historical inquiry, textual analysis, data analysis—and are encouraged to be flexible in their application. They are much more likely to think of themselves as investigators, undertaking case-studies, rather than being motivated by general theoretical problems.

Approaching research in this manner, it's more likely that they will find their own voice, or at least a voice that is uniquely theirs.

rather than aping the consensus voice of their discipline, or whatever influential master thinker they have been weaned on. It took me several years to shake off my own academic training and find a voice that I felt was my own and I had to go well outside my comfort zone to achieve anything. So my advice to young researchers is tailored to the goal of getting them to that point much earlier than I did.

GL: Does your move from Cultural Studies to a new form of labour sociology also imply a critique of the way in which cultural studies has been bogged down in studying popular culture and mainstream products and services? In my experience 'cultural studies' has not globalized but can increasingly be identified as an Anglo-Saxon project that has not broadened its reference system outside of the UK, USA and Australia. It may have adopted 'French theory' but in France itself cultural studies is nowhere to be seen. Now, there is nothing wrong with cultural specificity and the political heritage of research schools ... knowledge is always embedded in particular generations and experiences of a small group of players. I know there are zillion debates about the 'future of cultural studies' but could you nonetheless say something about this?

AR: To answer that question, I'd have to touch on a debate about why labour was not more central to cultural studies during its heyday. Indeed, some would say that a conscious effort was made to sideline attention to labour. This is quite understandable if you consider how the British Left, for example, was dominated by a labourist mentality in the 1960s and 1970s. It was necessary to get out from under the heavy weight of that mindset to appreciate that other things mattered politically. I myself grew up in the industrial belt of Scotland, where labourism was the air that you breathed, and so the discovery of cultural politics—the fact that you could even think about culture politically—came as a revelation. Naturally, there was a certain degree of overcompensation involved in the cultural turn. Folks just kept going further and further from the labour fold, arguing that this or that sector of daily life 'mattered' in ever more ingenious permutations of the feminist axiom that "the personal is the political." The result was that the field of political economy was abandoned, to some extent, to the hardliners, who no longer had to listen to the feminists, queers, cultural radicals, and ethnic identity advocates, and polarization set in between the cultural justice and the economic justice camps. The legacy of that split is still with us—indecid it has been played out in every US election since the early 1990s. There's no doubt it has hampered the Left, but the division has been exploited much more adroitly by the Right.

While you may be right about the limited geographical footprint of Cultural Studies as an academic discipline, I don't think these larger political conflicts are confined to the Anglophone countries. They are expressed in different ways in other societies—usually through the repressive filter of religion or statism or ethnic sectarianism—and are sometimes harder to discern, but they are no less relevant.

In all of the hand wringing about polarization, what's neglected is the work that was done—it was never really abandoned—and is still being done to reconnect these two wings of social justice. I suppose that's where I would place my own energies from the late 80s onwards, in areas of research—science and technology, and environmentalism in books like *Strange Weather*, *The Chicago Gangster Theory of Life*, and *Real Love*—that were not at all central at the time to the main currents of cultural studies. By the mid-1990s, I was being drawn into labour and urban research, both of which have dictated the bulk of my research and activism for the last decade or so. However, I'm not sure I would have gone in that direction if it hadn't been for cultural studies. For example, it was my interest in fashion consumption that took me into the anti-sweatshop movement and led to the publication of *No Sweatand Low Pay, High Profile*, and it was an interest in ecological politics that motivated my field work on the New Urbanist movement in *The Celebration Chronicles*.

One area where all these currents re-converge is in the emergent policy about the "creative economy." Here is a sector that has received a massive amount of attention from government agencies and national economic managers desperate for a development paradigm that will allow them to compete or play catch-up in the high-skill, knowledge economy. And it's all about cultural workers, once seen as completely marginal to the forces of production and now increasingly central as a source of potential economic value. Now there does exist an extensive body of cultural studies scholarship, initiated by Tony Bennett in the mid-1990s, that engaged directly with cultural policy-making, but it's only recently that this tendency has moved centre-stage, and will, I predict, occupy more and more of the field. In many ways, it's an angle that was missing from Raymond Williams' distinction between two conceptions of culture: one based on the high/low value hierarchy, and the other, more anthropological understanding of culture as "way of life." Neither made much room for culture as a livelihood, or cultural

work as labour. In Williams's day, it would have taken a remarkable act of social foresight to imagine that artists, writers, and designers would come to be seen, in the governmental imagination, as model entrepreneurs for the new economy, and yet here we are.

Let me give you an instructive example. Back in the mid-1990s, after the leadership of the AFL-CIO (American Federation of Labor and Congress of Industrial Organizations) changed hands, I became involved in a organization called Scholars, Artists, and Writers for Social Justice (SAWSJ). It was founded, mostly by labour historians, in recognition of the hope that the US labour's movement's era of complicity in the Cold War was over, and that a rapprochement with intellectuals was now possible. Most of the activities of SAWSJ were dedicated to supporting the industrial and service unions. This was entirely laudable, but it often meant ignoring the labour issues in our own backyard of the knowledge economies. Even at that time, it was difficult to get an audience for the view that we were not only in denial about this, and that we should be alerting the labour movement to the opportunities and dangers posed by the burgeoning culture/creative/knowledge industries (I wrote an essay "The Mental Labour Problem," which was intended to address this denial). Not long after, managers and ideologues of the New Economy dramatically reshaped perceptions about how value could be generated, and the labour movement was left sucking dust. New media employees helped to glamorize the 24/7 workweek, design, art, architecture, and custom craft were embraced as engines for boosting property values in the real estate boom, the amateur (MyCreativity) ethic became the basis for a whole new discount mode of production that exploited the cult of attention as a cheap labour supply, and much, much, more along these lines.

The only development along these lines that has really attracted trade unions is in academic organizing, and largely because it offers a fairly traditional opportunity to recruit new members. For sure, there are individual unionists, mostly in sectors like telecommunications, who are keeping up with changes in the mode of production, but the labour movement, as a whole, and not just in the US, may have relinquished the short-term opportunity to fight over the terms of the knowledge economy. Knowledge and cultural workers are accustomed to think of themselves as in the vanguard, and it will probably take a generation of "proletarianization" and another big recession to persuade them that collective organizing is in their long-term interest. But that's no reason not to build a movement of ideas and actions that will be serviceable, when that moment comes.

GL: I read your *Low Pay, High Profiles* as a search for new strategies in activism. In your 'academic activism' you leave behind the disempowering reform-or-revolution choice and try to imagine, being part of a movement, where the 'global push for fair labour' can be taken. Here in Amsterdam I have seen how the Clean Clothes Campaign is doing this. Is it fair to say that you practice a form of 'radical pragmatism'? Is there a politics of immersion? Many of us fear deep engagement and try to keep the appropriation machines at a safe distance. How do you gain the confidence to survive Disney's *Celebration*, the dotcom madness, and Chinese IT culture?

AR: "Intellectual activism" is a term we use among our students. We vastly prefer it to "public intellectual" because there are very few slots available on the public media spectrum at any one time, and they are usually reserved for gatekeepers or single-issue political advocates. For sure, activists and intellectuals function in a different kind of temporality. The activist needs something to happen tomorrow, the intellectual needs a slower germination of ideas. But you can't have movement of action without a movement of ideas, and the challenge really is to try to synchronize your thought with what's happening on the ground. If you work closely, as a scholar, with a justice movement, then requests will invariably be made to provide tailor-made research to further the activist cause. In some instances, that will be straightforward, in others it won't be so easy to provide because activists generally don't want complexity, they need black and white, and critical scholars are not trained to think in black and white. I have certainly encountered this dilemma in my own labour-oriented work, in the anti-sweatshop movement, for example, where, at times it seems that the only desirable research is that which corroborates the existence of corporate atrocities. But I didn't experience it as a fear of "deep engagement" as you suggest, nor as a fear of indulging in intellectual dishonesty.

Take the work I did in the China field as an example. I had been a China-watcher for a long time, but was clearly not a sinologist. Nonetheless, I figured that I may be able to produce some useful research (that a sinologist, bound by disciplinary convention, perhaps could not) by going there. So, too, since the AFL-CIO refuses to have any official relationship with the China labour federation, there was a real research gap for labour scholars and educators to fill. I was familiar with all the literature on the labour-intensive export

factories of South China, but I could find very little about the Yangtze Delta workplaces, where the lion's share of high-tech FDI was beginning to flow, and most of it higher up the technology curve than in South China. At that time, there was a wave of anxiety about the outsourcing of high-wage, high-skill jobs to China and India, but very little was known about the conditions, aspirations, and opinions of the new offshore workforce employees. So I enrolled in Mandarin classes for a year to give me some language mobility and took my family off to Shanghai to see what I could find. A trained sinologist would probably not have started out interviewing where I did—at the American Chamber of Commerce, in the belly of the beast, as it were—but in fact the contacts I made there helped open doors to many of the factory and office workplaces where I did my research. Nor do I think that a sinologist would have followed some of the leads I did since they were often about explicitly transnational flows of capital, knowledge, technology, personnel, and customs.

In fact, in the year's worth of field work I did in the Yangtze Delta industrial parks, I didn't come across a single researcher doing anything in any of the areas I myself was pursuing—documenting the regional labour market, workplace conditions, the nature and character of the investments, the rate of technology transfer and knowledge transfer into the industrial parks, the cultural conflicts between young Chinese engineers and their foreign managers, etc. Now this is the single biggest regional economy in China, and the most high-tech, so it was astonishing to find no one else in the field. Even the foreign journalists I got to know there rarely left their offices in Shanghai—a convention, no doubt, that goes back to pre-Liberation days.

So, to get back to the gist of your question, I think the "confidence" you refer to has more to do with not being bound by the conventions of a discipline or a profession that tends to dictate the conduct of scholars, activist, and journalists much more than we imagine. I became an agnostic in that regard a long time ago. The downside of this is that you have no idea who your audience will be, or that you will indeed have an audience. For example, the most detailed early review of my China book was by George Gilder, in his newsletter for high-tech investors. He mined it for information about the performance of Chinese tech companies that would be especially useful to his readers. Not exactly the kind of audience I had anticipated!

GL: How important is storytelling in your work and is it something that we, cultural theorists, can learn? I find this skill more difficult to practice, and teach, compared to the relatively easy act of summarizing the theory of canon of the day, now Agamben and Badiou, in the past Derrida and Foucault, and Althusser and Gramsci in the early 1980s. I see your recent work in the critical anthropology tradition. Action research also had a particular mix of observation and active participation. Is ethnography something we should look into or do we then again run the risk of turning it into a theory religion?

AR: You are right, it is not easy to teach, and largely because it is so experiential. I was trained first as a textual analyst, and then as a theorist, so I developed skills as a close reader and a conceptual thinker. What this meant was that I was a pretty bad listener. I grew up in a storytelling, working class culture in Scotland, but my academic training had taught me to distrust all of that, in fact, to distrust language tout court. Over time, and as I developed my own ethnographic techniques, I had to re-learn how to listen to other people's stories, and to be accountable to these people when I used their stories for my own purposes. So listening was important. As for telling the stories, the genre of investigative journalism has probably been as useful to me as critical anthropology. When anthropologists are in the field, they are often competing with journalists (though not on deadlines) but they rarely acknowledge journalistic narrative. In the full-length ethnographies I have done—in new media companies, in Celebration, and in China—I was competing directly with other journalists for stories insofar as my informants were often used to talking to journalists. Being a scholar was an advantage in those situations because people trust you more with their stories and confidence.

As for ethnography becoming a religion, I don't see that happening. To go back to what I said at the outset, it's a method for getting from A to B, but it's not the only way, nor is it always the best way. You have to choose your methods based on your goals. These days, ethnography feels more honest to me than the kind of armchair criticism that I started out doing in the 1980s, but I still do certain kinds of writing that don't entail getting out of my seat.

GL: Activist campaigning is becoming more and more associated with 'tactical media', social networking and so on. Is this justified? Do you think that a better understanding of Web 2.0 and new media would alter activism as is often claimed? As you know my work is associated

with the 'tactical media' term but I have often made clear that (new) media cannot create social movements out of nothing. A more effective way of using cell phones and the Net is not in itself a guarantee that the real existing discontent in global capitalism will flip into organized resistance or even protest.

AR: I agree, these days it is necessary but not sufficient for social movements to be tech savvy. The tactics for outwitting the oppressor have to be continually updated, and that is the job of movement tacticians, but the "sufficient conditions" for change haven't altered appreciably. You need a critical mass of popular sentiment, you need a significant fraction of elites to break with their class station and cross over, and you need an effective formula for capturing media attention. These days, most social justice movements have about six or seven years to make their mark before a) activists burn out or branch off, b) the formula exhausts its efficacy, c) the enemy coopts public attention. The anti-sweatshop movement was a good example; the formula of shaming the brand was like a narcotic for the media. "Nike sweatshops" became a household phrase, and elite guilt was appropriately mobilized. It took the lavishly funded efforts of "corporate social responsibility" several years to convince the public that the big garment companies had somehow "fixed" the problem and that it was OK to go out and buy Gap clothing again. In the interim, I think we achieved quite a lot. At the very least, the trading rules of the global economy are now contested in the public eye, rather than written in secret by unelected WTO officials, and consciousness-raising about sweatshops contributed, in no small part, to that shift in the rules of play.

That said, there is one key area of activism in which tactical media has become particularly important, and that is in the copyright over intellectual property. The corporate rush to prioritize knowledge is surely one of the biggest acts of theft in centuries, and new media activists have a frontline role to play, because the tactical tools they use are, more often than not, the technologies at play in the property grab. Disciplining rogue users (for the downloading of unauthorized content) is just the most highly publicized face of the massive effort of capital-owners to administer an effective division of labour within the knowledge industries. That effort increasingly depends upon control over not only the authorized use of technologies, but also the IP inside employee's heads. But it's not just the high-tech employees that are suspect. The new property grabbers are in a running battle with the ever-proficient hackers of the technocratic fraternity, and now they have to contend with a small army of legally-minded and tech-savvy advocates of the information commons.

As I see it, this contest is very much an elite "copyright" between capital-owner monopolists and the labour aristocracy of the digitariat (a dominated fraction of the dominant class, as Pierre Bourdieu once described intellectuals) struggling to preserve and extend their high-skill interests. The history of shareware and its maturation into free software/open source can be seen as the narrative of a distinctive class fraction—a thwarted technocratic elite whose libertarian world view butts up against the established proprietary interests of capital-owners. While they see their knowledge and expertise generating wealth, they chafe at their lack of control over the property assets. Their willingness to work against the proprietary IP regime is directly linked to their entrepreneurial-artisanal instincts, but, more importantly, it is a power-test of their capacity to act upon the world. The class traitors in their midst are engineer innovators who go over to the dark Gatesian side of IP monopoly enforcement. So, too, the mutualist ethos of the FLOSS communities is very much underpinned by the confidence of members that their expertise will keep them on the upside of the technology curve that protects the best and brightest from proletarianization.

What I don't see is all that much attention to those less-skilled who are further down the entitlement hierarchy, who are not direct participants in this power struggle, and whose prospects in the chain of production do not extend to the profile of the master-craftsman straining at the corporate leash. They are much more distant from the rewards of authorship, and are less likely to feel personally disrespected when IP rights are expropriated from above. So how do the interests of these below-the-line workers get represented in the copyright? I'd like to see new media tacticians think more about sustainable income models for everyone rather than focus primarily on the livelihoods of creatives or high-skill knowledge workers.

GL: Surprisingly, in the new media sector, young professionals are earning less and less while their working conditions aren't that great either. This is one of the outcomes of Rosalind Gill and Daniela van Daemon's case study on the Amsterdam web designers. It's important here to add another level that sufficiently describes freedom and subjectivity of the actors involved. People are passionate about the challenges that new media create. In what ways could we describe such a

paradoxical circumstance?

AR: The Amsterdam study is interesting, though these results don't surprise me. The labour market for new media employees was at its rouiest at the height of the New Economy years---there was a limited labour supply, the new entrants had a monopoly on skills and applied knowledge, and demand for them was fierce. Under normal circumstances, conditions and pay scales could be expected to deteriorate from that high. But the impact of outsourcing, since 2001, has accelerated that decline, if not in terms of actual jobs transferred overseas, then as a result of the general climate of insecurity that has been ushered into white collar and no collar workplaces by the imminent threat of "knowledge transfer." The house motto of Razorfish in the boom years used to be "Whatever can be digital, will be." It was by no means easy to predict what came to pass all too quickly as "whatever can be outsourced, will be." For sure, the offshore transfers started out in coding and in the more routine sectors, but they moved up into design and web development fairly rapidly. As far as jobs in the global North goes, there's no reason not to expect that the situation will soon resemble the garment industry, with the most specialized, custom work remaining onshore, perhaps along with a less formal sector of sweated or intern work needed for fast turnaround. Everything else will be done overseas.

As for on-the-job passion and enthusiasm, it's an integral part of the job profile, attested to through thick and thin. It was this devotion that got me interested in studying new media workplaces in the first place, since it's quite uncommon, in the history of modern work, to hear employees express this kind of zeal around their jobs. My study, in No-Collar, turned into an effort to describe and diagnose the conditions of "self-exploitation" that resulted. One of my informants put it most succinctly when she said she was given "work that you just couldn't help doing," and in a workplace from which the very last drops of alienation had been squeezed. Nowadays, every knowledge industry employer recognizes the benefits of this kind of ideal employee, who is turned on by the challenge of risk, accustomed to sacrifice (long hours) in pursuit of gratification, and willing to trade his or her most free time and free thoughts in return for the gifts of mobility and autonomy. Folks in the arts have long lived with this sacrificial mentality, and know a thing or two about the insecurity associated with it. So, too, gearheads, from the days of ham radio onwards, are familiar with the devotional cults that a machine can inspire. But neither cohort has been prepared for the consequences wrought by the rapid industrialization of their respective crafts and hobbies. The effort to industrialize custom creativity is a primary goal of capitalist production today, right now.

I suppose I would say the same of the academic sector, with the proviso that academics are so fond of their siege mentality that they can only see their workplaces being invaded by corporate logic or industrial process. They don't see that the traffic goes in both directions, they know so little about the corporate world that they can't see how the mentality and customs of academic life are being transplanted into knowledge firms, whose research is increasingly conducted along similar lines. The truth of the matter is we are living through the formative stages of a mode of production marked by a quasi-convergence of the academy and the knowledge corporation. Neither is what it used to be; both are mutating into new species that share and trade many characteristics, and these changes are part and parcel of the economic environment in which they function.

GL: You touched on the "creative economy." As you know, we've been dealing with this in the MyCreativity project that my institute in Amsterdam co-initiated. What should the critical research in this field look into? There is a call to go beyond the hype bashing and look into the labour precarity issue. Still, the consensus-driven hegemony of business consultants seems strong and uncontested. What work could be done to open the field and make space for other voices and practices? Are there ways to obtain cultural hegemony these days?

AR: That's a good question, and should be at the heart of anyone interested in a sustainable job economy. It's not all that productive to scoff at policy initiatives that might just be capable of generating a better deal for creative labour. As I see it, critical research ought to be doing what governments are not, and that is coming up with qualitative profiles of what a "good" creative job should look like, based on ethnographic methods. Currently, all we have are productivity and GDP statistics, on the government side, and, on the other side, a cumulative pile of scepticism based on the well-known perils of precarity that afflict creative work, dating back to the rise of culture markets in the late eighteenth century. I have yet to see a "mapping" of the creative sector that includes factors relating to the quality of work life. It wasn't that long ago, in the 1970s, in response to the so-called "revolt against work," that governments actively championed "quality of work life." Of course, corporations

came up with their own versions of "innovative" alternatives to the humdrum routines of standard industrial employment, but the hunger for mentally challenging work in a secure workplace has undergirded and outlived all the management fads that followed.

For those with an appetite for a dialogue with the policy-makers, I'd say that the qualitative research about good jobs is a plausible way to go (and I'm talking about fully-loaded jobs, not simply work opportunities). It wouldn't take all that much to come up with some proposals for guidelines, if not outright guarantees, about income and security, based on that kind of research. The goal would be to offer a sustainable alternative to the IP jackpot economy that currently drives the consultants' world-view. I'm not sure if the result would be what you would call cultural hegemony, but if the challenge to existing hegemony is going to draw on labour power in any way then it's in our interest to ensure that there will be a robust employment sector there to provide heft and volume to these challenges. Clearly, the strategies for organizing have to be re-thought in ever more ingenious ways, but there are no good substitutes for organizing, as far as I can see. Tactics like culture jamming or brand busting have their uses, and they have served as appropriate tools, but you can't give up on the power of numbers.

The Politics of Presence Research
Interview with Caroline Nevejan
By Geert Lovink

The Dutch cultural producer Caroline Nevejan is known for her work at the Amsterdam pop temple Paradiso, as a co-founder of the Waag centre for new media culture and in her manager role at HvA, the university for professional education. Currently she is a member of the Dutch Council for Culture and the Arts, which advises the Minister of Culture. She was about to leave the Hogeschool van Amsterdam in 2004, intended to write her PhD, when I arrived there. The dissertation is ready now. In April 2007 Caroline Nevejan got her degree at the University of Amsterdam. The title is Presence and the Design of Trust and can be freely downloaded at <http://www.being-here.net>. The interview below was done to reflect on her PhD research.

I must have ran into Caroline around 1980, during the turbulent riot days of the Amsterdam squatters movement. Late 1981 we were both part of the group that kicked off the bluff! weekly, bringing together undogmatic factions within the new social movements of the time. For a few months we were both in the editorial team. A few years later Caroline reappeared as the events producer of Paradiso. It was there, in August 1989, that we worked together during The Galactic Hacker Party, Amsterdam's first computer hacker's convention. I was there in my capacity of 'illegal scientist', as a member of the Adilkno group and Mediatic editor, writing reports and manifestos. A year later I participated again in an event of a similar visionary magnitude, the Seropositive Ball, which connected HIV-AIDS activists on a global level. Out of these grew the first Next Five Minutes (tactical media) festival in January 1993.

Key element of these events was the spatial arrangement of the interaction between the Paradiso audience and people elsewhere. In conjunction with De Balie, the cultural centre next door, an Amsterdam style was developed in which a lot of emphasis was put to create an 'aesthetics of public debating'. Discussion was more than a disagreement between key actors. It had theatrical elements in which the producer took up the role of director. It was in this context that new communication technology such as telephone, fax, video conferencing, bulletin board systems and the Internet started to play a role. Why limit a dialogue to those who were able to gather in a particular time and space when you can also involve others remotely?

‘Presence and the Design of Trust’ is certainly an innovative and non-conventional piece of research. Let’s call it singular. Caroline decided to take both The Galactic Hacker Party and Seropositive Ball as her case studies and came up with valuable insights that contribute to the yet unwritten history of Amsterdam’s new media culture. The central dynamic she studied is the one between natural and mediated presence. Technology has altered our sense of presence. The question that Caroline Nevejan poses is how networked entities can produce ‘thinking actors’ that play a role in building up ‘crucial networks’. Overcoming the usual binaries between real and virtual is one, but how can we build ‘communities of practice’ that really make a difference, beyond techno-fetishism and political dogmatism? How can we overcome the tendency to produce noise and tension on the line and develop a sense what ‘vital information’ is?

GL: You have a broad, conceptual understanding of ‘design’. Where does this idea come from? People know Dutch design and architecture, but that’s perhaps not what you refer to. Design, in your understanding, seems to be a procedure, a set of rules, not unlike project management, which is a practice, one that is not by definition related to aesthetics.

CN: Coming from Holland, the ‘man-made’ land where everything is designed and which has a remarkable design tradition of which the modern aesthetics have influenced worldwide perception of design, has definitely influenced my perception. I know the environment is ‘made’, I know aesthetics matter. I know different designs operate at different scales and need different approaches to resources, project management, distribution and protection. My personal understanding of design is also deeply influenced by social movements, by critical science and by the specific Amsterdam evolving digital culture at the end of the 1980s and early nineties, which was a remarkable inspirational environment to be part of.

It was not till I entered into the Doors of Perception community that I started to refer to my own practices in terms of design. In the Doors of Perception large global network people have been discussing and presenting best and worst practices in the developing networked society since 1993: scientists, engineers, artists, graphical designers, interaction designers, philosophers, businessman, inventors, computer wizards and others coming from art, grass root organizations as well as from small companies and large multinational corporations. All were concerned to find good and profitable ways to proceed in this unknown and fast changing landscape. Already in the mid nineties the discourse in this conference changed and started to imply that designing ‘stuff’ implied designing behavior and experiences of others. It became apparent from practices in business as well as social organizations that design is a way of looking at problems and solving them.

In the fast changing landscape design methodologies appeared to be capable of dealing with a large variety of input in a fast output process. People realized that such an approach could be very useful, also outside of the classical design realms. The evolving networked and information society and the elaborate digitalization of many processes had a huge impact on basic structures of many organizations and businesses. They needed the skills from the design world to be able to deal with the complexities they were facing. In my view, today, design has become a paradigm in itself. Because it emphasizes the ‘making of things’ people from different disciplines can contribute and collaborate. The ‘thing’ to be designed brings perspective to the collaboration. In design a variety of languages and media is used (writing, drawing, sketching, photo’s and film etc.) to make mock ups, demo’s, storyboards, scheme’s etc, and the use of such ‘boundary objects’ facilitates the conversation between people who usually have a hard time understanding each other. Nevertheless I argue that I think that ‘design as research’ or ‘deep design’ as Peter Lunenfeld formulated it, has not yet developed the rigor and knowledge base it needs to be able to deal with the complex issues it faces.

I propose to distinguish between 2D design for space (space) and 3D design for function (space and action), 4D design for dramaturgy (space, time and action) and 5D design for orchestration (space, time, action, relations between people). When focusing on dimensions, each of these kinds of design has its own traditions that it can build on. In the different arts and sciences basic issues around the structure of time and space, actions and relations between people have been studied and experiences have been gathered that can be used.

Originally ‘design’ referred to 2D design for space as in layout and to 3D design for function (space and action) for creating objects and architectures of all kinds. This design is inspired by the classical ‘design is art’ tradition. 4D design for dramaturgy (space, time and action) designs sequences of action. It is used to create events, educational modules, computer applications or the creation of games.

This 4D design can build upon the rich traditions of theatre, dance, music, film, architecture and certain sports. Over the last 10 years we have seen the rise of 5D design for the orchestration of processes (space, time, action and the relation between people). One is today much more aware how infrastructures, frameworks and platforms influence how people interact. Designing user platforms, intranets and communities online have led to using design methodologies for designing new business processes, learning ecologies and human communities. Sometimes one can wonder whether to call this design. I do when design methodologies are used to tackle complexities. Traditions to look into are the arts in which improvisation and synchronization between the artists plays a role of significance as well as into the social and organizational sciences. So, yes, I guess I do have a conceptual understanding of design. I do argue, though, that aesthetics matter.

GL: How did you encounter the concept of ‘trust’? Isn’t it a concept of business consultants who saw that their clients had a security problem with their computer networks? How did this concept get introduced in cultural theory and design?

CN: The moment I was introduced to the existence of Internet immediately raised the issue of trust. In the 1980s networks like Peacenet and Greenet provided us with news, which could travel beyond the censorship rules from countries like South Africa. So the Internet provided ways to get around not to be trusted formal news reports and it generated ‘trust’ because the witnesses themselves could speak up and testify unedited. When I started to make shows in Paradiso I collaborated with hackers and through them I found out how the technology itself is easily manipulated, how any code can be broken and how the business propaganda of delivering ‘safe’ environments was (and is) a fairy tale. At the time I could not have formulated it in these terms, but in hindsight I can see that we were dealing with multidimensional designs and were struggling how all these related and contextualized each other and in this process trust appeared to be fundamental to be able to understand what was happening.

Trust is a fuzzy concept and at the same time it is crucial in any interaction. Everyone who makes things that other people use faces issues of trust. In collaborations, agreements and contracts, in delivering and using services, as well as in every street, issues like safety, liability, believability and trustworthiness profoundly influence the dynamics of interaction. Even though little has been written about ‘trust’ as such in the design world, since people realize that they are modeling behavior of others, trust surfaces as an issue.

The possibility of using multiple identities on the Internet has made more and more people aware about for example the basic trust people exchange when they meet. I find the design of trust most complex in 5D designs. These often deal with power relationships in which the establishment of trust can easily be misused. I do not think such misuse only happens in business, I have seen it in many places. Especially when larger groups of people start to express themselves and start to take responsibility, as is facilitated by developments like the Internet, the old fashioned forms of control is not good enough anymore. With new ways of generating knowledge and new ways of interacting, new management styles are necessary. Such styles focus on orchestration, on delegating responsibility (instead of tasks) and facilitate people to contribute and meet other people with other skills and knowledge as well. The way ‘trust’ and its dynamics are shaped, shapes how people will relate and this defines possible success.

GL: I read your study as a reflection on the culture of organizing public debates that existed in Amsterdam. From early on you have been looking for alternative formats and ways to ‘stage’ controversies in a different manner, for instance through a banal detail like the rearrangement of seats. Do you think that we reflect enough on this new culture that has been created in Amsterdam? It is great to read about the Galactic Hacker Party and the Zero Positive Ball. However, you also get the feeling that we do not take ourselves serious enough. Could we talk about a ‘school’ in Amsterdam that deals with alternative designs of public debates? There is a lot of knowledge floating around amongst even an organizer that is not written down. You’re not a historian, and neither am I. How do you see that we could better ‘capture’ the overflow of innovative, unique practices that happen in this city? How can this fertile place of experimentation gain more influence, worldwide?

CN: When traveling I realize again and again that the Amsterdam cultural context in which I grew up and to which I could contribute to, was very special. It would be interesting to analyze this from a design perspective: to distinct the historical, the structural and the self-organizational elements for example. What created this

amazing challenging and yet safe playground at the time? Such an analysis also needs to take into account how it changed early this century. How community centers were shut and kids were back in the streets, how people retreated in their own realm, how bureaucracy and administration dehumanized, how the homo scene is suddenly in defense again, how the local media scene more or less disappeared. Most of all I wonder whether the current generation of young people in Amsterdam experiences this freedom and richness we participated in at the time.

I do agree with you that in the seventies, eighties up to the mid nineties there was a very special culture here, which was internationally recognized and which maybe you could even label as what I would propose to formulate as The Amsterdam School for Public Research. One of the characteristics of this Amsterdam culture was and maybe still is that things are made and tried out in public spaces and had a research character. People from different disciplines participated as well as artists, whose involvement has been crucial for success. By making things in public place, the public influences what happens. And as a result things that are made and happenings inform the larger political and social debates. Public Research, a notion we introduced when we founded the Waag Society in 1994, has not been much elaborated very much upon since. There is a lot of not-formulated experience and insights in how to make Public Research happen, here in Amsterdam as well as in other places (like the Sarai initiative in India for example). I wonder, though, whether this is a question of 'capturing'. I guess cultures fertilize new cultures when there is a chance to experience. Such an analysis should inform new designs that can operate in the new current contexts.

Your question also seems to suggest that the 'Amsterdam approach' should gain more influence worldwide. Even though I tend to be skeptical about such 'cultural transmissions', I realized through the many responses on the Al Jazeera broadcast of 'Couscous and Cola', a television series produced by my (own) sister, in which a group of migrant teenagers from the Amsterdam-West suburbs freely discuss their lives, that the 'openness' that till today characterizes Dutch society, resonates with young people around the globe. To be able and to be allowed to ask questions and listen to each other is fundamental to Public Research. The challenge as well as the safety needs to be provided though.

Personally I have taken the challenge to take the things I learned into a different professional arena in 1999, namely to higher professional education: to design a sense of performance in education, to switch the attention from designing 'education' to designing 'learning environments', to orchestrate public research in such large organizations. The methodologies we developed in the emerging Amsterdam digital culture were rather useful in that context. I also witnessed that the battle for power is much stronger which pointed out how fragile such processes can be.

Because of the Web 2.0 developments, and the knowledge management problems that organizations have, more study into Public Research makes a lot of sense. James Surowicki points out that diversity and independence are prerequisites for any 'wisdom of crowds'. Scale makes all the difference and as my research strongly suggests, a balance between mediated, witnessed and natural presence has to be found. Such research will address a larger movement in society: how do we create and communicate experience and collaborate at a time of post-industrialization, hypermodernity and mass-individualization? I like your suggestion to start this analysis with a focus on the re-arranging of seats. How the seats are positioned, I can testify and you as well, makes a huge difference in what will happen next.

GL: Over the years certain concepts become alive. As 'memes' they start to travel and become meaningful for a group of people and then are taken outside of that context, appealing to people you had no idea about. This happened to 'tactical television' that we both worked on with a group of artists and activists in 1992. This turned out to be the first Next Five Minutes festival. Three others followed in 1996, 1999 and 2003. These days there are academic anthologies and lectures series about 'tactical media'. In the book you haven't emphasized this event. Can you nonetheless say something about your role?

CN: It started in my perception with a conversation between David Garcia and me at my kitchen table. We were discussing how the current language to talk about media did not pay tribute to the things we liked and thought were good. It was not anymore about 'left or right', or about 'independent versus dominant'. We decided to explore this more and we invited a few people, like you and Bas Raaijmakers, Geke van Dijk, Raul Marroquin and Menno Grooteveld who were all concerned with media, to share this thinking. In my memory we met three or four nights and had long conversations and came up with the notion of tactical television, which emphasized the cracks in the media-landscape as well as the position of the media-maker.

I was the producer and 'concept-protector/communicator' of the first N5M. Each of you had a program-line and I was safeguarding that it became one program as well as that the developed thinking would communicate. You did Eastern Europe I remember distinctly. Bas en Geke did the southern hemisphere with Patrice Riemens as well. David invited artists from all over. Tjebbe van Tijen made the archive. It was a very rich program and in the end the atmosphere from the event was nearly utopian. For many participants it was very reassuring to see how people using media in smart ways could make interventions. Remember that the strategic freeze of the cold was over and so much potential seemed to blossom.

At the end of the first N5M I had a clash with David Garcia, which in hindsight was a very interesting one. He wanted authorship over the concept of N5M, being an artist this was very important for him because the building of reputation is crucial for new funding. I, being the producer and responsible for something that was a collective endeavour, said that this was out of question. It is a whole group who made it happen and in case of a community activity one does not claim authorship, one is happy enough to participate. The issue of reputation building through ownership of authorship versus the building of reputation through participation is till today an issue of tremendous importance.

When we started to produce the second N5M I ran into a serious disagreement with the editorial group. In 1996 the Internet was conquering the world and all you guys wanted to pursue net-critique. You and Pit Schulz had just started the nettime list and this was an opportunity to meet and explore more. The result was a program full of white young ambitious boys, yet it has been my pride to always make programs in which diversity is the fundament and also I thought that the scope and original agenda of the N5M was not pursued enough. Together with Patrice Riemens I wrote the article 'Vital information for social survival' to make my point (which was published in the Economic Times of India). In the end I withdrew from the editorial group. I supported the second N5M from out Paradiso, but it was not 'my program' anymore. It is great to see though how the notion of tactical television has traveled. It makes sense because the notion of tactical media is way to understand certain positions in today's complex media-landscapes. Also, many of the nettime-posters have become Professors of New Media and Digital Culture, who teach between them thousands of students all over.

GL: A concept that you emphasized, time and again, is 'vital information'. It appealed to me, and stayed with me, ever since it was used in the Zero Positive Ball event in 1990. Can you say something more about it? Has it been used in other contexts?

CN: Vital information has been an important notion for me since the Zero Positive Ball indeed. That is where it surfaced for me. The strive for survival and well-being, the conatus as Spinoza called it, makes people take hurdles they thought they never would. When this strive is triggered, original energy of people becomes available and what happens next will make sense. The dialogues and the connections that are made, will truly influence people's lives. When mediated presence offers 'vital information' the bridge between natural and mediated presence becomes very smooth. I have found that in any situation one can find the vital information. It always taps into this deeper layer of survival and therefore it also taps into the sense of ethics people feel. One communicates around the current status quo, so to say, to be able to create, if at all needed, changes in this status quo. It takes an effort to find 'vital information', one has to ask questions and challenge the current status quo.

I only know a few people who work with the concept of vital information. As you know I am not a regular writer, and after the first article with Patrice Riemens, I only discussed the concept again in my dissertation. Nevertheless I have worked with many people over the years and in those collaborations 'vital information' always has played a role of significance.

GL: You have somehow copy-pasted the NGO rhetoric around 'human rights' in your work. I wonder why. As you know there is a whole debate about how useful the 'rights' discourse is in the new media and activist context, and how, potentially, disempowering it can be to claim 'rights'. It's such a passive and institutionalized activity. Nonetheless, you have chosen the Universal Declaration of Human Rights as a central document in your study. One would expect boring government or U.N. documents to do. Is there maybe a personal reason why this document plays such an important role?

CN: It is interesting that you ask about a personal reason for this choice. It was not a personal reason at first. Since the moment I realized that 'the sense of presence' can be described as 'the

sense for survival and well-being' to formulate it shortly. I was looking for a way to make trust operational in which this sense for survival would resonate. I was aware of the many critiques that are formulated about the UDHR, but realized that in the light of destruction during World War II the UDHR is formulated (which is mentioned in the preamble). In the light of the unimaginable destruction that happened all ideological or religious reasoning became obsolete. Also the fact that it is a secular document and that it has played this vital role in international diplomacy for over 50 years, defines its significance. And I felt with the current developments in which there seems to be no limit as to how far we are digitizing people in mediating our presence around the globe, such a strong reference point is necessary.

Up to this day, when being involved in working with refugees, 'illegal' people and other political situations, the UDHR has been a declaration that one can refer to and on which basis one can go to local, national and international courts, to point out that in certain situations human dignity was denied and that therefore such situations have to be challenged and changed. If I would look for an even more personal reason than I guess the UDHR resonates in its fundament most with motherhood for me. Children have rights that are not to be neglected nor denied by any religion or political system. This is something I feel very strong about.

GL: I noticed that in your references and experiences that you describe, you easily switch between the world of global corporations, human rights activists and social movements. Is the context that you work in really without frictions? You do not often mention that there are conflicts of interests. I suppose you are not suggesting that we all work on the same project. In the past people would have asked: which side are you on?

CN: Already in the past the question: 'which side are you on?' has produced more than enough atrocities, exclusions and humiliations that were not beneficial nor necessary as well as that they were counterproductive to 'the cause'. I strongly believe that people can be 'good' human beings in all realms of society, even if they have different interests, as long as they are willing to enter into dialogues and conversations with others when appropriate. You notice indeed that I try to get around the 'being good' and the 'being bad'. I think that does not actually exist, as a scientist definitely not, but also in my personal life and in my professional life I find this distinction not useful at all. However, in my dissertation and up to this day, I have not entered into any thought or dialogue about the character and value of intentions, which is part of this debate and which I also expect to have consequences for this debate.

I focused on how things and processes can be good and bad in certain contexts from the perspective of supporting survival and well-being. The feeling of something being good or pleasant is an important indicator of where well being is to be found (I here take the perspective of Professor Antonio Damasio). To transpose such senses and feelings into judgments about other human beings in general I find medieval reasoning. That is why our judicial systems as well as our scientific structures are important. Logic and reasoning sanction the action and ideas of people in certain contexts, which is how we can protect ourselves from each other's misconceptions and destructive actions.

Nevertheless I do agree that when certain interests color certain actions and perceptions this should be mentioned. In my perception I show awareness of this. Are there any specific paragraphs where you miss the mentioning of certain interests? The introduction of the 'crucial network' specifically deals with these conflicts of interest. As you can read, I argue that the presence of the 'crucial network' the gathered conflict of interests, generates an environment in which trust can be found. Power becomes transparent in such a case and therefore the power status quo can be challenged as well.

GL: There is an example we can discuss here. Lee Felsenstein, who is featured in your book as one of the early hackers, has recently made some critical remarks about Negroponte's One Laptop per Child project (http://fonly.typepad.com/fonlyblog/2007/06/one_computer_pc.html). How would you, using your vocabulary of Presence and the Design of Trust, look into this controversy? Your PhD supervisor, Cees Hamelink, also has strong views on this 'ICT for Development' field.

CN: For a start I like to argue that we are not dealing with a controversy here. If anything we are observing a debate between two groups of Americans who both claim to know how to change the world. I guess it is great if they make cheaper computers, do more research into learning and I am always in favor of people who put children on the agenda. However, both do not seem to be inspired nor hindered by knowledge of things that are happening already, nor do they seem to

be aware of the social and economic circumstances of the 'developing world'. Even IT multinationals like Intel, Motorola, Philips, HP, Nokia and others have realized at the beginning of this century that while the northern markets are being saturated with their products, people in the southern hemisphere of whom most earn less than 1 dollar a day, can not afford their products. This realization is one of the reasons that they are shifting from product to service design.

To push for a hundred dollar computer per child excludes most of the children in our world, also many children in the United States are too poor to be able to afford such a machine. It is clear to me that this initiative generates lots of research funding for the Americans involved and has a potential business perspective worth billions of dollars. Where this initiative may become dangerous, in the sense that it will prevent other people to make their own things, is where they start developing infrastructure with American for-profit companies for all regions of the world. The material infrastructures of the Internet in the end define who has access to what. Especially the market of building infrastructures is, as Cees Hamelink has been pointing out for over 20 years, a new form of colonialism, cultural imperialism or whatever you want to call it. The ownership and responsibilities that come with this ownership (and its potential misuse and if not being affordable), should be of great concern worldwide. Even in Amsterdam we do not own our own information infrastructure anymore.

Concerning Lee's proposal for a computer per village, I can only point to things that are already happening. In 1990's Sam Pitroda, and Indian entrepreneur collaborating with the Indian government, gathered over 300 engineering students one summer to design India's telephone system. The idea was that one phone per village makes all the difference. And so it appears to be. By 2002 every village, so is claimed, now has an STD phone in its local shop. The shop owner provides the service of making phone calls to the villagers who pay a few cents per call and the shopkeeper has a raise in income because of exploiting the phone. Jiva, one of the many social entrepreneurs in India, has started to put a computer with every phone to develop telemedicine as well as distant learning. Infrastructure matters, but even more so do new models for learning. Since 1999 Professor Sugata Mitra, at the time connected to NIIT and now connected to Newcastle University, has been exploring the idea of children who learn through self organization. His by now famous Hole in the Wall project has advanced a lot since. In his last experiment he asked the question whether Tamil speaking children could learn bio-technology in English on their own and he found that they had acquired 30% of the material he had left them alone with for three months (speaking English with a Texan accent they had acquired from one of the sites!). He comes to the conclusion that groups of children, when left alone with a computer hooked up to the Internet, actually learn a lot. For this to happen the computer should be located in a public space so that children can discuss what they see and can enter into competition with each other as well as learn by copying each other.

You ask me to connect this to my research into Presence and the Design of Trust. I guess the market of infrastructures should become transparent for it to generate trust. However, we people will use anything that works and a worldwide judicial system that will respect privacy and promote freedom of expression is not in place. Much government policymaking is way behind technological developments.

Sugata Mitra's work on the self organization for learning I find extremely interesting, also from the viewpoint of my research. He emphasizes that children who gather in natural witnessed presence, because they enter into conversation with each other, have unexpected high learning curves. They make 'sense' of the mediated chaos they encounter in the first place and within days are capable of operating this chaos and learn from it. From his research one could conclude that mediated presence generates the highest learning curves when it is perceived in natural witnessed presence. A similar experience we had with projects like Demi Dubbel from the Waag, and also my experiences at the Hogeschool van Amsterdam point into this direction.

GL: If we become culturally specific, much of the Amsterdam 'making things happen' that you and I are part of can be reduced to the exchange between the Netherlands and the United States. In both case studies, the hackers event and the AIDS conference, US-American activists, and their concepts and reference systems, are playing a key role. Obviously, continental Europe had a lot to catch up with in 1989-1990, particularly if we look at cyber culture. If we switch to the current Web 2.0 craze not much has changed. Americans are flown in to do their spiel, both in the academic, commercial and cultural contexts. Just look at the large creative industries event, held here in Amsterdam so far in 2006 and 2007 called Picnic. The cultural flow seems one-sided. Have you seen much change over the past twenty years in the way that the USA and Europe are interacting?

CN: In my perception, being a witness of USA policy since the seventies, the USA has rudely intervened all over the world and does not hesitate to offend the international community nor does it hesitate to promote their culture with all means available. This has not much has changed. In the telecommunications sector the battle about infrastructure is not over. But also, because the US government has shown such disrespect for others, the USA underground is also profound, which again is an inspiration for many of us. The USA is and has been over the last 50 years (the major player in information and communication technology as well as in the cultures (music, film, internet, TV) it produced. In 1989 when we organized the Galactic Hacker Party (before the Berlin wall broke down) the UNESCO declaration in which a (more-balanced flow of information) was on the agenda. However, since the cold war was over, (wild capitalism) has conquered the planet as you know, but such dynamics also produce its counter forces and for example the fact that whole regions of the Internet are not English anymore will have impact. In the shows we organized in Amsterdam Americans were never our only guests. And of course this takes a lot of effort, with many European countries it is not easy to interact and with other parts of the world it is even harder. Even with the Internet being so omni-present today, it is often complex to identify the right people. Networks of trust are crucial. I remember distinctly that because you had spent time early nineties in Eastern Europe we had regularly had East-European guests. Because you were the (social interface) as you are till today for many of us to many others we do not know in other areas of the world. I do argue that current event-organizers do not take enough trouble to make sure they present a diverse program and reach out to diverse publics as well. In my dissertation I describe how in Paradiso a constant effort is taken to prevent the rise of mono-cultures and include new or not known or not-staged people again and again. I think the taking of such effort is a prerequisite for any good program that wants to make a difference.

GL: At the end of your dissertation you have proposed your own methodology, and coined it YUTPA. It describes a design method in which the relation between presence and trust takes centre stage. Could you explain it to us?

YUTPA is the acronym for (being with You in Unity of Time, Place and Action). I argue that if we want to understand the relation between presence and trust there are four dimensions that deeply influence this relationship: here/not-here, now/not-now, do/not do and you/not-you. The dimensions place and time define what synchronicity is possible and what feedback possibilities there are. I also realized that the perspective of possible action, to be able to intervene in what happens next, influences the responsibility we can take (and not retreat in a moral distance) and therefore influences what trust we can establish in a certain situation. And this is influenced also deeply by the relation we have to other human beings. When we are in relation with someone (family, friends, colleagues, neighbors) we understand what happens in the context of this relation, people we do not know and with whom we have no connection we merely treat as information to which different laws of causality apply.

In the model I developed the four dimensions create 16 possible spaces for social interaction. I argue that each of these spaces for social interaction have specific possibilities for certain kinds of trust/distrust and delegations of trust. When designing communication processes a much more deliberate design of such processes is possible. By identifying what kind of trust is necessary, you can also decide what medium and format to use to be able to establish such a kind of trust. I find through giving lectures and working with people that especially in 3D design trajectories YUTPA seems to be a valuable contribution.

GL: In terms of education, so much seems focused on short-term skills, in particular when we look at new media. There is a great fear amongst higher education officials to miss the connection with the labour market. However, there are places, such as the Design Academy in Eindhoven and the Sandberg Institute in Amsterdam, where they do focus on concept development. Is it possible to teach conceptual design on a broad graduate level, to the thousands of students who are now into new media design? Or do we really have to limit this to a small group of more experienced students that work in post-graduate labs?

CN: I definitely think you can teach conceptual design to children, grown ups of all ages and also to the thousands of students who are now studying new media design. The issue though is (attention). To be involved in conceptual design requires reflection. To be introduced to the skill of being able to use different ways of reflection requires personal attention. I think more emphasis is needed on the development of solid analytical skills and ways of doing research. Also I found that a lot of the students I worked with were not used to openly reflect and needed to find the confidence to do this. One can learn

analytical skills by seeing it done, especially when the subject is intriguing. In my twenties for example I did this fantastic minor in film in which we saw many unusual films as well as great analytical talks about them. We were with a few hundred students attending this course. But we also had breakout groups that were guided by students who had already done this course before and that made a huge difference. I realize that education had to deal with huge budget cuts in the last decades, which triggered the need for more a self-organizational design of education. Nevertheless I have been amazed in my years of higher professional education at the Hogeschool van Amsterdam, how the concept of students teaching other students is used so little in the orchestration of learning environments. Today students are mostly left alone in project based groups, but do not have the advantage of being guided by students who are ahead of them. So I would argue that it is a question of orchestration in the learning environments to make sure that the skill to reflect can be developed and conceptual design can become a ground from where you actually design (stuff). I also think it is very necessary to do this because otherwise, as you point out, the fear to miss out the connection with the workforces of the future will appear to be correct.

GL: You have not chosen for a classic academic career. Instead, you have been active as a cultural producer, consultant and manager. Over the past years you sat down and reflected upon your practice. This is in accordance with the general trend in the Anglo-Saxon countries to have more (practice-based) PhDs. Now that you're done, how do you look at the academic rituals? Universities seem to stick to their own people who have followed the ordinary career path as required by the sitting professors. New media, design and activism, it all doesn't seem to fit very well within the university system. If students do not chose for a life-long career in their late twenties, they usually can't enter academia at a later stage, so it seems. What are the implications of this for society at large?

CN: I perceive the same trend as you do although it is not everywhere as rigid as the Dutch situation seems to be. In the United Kingdom and the USA for example I see that professional PhD's are valued very much and academic careers can consist of diverse practices. But overall, yes, I see that the social sciences strongly defend their position. It is as if academia has become a class that one has to be born into. I find this very alienating since social sciences can really make a difference, which they are more and more loosing out to do. Today, interestingly enough, mostly in business schools I find the original thinking and the development of new social practices to be valued and supported.

To answer your question more in depth I turn to the concept of the (double hermeneutic) as it is formulated by Anthony Giddens. Social sciences retrieve their concepts from society, add and produce new concepts that in turn produce new practices which are then analyzed which produce new concepts which produce new realities and so on. This makes the social sciences very complex, as Cees Hamelink points out again and again. Only when I found out how much my practice has been influenced by the concepts I gathered, of which quite essential ones come from social sciences, I realized the implications of this double hermeneutic in the social sciences. When the exchange between academia and society is diminished to academic publishing and the influx of other kinds of knowledge and output is discarded of, it will be lesser and lesser equipped to be able to deal with today's complexities and for that reason slowly fade out in the end. In professional social science's realms (in business, in large organizations as well as in individual practices) you can clearly see that many more methodologies for creating engaging reflexivity have emerged. Interestingly it are the business schools and some anthropology departments that have devoted attention to such new models. It seems that academia is still trying to show the natural sciences that it matters by focusing on questions that can be measured in the manner of natural sciences. Such positivist research can be very useful provided it is contextualized in larger frameworks of thinking. Especially in the thinking I perceive a reluctance to connect to innovative and original theoretical and professional practices. Instead of claiming specific methodologies for its own domain, it adapts to a system which in the end, I suspect, will appear to be very counterproductive to its own goals.

Another way of analyzing the current situation is by focusing on the current social sciences research paradigm. As Thomas Kuhn elaborated so eloquently, science develops steps and gaps between paradigms, which make previous paradigms obsolete. Possibly the social sciences are stuck in a paradigm that deals with social realities as we could perceive them in the 1980's. The current huge changes because of technological development as well as the scale of globalization that we have to deal with everyday, are mind blowing. Instead of taking the lead in these developments it seems that the social sciences have

retreated in a world as we knew it, adding /some new wine in old bags/ and, what I object most to, demanding obedience from its students in the first place. The result is a mediocre thinking, which does not inspire social practices at all, since it does not take into account the need for innovation as it happens in education, in health, in business, in government etc. I also object to the fact that the few people, who dare to develop concepts that deal with these issues, are marginalized up to the point of exclusion.

So you can ask me why interact with this community? I guess that social sciences are dear to me, that I value the scientific methodologies very much and that they can help to understand and to invent the new ways of social interacting that we witness and practice everyday. I wish that the research establishment of today would open up and start to play its role of significance again because there is a body of knowledge to be developed that is badly needed by many. The current fragmented and distributed development of social practices would greatly benefit from social sciences taking up their historical role again.

<nettime> Interview with Wolfgang Sützl: Sharing –

From: Cornelia Sollfrank

To: nettime-l@kei.n.org

Date: Wed, 23 Nov 2016 09:29:53 +0100

Sharing – the rise of a concept

Cornelia Sollfrank in conversation with Wolfgang Sützl
Liverpool, 5 November 2015

Cornelia: Your recent research has revolved around the notion of “sharing,” and I would like to get a better understanding where this interest comes from and how it is embedded in the larger context of your work.

Wolfgang: This interest in sharing has resulted from my research on media activism. In the course of a research project at University of Innsbruck, we realised that “sharing” plays an important role in many activist communities – while its actual meaning seems to be rather vague. It obviously relates to the then very topical phenomenon of file sharing, but there seemed to be other implications as well.

Media activism was not just brushing media against the grain, but also intervening in the socio-economic structure of the media and tech industries. This involved questioning the notion of scarcity. If you can make digital content available to many people for free, why not do it? In an interview I did with Eben Moglen, a co-founder of the Free Software Foundation, he asked: if you could provide everyone with enough food to eat by pressing a button, what would be the moral argument for denying people that food? Activists realized that digital media had this potential of functioning outside an economy of scarcity. To examine such questions, we organized a conference, *Cultures and Ethics of Sharing*, in Innsbruck, and later I co-organized an ICA preconference on digital sharing with Nicholas John (Hebrew University). Since then my research has been mainly concerned with the conceptual dimension of sharing.

Cornelia: Before we talk about the phenomenon of sharing in the context of digital networks – which obviously is the field in which it has been rediscovered and has proliferated most in the twenty years – I would be interested in learning more about the intellectual roots of this concept. You have looked at a number of philosophers who might be useful in order to conceptualise the notion of sharing – one of them being Georges Bataille and his idea of the excess... Wolfgang: Bataille is of particular interest in this regard, because he developed outlines of an anti-economy that starts from surplus rather than scarcity. He focused on what we do to expend resources, rather than make them. He felt that Marxism was not radical enough, buying into the notion of scarcity which is at the heart of the capitalist economic model. He defined a boundary to economic exchange, with expenditure being that which can no longer be exchanged, that which no longer yields anything and cannot be recycled into additional growth. He calls this “The Accursed Share,” which is

also the title of the book he wrote in 1949. And just like Bataille’s expenditure, sharing is not something that can be used towards growth. The concept of a “sharing economy” does not make any sense.

Cornelia: What also comes to mind when thinking about sharing is its embeddedness in Christian culture. How much is the positive connotation of sharing due to this religious origin?

Wolfgang: The New Testament contains many references to sharing, the most widely known is perhaps the Feeding of the 5000, where Jesus and his followers share what seems to be a ridiculously small amount of food. This happens after Jesus tells his disciples not to send people to the surrounding villages to buy food, that is, he stops them from engaging in economic exchange. What seems key to me here is not so much that by sharing a large crowd is fed from a few loafs of bread and some fish, with everyone getting enough. The point is that there are several baskets full of food that remain uneaten. There is a surplus that comes from sharing, and it is, just like Bataille’s “accursed share,” a surplus that cannot be recycled into further growth. This is a model of an anti-economy that also underlies the demand to offer the second check. The positive connotation of sharing, its “niceness,” comes perhaps from the idea of equality and togetherness in sharing. This is very different from the formal equality enjoyed by participants in a market, and the hierarchies that are created or strengthened through almsgiving...

Cornelia: Together with Bataille and his notion of expenditure, the multiplication of loaves and fishes suggests a parallel to what we have been experiencing with digital networked media: abundance instead of scarcity. I would be interested in how you think these two schemes together.

Wolfgang: Bataille applies the word excess to practices that waste energy without return, including sacrifices, luxury, war, and non-reproductive sex. To him, wealth is a matter of expending what cannot be recycled into growth, and it is up to us what form this expenditure has. In principle, digital networked media can be seen as excessive in this way because digital objects are infinitely reproducible, so that in a sense there is always too much, there is always more than we can productively use. However, the commercialization of the internet has led to the paradoxical situation where this excessive availability fuels the growth of Facebook, Google, etc. A few years ago, media activists started virtual suicide platforms that allowed users to delete their profiles, a kind of sacrifice, if you will, that is reminiscent of Bataille’s giving.

Cornelia: If we continue this thought, and bring in the notion of sharing, it becomes necessary to distinguish more precisely between sharing and exchange as an economic transaction. Could you please generally explain the difference of these two concepts?

Wolfgang: Unlike exchange, sharing is not reciprocal. It does not consist of the mutual give-and-take that forms the structure of exchange, both of economic exchange, as in a market, and of symbolic exchange, as in the giving and returning of gifts, words, or other symbols. Baudrillard’s *Symbolic Exchange and Death* (1976) showed the importance of symbolic exchange in capitalism, and takes the Marxist critique beyond the merely economic. Bourdieu has also developed a critique of symbolic exchange around his notion of cultural capital. But they both stop at the point where a formal representation of reciprocity is no longer possible, the point Baudrillard later theorized as “impossible exchange,” in his book of the same title.

Cornelia: It appears to me as if symbolic exchange was somewhere between economic exchange and sharing...

Wolfgang: Almsgiving, like gift-giving in general, is a form of symbolic exchange, which in Bourdieu’s thinking affirms and stabilizes social hierarchies. Symbolic exchange determines who is on top and who is at the bottom. By tipping a waiter you, and the waiter who accepts the tip, agree on this. This verticality of symbolic exchange explains why giving and receiving of gifts in relationships between people who want to be equal, such as the modern couple, is often such an awkward affair, sometimes resolved by giving up the idea of a gift altogether.

Baudrillard argues that symbolic exchange has many forms that support the functioning of economic exchange—for example, the law and the state, which intervene when economic exchange fails, as in bankruptcy, unemployment, or by setting base rates. This too shows how symbolic exchange is bound up with political power. Organized crime, black markets, or state-controlled economies function predominantly in this way.

Cornelia: That means we actually remain in a sort of economy with the gift-giving, while, as you have already indicated, sharing is something

that leaves the realm of economic relationships behind altogether. I think this is where we should continue talking about the philosophical concepts which you are exploring in order to develop the concept of sharing. And I'm thinking of phenomenology, for example.

Wolfgang: Once you realize you cannot theorize sharing in terms of exchange at all, you face certain problems that are similar to theorizing everyday experience. Sharing is indeed an everyday routine, as such it does not have its own truth, or at least it does not stand out as an object available to scientific investigation or to the aesthetic privileging that happens in art. Duchamp's ready-mades were a response to this difficulty of the everyday. What would an artwork look like that is not set apart from the profanity of everyday experience? His answer was, perhaps like a urinal, perhaps like a bottle rack. Phrased in ontological terms, Heidegger undertook a similar enquiry in his *Being and Time* (1927), where he sought to understand being through everyday Dasein, the simple fact of our being-there that is always already assumed, whatever question we may ask.

He uses the term *Mit-sein* or being-with, to understand being as always already shared being. According to him, there is no way to understand the meaning of being other than as shared. As I find myself in the world, I have already shared this world with others. Being cannot be separated from sharing, and the others come into appearance as others because of this sharing. This is why sharing in the commons, as described by Ostrom, defines a political subjectivity. To me, it also offers a point of departure for understanding why an economy of exchange on the way to totalizing itself, as in the current advance of neoliberalism, has such difficulty with the notions of otherness or difference. Exchange must, in order to function, render otherness or difference meaningless – turn it into a “farce” as Žižek says. The only meaning that it leaves for otherness is the unrestrained negativity of random violence, which is just another caricature of a quest for meaning. Cornelia: What is not nice about sharing?

Wolfgang: For one, once we understand sharing as a limit to economic expansion, an anti-dote to the economic principle itself, it questions a deeply held belief of Western culture. It represents an outside that can be scary because it cannot be regulated by law – because the law is also an exchange operation. Pirates, who did not recognize the law of the sea, had a strong sharing culture, which came back to life in digital piracy. Also, at the moment of sharing, we cease to be as self-contained individuals, and enter the sphere of intimacy. There is a vulnerability that comes with sharing that is expressed in the problem of “oversharing” on social media, where users offer intimate information to others they do not really know. Because of this, sharing as a practice was traditionally limited to smaller communities. And finally, we also share things like the exhaust fumes and noise of our cars or the crudeness of our advertising billboards. It's not always nice.

Cornelia: Now, both of these concepts, exchange and sharing, exist in parallel – offline as well as online. I would like to ask you to describe and unravel this coexistence with regards to digital networked media and also talk about the – maybe intentional – confusions that are emerging from this.

Wolfgang: Today sharing is often confused with exchange because of the way we use the word in online communication and the hype around the sharing economy. This confusion is an easy one to make because of the very nature of sharing, but there is also an obfuscation that is part of the business plan of the digital media industry that considers sharing as a profitable form of “customer engagement.” The confusion is easy because sharing is a communal phenomenon: it is because our being is always already a being-with-one-another that we can share and experience meaning. This is also why Jean-Luc Nancy can say “meaning is the sharing of being.” But in corporate social media and the sharing economy, subjectivities are formed through structured forms of communication that providers prefer to call “sharing,” benefitting from the anti-economic potential of the digital (its excess) and the connotations of niceness that come with sharing. These subjectivities are shaped to match business plans, they form around the users' status as customers, as subjects of exchange. But meaning cannot be exchanged, only shared. This is why so much of social media communication is either commercial, or trivial, as in the classic cases of cat videos. There is an erosion of meaning through the dominance of exchange, and a lot of sharing of meaningless content, because what matters to the provider is the profit that comes from customer engagement, from making users do things that affirm their status as customers. But this is due only to the commercialization of digital networks. It is not inherent to digital technology, as for instance the case of Wikipedia shows.

Cornelia: To conclude our little conversation, one could say that “sharing” as an essential form of being with others has gained a new dimension through digital technology. At the same time this new form of sharing in the realm of digital files and knowledge is dependent on a

technology which is totally embedded in the cycles of capitalist production, i.e. exchange. I think here is one crack in the concept. Another friction I see in the fact that neoliberalism expands its logic of economisation into all possible domains of life and, through the sharing economy for example, has started to blur a clear distinction between sharing as a way of being or becoming subject and economic exchange. What is at risk here? What is it that drives your research?

Wolfgang: What drives me is the belief that with a better understanding of sharing we can gain more clarity about the limits of exchange. This is necessary, because the current neoliberal rationality sees a frontier instead of limits. This frontier is a temporary boundary to be pushed forward, a site of emerging markets and venture capital. Helped by the rise of corporate digital media and the disappearance of a serious alternative to capitalism, this frontier has advanced into the political sphere, into subjectivity, and into rationality itself. Wendy Brown offers a compelling analysis of this process in her latest book, *Undoing the Demos* (2015). What is at risk here is the possibility of forming meaningful political communities in the most basic sense of the word, and along with it the possibility to communicate anything political. Therefore, an improved understanding of sharing may help formulate a political argument against neoliberalism, which is the only type of argument that can be expected to be effective. And I agree, for an argument to be communicated, communication channels are needed that will not instantly turn the sharing of ideas into an economic transaction. We can still learn from the tactical media movement in this regard, and perhaps with the dominance of corporate social media and their business strategies, tactics is even more important than before. Digital media do still offer a real, non-utopian possibility of sharing, and simply remembering that is a first step. The fact that criticism of the sharing economy is becoming more widespread is also a positive sign. It opens some space for a real discussion of sharing.

Cornelia Sollfrank is an artist and researcher living and working in Berlin. She is associate researcher at the University of Dundee (UK) and was until recently guest researcher at Aarhus University (DK). The combination of conceptual and performative approaches in her work result in the production of research-based practice and the writing of practical theory. Main fields of work are copyright and intellectual property, feminism/cyberfeminism, self-organisation and commons. Her current project *Giving What You Don't Have* (GWYDH) explores artists' contributions to the production and maintenance of commons. Website: <http://artwarez.org> Wolfgang Sützel is a media theorist, philosopher, and linguist. He is based at Ohio University's School of Media Arts & Studies (USA). He is a visiting faculty at Transart Institute (USA/DE), and at the MA program in Peace and Conflict Studies at the University of Innsbruck (A). His chief research interests concern media theory, media phenomenology, media aesthetics, mass communication theory, and the role of media in conflict. He is currently working on a book on the phenomenology of sharing, and a textbook on the evolution of media. Website: <http://wolfgangsuetzel.net>

[oldboys] Next 5 Minutes

From: nathalie

To: n/a

Date: Mon, 30 Jun 2003 12:11:34 +0200

i don't know if it is technically still time to propose at N5M conf.

However, what do you think, if we proposed very simple things, like :

- scanning the girls
- 5 minutes presentation of "our" work (anybody who identify as woman), so we get to know each other,

- pool party as was talked about in berlin ?
- so we plug with the whomever we feel possible connection with.

very simple, degres zero of intervention.

a +

dear boys - and girls,

what is schedule from our side so far is a party with
female musicians, performers and dj line up at melkweg: "fem snd"

further more two meetings, one in france and one in berlin,
resulted in a project called 'pool-prj'
which is a basic concept for audio interventions at events,
n5m would be first opportunity.

as i am in the editorial group, i would be happy to see other suggestions from
your side,
although most of the program is set up already --
but good ideas are always welcome.

as soon as there is a public draft of the programme i will post it.

best, c.

>hi, but why scanning the girls' again?

hi, but why scanning the girls' again?
feel like we never go beyond 'introduction' of 'our' work.
is this a form of congratulating ourselves how far
we have come to/ or another form of seeking recognition
from the others?

consider the theme of n5m for september--

"The program of Next 5 Minutes 4 is structured along four core
thematic threads, bringing together a host of projects and debates.
These four thematic threads are:
"Deep Local", which explores the ambiguities of connecting
essentially translocal media cultures with local contexts.
"The Disappearing of the Public" deals with the elusiveness of the
public that tactical media necessarily needs to interface with, and
considers new strategies for engaging with or redefining 'the public'.
"The Tactics of Appropriation" questions who is appropriating whom?
Corporate, state, or terrorist actors all seem to have become
effective media tacticians, is the battle for the screen therefore
lost?
"The Tactical and the Technical" finally questions the deeply
political nature of (media-)technology, and the role that the
development of new media tools plays in defining, enabling and
constraining its tactical use.'

maybe can be more tactical in bringing in forces?

best

**<nettime> interview with armin
medosch**
From: Geert Lovink
To: nettime-l@desk.nl

Date: Fri, 11 Jul 1997 18:42:07
+0200 (MET DST)

Interview with Armin Medosch (Telepolis)

the following text I wrote in response to questions of the danish journalist erik kjaer larsen. I thought it might be interesting for nettimers too. It is about internet laws in germany.

Hallo Erik,

find here some URL's and some commentaries to your questions:

> I gather from Telepolis informations that the laws
> are generally very unpopular in Germany, at least with
> the opposition.

That's not precisely true. The law is unpopular amongst economists, researchers, users. But concerning political parties in parliament the split goes right through the parties themselves. The only party with a clear position are the Greens, they are against the law. Within the SPD there is a small group which is net-wise and against the law. But the majority of the SPD Parliament members doesn't understand anything and just wants to secure their influence on the regional level (many regions are spd-governed).

And also the leading christ-democrats are split. There is a hardline law and order enforcement group around Minister Kanther, which tried to bring in these sharp paragraphs about liability of isp's. There is the economy-friendly liberal group around Rexrodt, which would rather have liked to have another Law. Ruetgers, the one who conceived the law, is somewhere in the middle. he doesn't seem to have a real opinion of his own.

You can find out about diverse positions in a funny photo story about the parliamentary discussion with cites of original statements.

> If you can find the time, I would also ask you to
> specify the most obvious threats to freedom of speech.
> coming from the new laws. Are they in reality similar
> to CDA...

No, I would not say that. The CDA is a completely other cup of tea. "Free speech" was not in the centre of the german discussion. It was rather that the government wanted to hold ISP's liable for illegal and harmful content on the net. The idea was/is, that if an ISP has got notice of illegal content which he is providing access to (he is not giving the information, just access to it through the internet) then he should block access (block a certain newsgroup, a website). There is strong incidence that the Kanther-Hardliners purposefully created a test-case with the leftwing newspaper "radikal". This magazine is forbidden in germany since it was found guilty in several trials of supporting terrorist action in the eighties. For ten years they could not produce an issue in germany any more. So their latest issue was put on the server xs4all in holland. Last September the german state prosecutor wrote a letter to all ISP's that they should block acces to xs4all. Unfortunately for the state prosecutor it is not possible to ban a single website, instead the whole server has to be blocked. But xs4all is very popular and soon there was a huge wave of protests. The accused webSite of radikal was mirrored on 60 -70 servers around the world. So just a few ISP's followed the wish of the prosecutor and tried to ban, but many didn't. It is yet an open question if those who didn't block will be accused by the state prosecutor.

Then in January 97 the government did the next unwise strike on the net. They accused Angela Marquardt, former vize-director of the post-socialist party from east germany (follow up party of SED) that she supported terrorism by displaying a link on here homepage to the "radikal" - page. Actually the prosecutor said that she was "providing access to terrorist material" through this link. This lawsuit raised the question if users can be hold liable for links they supply on their private homepages. In June Marquardt was spoken free, but the argumentation of the judge was very formalistic and didn't touch that basic question about users liability for links.

So you see, in germany the discussion is rather not about indecent speech, you can say "fuck" if you want, but about political radicalism of the extreme left and the extreme right. As often the government choses the left as open target because the right is much more dangerous and federal police is said to be in serious investigations about right-wing activities but does not want anything to go out in public in a too early state because that might warn the neonazis about police inquiries.

Marquardt case see here

<http://www.heise.de/tp/te/1235/thome.htm>

This special concern about radicalism is a heritage of germans special history - the third reich and the RAF (Read Army Fraction) terrorism in the seventies and early eighties. Because of fascism in the german bill of rights the right of free speech is not given to neonazis. Any holocaust denials or activism of neonazis is strictly forbidden and not considered free speech. Because of the RAF this was extended also to the radical-left.

Another area of specific concern is organized crime in general and child pornography in particular. Thats why Minister for Inner Security affairs Kanther wanted to forbid strong cryptography and wants to hold ISP's liable for content. Law enforcement agencies of the state should have access, to his opinion, to all communication channels which people might use. Thats why allready in 1996, when the telecommunications law (not to be mistaken as the new multimedia law) was passed, a paragraph was included, that the state should have secret acces through special phone lines to all customer databanks of telecommunications providers (phone companies, so to say). Without the provider or the customer even taking notice of it they can get their connection data. This is not the same as wiretapping. They are not listening automatically to phone conversations (this needs still a verdict of a judge). But they can easily find out, who talked to whom at which time. They can find out who uses phone sex or other special services. Especially journalists are very suspicious about this paragraph because they fear that the anonymity of informants cannot be secured any longer. Also people involved in political affairs can easily become blackmailed if they do phone sex ore other things which seem to be socially not acceptable for public persons.

> Do you think the insellösung could/would be adapted by other countries?

I think that Germany is not heading for an "inselloesung" any longer. They obviously lost the battle with xs4all and they lost the radical case. And maybe they even got sick about being mentioned in one sequence with Singapore and China when talk is about internet censorship. So Kanther drew back from his cryptography banning plans. Probably not because of protests of the left but because of industry protests. Quite a significant effort is done in germany in research about cryptography with major companies like Siemens and Daimler Benz involved. Cryptography is free now in germany, at least for the next two years (try-out phase). Also it seems that they don't see the ISP's liability for content so narrow minded any more. Instead of state action they seem to favour now rating systems like PICS.

The Bonn conference and the Ministers declaration about the internet published on 8th of July marks a turning point in the position of the german government. Instead of an "inseloesung" they try now to find consensus about how and to which extend the internet should be regulated on a European level. They probably found out that one country alone has not even the technical possibility of gaining control over the net. What should they do, build a huge firewall around the german net?

The tendency goes, as in economy, towards the building of huge power blocks - Europe, North America, the ASEAN states. The Bonn declaration is an attempt to formulate a European position: Not the internet as a "free trade zone" as Clinton has proposed recently, but as a mixture of regulation, self-organisation and economical liberalism.

Bonn Declaration

<http://www.heise.de/tp/te/1244/fhome.htm>

- > Was Rexrode one of the laws protagonists?
- > I may sound a bit paranoid, but it could look like the
- > Bonn declaration of last weekend is just a fancy
- > facade atop a hidden EU-internet-agenda?

So I wouldn't say that this is paranoid. But also it is not so "hidden". It is, as I said above, about forming a European position within the triad of economical superpowers. There is a number of issues involved with this and the driving force to act is economical growth and the creation of new jobs. So the Europeans disagree with the USA in a number of issues. For example the domain name question. The EU opposed the IHAC proposal for new top level domain names. The Europeans are also no longer pleased with the fact that all top-level-domain name root servers are located in the US.

The Bonn Declaration reads like a sundays sermon to me.

To gain the foremost goal of economical growth and staying at least in touch with the technological development they have, to my surprise, included a number of social issues. They say that the net should not cause new exclusions, the gap between information rich and information poor should not become bigger. They even talk about public access terminals in libraries and that europes chance is content on the net. Governments should improve possibilities for citizens to get informed and to participate in democratic processes. They even declare "good will" to support development countries to get connected.

So has the wind changed? The turning down of the CDA by the Supreme Court might be further incident. Maybe it also influenced the Bonn declaration. But I think we should be careful with any prognosis at this state.

Just some examples:

The EU is also in favour of extending copyright to databanks "sui generis", that means that any statistical data displayed on the net is copyright protected. The WIPO conference in Geneva in December 96 turned this proposal down which could have a very negative effect on educational purposes because financially weak educational organizations will not have the money to pay for acces to data banks. Also the rating systems issue will become big in the EU in the next months. Nobody knows yet where the legitimation for rating authorities should come from. Companies and Organizations rate on a very arbitrary basis. Also the EU seems to believe that the further building of the technical infrastructure for the net should be done merely by market forces. So it is hard to believe that an information superhighway, which is entirely created and owned by companies will not lead to new exclusions or would out of humanitarian reasons give free acces to the poor, the unemployed, the homeless people and the people of the (non-geographically understood) third world.

CDA

<http://www.heise.de/tp/te/1235/fhome.htm>

- > Could you help me to specify the role of

- > Rexrodt/Bangemann in all this - I heard they stood
- > behind the Bonn conference, and apparently Bangemann
- > is also the architect of the INFO2000 scheme.>

There is not much to say about them. They are blunt neo-liberalists. Rexrodt, as his liberal-democrat colleague in the Kohl-cabinet, Schmidt-Jortzig, Minister of Justice, have not got much to say in the government. They might do some typical liberal statements in public but the decisions are made elsewhere. Bangemann probably wants to be seen as the grounding-father of the european information-highway. But as a technocrat he lacks any vision of cultural dimensions.

Germany is very federalistic. So lots of the real power is in the hands of regional leaders like Stoiber, minister president of Bavaria, Schroeder, minister president of Lower Saxony and Rau/Clement, leaders of Northern Westfalia. These are the richest and most poulated states in Germany. There is the car industry, the defense industry and the media power. These regional "barons" often unite against their own party leaders and the federal government. Especially Stoiber (CSU, very right wing) and Schroeder (SPD, probable "Blair-like" candidate for the next federal elections) are acting joined forces when it comes to a strong DMark, a delay of EMU and a pro-industrialist position.

So, and this is a remark going back to the Multimedia law, this law would be maybe even not so bad, if there was not a second law. This second law, a kind of contract between the federal states of germany, gives regional leaders control of the internet to some extend. The two laws try to create an artificial separation between internet services adressed to closed circles and other services adressed to "the public". The public part should be treated in a similar way as radio and television with all laws counting for press, radio and tv being extended to the internet. But where is the separation? Can a real audio server be compared to a radio station? Is a mailinglist adressed to the broader public, if anybody can subscribe?

So both laws went through parliaments now and both come into force on 1st of August. But in the parliamentary discussion it became obvious, that even the lawmakers are not very pleased with the results. The split between regionalists and internationalists goes right through the parties, the government as well as the opposition. Those MP's who have got some idea of the working of the net know that the split between closed and public services is artificial and will cause many unnecessary lawsuits. Companies are threatening that they will operate german internet business from abroad (IBM, CompuServe) and will only come back, when the "legal dust has settled" (Hermann Neuss, IBM). So when passing the laws an addendum was created that the law maybe should/could be soon revised.

- > I went to a INFO2000 congress in Denmark recently,
- > It was disastrous - EU talks about content, but no
- > money is apparently given to those who actually
- > develop content. Only for as far as it is commercial.

Thats right, thats one of the problems. It is easy to write down a sermon of twelve pages and call it "Ministers declaration". At the moment the EU not even has a department for something as digital culture or media culture. There is the arts funding programme "Kaleidoscope" with a very limited budget and there are all these programs of DG XIII. There is a lot of money at DG XIII, but small cultural content providers will find it hard to get it. The big consortiums of research departments of multinationals like Siemens or Philips, together with Universities are in the race there. So how can three small registered societies from, lets say Hungary, Danmark and Netherlands can compete with these giants in the race for funds. Telepolis also tried to get in touch for information about the multilingual program. We would really love to have the possibility that articles that we write in german can be translated into english. We are only able to translate into the other direction ourselves. But we didn't even get a letter back from the EU.

So I would be in favour of a europeanwide campaign to

support small content providers throughout Europe (deep Europe, as syndicalists would say) and to support the free publication of publicly interesting material through EU money.

I hope all this could be of any help for
you.
yours
armin

(MET DST)

"There is no information, only transformation"
An Interview with Bruno Latour
By Geert Lovink and Pit Schultz

Hybrid Workspace, Documenta X, Kassel
August 16, 1997

Bruno Latour (Paris) is a philosopher, specialized in the anthropology of science and technology. He is a professor at the Centre of the Sociology of Innovation at the l'Ecole Nationale Supérieure des Mines de Paris. He is called "one of today's most acute, if idiosyncratic, thinkers about science and society." Amongst his books, published by Harvard University Press, one can find "We have never been modern", "Aramis, or the love of technology" and "The Pasteurization of France". His Documenta lecture can be seen or heard at:
http://www.mediaweb-tv.de/dx/o8t6/gaeste_frame.html

Geert Lovink: At the moment there are two concepts of the computer: an abstract, computational machine, based on mathematics and language. Opposed to this we have the future computer as an image processing device, an interactive television set. How do look at this distinction between the language based machine versus the image based medium?

Bruno Latour: I do not believe that computers are abstract. There is a very interesting article, 'On the Origin of Objects' by a computer philosopher called Brian Cantwell-Smith, in a book about digital print.

He made the comment that the fact that there is (either) 0 and (or) 1 has absolutely no connection with the abstractness. It is actually very concrete, never 0 and 1 (at the same time). The distinction you suggested is slightly misleading. The origin of this (distinction) is lying in the notion of information. There is only transformation. Information as something which will be carried through space and time, without deformation, is a complete myth. People who deal with the technology will actually use the practical notion of transformation. From the same bytes, in terms of 'abstract encoding', the output you get is entirely different, depending on the medium you use. Down with information. It is a bad view on science and a bad rendering of contemporary critique of images, all this fight against the naturalization.

GL: Still are the two views of the computer: either it is a machine which is still owned by the scientists, or it is going to be an image processor, which will soon enter popular culture.

BL: I am not sure if I agree with the terms of the divide. To say that the computer is a scientific, abstract machine is largely misleading. There is a book called 'The Soul of the New Machine'. That is the right expression. You can find that in the work of Brian Smith on the embodiment of the computer. After all it is made of silicon. It has its own embodiment on the level of digits and bytes. The computer is not a reservoir of abstraction, scientificity and technicity. Science and technology for me does not mean abstract. It means highly socialized, extremely embodied and localized. There might be badly designed computers, or interfaces

that are not ergonomic. But the idea of an abstract computer that, so to say, falls in a humane dimension which will be threatened by this eruption is absurd. Computer as a foreign body, a meteorite. Even since Pascals first calculating machine, the socializing has been going on.

Michel Serres made the argument that all what we are talking about concerning computer is Leibniz' dream, finally materialized. The idea of a universal language that will code and encode everything, the idea of free accessibility of gigantic libraries is Leibniz' idea. So finally are doing what Leibniz has proposed. But it became a machine that never works exactly the way we want and was dreamt of in 17th century. It is the history of what I call the history of the immutable mobile. The notion of the true contradictory function of immutability and maximum mobility. It is linked of course to the history of the West, to maximize these two contradictory functions. Elisabeth Eisenstein makes this same point in her history of the printing press. Digitality is the extension, one step further of mobile types. It is not a revolutionary element. The moving pixel is added to the movable type. I always react negatively against the idea that technology is a foreign body inside the humane. It does not come from another planet, it is highly socialized and connected with a long history. Negating this typifies the danger of techno-enthusiasm. I would add to the Peoples Communication Charter that is hanging here on the wall: 'Do not believe that the computer has a short history.' The computer is a perfect example of how non-modern we are. The possibility of shifting boundaries between images, text and things and virtuality is a completely classical anthropological feature. Now in Paris, people are using a visualized 'Second World', where you can rent flats. People who are living in the drab 'banlieues' at the periphery can now have virtual flats on the Champs Elysees. But that is nothing compared to what it is to live in the society, which is a virtual reality from scratch. It materializes on the screen, with the notion of avatars and second reality. But it is not a revolutionary break from being in the society. My argument is exactly anti-Virilio, if you want.

GL: At the end of your lecture you suggested that we should step back, out of flow of images. Do you also think that there is the danger of information overflow?

BL: My argument was always the opposite. There is a heritage of the iconoclastic dispute, which is nowadays renewed around this notion of the overload of images. Lots of images were destroyed because people were overloaded. That was exactly Luthers argument. Too many images which hide the important features which is itself not visible. My argument is an iconophilic one, which is always the opposite. One image, isolated from the rest, freeze framed from the series of transformation has no meaning. An image of a galaxy has no reference. The transformation of the images of the galaxy has. So, it is an anti information argument. Pictures of a galaxy has no information content. Itself the image has no meaning if it cannot be related to another spectrography of a galaxy. What has reference is the transformations of images. Being iconophilic means following the flow of images, without believing that they carry information. It is neither iconoclastic in the sense of: let us get rid of the image because what we want to access is the invisible, the ineffable. On the contrary. If we follow the logic of the images, they themselves past into one other image. Images demonstrate transformation, not information. But then there is the contradiction the very daily practise of transformation and the talk, the hype about information flows, internet universality etc. It is the same with money. When you talk with financial specialists, it is highly localized, confidence based, small networks of people calling one another by first name. Again, if we go outside, we talk about huge flows money going from New York to Hong Kong in a second. We have a tremendous hype about globalization, immediacy, universality and speed. On the other side we see localized transformations and there seems to be not connection between the two. Somebody like Paul Virilio is interesting because he, rightly, attacks the hype. This is good common sense critique. But we never study the practise. So the computer is not an abstract machine. Nothing is chewing like. Everything is highly incarnated and situated in silicon chips. There is this bizarre love-hate relationship. Virilio is typical in this. He loves to hate the techno hype. And the technicians very often hate to love. But there is another way, in between.

Pit Schultz: But there is the notion of secrecy and hermetism. Specialists and technicians do have secret knowledge about the implementation of the modes of transformation. Average people do not know how financial markets work, how currencies are transformed from on into the other. But these tranfers have a lot of impact on the society. The transformations become myths and are causing fear.

BT: But is it secret or is it localized knowhow? My feeling is that we should not add to the myth. No myths about local knowhow! The notions of information, universal immediacy, globalizations, add to the myth.

It is not very surprising for the common public that you need a lot of work in order to produce an image. Look at the cloud chamber which is here at the Documenta, or Hamilton's display. When you talk about particles, no one will understand it. When do speak about bubble trails in the bubble chamber, invented by Wilson to study clouds, it becomes extremely simple to understand. Secrecy exists in research labs for legal reasons, for patent reasons, but it is much less important than is usually being said. A lot of mystery in the science practise, which I know best, comes because we render things more obscure. And intellectuals should not render things more obscure than they are. It is a mystery we like to have in order to debunk it. The notion of localized practise is so common sense. I do not know how sausages are made. Sausages are obtained through a lot of transformations as well. And since I do not make a hype about sausages I do not see why we should make one out of computer images. Like what you do here in Hybrid Workspace: introducing groups week after week in the practise of technology. That seems a perfectly sensible thing to do. Nothing is hidden, expect through our love to hate.

GL: Universities are now closing their public part of the internet and are building up their own, closed, parallel intranets. A lot of data that were publicly available will be drawn back. This goes together with the privatization and commercialization of much of the scientific research. How do you look at these developments?

BL: I am not enough of an expert in this. What I know is that you cannot ask scientists to work publicly, immediately connected to millions of people. The notion of openness and immediacy is a complete nightmare. But this is different from the notion of private knowledge. This is process, again, has been going on for centuries in chemistry. One of the aspects is the legal one. How much is private and how much is appropriated? Openness is not very productive. You need to have local niches. Isolated, provincial, unconnected disciplines have been shown very successful in the past. You need to have your own little corner and we will see what the consequences of the internet will be on scientific work. Scientists keep on subscribing to very expensive journals because they need the stamp of hierarchical knowledge. As long as the Net does not find a way of providing this, it will not achieve the authoritative status with the scientific community. Publications on the Web are still very traditional. It has not moved much, with the exception perhaps of e-mail.

GL: How would you then judge attempts, like nettime, to develop a so-called 'net criticism', locating itself inside the technology, no longer judging it as an outsider, in order to overcome the phase of the hype, without going back to cultural pessimism.

BL: If you find a way to deterritorialize, to dissolve localities and hierarchies, there might also be ways to reconstruct hierarchies and come with filters, tastes, judgements and values. Everybody is complaining about the lack of hierarchy in the Net. The more unmediated access you have, the more closed and highly hierarchical and critical sites you will find. In our centre we invented a system called 'semiotext' which gives maps of internet texts by clustering the words into a system called Leximap. It gives you highly hierarchized maps. This sort of system will proliferate. It gives you depth of vision, which can be given a critique. It will be a highly elaborate site if people know that they can find good critiques there. Again, everything which runs against the notion of information will happen just by itself. Universality, fastness, immediacy will not suddenly be there, despite the hype.

On the contrary, local transformation, hierarchy, taste, critique: that will happen. The idea of information as immutability and mobility being non-contradictory, being able to flow everywhere, does not work at the level of science, nor at the level of the computer or politics. We can make a save bet that it will not happen.

GL: How do you see the relation between real and virtual spaces, the ruptures and possibilities to connect them, like we do here, in Workspace? Do you believe in the so-called synergy of all media? Here we work with video, the Net, we have the tradition of film, and print of course. We have all these different media here. Should we encourage the hybridity of all these machines?

BL: Hybrid is a word I like. But you know also there this no instantaneous access to these machines. You need to train people. It will never work exactly the way you want it. You need a lot of different cables. They are hanging on the wall here. Sometimes television works with another medium. In France we never get something done because we have the SECAM standard. Everytime the hype is deflated and you say that you will locally connect media to produce a few new effect, is a perfectly reasonable statement for me. To connect all with connect is pure ideology. When it comes to multimedia, I was was in Colmar, looking at the Isenheim altarpiece by Matthias Gruenwald. It is hypermedia: the different panels are opening and closing,

depending on the days of the week and the feasts. It includes painting plus sculpture plus the reading of the gospel, the mass. The rule is: whatever medium there is, you will always find someone to make a connection with them. But this is not the same as saying that there is an instantaneous connectivity. The digital only adds a little speed to it. But that is small compared to talks, prints or writing. The difficulty with computer development is to respect the little innovation there is, without making too much out of it. We add a little spirit to this thing when we use words like universal, unmediated or global. But if way say that, in order to make visible a collective of 5 to 10 billion people, in the long history of immutable mobiles, the byte conversion is adding a little speed, which favours certain connections more than others, than this seems a reasonable statement. To say that we are living in a cyberworld, on the other hand, is a complete absurdity.

<nettime> interview with Cornelia Sollfrank

From: Josephine Bosma

To: nettime-l@desk.nl

Date: Mon, 7 Jul 1997 21:44:11 +0200
(MET DST)

Cornelia Sollfrank is a professional artist from Hamburg Germany. She regrets doing too much work, nine projects at the moment. She spends a lot of her time organising her work, putting up schedules, making lists, creating databases. She was interviewed at the nettime meeting in Ljubljana in May this year. She is one of the women involved in organising the workspace block at Documenta about cyberfeminism.

*

Q: Could I say you are mostly known for your work with the group Innen?

CS: That's certainly a very important part of my work. In this group I am together with three, meanwhile four other women. The concept of the group is that whenever we show up in public, we all look the same. Its a bit confusing for people to identify a single person. We never use our own names when we show up with Innen, we always say 'we', we all have the same opinion and we all look the same. So we created the identity of one person consisting of five different. Its the opposite phenomenon of what is known as schizophrenic, where one person is split up in many. We are suffering from the opposite symptom: we are many and we all became one. I won't talk about the philosophy behind it. I just say it works well.

Q: You were asked by Geert Lovink to fill up one of the blocks in the Documenta workspace. What do you want to do?

CS: First I said no, because its not *me* that is going to do it. I won't do it as one person. So I asked some more people if they would like to contribute or join me for everything and we set up an organisation which is now responsible for this block. The name of the organisation is "Old Boys' Network". Its the first cyberfeminist organisation worldwide as far as I know. What we are going to do at Documenta is we are going to think about what cyberfeminism could be. As far as I know there are no definitions or there are many different ones. We'll try to bring together all the different notions of this term. We'll think of strategies of how this term could perhaps help to set up a new goal, a new political goal.

Q: You say you want to explore what cyberfeminism is or find a new definition: does that mean it doesn't have one yet?

CS: They are so different that they are really no definition. It also seems not very spread. Its only in a few countries, a certain group of people uses this expression. One plan of our Documenta appearance is that we want this term heavily spread all over the world. We want everybody talking about cyberfeminism.

Q: But why if you don't know what it is, if you don't have a definition yet and you don't know what cyberfeminist issues are, why the hell do you want to spread it all over the globe?

CS: Because people will ask themselves what it is. They will find out that they won't find out, so the next question is: what could it be? They have to start thinking for themselves what they want it to be. Its very open so maybe what I want it to be, could be the definition of cyberfeminism. The basic question is: where do I work, what is my goal, where do I want to go to. I want to use cyberfeminism to rethink these things.

Q: Does that mean you are missing something in feminism or you want to continue something from feminism into the new digital age?

CS: I think the phenomenon about cyberfeminism is that it became kind of tabu in the nineties to be a feminist. Nobody actually wanted to talk about it. This certainly has reasons for women. I think we all live of the benefits of feminism, women, but also men. There are however some very problematic aspects that came along with feminism. It took many years, it took less say the nineties to think about these things. What were good things we use and what were the bad things, to become aware of it. I'd like to break this tabu of feminism and rethink the whole history of feminism. I'd like to connect to it again after this whole period of not using it anymore.

Q: How do new media come into that?

CS: All kinds, mostly as a means of distribution, of exchanging, of connecting.

Q: Do Donna Haraway's ideas come into it at all? The cyborg notions of technology and biology being sort of undermined by some of these new technologies, that produce new models of different ways of looking at gender, does that come into it at all?

CS: Certainly. She is very important. She used this model of a cyborg as a projection without gender. So as a model for trying to think not genderrelated. That's very interesting. But I don't think it is the right time to use these big names. For me cyberfeminism is a concept for every single person to start thinking by themselves and not reading the big thinkers.

Q: Do you think there any specific issues for women online?

CS: No, I don't think so really.

<nettime> Interview with Rem Koolhaas

From: Pit Schultz
To: nettime-l@desk.nl
Date: Sun, 13 Jul 1997 03:48:25 +0200 (MET DST)

Interview with Rem Koolhaas by Tom Fecht

June 26, 1997 in Workspace at Orangerie, Kassel

(first transcription, audio version available at <http://www.icf.de/cgi-bin/RIS/ris-display?868751729>)

Tom Fecht for Kunstforum International: I would like to continue a little bit the discussion we had last night with Edward Said. There was a very important statement, as far as I understood it, in the context of the division of labor in the field of aesthetic production. He made a very important point about the role of intellectuals being confronted with expertise. And he made a very strong statement, which made a point very clear in the political context of Palestine, which I think, we can take the risk to generalize a bit. He said that "every time there is a cry for identity we should be careful because scandals and lies are around"

Rem Koolhaas: Because what?

Fecht: "Because scandals and lies are around". And he had a pladoyer to offer instead several identities to allow transformation for future partnership. This was one of his essentials. So when I look to your manifesto which has been published in 95 about the generic city, the city without character, identity is one of these important obstacles to think freely about the future. So I would like to get to the geographic elements in your terminology of identity. When you talk about the centers, this becomes a very important point. Maybe you like to give some points to that question.

Koolhaas: Yes, maybe we should not assume that those texts are known. But anyway, as an architect I became aware at a certain point, that there was a strange obligation of our profession to call the dominant condition of the contemporary urban environment, and when I say dominant I don't mean the centers but relatively recent urban substance, that most of us live in, to always call it identity-less and to always refer to the identities of the well-known centers, the identity of Paris, the identity of Berlin, the identity of ... So I noticed a kind paradox: On the one the vast majority of people was living in so called identity-less conditions and there was still the discourse was mostly about preserving identities, establishing identities and exploiting identities. So basically I reversed the questions and decided to make an inventory which I called the "generic city", the general city, the city without qualities, the city without identity, which is simply an inventory of a new urban condition that is very pervasive in Asia but which is equally pervasive in America and in Europe, and try to explain or basically try to explain to myself maybe in the first place what the virtues of this identity-less space could be and obviously one of the enormous virtues is that once there is no identity you are also liberated from a whole series of obligations, a whole series of assumptions and a whole series models.

Fecht: When one looks at your installation in the Ottonaem which is one of the two important key installations in the whole Documenta if one compares it to the one in the Friedericianum of Van Eick, the room right next you has the installation of Reinhardt Mucha, which shows sort of shrines of pieces of architecture, an archeology of architecture. In your manifesto you raise the point that architecture is one of the most important media to register history on the horizontal level, when it comes down to archeology and you are scheming up with next century to have rather an archeology of the horizontal where you stop digging and instead you need an endless supply of airport tickets to move around the world.

Koolhaas: Of course the whole article on the generic cities has a level of irony. What I am fascinated in is that kind of compared to earlier civilizations that actually left traces. It seems as if our civilization is doomed partly because larger and larger parts of it are taking place in cyberspace but also because our style of building is less and less permanent and more frivolous and flimsy. It seems that this literally age old tradition of leaving a kind of imprint of civilization in the form of an architectural layer, that we will be the first generation not to do that any more. But what you are saying is on the other hand between Mucha and ourselves: It is very interesting for me that at the moment that architecture has lost an enormous amount of its original credibility that many artists are becoming seemingly obsessed with architecture. And I don't know whether this is whether that is simply because they don't know how completely eroded on the inside the credibility of architecture feels or whether they actually may have something to contribute.

Fecht: I can see that architecture becomes a field of vision for a lot of artists and in your manifesto you raise the point that exactly at that moment in history when the city started to die out, you can observe the discussion of art in public space. And you make the equation that if you add two dead things you can't get the thing alive again. So this is not a dracula, the performance doesn't work. So I would be curious if we come back to the beginning question of the division of labor, not to say 'industrial' division of labor in aesthetic production what kind of potential you

see in the artistic production to maybe come to this point of changing identities, transforming for future partnership between the art, artists and maybe even the question of authorship. Maybe you can even give some details of the organization of your office.

Koolhaas: OK, I think one thing which is really liberating about the Documenta as a whole is that all the professional kind of identities have been leveled and taken away and that there has been a much more even condition where somehow the theme is the urban condition and how we inhabit the urban condition, it's illuminated by people called artists and people called architects, and also be people called photographers or scientists. For me it really represents an enormous relief and a sense of freshness that we are no longer forced to pretend to have certain competencies and abilities, but it seems what the main theme of the exhibition is that there is a collective and that each of us makes part of this collective and that therefore the old play of vaguely different roles that still the collective responsibilities are asserted about the individuals and professionalised identities. I think that is a very liberating theme of this exhibition. I am very curious whether in reviews that eventually will come out.

Fecht: When I spoke several days ago with Katherine David, one of the key points for her conception was that she sees the urban area as one most essential and important aesthetic and social experiences of the 90s...

Koolhaas: I don't think so. Ironically it has nothing to do with the 90s, their interest here... what is happening now, and I think the 90s are just marking the condition that whether we want it or not or admit it or not, for the first time almost every one on the world lives in an urbanized condition, or is about to live in an urbanized condition.

Fecht: So the whole terminology of architecture, the city, doesn't work any more the way we used to handle these terms.

Koolhaas: No, I think that for instance in China and about what I will talk about also tonight. [see links] There are conditions where a village, or a person in this village, owns a fishpond, sells the fishpond to a developer, the developer builds a skyscraper in the fishpond, the entire village moves into the skyscraper, so some farmers live with chickens and goats on the 42 floor, and around the skyscraper there are rice fields. I think that things that we, in our minds keep separate and place very far apart, with a kind of suddenly telescoped, as if according to a computer program like Photoshop where you can simply combine everything in a single image that you want to combine. So it seems as if certain inhibitions that have traditionally organized architectural and everyone's space have disappeared and we are suddenly in a situation which is much more absurd and potentially much more dangerous but where anything can be combined to coexist with almost anything else. And I think that in that context, public art and public space as they have traditionally been interpreted are both extremely dubious, because public space is an organized form of space which implies a certain behavior and insists on a correct use. And I think that is already too authoritarian to really function in these conditions. And in the same way art which is supposed to represent this kind of publicness, also in my eyes at least is no longer believable. I think that in the last ten years it just has become bigger and bigger and more and more desperate.

Fecht: When you wrote about your generic city you said the generic city is what's left when important parts of urban life takes place in cyberspace. Which explains why we lose places and streets as public locations. To what extent are these medias in their aesthetic potentials useful to reorganize the tools and the skills of architects and in terms of education and practice.

Koolhaas: That is a very interesting question because architecture, in my view, is a profession that consists of concrete entities that are built and that have a real existence. Or even though, of course, you can also create a kind of virtual architecture in cyberspace or can have a

kind of architectural experiences in cyberspace. But I think the more interesting aspect of architecture is still the more concrete architecture. But nevertheless I think there is an enormous influence of virtuality on architecture and you could say and it is only a partly a caricature that probably out of a sense of insecurity some of the best architects these days are trying to make their buildings immaterial, as if they don't exist. And trying to endow them with that kind of glamour that computer aided images have, the perfection and the sterility maybe also. So there is in a way a kind of strange simulation of virtuality in real architecture. But what is for me more interesting is the kind of shamelessness and amorality that basically the computer implies in terms of the ability to combine everything with everything else in single frames, that kind of lack of resistance, and the absence of necessity for discipline, that all these are in effect deeply effecting architecture, but the built form of architecture.

Fecht: In the portraits given in the guide of the Documenta, there is a strong emphasis on the importance of theory in your architectural practice.

Koolhaas: Basically I don't think that architectural theory exists, that's a side I am very modest about, of course there is thinking in architecture, and what I have noticed in my architectural practice is that it is incredibly difficult to combine the production of buildings and some kind of intellectual reflection because the production of buildings is really a very brutal and exhausting process. What I have always been concerned about is that how in the typical architect's career there is an initial beginning with ideas, then an enormous effort to make the ideas real and then at the end of this effort a kind of exhausted, empty condition where there are no ideas any more. That is why in our work we try to alternate between research and reflection and that is also why I am teaching at Harvard University because this is the only way in which, against the consumption of ideas, of the practice, we are able to find domain of renewal.

Fecht: Do you see any emotional or moral qualities in architecture that might survive the processes of profound changes in the next century. When I look at your book of the 'small, medium, large, XXL' it appears to me like the manifesto which some of your critics put in the context of the manifestoes by Duchamp or Manetti and the futurists, so when I think about Marshall McLuhan's book 'the medium is the message' which was a book that had an element of this free-folded typography, where the message was not that clear, this was one of the points we had in the discussions last night, that it is important to see that the borderlines got out of focus. You describe architecture or activities in the aesthetic field as the possibility to give an urban fashion to the planet. What is this free fold? Is it a movement of search which you could also find at the Documenta?

Koolhaas: No. To the extent that the book was called 'free fold', we were only talking about the format of the book, because the problem of the book is to create a container or an envelope for work and ideas that in themselves don't make any claim to consistency. Because I think that Said didn't speak about consistency, for me the need for consistency and the way only consistency earns respect, is one of these other dangers of the intellectual, because I think inconsistency is at least as important so therefore in the book we had a lot of different projects, a lot of different essays, a lot of different insights, and I wanted exactly to avoid the impression that it is one theory, one line, one argument. The issue was how can you develop a container that still allows the diversity, the conflicts and the contradictions to remain evident.

Fecht: When you take this container: What do you think are the most urgent tasks in the education of architects during the next decade speaking of Europe. In your installation in the Ottoneum you make a strong point which is basically statistics: How many living unions are constructed in one night, two architects, three computers. So it is a quality which changes by quantity in a dimension which is hard to imagine for European traditional architectural education.

Koolhaas: I am always very bad in saying what people should do or I am already bad on the level of the individual, I am certainly bad on the level of a continent, but I think that, just as an example, I negotiated a situation with Harvard University where I said I would teach there under the condition that I would not be involved in design, or design education. I guess that basically suggests that I don't believe in design education at this moment. And that I think that the discrepancy between issues that could inspire architecture and the education has become so big so that it would be probably much better to suspend design education for 10 years, and to introduce 10 years of solid research. I am sure that there is vast research to do in the urban condition in East Europe, in Kazakhstan, where ever. The pretension that you can still tell people how to operate is becoming for me personally more and more unthinkable.

Fecht: To what extent you could imagine a cross-cooperation between artists, no matter what field. Do you see any chances in your economic and developing structures to include artists in this process or is this rather a position of analysis and observation.

Koolhaas: It is hard to say, and you yourself started with it already, that the basic idea of specialization is one of the things that inhibits forms of thinking. For me it is more interesting to think about brains, and to assume that artists also have brains, and the artists have a very particular reflection of intellectual processes. In that sense we work with friends which happen to be artists or sometimes we actually formally invite somebody because he has specific reasons to do it. It is not the need for architecture to encounter artists, but it is more to combine different kinds of brain power.

Fecht: One specific question in the context of identity. Last night we had this interesting position of Mr. Said, where he basically said: Many identities are much better than one. But we can't understand history without memory. Since architecture is a very important element of storing memory and history, what function could memory have in the context of architecture from your point of view looking at the next century.

Koolhaas: Well I am very bad to tell people what to do and I am also incredibly bad in looking forward. I don't know why that is exactly but I think I have an obsession with the present and I am extremely reluctant to make any claims or dictates for what is going to happen. We have already talked about the way architecture leaves less and less traces. What I guess is that some other domains have to take over the role of memory from architecture. Exactly this traditional doesn't work any more, for instance you can look at Berlin now to see very clearly what is happening because to the extent that architecture embodies memory the present reconstruction of Berlin is a kind of blatant attempt to extinguish and to eliminate certain kinds of memories, the memories of communism, the memories of the fifties, the memories of a kind of sober, optimistic moment of modernity. So already see that this kind of responsibility to embody memory is no longer part of the inner self-image of the profession. So, there is such a kind of ruthless judgment in terms of what is good and what is bad that the most intelligent part of the profession which for the sake of argument we should assume, is involved in redoing Berlin is actually basically a single empty memory operation.

Fecht: I don't know if you had the chance to look at the most part of the exhibition. Let's take for example the installation of Syberberg, called "Memory Cave", the cave is explicitly not architecture, it is an element going beneath. In this context Syberberg starts with Plato's metaphor of the cave, and he gives some images of the Potsdamer Platz in the context of the Reichskanzlei, and some images out of the car, a few days later, all these images interfere with memory which loses its location, which obviously no longer has a consistent place. Is this an aesthetic approach which you could feel to get into closer communication with advice for a solution. Or if you look at the national library which has been recently opened in Paris, where you have this metaphorical element and you have practical implements of the building in the same time. In this context, could you reflect on memory maybe.

Koolhaas: I think this building is a kind of desperate attempt to impose a memory on an entity which, as you say, in terms of its pragmatic needs has nothing to do with a memory. Therefore the only consistency, if I can make a confession, that our thinking in our work have had in the past, is that we refuse ever to be bitter about anything that happened in the past and we try to, without being foolish, try to interpret the inevitable, which allows a forward movement. To the extent that we no longer have the responsibility to symbolize memory or to represent memory or no longer have the responsibility to represent anything, I think it is extremely exciting for us, then it means that we can be completely new, completely dumb, completely inarticulate, completely inert, completely meaningless. It simply reintroduces a vast amount of possibilities.

Fecht: thank you very much.

Eike Becker: Just a very quick question. A lot of people came here to this exhibition and they expected something similar like the gestamapet kunstwerk or so on. They identify where they identify of one single artist or so on. The question of Gestamp kunstwerk. Then the question of collage, what is your position towards collage, what is your position to these two areas.

Koolhaas: Are you talking about Documenta as a whole?

Becker: Yes, Documenta as a whole, and of course, the relationship of gestampwerk and collage to your work and the works of others.

Koolhaas: I don't whether I can answer the question, but for me in spite of the criticism we have heard and read I think what is extremely exciting there is a very thematic and ambitious and uncompromising situation in this Documenta. Greater Urban and all its aspects has been represented as the dominant and continuous setting. Whether its gestampkunstwerk or not, I think gestampkunstwerk is a kind of romantic notion and I think that there is a kind of, very insistence on a romantic view in whole ex and an insistence on cooling the temperature kind of rather than creating an overheated expectation an almost clinical quality which I think is extremely stimulating because it allows you for the first time to really look clinically at a number of things and relate make your own connections, between them instead of being guided by hand of the gestampkunstwerk in terms of forcing you to make those decisions so the clinical quality also has a certain freedom for creating your own raptor. In terms of collage, I've always been uncomfortable with the notion of collage, because I've always been much more interested in the notion of montage. I think because the montage is basically the planning of a series of events or the planning of a series of visual or other episodes. Whether its stories or in a movie, or episodes in a painting. I think that collage is something that anybody can do but montage introduces an abstract strategic value which I sense here in the hand of this exhibition. It is much more a montage than a collage.

OK, thank you.

Bandwidth and Accountability
An Interview with Saskia Sassen
By Geert Lovink

Held in Hybrid Workspace, Documenta X, Kassel
July 11, 1997

GEERT LOVINK: What will be the topic of your lecture tonight and will you speak about bandwidth?

SASKIA SASSEN: For me, no matter where I start. I will arrive at bandwidth... The subject is cities as strategic places for economic actors, and possibly, for a new kind of politics. In that new kind of politics I am thinking of such diverse actors as immigrants, but also net activists.

LOVINK: Let's talk about the geography of cyberspace. We have a lot of maps on display here, in Hybrid Workspace, and they show the inequality of (the distribution of) bandwidth worldwide. These figures are giving a dry and precise picture.

SASSEN: Many people are of course aware about this basic architecture of the networks. But to have the data so precisely is extremely important. One of the concerns for me has been to understand the differences between private digital space and the public one. A lot of theoretical work has been done on public digital space, like for example about the Digital City in Amsterdam. I have been concerned with private digital space. And with what I see as a colonizing of public digital space by private (i.e. corporate) actors. We have three phases of the Internet. The first phase is that of the hackers, where access was the issue, making the software available. The second one, when you begin to have the interest by private actors that did not quite know how to use it. It still was mostly a public space, in some ways protected. And now a third stage: the invasion of cyberspace by corporate actors: it's really combat out there. So for me, the Internet becomes a space for contestation. I am here not only thinking about multinational corporations. I am thinking of all kind of actors, including the misuses of the Net, which is something serious also.

The bandwidth capacity is forever a very difficult issue. It is not clear to me if the capacity will be endless, like in the notion of the old frontier, where you had 'endless land'. But it is not really endless. It takes a number of events to discover that. Certain laboratory production of capacity are enormous, in term of bandwidth. But I am not sure what happens once it moves from the lab to people and companies. There are two issues: the economics of introducing the new technical capacities is possible. And economics matters. We already now have poor men and women's e-mail, where you wait forever. If you can pay, you will have a high speed connection. The other issue is a 'de-greening' of the practices in the Net, which I find very disturbing. The issue bandwidth consuming multimedia, for instance, where things could also have been done via e-mail.

LOVINK: In order to have a broad, general debate about the issue of bandwidth, it might be important to see how we can visualize this topic. Which metaphors do we use, what kind of images? How would you describe the bandwidth topic for a wider audience?

SASSEN: I grew up in Latin America. Anybody who has spent some time there or in Africa, knows what it is to get a international, long distance call going. You have to wait, sometimes for hours. You don't just get on the telephone and get access. Why? Because it is a question of the capacity. You will experience the notion of inadequate carrying capacity. Today, those of use who use e-mail through institutions have also had that experience. In Europe, in the afternoon it is difference than in the morning. Why? Because it in the afternoon the USA has woken up and has invaded the Internet. You get to wait a much longer time. If you have a lot of money, believe me, you will have a fast lane. In Bombay or Sao Paolo, you will find different circumstances. For instance, there are poor and rich universities. Some universities in

the US, in order to save money, shift part of their bandwidth to commercial users after 5 o'clock. And you will sit there forever to get a connection.

LOVINK: The campaign here, 'We Want Bandwidth', could be part of a strategy to re-imagine what the public part of cyberspace could look like. We could complain that the old parts of the public realm are disappearing. But we could as well start reinventing new public spaces.

SASSEN: It is not disappearing, it is being colonized. One of the key issues is to develop and promote more different sub-cultures. In Latin-America there is a whole lot of net activity in Spanish (Castilian). The more diversity we have, the better. The colonizing of the space is going in many different directions. It does not only have to come from private companies. Even if it is just e-mail. Whether it is poor women in India connecting directly with a group of poor women in New Jersey, or labour unions that are beginning to do more international organizing because they are on e-mail. It is really a question of maximizing the activity on the Net, and militance, if you want.

LOVINK: On the other hand, we have this economics of the networks. Simultaneously, with stiff competition and a drive towards monopolization. Maybe this comes as no surprise. What may look like chaotic markets, is in reality quite frightening. Specially if look at the mergers between the telcoms.

SASSEN: This is a very real story, this joining of large firms across borders. One of the ironies is that insofar as fiber optic cables does remain a very important way of getting the communication going, in order to provide global services, these companies have to cover the whole, actual geography of the globe. Hence the necessity of the mergers. At the end we will have a limited number of very large global companies. Going global is the name of the game.

When we talk about regulation today, we tend to give it a narrow meaning, which has to do with the government regulating content. That is a totally different notion, compared to regulation access and accountability. We need to free the concept of regulation from what it is. We should innovate and start to think how we can regulate those big conglomerates. They are reshaping the topography of communications. They are now moving into Latin-America, where the telcoms are being privatized. For the upper middle classes and above, this will be fine. The problem are lower income communities, and more isolated places. Even in the USA there are people who cannot even afford a telephone. Insofar as the global telcoms are dealing with a condition that is essential to us, whether we look at it as people, who have forms of sociabilities. Or if we look at it as democracies, where communication is necessary. But now these firms are privatized and not accountable, which means we might run into scenarios that are very nasty.

Demystifying the Virtual Power Structures
An Interview with Susan George
By Geert Lovink

At Hybrid Workspace, Documenta X, Kassel
July 16, 1997

[Susan George is the vice-director of the Transnational Institute in Amsterdam and was from 1990-1995 on the board of Greenpeace International. She is a well known critic of the Worldbank and the IMF and has published several books on the debt crisis.]

Geert Lovink: I was surprised about the opening statement of your 100 days lecture. You stated that economy and ecology are at war. Here in Germany, many from both the corporate world and the ecological movement think in terms of collaboration and harmony. Influenced by New Age, they think that the two might go together in the end. You called

yourself an 'alarmist'.

Susan George: For the first time in history, we do not have much time ahead of us. If New Age people think that everything can be made into sweetness and light, they have not examined power relationships very carefully.

I fear that if people can be persuaded that these two paradigms can be made to match without deep changes, it will distract them from the kind of politics that we have got to do. You are speaking from a very German point of view. Germany is at the very forefront of ecological awareness. Where I live, in France, people are way behind in such things as recycling. For the first time, France has got now green MPs and a green minister. Although the United States might have a high degree of awareness in some areas, politically speaking this has not been translated into reality. The kind of radical politics that I was trying to talk about has not yet reached any kind of level where major changes are going to come about. Many of these changes are taking place at the international level. And that's where it is going to be most difficult to act. Many of the destroyers of the planet are acting with impunity, because they are acting at the international level. They are not transparent and are answerable to no one.

GL: You have been on the board of Greenpeace for many years. Are you optimistic about the growth and strength of the ecological movement?

SG: I left the board at the end of 1995. The new administration tends to engage a lot less in confrontations. Personally, I think that is a mistake.

Confrontation and exposure are still very much needed. There are areas where one can cooperate with businesses. Yesterday I mentioned the insurance industry which is getting knocked out. They incurred \$ 50 billion of losses within the last ten years. Why? Because of global warming and the increasing frequency of storms. Even if George Bush and Bill Clinton were not convinced of global warming, the insurance companies are. And they are listening to Greenpeace and teaming up. The case of the Greenpeace refrigerator has been overblown badly. It was clear that the manufacturers were not interested in listening, or doing any research about new technologies that would not destroy the ozone layer. What Greenpeace did, with a couple of scientists from East Germany is simply to show that it can be done. The same holds true for a car engine, that would use much less petrol. But who wants that in the oil industry? That is what I mean with confrontation: embarrassing the decision-makers by showing the consumer that it can be done.

These products are also coming to developing societies like China and India, highly populous countries, where a substantial middle class is now in a position to buy refrigerators. If all of China is going to have refrigerators with CFCs, we might as well put on our hands and sunglasses and hope for the best. Not all manufacturers have switched, even in France. You live in a paradise here.

GL: In your lecture you did not mention the debt crisis. Could you give us an update? How do look at the recent developments, having done more than ten years of research into it?

SG: I only mentioned the debt crisis in relation with the ecological crisis in the South and the East and the capacity of the Worldbank and the IMF to impose neo-liberalism. As soon as a country has no other source of fresh cash, it has to go to these international institutions. Then they are in a position to say, we lend you money, but on the following conditions. That is how they have been able to forcibly integrate into the global economy close on a hundred countries. I published my first book on the topic in 1987, having worked on it for two years. There comes a time when you have to leave a subject alone. In the last year, I have prepared a report on Mediterranean debt for the Italian government. Most activists are concentrating on Africa. As well they should. But what I discovered in the cases of the Maghreb countries, Egypt, Jordan, etc is that the scale of the problem is much greater. The impossibility of this debt ever being paid back is exactly the same as for black Africa. The boomerang arguments (the impacts it has on the North) hold true and Europe has already started to pay heavily for the debt crisis in the Southern Mediterranean rim.

GL: Within circles of cyberculture, money has been looked at from the angle of virtualization. Most of capital is now virtual, no longer related to the realm of the production of material commodities. It is seen as a closed, 'other' computer network, next to the Internet, and where the money is circulating constantly, all over the world.

SG: The existence of those financial electronic network is not a secret, but it is difficult to get access and knowledge about it. Without electronics, economic globalization could not have happened. In the

foreign exchange market you got \$ 1.2 trillion circulating every day. Less than 5% of that represents actual cash transactions. Most of it is just making money out of money. When I looked at the quite boring annual report of the Bank for International Settlements, a serious institution, the central bank of the central banks, in Basel, you detect a note of utter panic. What they are saying is that the financial markets are inventing new instruments, much faster then we can get a grip on them. The IMF stepped in when we had the crisis in Mexico, in Russia and now in the Philippines. My question is: when we have the big crash, as we are going to have, quite soon, where is the IMF that is going to move in? There is nothing big enough to counter an accident like that. When it is going to come, this crash is going to create tremendous suffering, as it did in Mexico in January 1995. Workers lost their job, malnutrition rate immediately went up, the suicide rate and the crime rate are way up. The effects of electronic markets actually fall down on society.

GL: In his article in the 'Atlantic Monthly', George Soros has also warned for this to happen. He is supporting a lot of the NGOs worldwide. How do you look at the growing importance of the NGO-sector?

SG: I am not aware of growing power of NGOs. I am not well informed about the activities of his foundation, but I would love to meet him. I think he has got the right attitude towards the stockmarket because he does not follow the herd. He also proved that central banks are totally powerless when confronted a determented army of speculators. I want to say here that these people are perfectly identifiable. One should not treat this market as something mysterious, like giving the law on high, like God speaking to Moses and then we all have to follow it. This is 30-50 major banks, about the same number of brokerage firms, and a few, mostly US pension funds, which are in on this. 250 major guys doing all this. There is no reason, in my view, why, if governments got their act together, and were a little bit less cowardly, then there is no reason why these transactions could not be taxed. The money should not go to the UN. But there is no reason that one could not constitute international funds which could be democratically managed. One could palliate the debt crisis and write off debts with that sort of a fund.

GL: This campaign here in Hybrid Workspace is dealing with bandwidth. We are trying to map who is owning the cables. What are your experiences in visualizing those abstract structures?

SG: To be honest, yes, I was able to name the major players in the debt crisis. I began to do work on those emerging markets. I could not carry it out because it was too expensive. I was able to interview people in South Africa because I was there for a conference. The same thing for the Philippines. That is another reason why Soros is important, because he is demystifying a lot of what the markets are doing. Being one of the players himself, he certainly is not down on his knees, worshipping them. That is one of the dangers. Capital is like a religion. The anthropologist Fabricio Sabelli sees institutions like the IMF depending on believe systems, with the Worldbank as the medieval church with its heaven and hell. The same thing is true for the market. There is a good deal of popularizing to be done, in this case, to demystify the Internet. And do remember that half of the world has never made a telephone call.

Telephone interview with Paul Garrin
We Want Bandwidth!
By Geert Lovink

12. of July 1997 -
at Hybrid Workspace Documenta X, Orangerie, Kassel

audio version :
<http://www.icf.de/documents/RIS-DATA/86898445/8689844553.ram>

see also:
<http://www.waag.org/bandwidth>

Geert Lovink in Kassel: People that are visiting Documenta might find the whole topic of bandwidth a little bit abstract. They are not really familiar with it.

Paul Garrin in New York: Let me make it clear to the average layperson, understandable bandwidth - what that means is that one of the acronyms of WWW is World Wide Wait. So everybody is waiting around the world for the pages downloading, because there is not enough bandwidth.

GL: Yes, everybody knows that. That's a way to enter the whole story, and then up to the next chapter - content and the economic aspects behind the telecommunications business.

PG: Definitely, and the question of who owns the bandwidth is a big issue. Because it is all the big telecom companies. And although there are many, they are becoming fewer as they merge. MCI was just eaten up by British Telecom, and Sprint is about to be eaten up by Deutsche Telekom, probably between the next 18 months or so. Deutsche Telekom has already a 20% interest in Sprint, I believe. Deutsche Telekom makes invoices into the United States in terms of telecommunication infrastructure through Sprint, then in terms of public relations through the Guggenheim Museum. 'Control the art and you control the people'.

GL: They are then also directly involved into the Content Business which is the next level.

PG: Exactly and this is the next trend of what the Bandwidth owners are starting to do, which is now, for example, Time Warner and Disney and Microsoft buying up Network Capacity all over the place and they are also content providers, if you can call it content. What is happening here, and what is going back to what I was talking about at Next Five Minutes back in 96, was discussing the idea of the permanent autonomous network. Which is the only way we can assure our presence: to buy the bandwidth because there is no guaranty of survival, especially if the Big Content Providers are buying up connectivity to control the content. There is no guarantee. As I said in my article "The Disappearance of Public Space on the Net" about the encroachment of any kind of public space or free space on the Internet by Big Media. The Old Media companies are buying up New Media and are imposing the Old Media models, such as, for example, Push Media. This is the way how old media powers deal with new media, two way interactive media equals transmissions in both directions, but it is two way in the sense that they pump the content to the consumer and the return pipe is a thin pipe just to suck the data of their credit cards.

GL: Critics might say "we want more bandwidth", the slogan of this campaign (at Hybrid Workspace), that's why we criticize the so called Push Media, maybe we are not quite well aware yet what we ourselves might do with all the bandwidth. How do you see that?

PG: Well, I say it is not necessarily a question of how much bandwidth, but that we have any at all and, of course, what we do with it is of vital importance. That has always been the problem with the net and the web, that there are plenty of places to go, but nothing to see. And this problem might potentially be solved by artists and creative people who have something to say. I don't think this should really be an issue because we have all the tools before us, so lets not plunder them. We have all the access in front of us, lets not waste them, lets not waste time, because the more time we take to establish our presence, the more the spectacle and the creator, the more the encroachment of the commercial media will be, which will ultimately insecure any efforts by independents.

GL: The latest update of Name.Space, lets tell it to the listeners.
(see <http://namespace.autono.net>)

PG: The case against Network Solutions, Name.Space filed back in March, alleging anti-trust against Network Solutions Inc., is now in front of the judge of the Federal Court of New York at the United States Federal District Court. And this week is a week of paper work, as it goes right now, publicly the case is proceeding, and Network Solutions has basically admitted in papers they have published on their homepage many of the things that Name.Space has proved. Such as there is no technical limit of the numbers of top level domains, even quoting the inventor of DNS, that the Domain Name Service and the software are a highly scalable system and that there is no technical limit of the numbers of top level, or second level or third level domains, that the limit of 36 characters of each level is not necessary. So as it looks, things are moving forward in our direction, and we are very optimistic about them coming out in our favor.

GL: Yes this article that you were posting on nettime was

very interesting..

PG: It appears that the United States Department of Justice, I guess, got wind of the Name.Space antitrust lawsuit against Network Solutions and themselves approached Network Solutions and as we see into possible anti-trust practices.

GL: An interesting move, isn't it?

PG: It has nothing directly to do with our case, or any direct influence on our case, because this is done under a separate jurisdiction, not of federal law, but however it is interesting that somebody else is taking it very serious.

GL: Can you explain to us a bit how you are moving yourself from the topic of Bandwidth that you are raising to the practical project of Name.Space because name.space seems to be a little bit on the symbolic level, having to do with Names, and the freedom, and bandwidth seems to be a very hardboiled economic topic. Is that true?

PG: Well, these two things are highly related and as in my statement before: if we want to insure the presence of free media on the net, then we have to buy our bandwidth. How to do that? To create an economic structure which is basically a self-sufficient, self-supporting network. This type of thing I thought that the idea of creating name.space as a service to potentially fund the bandwidth that we need. Apparently the market for Domain Name Registration is a high one. In 1997 Network Solution add 90.000 domain names a month charging a 100 dollars up front for two years. If you look at the map, that 9 Million dollars a month is cash flow at that rate. That is only selling com, net and org domains. Now on name.space, thanks to the public who have suggested many new top level categories, we have over 400 top level names available at the moment for registration. So at that rate, at 25 dollars each, the potential is there. At least a couple of million dollars a month, in cash flow. This kind of money coming in independent hands such as ours, probably is a bundit enough to fund our networks and to support our cooperative partners in Europe and even hopefully sponsor some other activities for producing media and holding conferences. So I think that it could be a very important aspect of independence of not only buying and providing bandwidth and server resources, but also supporting content production.

GL: The question was, I can imagine that we could do something like name.space, could we even make a jump and start a kind of autonomous and go to that very hard level of providing bandwidth ourselves or even owning it.

PG: Well, this is always a question of scale, scale is a question of money, if it turns up that we end up making money in the billions, sure we can lay fibre, and buy up satellite links. I wouldn't say that this is in our 2 year plan, but I wouldn't rule it out either. In fact I am known for my capacity for reinvesting resources and therefore if we do make that amount of money I am not that kind of person that buys fancy clothes and a Porsche and moves to a house in the country, I would put that into infrastructure.

> or even owning it.
>
> PG: Well, this is always a question of scale, scale is a question of
> money, if it turns up that we end up making money in the billions,
> sure we can lay fibre, and buy up satellite links. I wouldn't say
> that this is in our 2 year plan, but I wouldn't rule it out either.
> In fact I am known for my capacity for reinvesting resources
> and therefore if we do make that amount of money I am not that kind
> of person that buys fancy clothes and a Porsche and moves to a house
> in the country, I would put that into infrastructure.

Dear Geert, dear Paul Garrin,
yes, nice move, the namespace idea.

But please talk more precise about
- who of us is part of the "we" in alternative/"autonomous" projects of
owning fibre, satellite links etc.
- what form of (economic,political) organisation/powerstructure you talk
of when you say "autonomous". Co-ops? Syndicates? Bandwidth-NGOs? Inc.s?
Oligarchy?

And: do we want our future Richard Bransons rejecting fancy clothes and
penitentially walk in humble rags?

We Want Porsche

note: the interview posted yesterday with Ackbar Abbas was edited by
Linda Wallace.

A visit to the Makrolab in Lutterberg
The Documenta X project - Marko Peljhan/Projekt Atol

<http://markolab.ljudmila.org>

Communications equipment check with Marko Peljhan and Brian Springer
Lutterberg, July 20, 1997
By Geert Lovink

Makrolab is a research station up on the Lutterberg, 10 km from Kassel.
It is an autonomous solar and wind powered communication and survival
tent, full of equipment. One night I went there to find out about the
first results of the project. Like Workspace, Makrolab had lots of
technical problems in the first weeks of documenta X, but now the lab is
up and running. In the coming days Makrolab will post an own text on
nettime about the system.

GL: Could you explain us what kind of interception equipment you have
here? This machine here says 'Microwave Videolink Transmitter -
Designed for Makrolab.'

BS: It is a 10 gigahertz microwave link, going to the Documenta Halle
where the video console of Makrolab is located. It is used to relay
video information from the lab's side to the Halle. Beside that there
is a video switcher for the cameras that are related to the
console. Here is some short-wave and two meter gear which we for
example use to monitor the Mir transmissions.

MP: You must have special decoding software to work with short-wave
digital transmissions and different modulations. All what you hear now
is different kind of HF modems or encoders. Tele-printers which use
different standards. A lot of it is encrypted and there are specific
NATO and Russian systems with specific baud rates that are almost
impossible to decode. It is not like baudot weather services or stuff
like that, it's much more complex and hidden and there's no readily
available information on it. When you hear and identify a baud rate of

81 or 73 or 96 p.e., than it is probably some NATO transmission and you
know that you cannot get the message. But there's other systems which
are very easily de-codable or even voice services which are usually not
scrambled. What we hear now is p.e. information about the weather over
the Atlantic, the Shannon volmet for the air traffic flying towards
Europe. On another channel we hear Stockholm Aero, and HF aeronautical
station for transatlantic and transpolar routes. What we can decode
quite easily is the SELCAL signals transmitted by aircraft, together
with their position, wind, temperature and fuel status. With the short
wave setup we have it is of course also possible to transmit, and every
night I try to talk with some stations, yesterday it was Estonia and
Belarus. In the past two days it was Mir packet radio time, three times
a day and more.

We try to get the Mir signals when it over flies Europe. As you know Mir
was in trouble, but now they repaired their electricity circuit, and
today they were resting, communicating with radio amateurs of the world.
I've put some signals information on the website.

BS: On the other machine we are receiving signals in the L-Band around
1.5 giga hertz. It is a communications receiver. It could be use for
mobile phones, but they are mostly regionally located. We were specially
interested in crossing boarders and boundaries. Across five countries
or more, like INMARSAT, which is a satellite telephone system, a
briefcase size. Maybe you saw Peter Arnett using this during the Gulf
War, speaking to CNN. There are still vestiges of the INMARSAT system
that are analogue based, which do not require any special digital
decompression. So here in Germany you could be listening to America,
Ireland or Teheran. This is where communication start to get
interesting, where the medium does what it does best, which is
communicate. And where culture does what it does worst, which is
communicate. We are investigating if the collision of these best and
worst characteristics can create a interesting stage for intervening in
the trans-national flow of information.

MP: What makes this set of radio amateur gear perhaps specific is the
context in which we are operating. The result is only becoming visible
only after quite a long period of time and a period of reflection. We have
just started.

GL: Brian, you have been doing satellite interception before. You
released a videotape where you see politicians getting ready, doing
tests for an open camera.

BS: In the United States, these satellite feeds which were un-encrypted
video transmissions, either by television networks or by corporations,
were accessible. One could find the Philip Morris Television Network
every now and then, doing a corporate teleconferencing. From their
lawyers point of view it is a private transmission. And then it is my
point of view that this is public transmission because it is not
scrambled. Anyone with a home satellite dish, which is 4 million, can
receive this. The issue here is: what is a common carrier, and what is
a broadcast? A broadcast is something that goes out to a mass public. A
common carrier is something like a letter. But what happens if a letter
is broadcast across a whole continent, when it is not encrypted, not
in a digital but in an analogue form? A lot of contradiction can arise
of what is public and what is private. The satellite's broad beam pushes
these contradiction to the surface.

GL: Could you compare that kind of work with video feed with current
research on the audio spectrum?

Coming from the States, it is such a televised nation. There is a
hoard of images, spewing forward. Everyday at 6 p.m. when the local
news starts, maybe 15 news reporter, are standing in front of chart
buildings, dead bodies and blown down houses, getting ready to report
the days carnage to the local television viewers. With the satellite TV
feed you could see these reporters before they go on-air. These satellite
out-takes can sometimes be revealing. Now it seems everyone who appears
on a satellite feed knows someone might be watching and/or taping them, so
now that candid stage has disappeared. Here the audio is interesting
because it is still an open stage at times.

MP: I have not worked with satellite video much, just for a year now.
One year ago we put on a 3m dish on the roof of Ljudmila in Ljubljana.
In Europe there are less feeds. What you get is pre-taped material that is
sent to different broadcasters. I have been working with short wave for a
long time, since the early eighties. Short wave is the cheapest and most
accessible way of communicating over long distances and still widely used.
I think that almost everyone has the experience of suddenly hearing a
female voice giving out four-letter codes for five hours on their own AM
radio receiver. We listen to those here too and try to make some sense
and basically map them. There is information available on the Internet
about the frequencies secret services use, but things are changing quickly
in that world. And basically every posted data is already old data. Audio
and data traffic on SW is still not so accessible, compared to video.

where you just hook your TV up to a satellite receiver and a dish and there you go.

GL: Brian, you experienced the closing of the open video channels. Most of it is now encrypted. This is also happening in the audio spectrum. Do

you see the same patterns occurring there?

BS: The open windows are slowly closing. It is a unique opportunity to have one last glimpse at the curve of the analogue spectrum before it closes forever. Analogue seems to be more natural, curved, not binary, with less protection for the information contained on these channels.

GL: So we have to move than and crack the digital spectrum.

MP: The big game is to move forward to digital domains. A complete set of new knowledge is needed. We heard rumors that digital communications, for example banking information were cracked. That is illegal and basically a criminal offense but tells a lot about the safety of our own data being transmitted and re-transmitted over the networks. The encryption that is currently used by states in diplomacy is very hard to decrypt. You must have the key, that's it. Intelligence services are working more on getting the keys than to decrypt. The human is the weak element of the chain, not the signal anymore.

xx

Appendix: this is why we built makrolab

the process of following a certain problem could be metaphorically expressed as travel through the areas of a big organism. the existent cognition systems explain various parts of the ur-animal (e.g. the foot, the organ, the tissue, the structure, the particle...)

by means of links they create topographical areas. viewed from inside in the man who thinks, explores, learns, experiences and feels the latter form and organize themselves as complete experiences, whereas viewed from outside they manifest themselves as neutral objects: tools, books, images, plans, calculations, data bases, models, systems...

the exhibited object, the makrolab-console represents the external, fragmentary view on the makrolab - research station, which is set on the hill lutterberg.

makrolab is designed as an autonomous, modular communications and living environment, which is powered by sustainable sources of energy (solar and wind power). it is designed for a long existence in an isolated environment and can withstand extreme natural conditions.

it has its own research and experience goal. the station is built as a combination of various scientific and technological logistics systems. makrolab makes use of scientific and technological tools, knowledge and systems, but it projects them in the social domain of art, we, the authors and crew make use of the system of art for the shaping and representation of an integral empirical and creative experience.

telecommunications as the main aspect of the project is concentrated on the discovery and recording of the events which take place in the densely populated abstract areas of the electromagnetic spectrum. the electromagnetic spectrum is a part of the global socio-political space, which is invisible and immaterial on one hand but presents a productive factor of

general living and social conditions on the other. it can be sensed only by the means of suitable interfaces and specialized knowledge. the telecommunication activities of makrolab are created as the process of transcribing invisible and vague micro-environmental activities into traditional, three-dimensional textures - documents.

the research station makrolab on the lutterberg hill nearby kassel (which is at the same time one of the exhibited works of art at the documenta 10 exhibition) is the primary conceptual and material plan of the project which has yet only started to follow its objective, and which constantly shapes its contents and lives its own individual experience.

Pax Electronica: against crisis-driven global telecommunication
An Interview with Gayatri Spivak
By Geert Lovink
July 23, 1997

At Hybrid Workspace, Documenta X, Kassel
<http://www.documenta.de/workspace>

"Gayatri Chakravorty Spivak, born in India, is a professor of English and comparative literature at Columbia University in New York. Her name is primarily associated with the concept of postcolonial studies and along with Edward Said and Homi Bhabha she is regarded to be one of the most important representatives of this Anglo-American theoretical field. Her literary analyses and theoretical writings have invariably dealt with the deconstruction of neocolonial discourses and a feminist-Marxist approach to postcolonialism, particularly to the schematized forms of representing women in the Third World. During the summer months Gayatri Spivak works with a non-governmental organization in Bangladesh to organize an educational program for women and a teacher training course." The official Documenta X biography

You can see the lecture of Gayatri Spivak (real video) on:
http://www.mediaweb-tv.de/dx/0724/gaeste_frame_e.html

The Global Knowledge conference she is referring to was organized by the Worldbank and took place in Toronto from june 22-25 june 1997. See also:
<http://www.globalknowledge.org/>
The protests against this event were impressive. Read the report on:
<http://www.iao.ca/earth/lk97/archive/0119.html>

Geert Lovink: You are writing by hand!

Gayatri Spivak: It is not so much deliberate, but I just can't help writing by hand. One types by hand also. It is not that the hand disappears, but if I start typing, or working on the screen, I am dinosaur. I find that it disappears from me. I have a secretary but she certainly does not type the stuff I write. I am from the manual typewriter era. The extraordinary editing capacities of the computer also touch me. That second typing on the screen is a creative moment. It is just not the first moment. Is writing the first moment we do not know. I consume the affect of writing by hand. Another reason is that I do a lot of work in areas where there no electricity at all.

GL: Here we try to mix real and virtual spaces, old and new media,

thereby polluting the clean, bright concept of high-tech. We are trying to get away from the autopoietic, self-referential tendencies and ideologies written into both the hard- and software.

GS: The high-tech is an epistemological constraint I want to escape. That's the secret of hybridisation. The biggest hybridisation is of course the sexual encounter which you want to escape and at the same time are seduced by. Yes, epistemologic constraints seduce me because they are outside of me, while at the same time I want to escape them. This is how the game of hybridisation in my life goes on.

GL: Do you consider the computer as a machine of exclusion? Or is it just a tool?

GS: It does seem to me that in one way the computer is part of an empiricisation of the desire for virtuality. This made D.H. Lawrence write some time ago that the sexual encounter is the eternal virginity of the soul. To an extent, real virtuality is the imagination, which does indeed exclude. It constantly makes you other yourself and other the Other. So it is not as if the computer is alien to the way we are. I don't see a distinction between natural and artificial intelligence. I think that's bogus. At the same time it can become exclusive, an instrument of a certain narcissism, a simulacrum of reaching the other, which is exactly a withdrawal of the responsibility. In a much broader, political sense, it can be exclusivist because of the stratification of the world. But that's another story. Like most answers: what is poison is also medicine.

GL: In what direction would you like to see this new genre of 'net criticism' grow into? Is there something we could learn from literary criticism?

GS: I can only tell you what my notion of literary criticism is. The imagination is the possibility of real virtuality. The claims made for virtual reality are sometimes, somewhat empiricised. The imagination is the possibility of being somewhere that is not the Self. This is related to being human, as already being open to a connection with something other. That is what to be human is. Otherwise the infant would not be able to invent his or her mother tongue. That is how the infant begins, by creating a language which then the parent learns, as it were. Through that it develops into a language with a history. That is the synthesis with the absolutely Other which is monitored by the imagination. You could look at literature in this way, as a kind of machine for the training into relating with the Other.

I am not in the business of getting information from the South and then doing research in the North. I teach Marx to Americans. And I do practical work in Bangladesh so that I can learn. I say to my American students, let us now imagine that there has been no history. Nothing has happened, this text is about to be written. It is not that one denies history. We learn to learn from the singular and the unverifiable -- that is what the literary is. It is hard to describe because it is a doing thing. It sounds romantic if you talk about it. I believe that this literary critical practice has connections with the notion of virtual reality, but I don't know what they are. You will have to think about it in your own way.

I don't see the literary primarily as a field of expression. I see it as a field of being impressed: 'gepraegt'. Perhaps that is one way of looking at the Internet. If I ever got into developing net criticism, I think I would probably be as eccentric as I am in the field of this literacy stuff. Maybe you could pull me in and see what peculiar comes out of it.

GL: For a country like India it seems of strategic importance to introduce cyber-technologies. Do think that this has a priority over other infrastructure, like roads or electricity, or even over education or food?

GS: I don't think that is a choice anymore. Here in Kassel I will talk about a conference that took place in Toronto on June 25, called 'Global Knowledge'. The actual agenda said that the so-called developing countries should be given preferential treatment. It was all about selling access to telecommunication-as-empowerment as such. There is this picture of a very tall and lovely African woman, in her cloth, with a spear her right hand and a cellular telephone in her left. It is scary. Global telecommunications combined with actually women's 'micro credit' is spelling out the importance of finance capital. In a situation where financial capital turns over twenty-five times more than world trade, states are undermined and the possibility of social re-distribution is being questioned, it is a luddite idea to think that one can stop the world and that a developing state can choose whether to prefer electricity, food, roads, seeds, bio-diversity, or primary health. This is not a choice because telecommunications are being sold as access to all of this. The idea of the Pax Electronica, coming from the Pax

Romana, the Pax Britannica and the Pax Americana is a very welcome notion when one is not aware of the worm in the rose. McLuhan was the avatar of this Global Knowledge conference. Both McLuhan in his 'Global Village' and Lyotard in his 'The Postmodern Condition' suggest that with telematic societies, what pre-writing societies used to have -- the oral cultures -- will come back. The first world will be able to access the internal, unmediated richness of the oral culture. Not only go back, but go forward. One of highlights of the Global Knowledge conference was a school in Alaska for the Inuits, so far West that if you cross the water you cross over to the East. That is the ultimate notion of the slogan 'Go West, Young Man'. McLuhan said that today's Third World has lost touch with the holistic view, and in the telematic world we will go back this immediacy. Lyotard's example in 'The Postmodern Condition' is of the Gashiahoo Indian, the native Canadian American. There is certainly an allure here to the post-affluent, superannuated hippie -- the walking wounded from the sixties.

I got news of this conference in Bangladesh. I was not in Toronto. What was striking was that the mailing from this conference has already started. The so-called least developed nations are already getting the letters. If we protesters take our time, we will have missed the boat. It is no use vaulting the World Bank. The notion that 'women are truly stepping forward to an unexamined notion of global feminism through telecommunication' is very scary thing.

GL: Could you tell us about the work you have been doing in Bangladesh, regarding the media situation and the question of access to telecommunications?

GS: I am not connected to an NGO, as the Documenta brochure says. I am not connected to anyone. Since you can't work complete alone. I am friendly with, tolerated by, a group that is an alternative development policy research collective in Bangladesh. They are deliberately not an NGO, they pay taxes. In the current post-Soviet conjuncture we have to be very critical about this new, rising NGO-culture. They call themselves a consulting agency. They produce research that is not government sponsored or NGO sponsored. NGO is not really a category. You can't define something simply by saying that it is non-governmental. An organisation is content specific, funding specific, structure and salary specific, who evaluates, what kind of advisers exist, etc. In India there is now a new category called 'people's movement' which is neither a new social movement, according to the European notion of the greens. Nor is it an NGO thing, to the extent that a people's movement must be a group whose work will survive even if the funding is stopped. The critique of the NGO is that in the New World Order of economic restructuring, whereby barriers between state economies and international capital are one-by-one removed, you need something which can take over the 'economic citizenship', as Saskia Sassen calls it, and this is done by the huge structure of collaborative NGOs. This is called the 'international civil society'. In 1995, after the GATT was concluded, immediately the World Trade Organisation began making the GATT something that could be enforced. In this context, NGOs are not a useful group to work with as they are too involved in the New World Order -- in terms of big players like the World Bank, the International Monetary Fund and the World Trade Organisation as the economic arm and, unfortunately, more and more, the United Nations as the political arm.

GL: How does this group you work with look at global telecommunications and to whether access is important?

GS: Yes, access is important. This group I work with brings out a journal in Bengali called 'Informatics'. They use the English word in Bengali script. What they are interested in is strategy-driven, rather than crisis-driven, access to telecommunications. Certainly not the idea that simply access as such is empowerment. In the old days we used to say that rights are an empty notion. You have to bind every freedom to a content, so that in its binding a freedom is exercised, otherwise you only have non-exercised guarantees. When they are exercised you have riots and violence. They are trying to effect the charges that are being imposed, so that your idea of a public space becomes class-fixed.

This is an up-hill battle, especially when the telecommunication will be sold 'for free'.

GL: Could you tell us more about this group: who they are and what they are doing.

GS: They are called, in English, Alternative Development Policy Research. They focus on ecological agriculture on a large scale. One of their main projects is the struggle against pesticides, chemical fertilisers and bio-piracy. Bangladesh has 12,000 kinds of rice. As monoculture is coming in, the farmers are having buy back their own seed. What they also do is the struggle against the international

population control lobby. Not against family planning, Against pharmaceutical dumping, coercive contraception, etc. These are the negative uncertainties. They are part of the Third World Network and are connected to the Asian Women's Human Rights Council. The development of a notion of informatics fits into this.

They are also active on the cultural front. They are profoundly connected to Bengali Sufi: a dethologized islamic-hindu combinations on the ground, which is very different from either bourgeois secularism or virulent nationalism. This comes through their attachment to music. Also they are involved in the reform and restoration of old Arabic-Persian words in Bengali, which supplanted in the 19th century when Indian nationalism picked up Bengali and made it into something more Hindu.

What I am interested in doing is learning to learn from below. I hang out with extremely deprived groups to see how their children should be taught. I am with the children so that I can find ways of telling the teachers what to do. Now this is very slow work, one on one. I have been doing it for the last ten years. You can't do it by reading Paolo Freire. Each place is different and the teachers are full of good will, but extremely ill-educated. I can't do this for long because the teachers, given the way in which they have developed, cannot believe that the ideas that I am giving are any good at all. The workshops given by NGOs or the government are so different from what I say. If they start obeying me, everything will be ruined.
