

List server busy. Full digest rescheduled.
A compendium of listserv discussions & divagations — Nettime, CRUMB,
-empyre-, Spectre, Syndicate, oldboys, Nettime-bold

Assembled by David Gauthier (Le Club des Sans Sujets)

<http://full-digest-rescheduled.info>

Produced in 2020 for transmediale's *The Eternal Network* exhibition at HKW, Berlin

Funded by: transmediale e.V. and Stimuleringsfonds NL

A Torque Editions publication // www.torquetorque.net

Typefaces: Courier, Doves Type and Eurostile

Design: Sam Skinner and Mark Simmonds

Printed and bound by CPI, UK

List Report:

Nettime-l (nettime.org/archives.php)

[nettime_l] Total contributions: 26785

[nettime_l] Contributions per year:

1995: 53
1996: 543
1997: 1192
1998: 1279
1999: 2438
2000: 2745
2001: 2340
2002: 2013
2003: 1653
2004: 959
2005: 815
2006: 839
2007: 783
2008: 804
2009: 753
2010: 523
2011: 929
2012: 732
2013: 619
2014: 818
2015: 795
2016: 696
2017: 661
2018: 901
2019: 902

[nettime_l] Number of written characters per year:

1970: 8236
1980: 2744
1995: 8845
1996: 62694
1997: 82881
1998: 152559
1999: 126916
2000: 118280
2001: 269724
2002: 219259
2003: 133117
2004: 152780
2005: 112631
2006: 71829
2007: 49297
2008: 44416
2009: 116954
2010: 66603
2011: 147795
2012: 43867
2013: 74387
2014: 137476
2015: 102895
2016: 106004
2017: 50546
2018: 186655
2019: 144428

[nettime_l] Number of written words per year:

1970: 1353
1980: 442

```

1995: 1366
1996: 9750
1997: 13904
1998: 24438
1999: 19375
2000: 18783
2001: 32079
2002: 33310
2003: 21833
2004: 21315
2005: 18391
2006: 11745
2007: 8241
2008: 7071
2009: 18635

Welcome

...

O.O

Welcome, and information on the <oldboys>-list

From: Cornelia Sollfrank
To: oldboys@lists.ccc.de
Date: Tue, 20 Mar 2001 20:28:29
+0000

Welcome to the mailing list of Old Boys Network, <oldboys-list>!

Please save this message for future reference. Thank you.

TECHNICAL INFORMATION: (as regards content, information below)

This is the ezmlm program, managing the oldboys@lists.ccc.de mailing list. It will speak in the first person further on...

I can handle administrative requests automatically. Please do not send them to the list address! Instead, send your message to the correct command address:

To subscribe to the list, send a message to:
<oldboys-subscribe@lists.ccc.de>

To remove your address from the list, send a message to:
<oldboys-unsubscribe@lists.ccc.de>

Send mail to the following for info and FAQ for this list:
<oldboys-info@lists.ccc.de>
<oldboys-faq@lists.ccc.de>

To get messages 123 through 145 (a maximum of 100 per request), mail:
<oldboys-get.123_145@lists.ccc.de>

To get an index with subject and author for messages 123-456, mail:
<oldboys-index.123_456@lists.ccc.de>

They are always returned as sets of 100, max 2000 per request, so you'll actually get 100-499.

To receive all messages with the same subject as message 12345, send an empty message to:
<oldboys-thread.12345@lists.ccc.de>

The messages do not really need to be empty, but I will ignore their content. Only the ADDRESS you send to is important.

You can start a subscription for an alternate address, for example "john@host.domain", just add a hyphen and your address (with '=' instead of '@') after the command word:
<oldboys-subscribe-john=host.domain@lists.ccc.de>

To stop subscription for this address, mail:
<oldboys-unsubscribe-john=host.domain@lists.ccc.de>

In both cases, I'll send a confirmation message to that address. When you receive it, simply reply to it to complete your subscription.

If despite following these instructions, you do not get the desired results, please contact my owner at
<oldboys-owner@lists.ccc.de>

Please be patient, my owners are a lot slower than I am :-)

WHAT IT IS ABOUT:

<oldboys-list> is an international discussion mailing list owned by the Old Boys Network.

OBN is regarded as the first international Cyberfeminist alliance and has been founded in 1997 in Berlin. Under the umbrella of the term 'Cyberfeminism' OBN contributes to the critical discourse on new media, especially gender-specific aspects.

OBN is dedicated to appropriating, creating and disseminating Cyberfeminisms (plural). OBN creates real and virtual spaces where Cyberfeminists can research, experiment, communicate and act. The OBN platforms aim to provide a contextualized presence for the diverse and interdisciplinary approaches to Cyberfeminism. One of these platforms is <oldboys list>.

One of the basic rules of OBN is that every member is required to call herself a woman (without consideration of the biological base of this intelligent life-form). With regard to its contents - the elaboration of Cyberfeminisms - our aim is the principle of disagreement!

Additional to our communication in virtual space OBN regularly organizes real space meetings.

- First conference: 'first Cyberfeminist International', documenta x, Kassel, 1997, hybrid workspace;
- Second conference: 'next Cyberfeminist International', 1999, Rotterdam, de Balie (in cooperation with 'next5minutes, festival for tactical media, Amsterdam).
- Third conference: 'very Cyberfeminist International', 2001, Hamburg, is currently in preparation.

All conferences are documented in printed readers. No.1 and no.2 are sold out already. The content will be available on our new website, soon!

Currently (2001) the book 'Cyberfeminism - next protocols' is in production in collaboration with the Publishing House Autonomedia, New York.

In 2000 OBN presented itself in the 15 minutes long video 'processing Cyberfeminism'.

Since OBN has come into being it's personnel as well as the organisational structure have been in a constant flow.

If you want to learn more about the regulating structure of OBN, and you are interested in finding out what is special about this transitory network, please visit our website (currently being redesigned by Slovenian artist Irena Woelke), <http://www.obn.org>

<oldboys-list> can stay unmoderated as long as all subscribers feel responsible for the list, share it's policy and the general netiquette.

* text-format:
plain ascii, no MIME-attachements, maximum size: 40.000 bytes (please split bigger texts);

* visuals:
basically visuals are welcome to be distributed, but not automatically via the list; pls. announce your visuals and send them at request to individual addresses.

* all postings are automatically forwarded to the searchable <oldboys-list> web-archive. This archive is only accessible by subscribed members of the list who have the password. (further instructions soon)
address: www.nettime.org/oldboys

* copyright policy:
forwarding of public announcements via e-mail is allowed if the footer is included; all other forwarding has to be checked with the authors. for republishing on a web or ftp site, contact with the authors is obligatory. The same regulation is valid when republishing in paper media, or if money changes hands.

* <oldboys-list> is a way to form a large network of active cyberfeminists. Please feel free to invite new subscribers or to suggest them by simply sending a mail to the list-owner.

* questions, comments, criticism are welcome!
please direct them to <oldboys@lists.ccc.de>

Old Boys Network, march 2001

[oldboys] Personal Welcome!

From: Cornelia Sollfrank
To: oldboys@lists.ccc.de
Date: Mon, 26 Mar 2001 16:25:13 +0100

Welcome to the <oldboys>-list!

As I have already announced to you individually some weeks ago, OBN has finally installed it's mailinglist. It is running on the list server of CCC, Chaos Computer Club in Berlin, which is the German hacker's club. About 150 cyberfeminists have subscribed so far.

Attached to the list is a searchable webarchive: <http://www.nettime.org/oldboys>. This means that <oldboys>-list is an open list and everyone who is interested can follow what is going on here.

In order to give you a better understanding of what OBN used to be and what it is now, and also what the list is supposed to be used for, I would like to describe the situation of OBN from MY PERSONAL point of view.

I am sure, most of you know OBN through our conferences and the documentary readers. Indeed, the 'real' platforms of OBN have been dominant so far, in contrast to our 'virtual' ones. But this mailinglist is the first step to improve our virtual presence and communication, and is meant to host a global discourse on Cyberfeminism.

As a matter of fact, we are also working currently on the relaunch of our website. Irena Woelle from Ljubljana is our webdesigner, and we are looking forward to our new site, which will represent what OBN is, much better than the current one. Amongst many other things, next to a theory section, there will also be a gallery space, and a calendar which contains all current events in which cyberfeminists take part. As soon as we have a Beta-version, we will put it up and inform you, as well as ask you for your contributions.

Furthermore OBN is planning a third international conference, called 'next Cyberfeminist International' which hopefully will take place in November this year in Hamburg. The current situation is, that we are in the middle of organizing the funding for the conference. We will keep you updated about this and send out a call as soon as we can verify the details.

OBN itself has gone through several major shifts in the almost four years of it's existence, shifts in personnel and shifts in the organisational structure. Some of you might know our video 'processing cyberfeminism' which represented the so-called core-group of OBN. Our current website also still contains this outdated information that there is something like a core-group. There used to be one, right, and it consisted of Cornelia Sollfrank, Susanne Ackers, Julianne Pierce, Helene von Oldenburg, Claudia Reiche, Faith Wilding, Yvonne Volkart, Verena Kuni. But we had to realize after a while that it was no longer functional, for several reasons. For me, most irritating was the fact that the existence of a core-group transported the idea of a closed inner circle to the public, and consequently many interested people felt uncomfortable and not really welcome. I feel very sorry for that, because OBN was always meant to be an open network.

About one year ago, the core-group abolished itself in order to open up the structure and make space for new boys, new ideas, new projects, and new cyberfeminisms. Still, there was no infrastructure where we could have announced and practiced our desire for change. We found ourselves in the contradictory situation that it was up to the ex-core-group again to build these new structures.

In this very transitional phase during the last year, a fragmented ex-core-group consisting of Helene von Oldenburg, Claudia Reiche, Verena Kuni, myself and partly Susanne Ackers gathered again and made efforts in order to realize the transition of OBN. We have set up the list, made the concept and raised money for the new website, thought and talked about the possible future of OBN, and are now busy making the next International happen.

I would like to welcome you, on this list and in the network. Please understand OBN as an open structure where activities and contributions are welcome, and of course a lot of qualified critique;-) And, be also aware that all the work which the boys have invested so far in OBN was voluntary. Although, our resources are very limited, we try to make things happen, but we can not function as a service business.

I'm looking forward to your input and many lively discussions, and hope you enjoy this piece of autonomous infrastructure. Make the best out of it!

To find out more about OBN and the current regulatory structure, pls. send a mail to <oldboys-info@lists.ccc.de> and/or <oldboys-faq@lists.ccc.de>

Cheers from Scotland, Cornelia

Date: Fri, 4 Apr 1997 00:17:49 +0100

Welcome to the nettime-l mailing list!

If you ever want to remove yourself from this mailing list, you can send mail to 'majordomo [AT] Desk.nl' with the following command in the body of your email message:

unsubscribe nettime-l nettime-archive [AT] factory.org

Here's the general information for the list you've subscribed to, in case you don't already have it:

[Last updated on: Tue Feb 27 22:38:19 1996]

<nettime> is not only a mailing list, but an attempt to to formulate an international, networked discourse, that is either promoting the dominant euphoria (in order to sell some product), nor to continue with the cynical pessimism, spread by journalists and intellectuals working in the 'old' media, who can still make general statements without any deeper knowledge on the specific communication aspects of the so-called 'new' media. We intend to bring out books, readers and floppies and web sites in various languages, so that the 'immanent' net critique will not only circulate within the internet, but can also be read by people who are not on-line.

<nettime>
is closed and slightly moderated,
it has two channels:

Welcome to new-media-curating!

This list is intended for those involved in curating, exhibiting, archiving or interpreting new media art (including net.art, interactive installations, digital video etc.)

It is the discussion list of the CRUMB web site (Curatorial Resource for Upstart Media Bliss <http://www.newmedia.sunderland.ac.uk/crumb/>).

The list will be active from March 2001, and list members will be emailed with details nearer the time.

[-empyre-] welcome

From: n/a

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jan 6 14:39:01 2002

welcome to -empyre-

-empyre- is a soft space where invited guests from the media arts field - artists, theorists, curators, producers and administrators can discuss their projects, publications, productions, and share knowledge and experience. it's specific to the issues which surround media arts, without necessarily being academically referenced, nor concerned with delineating areas of practice into interactive, or digital, or net, or rom, or pda, or web, or text, or flash art.

how it works:

guests will send out an initial email statement about their work/project/publication, and then for two or so weeks will be open to comment, questions, discussion around the topics. on 15 january 2002 the discussion starts with Ollivier Dyens (bio at <http://www.subtle.net/empyrean/empyre/dyens.html>) who has generously agreed to be the test guest.. a new guest will be invited at regular intervals..currently every second month, however depending on the level of interaction perhaps i will make it more or less frequent. administratively there may still some glitches to be ironed out over the next few weeks as well - the net is never a seamless experience.

many people have subscribed since i opened the list a few days ago which is great.. and leads me to think a lot of you want something extra in the way of content from your email.. however i know i get enormous amount of email in my in box everyday, a lot of it duplicated info which i have to filter out..

-empyre- is not the place for conference announcements, or art show invitations or email text works. i think we are all connected to (often too) many networks which provide these functions already.If anyone consistently spams the list, sends attachments, or is abusive towards other members i will unsubscribe them.

as i have made the subscriber list invisible so that it can't be harvested by bulk emailers, i would encourage people to post a brief introduction to the list before the first guest arrives. i'm glad to see new names, as well as so many subscribers whom i've known in other hard and digital realms over the years, and i look forward to your participation, which has always been informative and stimulating... often controversial and sometimes extremely funny.

-empyre- is an experiment in this format, and like most mailing lists will have an organic lifespan generating its unique rhythms, highs and lows, jumping between furious pace and slow silences... basically -empyre- will live or die according to your input, - you are the animating fluid of -empyre-

Melinda Rackham

[spectre] Rise and Decline of the Syndicate

From: Arns/Broeckmann

To: spectre@mikrolisten.de

Date: Tue, 13 Nov 2001 15:52:15
+0100

Rise and Decline of the Syndicate: the End of an Imagined Community

Inke Arns & Andreas Broeckmann, Berlin, November 2001

The Syndicate mailing list imploded and went down in August 2001, destroying the life-line of the Syndicate network. The network had been in a shaky situation for a while, due - we believe - to the destabilisation of the problematic balance between personal contacts of list members, lurking and filtering-and-not-reading-let-alone-posting subscribers, and a growing number of self-promoters who used the list as a personal performance space and disregarded the social rules of the online community.

Some people insisted on continuing the list on a new server, taking over the subscriber list, while we decided to form a new list, SPECTRE, which has been running on the previous Syndicate list-serve in Berlin since 28 Aug 2001. The list currently has 250 new subscribers (Nov 01) and continues the tradition of the Syndicate list as a low-noise, open platform for exchange and cooperation in media culture in Europe.

After six years of successful work with and for the Syndicate community, the demise of the Syndicate list in August 2001 was a rather shocking experience for many of us, imposing on us the realisation how feeble such a community channel can be, and how easily destroyed. It proved that responsibility and care are essential elements in a viable social online environment, and we had to learn the hard way that there is no consensus about the rules that should guide behaviour and interaction. The following text gives a brief summary from our personal perspective of the Syndicate initiative as it developed since its inception in 1996, and attempts an evaluation of its end.

Andreas started administering the Syndicate mailing list after its installation on the server of the Ars Electronica Center in Linz (aec.at) in January 1996, helping people to subscribe, unsubscribe and post to the majordomo list. As the subscriber base grew from the original 20 subscribers to about 200 in 1998, Inke joined in administering the list and - together with Arthur Bueno of the V2_Organisation in Rotterdam, who also maintained the Syndicate website and archive on www.v2.nl/syndicate from 1998-2000 - mostly managed the list administration through these years. We taught ourselves the basic majordomo commands, had our private mail accounts jammed with bounced messages, and therefore installed an admin account. Each time we would look into this account there would be hundreds of mails sitting there and voraciously waiting for us ... but somehow it worked. Problems started appearing on an entirely different field.

With its completely open structure (technically and socially speaking) the Syndicate mailing list soon proved to be vulnerable. In the beginning of November 1998 the list was first targeted: all the subscribers were unsubscribed. Luckily we had been extracting the "who" file on an almost daily basis and thus were able to reconstruct the list quickly. In September 2000 the list software on the server faced a serious crash which the sysops in Linz could not take care of because of the festival they were in at the time. So we decided to relocate the list onto a server to which we would have easier access for administration and configuration. Since then, the Syndicate list was hosted by an ISP in Berlin (openoffice.de) which also soon gave us the opportunity to switch from Majordomo to the more easily administratable Mailman software.

But the Syndicate was much more than a piece of software: it was a network of people. The Syndicate was founded in January 1996 on the last day of the Next 5 Minutes 2 Festival in Rotterdam. It was a network which devoted itself to fostering contacts and co-operation, improvements in communication and an exchange between institutions and individuals in Eastern and Western Europe active in the media and media culture. By allowing regular e-mail communication between participants regarding forthcoming events and collaborative projects the Syndicate mailing list developed into an important channel and information resource for announcing and reporting new projects, events and developments in media culture. The complete mail archive is kept at <http://www.v2.nl/mail/v2cast/>

Since the first meeting in Rotterdam in 1996, which was attended by 30 media artists and activists, journalists and curators from 12 Eastern and

Western European countries, the Syndicate network grew steadily. In August 2001, it linked over 500 members from more than 30 European and a number of non-European countries. The original idea was to establish an East-West network as well as an East-East network. In the meantime, however, the Syndicate had increasingly developed into an all-European forum for media culture and art. Over the last few years the division between East and West had been growing less important as people cooperated in ever-changing constellations, in ad-hoc as well as long-lasting partnerships.

Syndicate meetings and workshops have been held regularly, in most cases as part of festivals and conferences. The main meetings have taken place at half-yearly intervals in Rotterdam (Sept. 96), Liverpool (April 97), Kassel (July 97), Dessau (Nov. 97), Tirana (May 98), Skopje (Oct. 98), Budapest (April 99), and Helsinki (Oct. 99), with many smaller meetings and joint projects, presentations and workshops happening in between. Readers edited by Inke and published on the occasion of some of the meetings (Rotterdam 1996, Ostranenie Dessau 1997, Junction Skopje 1998) have collected the most important texts from the mailing list in printed form.

It was worth condensing Syndicate stuff in this way because most of the time the mail traffic was dominated by announcements. Attempts to turn the Syndicate list into a discussion list and encouragements for people to send their personal reports, views, perceptions of what was happening, were met by only limited response. In the beginning, when many people on the list still knew each other personally, this strategy was more successful, later, with the exploding rate of lurkers, less.

While in the first three years of its existence, the Syndicate held its meetings quite regularly (almost every six months!), and organised panels and workshops with its members, since 1999 the Syndicate list came to be more like a sleeping beauty which in times of crisis would awake and show its full potential. Suddenly, when necessary, everybody was back on, communicating almost breathlessly with each other ('Have you heard about X?' - 'The cultural center Y was closed!' - 'Z received his mobilisation call.') The list was last activated in order to support Edi Muka, Tirana-based long term Syndicalist, who had been sacked from his post at the cultural center Pyramid by some politically malevolent officials.

The meetings and personal contacts off-list were an essential part of the Syndicate network: they grounded the Syndicate in a network of friendly and working relationships, with strong ties and allegiances that spanned across Europe and made many cooperations between artists, initiatives and institutions possible. The Syndicate thus opened multiple channels between artists and cultural producers in Europe and beyond, which is probably its greatest achievement. It connected people and made them aware of each other's practice, creating multiple options for international cooperation projects.

A structure like that can work so long as it is supported and protected by a sufficient number of participants. It needs an ethical consensus about what is and what isn't possible on the list, which kinds of actions support and which may tilt the social equilibrium. The case of Andrej Tisma, a Yugoslav artist from multi-cultural Novi Sad and a defender of the Milosevic regime throughout the late 90s, is a case in point: many perceived his tirades against the West and against NATO as pure Serbian propaganda which became unbearable at some point. Later, Tisma came back to the list and continued his criticisms by posting links to anti-NATO web pages he had created. For us, he was always an interesting sign post of Serb nationalist ideology which it was good to be aware of. And it was good that he showed that people can be artists 'like you and me', and be Serb nationalists at the same time. The Syndicate could handle his presence after he agreed to tune down his rants.

However, this consensus was further eroded through the last two years. The nn episode on Syndicate in August 2001, then, was a symptom, but not the reason for the death of Syndicate. This started way before August 2001. Not only that there were no more meetings after 1999, one could also notice that since mid 1999 people felt less and less responsible for the list. Many Syndicalists of the first hour grew more silent (this was partly incited by the hefty discussions during the NATO bombings in Yugoslavia), perhaps more weary, perhaps less naive, many also changed their personal circumstances and got involved in other things (new jobs, new families, new countries ...). At the same time, the number of subscribers kept growing: more and more newbies kept flowing onto the Syndicate list.

The major change that occurred on the Syndicate around that time (1999) was the transition from a network of people and of trust to a more and more anonymous mailing list, a list for announcements like so many others. A growing majority of Syndicate subscribers now tended to see the mailing list merely as a quick and handy tool for spreading self promotion. The mailing list was to serve them for promotional goals, rather than as a tool of communication. When calls went out for support in the administration of the list, far too few people responded at all. Many people still do not understand the voluntary nature of the Syndicate initiative, and that the whole project depended on the sharing of work and responsibility. Too many

people took the efforts of too few people for granted. Investing time and energy in the administration of such a list became more and more frustrating. When some fellow Syndicalists joined the admin team early 2001, we could have realised that the project had peaked and should have been transformed into something different altogether.

The net entity nn (Netochka Nezvanova, integer, antiop, etc.), a pseudonym used by an international group of artists and programmers in their extensive and aggressive mailing list-based online-performances and for other art projects, had been subscribed to the Syndicate list in 1997. It was, as the first of less than a handful of people ever, unsubscribed against its will because it was spamming the list so heavily that all meaningful communication was blocked. In January 2001, nn sent an e-mail asking to again be subscribed to the Syndicate mailing list. (What nn never bothered to realise was that subscription to the list had always been open so that, at any point, it could have subscribed itself - we have always wondered why Majordomo is such a blind spot in this technophile entity's arsenal.) After getting assurances from nn that she was not out to misuse the list, we subscribed it to the Syndicate list.

Naively, as we had to realise, nn went from one or two messages every day in February to an average of three to five message in April and up to eight and ten messages per day in May and June - and that on a list which had a regular daily traffic of three to five messages a day. The distributed nature of the nn collective makes it possible for them to keep posting 24 hours a day - great for promoting your online presence, irritating for people who have a less frantic life rhythm. nn's messages are always cryptic, sometimes amusing, often tediously repetitive in their quirky rhetorics and style, and generally irritating for the majority of people. Its activity on the Syndicate - like on many other lists it has used and terrorised - soon came to look like a hijack. But the sheer mass of traffic nn was generating, the sheer amount of nn's presence, was overwhelming. Perhaps this phenomenon could be compared to SMEGL, short for super mental grid lock, a term that was developed to describe traffic jam situations in NYC back in the eighties (or was this term coined in Berlin-Kreuzberg's famous Fischbuerof? Who knows, the boundaries get blurred...).

In the spring of 2001, nn's and other people's activities who use open, unmoderated mailing lists for promulgating their self-promotional e-mails, triggered discussions about 'spam art', on Syndicate as well as on other lists. Actually, given the extreme openness and vulnerability of a structure like the Syndicate it remains quite astonishing that this structure survived for such a long time. What happened in the course of 2000/2001 (not only to Syndicate, but also to several other mailing lists) was that the openness of these lists, i.e. the fact that they were unmoderated, was massively abused, and, finally, destroyed, by relentless 'creative' spamming. One of the basic principles of the Internet - its openness - suddenly seemed to become a mere tool for attacking this very principle. 'Netiquette' did not seem to be of much value anymore and was sacrificed for the egotistical self-expression of (distributed) artist egos. The irony of this process is that, like any good parasite, this artistic practice depends on the existence of lively online communities: it not only bites, but kills the hand that feeds it. - These parasite nomads will find new hosts, no doubt, but they have over the past year helped to erode the social fabric of the wider net cultural population so much that communities have to protect themselves from attacks and hijacks more aggressively than before. Their adolescent carelessness is partly responsible for the withering of the romantic utopia of a completely open, sociable online environment. However educational that may be, we despise the deliberation with which these people act.

nn got unsubscribed from the Syndicate without warning on a day when there had been nothing but ten messages from her. After some days of silence and sighs of relief, angry protests by nn came through. On the list, accusations of censorship and/or dictatorship were made. A small but noisy faction denounced unsubscribing nn as an act against the freedom of speech. They called the administrators fascists, murderers, and 'threatened' to report the case to 'Index on Censorship'. While some other list members welcomed the departure of nn on and off the list and the admin team again and again explained their move, the ludicrous allegations and vociferous insults continued.

The real shock for us was that the majority of list subscribers did not participate in the discussion and thus silently seemed to accept what was going on. It was personally hurtful not to receive more support against the insults raised against us, but more frustrating was the indifference that made the whole process possible. Within few days, the alienation from the atmosphere on the list was so great that we admitted defeat, re-subscribed nn and began to withdraw from the Syndicate. The list was moved to a different server and is now administered by other people at anart.no/~syndicate. We wanted to avoid further verbiage and conflict and therefore gave up the name, but we insist that from our perspective the Syndicate project that was founded in 1995 ended in August 2001. What remains under its name is a zombie kept alive by misconceptions about what the Syndicate really was. Maybe we should have stopped the project

altogether in the summer!

Filtering has, in a way, done us in. Before there were effective e-mail clients that could filter out lists and other mail communication, everybody on the list got everything more or less instantly, which also meant a higher level of social awareness and social control of what goes on on the list. Today, many people filter the lists they subscribe to and only look at the postings at irregular intervals - some mailboxes don't get opened for months. Like this, people consume the list passively and do not even notice a fiasco like the one that we experienced on the Syndicate list in the summer. I guess that some people who remain subscribed to the Syndicate list still have not noticed that anything has changed. For a social community, that kind of behaviour - automated deference - can be fatal. "There's a spectre haunting Europe ..."

In August 2001, after unsubscribing from the Syndicate, we initiated a new mailing list under the name SPECTRE. It is an open, unmoderated list for media art and culture in Deep Europe. SPECTRE offers a channel for practical information exchange concerning events, projects and initiatives organized within the field of media culture, and hosts discussions and critical commentary about the development of art, culture and politics in and beyond Europe. Deep Europe is not a particular territory, but is based on an attitude and experience of layered identities and histories - ubiquitous in Europe, yet in no way restricted by its topographical borders. (The term Deep Europe was coined by Anna Balint in 1996. It was passed on by Geert Lovink. It was used by Andreas Broeckmann and Inke Arns. It was interpreted by Luchezar Boyadiev. It was used more by Sally Jane Norman, Iliyana Nedkova, Nina Czegledy, Edi Muka, and many others.)

SPECTRE is a channel for people involved in old and new media in art and culture. Importantly, many people on this list know each other personally. SPECTRE aims to facilitate real-life meetings and favours real face-to-face (screen-to-screen) cooperation, test-bed experiences and environments to provoke querying of issues of cultural identity/identification and difference (translatable as well as untranslatable or irreducible). The new list was immediately welcomed by many frustrated Syndicalists who quickly made the move.

SPECTRE is an unmoderated, but by no means open mailing list. With the Syndicate experience in mind we felt the need to explicitly formulate some basic, apparently no longer self-evident netiquette rules, like "meaningful discussions require mutual respect," and "self-advertise with care!" The list is initially hosted by the two of us who also have to approve requests for subscription. The blurb explicitly reads: "Subscriptions may be terminated or suspended in the case of persistent violation of netiquette." We regret that we have to introduce such a system of control but see no other effective way of protecting something that is dear to us. A lack of sensible protection brought down the Syndicate. Information about SPECTRE: <http://coredump.buug.de/cgi-bin/mailman/listinfo/spectre>

We try to continue the good Syndicate tradition of amiable exchange and are more hesitant about the illusion of being an 'online community'. We maintain our romantic belief in lasting friendships and insist on the need to infuse networks with a strong sense of conviviality. We believe in people and their needs more than we believe in art.

O.O

[spectre] new mailing list: SPECTRE :info
From: Andreas Broeckmann
To: spectre@mikrolisten.de
Date: Fri, 7 Sep 2001 17:47:48 +0200

[folks: if you are interested in subscribing to this list, please, follow the instructions below; as we are expecting quite a lot of initial requests, please, give us some time to process everything; greetings, andreas & inke]

SPECTRE is an open, unmoderated mailing list for media art and culture in Deep Europe.

Initiated in August 2001, SPECTRE offers a channel for practical information exchange concerning events, projects and initiatives organized within the field of media culture, and hosts discussions and critical commentary about the development of art, culture and politics in and beyond Europe. Deep Europe is not a particular territory, but is based on an attitude and experience of layered identities and histories - ubiquitous in Europe, yet in no way restricted by its topographical borders.

SPECTRE is a channel for people involved in old and new media in art and culture. Importantly, many people on this list know each other personally. SPECTRE aims to facilitate real-life meetings and favours real face-to-face (screen-to-screen) cooperation, test-bed experiences and environments to provoke querying of issues of cultural identity/identification and difference (translatable as well as untranslatable or irreducible).

WHAT IS (A) SPECTRE?

1. 'There's a spectre haunting Europe ...' (K. Marx/F. Engels)
2. S.P.E.C.T.R.E.: Special Executive for Counterintelligence, Terrorism, Revenge and Extortion (James Bond 007 movies)
3. spektr was a module of the MIR space station focussing on the research of micro gravity
4. Les Spectres de Marx (J. Derrida)
5. Craig Baldwin's latest movie: Spectres of the Spectrum (2000)
6. to be continued...

NETIQUETTE ON SPECTRE:

- no HTML, no attachments, messages < 40K
- meaningful discussions require mutual respect
- self-advertise with care!

SUBSCRIPTION POLICY:

SPECTRE is initially hosted by Inke Arns <inke@snaful.de> and Andreas Broeckmann <abroeck@transmediale.de>. Requests for subscription have to be approved by hosts. Subscriptions may be terminated or suspended in the case of persistent violation of netiquette. Should this happen, the list will be informed. The list archives are publicly available, so SPECTRE can also be consulted and followed by people who are not subscribed.

> deep
> europe from Geert Lovink, with whom I was discussing my idea in 1996,
> please
> clarify this.
> greetings,
> Anna
>

the term came up in discussion with geert in 1996/97 when we were preparing the syndicate workshop for documenta x in 1997: it is quite possible that geert brought it up, and i am happy to assume that the term came from anna originally. it is a bit odd that you never felt the need to point this out in the last 5 years when this term has been used also in other publications (like my text in the ostranenie 97 catalogue), but i see no reason why you should not be credited for 'inventing' it. it's a useful and strong metaphor! (is your own interpretation closer to the one that equates Deep Europe with eastern europe, or do you follow the interpretation formulated by luceazar, referring to the depth of layered identities which can be found any where in the continent, and beyond?)

i look forward to reading your text from 1996.

best regards,
-a

[spectre] "Deep Europe" is really
deep?

From: Pasztor Erika Katalina
To: spectre@mikrolisten.de
Date: Mon, 10 Sep 2001 11:48:20
+0200

Dear Anna, dear Andreas, and dear all, who are involved,
I was lurking on the syndicate list for years, I never dared to send a letter.
Well, I never had any special reason to do so. But now I have to write a
comment on "Deep Europe" and its copyright problem of Anna.

"Deep Europe" is only a flat slogan in my opinion.
(Except Anna I guess not so many of you follow the developments of the
political situation in Hungary, which is a kind of illuminating story of how
modern political marketing-communication (and media!) can sell about 5 million
Hungarians down the river... with fine tuned slogans.)

There is a lot at stake at the election 2002: if the Rights (the Guys) win,
than Hungary will be conserved into a society what is an interesting mixture of
network capitalism and new-feudalism spilled professional political Public
Relation sauce on it. The national identity ("the national copyrights") begins
to awake again but now it is assisted by the active service of marketing and
management sciences. Philip Kotler's excellent and energetic students' rhetoric
feeds losers of the society with slogans and kitschy shows: national identity
becomes more important for the "folks" than the parliament controll of the
budget what The Guys spend on it. "Hungary - what you hide in your heart",
"Memory becomes Hope": politics are full of pink emotions nowadays around
here.

(The sweet-gloomy-funny thing is that all the slogans of the government are
"invented" by the "Happy End PR Agency" :-)

"Deep Europe" - is nothing more than a slogan, invented by Anna or Gert, who
cares. Slogans kill meaning, slogans are the effective power of our media and
Public Relation culture. Slogans has a function to be obscure to understand as
many ways as many people gets it.

"Deep Europe" means nothing without context - and the context is created by
physical and intellectual activity of people in time: the context is a process
in space and time. Although The Guys introduced successful PR slogans into
politics, only the context shows the real meaning.

"the past just has been started" in Hungary (I do not know who said it,
sorry... probably I read it in the Narancs - a liberal weekly) - why should we
start it Anna, too? I hope we can kill off slogans and their
copyright-arguments in case of starting to think in - as distinct and exact
terms as it possible. Anybody who cares, should see further and deeper than
"who owns the copyrights of Deep Europe".

Sorry for my poor English mistakes what may confuses the transmission of the
core message:-)
Yours truly,

Erika Katalina Pasztor
media artist&designer, DLA student of Intermedia Dep., MKE
founder and editor of Hungarian ArchitectForum (Epiteszforum) Online

[spectre] RE: "Deep Europe" is really deep?
From: anna balint
To: spectre@mikrolisten.de
Date: Mon, 10 Sep 2001 12:59:43 +0200

Dear Erika,
maybe not many people care about slogans, but I do: if once for a term is given a history, I feel better if that history is correct. In my view it must have been important, if once it gave inspiration for so many people. For me the most funny and ironic is that all this discussion is going on out of its syndicate contexts. I was always happy to give and I am glad if people use the term I invented, and naturally I don't copyright the term, I say that I coined it. If you are curious to my context and my interpretation, please subscribe to the syndicate list. Now there is a discussion about acci art definitions, when I feel it will be appropriate I will publish my text.
greetings,
Anna Balint

[spectre] Deep Europe? Deep troubles! with the "authors"
From: ana peraica
To: spectre@mikrolisten.de
Date: Mon, 10 Sep 2001 13:31:00 +0200

Dear all,

I had problems deleting boring Syndicate mailings last months and then illiterate (Syndicate) mailings / attachments. I have a pain in my finger that I use for the Delete type.

Just few minutes ago I recieved an e-mail, one of the most beautiful e-mails from the old Syndicate list - asking is someone is still there. It looks like a child entering to the village abandoned. The list still exists, but emptied, evacuated. The person knows not that there was a war. As seems, right now, there is an abandoned territory, one refugee camp and one new self-proclaimed republic. I saw that scenario, and I know those arguings right now... of who was the first calling on the of independency in 1968, of who spoken, who wrote.

Sides are chosen. And now we don't have a Red Cross that will locate people we need to. I still don't know who is where as there are only few names posting. How can I find people whose e-mails I like? The war happened.

And now the discussion is on inheritance. We are dividing names, history, terms...

About terms, I am not fascinated anyhow. It is like the Humpty Dumpty from the Alice in Wonderland who coincides terms, and with the exclamation of the White Knife: 'I invented it'. So what!!!!

(BRACKET NOTE - But it makes me to think, do I need to protect my terms as 'Soros realism' in arts? Where do I need to go for that? Ok, I tell you - I invented a term Soros-realism I find crucial in interpretation of the artworks of nineties and last few years of this century, and it refers to the arts of politically founded melancholia and pitness, that has a connection to the socrealism of engaged art. It provides a reading of one narrative continuously and gives a differentia specifica to the art of activism on the West. I find it ingenious, I am so delighted that every day I wake up and thing - how clever I am when I manage to invent such a thing.

I feel so good, I love myself more since I done it. And I find myself more beautiful, thinking - one day if this continues I will get the Miss Europe prize. I am so clever and so beautiful since then. I am a witch. I knew it is going to happen. I wrote a text Unsubscribe! and I should have done it then. Why I didn't follow my intuition? Doesn't matter, I am so clever and so beautiful. I am a princess of the cleverness and beauty and witchcraft. When I recieve too many stupid e-mails I just go to the bathroom to see something nice, and I exlamate 'Soros Realism!!!! Yes, Yes'. So, please, if someone hears anyone else telling it without my name in reference, please - slam him in the face for my own dignity. You are my friends anyhow... And I will protect words you told, and wrote, to me. Please just put them bold, so I know which one you want to keep for your own creme against time, for your own grave. On my it is going to be written: A. P. (1972 - ...) THE INVENTOR of the term Soros-realism. It would be ME, ME, ME. It is I; I, I, I who invented it. It belongs to me and I carry it to my grave! Everyone who invented a term should write right now! On the graveyard we'll have terms and ideas. Terms should keep us to tell we are immortal no matter we are under the face of the earth.)

But, if you find this stupid (mast..., fu...) that I have a certain erotic effects to my own terms - please ignore, I was joking, Soros realism was invented by artists, and Soros, and Stalin, and Lenin. But that topic is erotic too (mimm..., nice!), nothing is erotic as those names...

'Deep Europe' is invented by those who were digging, in a certain sense. Digging what? Digging who? Digging under who? Otherwise people call it East, living on the surface. But who invented East - West - South - North?

How can one write providing references... Weather (ref. anonym, since Aristotle On meteorelogy) in Croatia (inv. Zvonimir, ref. Pavelic, ref. Tudjman) is sublime (inv Aristotle, ref/bold: Kant, ref Bataille...) today (ref. fuck who invented today?), rain (ref God?, ref Aristotle ibid) falls (ref. Archimed, ref Newton...), writing (ref Arabians) to you (ref. Syndicat e) an e-mail (ref. ref. ref. ref....).

Deep Europe? Deep troubles! Andreas vs 'Anna', Syndicate vs (Syndicate) vs (((Syndicate, ref (((Syndicate), ref (((Syndicate)ref (Syndicate))).

Who invented 'Syndicate' (Marx?), who invented NN, Andreas, Anna? When do you need to start with the intellectual property? It is destroying text, it is destroying communication, it is self-referent at the end. And in the reference I can only write terms as - copyright, brand. It is boring as NN was boring. Booooooring, the worst that can be.

Who has a copyright, which brand is this piece of activism? Now what is the original Syndicate - copyright, brand???? Seems this is the original discussion, covered by the terms. Tell it loudly! There are three lists, one is empty, one is Intenger's, one is elite. One interpetation what is/was Syndicate is its original address, the second - name, the third - people. Or, this is a discussion on factory, brand and quality?

best,
Ana

[spectre] RE: Deep Europe? Deep troubles! with the "authors"
From: anna balint
To: spectre@mikrolisten.de
Date: Mon, 10 Sep 2001 15:13:00 +0200

Dear Ana,

as a researcher the main and very important questions I am fascinated about are who, when, what did, organized, wrote, said, how idea circulates. I confess repently that I spend weeks thinking about who for example Dionysos Aeropagitos was, what and when did he write. Or for instance I spend months to compile a Robert Filliou bibliography and I am happy to find under any circumstances a fragment of his. If once he influences the whole media art scene, I am curious to find any detail of his work, and I try to go back to the most authentic sources.

This fascination made me also to subscribe to the Syndicate list. I find more than fascinating how the individual, the private interacts with public, how one individual influences the other, how authors can grab contemporary spirituality, how collaboration takes place. If many terms are invented, I

wish to know who, and when invented them, myself I never use for example the word 'intermedia' without thinking to Dick Higgins. He has coined it, and with this word and his way of thinking still influences the whole art scene. I like to be aware of that, and I like to handle with care and in a responsible way terms. That's part of my ars poetica if you like.

I am honoured if I can be in touch with authors and I can follow their works as they arrive unmoderated to a mailing list. I find interesting the way 60 people left the syndicate list, and feel more comfortable with less information to deal with on a new, restricted mailing list, though I see here many problems - that of the syndicate archive for example - which still waits to be discussed and solved.

Syndicate list is not interger's list, it stays for those people interested in East-West media art contacts and in contemporary media art theory who don't find too difficult to not open, delete, archive, read or enjoy the mail coming from artists, organizers, curators from East and West Europe and who care about the public space of the list. There are subscribers, readers and contributors. Claudia Westerman and Jaka Zeleznikar build a web page for the list, and we are all considering ways for organizing the incoming mail through self moderation, bureau automatism, perhaps a digest for announcements and theoretical texts.

greetings,
Anna

[spectre] Syndicate (ref. Broeckman, Arns, Kluitenberg, Benson, Pandilevski...)

From: ana peraica
To: spectre@mikrolisten.de
Date: Mon, 10 Sep 2001 18:09:48 +0200

Dear "Anna",

The problem of the circulation of ideas, and tracing of them is today quite hard. Circle is replaced by the more dimensional bowls, explosions, curves. Tracing (of authors, of e-mails, of people...) is also hard. Linearity is impossible. For that one should have at least continous space or time.

Once I done an exhibition project completely based on gossiping, it was on the Oreste show in Venice, on Biennale (I hope you will not take this as a self-promotion I don't intend to do among people that know my work and ideas). It was the same obscure idea that lead me, that things are running out of the documentation, catalogues, newspaper's reports or critiques. That information is spooling.

Then, as the problem of redundancy happened to me (and somehow I expected and calculated on that phenomenon), as every name would invite in mind another one, at least those of love affairs related, and each topic and reference another one, and we know it from the hypertexts that it is - real, I decided not to border anymore.

I am, myself, more considered with the streaming ideas than on linking them endlessly in any case even in .html (and that is why I never use footnotes, so what? - McLuhan never give his due respect to anyone before, hardly mentioning any other name, and that does not make him less fair writer). Only bad writers need to plug in the theory into someone elses, as the theory they plugged in will save them from the critique. Only desperate souls need to say - you didn't make a reference on me.

Reading according to names reminds me on the old time investigations... 'I read complete Hegel' - do you think Hegel is the one that is interesting or the world of his ideas. I know, it is a matter of the original thinking and hypercitation, when the author becomes the 'author', and a person becomes a kind of - it, a book, and turning back to their original existence on this planet is also an interesting point, but reading Hegel so deeply one can only become Hegel. Moreover he is dead, so becoming a dead person is not some erotic idea...

What do you get willing to pay attention to dead ideas (and what worse can be than a dead idea?), and making your own a cornerstone for the graveyard? That is necrophilic, and more - nomenclophilia is the worst deadness of the dead. Nomen est amen! Name does exist separately from the named... That is a

point of buiocracy. Even alive authors don't like to live only in the brackets (((((as they are claustrophobic)))))).

Why do you go back and did you really find important branding of thoughts? Authenticity in the Internet age!!!! Don't you find yourself doing a kind of Sizi's job. Why didn't you post that text, why are you bordered with copyrights, authenticity, and invention of small notions such the one of deep europe is. Copy-left it, we done it on the Syndicate not egotically, and now you protect your own rights? And you were, as you say, reading it? Why do you border with words, dots, commas... What do you want to say is important, not how you designed it. We all know who told what, we are not illiterate so much to think that things might be so original...

I understand the term Deep Europe, but not like you. I don't like it, i feel referring to the d e e p s h i t and i wouldn't like to enter deeper in that part of the Europe, as I was already too deep. That means 'your' term is for me frightening, not challenging on thinking. It makes me to run away...

Unfortunately in your e-mail I saw more the problem of the originality of the name Syndicate, not the problem of Deep Europe, as - sorry on a note - Syndicate meant more than one term, and it made many of terms to be coined. Actually why, when you feel so related to authenticity don't face the fact you lost the Syndicate of the Syndicate? You quoted the name with no content!

If you were consistent, you would have to write Syndicate (ref. Broeckman, Arns, Kluitenberg, Lovink, Benson, Harger, Pandilevski, Zivanovic... and around hundreds of more!) in the head of every e-mail on that bracket list (the quote, the reference to the Syndicate). And pay attention to the order, use alphabetically, it is better, there was no hierarchy of me - myself and - I!

Who the fuck invented friends !!!!!!! (cough, ref. M. Benson)

best,
ana

what about this:

SPECTRE concentrates on the artistic and political situations of Eastern Europe to foster links of communication and collaboration among media art communities throughout the continent. This network connects artists, activists, theorists, and media producers from 28 European countries through both online and offline venues, embodying the tensions and conjunctions arising from the cultural, geographic, and economic remapping of Europe.

(slightly modified version of Jordan Crandall's column _ European net communities_ published in Artforum, March 1998, p. 20)

nope. :). why should spectre concentrate on situations in eastern europe? i have to admit that i am as much interested in western "situations" as i am in northern, eastern or southern ones. Madrid, Warsaw, Stockholm, Budapest, Lisbon, Moscow, Berlin, Tirana, Marseille, Ljubljana, Genua, Bratislava, Sheffield, Lodz, Linz, Tbilisi ...

>foster links of communication and collaboration among media art communities >throughout the continent.

i like "throughout the continent" though.

perhaps we should really leave of the notion of "deep europe" and rather simply call it "europe", or "the continent", although "continent" might sound as if you were speaking from a GB perspective (I was once invited to a panel discussion in GB where i was supposed to give a "continental view" on the media art education situation in GB... i told the audience that i was "amused" :)

the advantage of "deep europe" would be that it does not really designate a geographic territory, but rather a state of mind, a kind of openness, or a special way of joining different/separate entities together ...

>This network connects artists, activists, theorists, and media producers from 28 >European countries through both online and offline venues, embodying the tensions >and conjunctions arising from the cultural, geographic, and economic remapping of >Europe.

too much focus on "tension", and, more importantly: like this it all sounds like a "finished" project. I think it should be kept more open.

Hi all,

concerning announcements. I am not so much against them and I think that are not exactly creating a environment in which an interesting discussion/exchange will occur. I am not saying that Spectre should have less announcements. I personally find them secondary and not all that interesting. Necessary and but not vital for a list. I understand that Annick and Eric as media professionals need this info but that can't all be it. I like the idea of a quiet list but I would rather say a quality list, with surprises and necessary differences. The silence related to the crisis in Macedonia really worried me.

I do think that Spectre should not just be Syndicate 2.0 or even worse, 1.1. Something went wrong and that something needs to be analyzed. Just to continue doesn't make sense to me and has the danger of repetition in it. Why not change a few basic parameter or has everyone turned conservative in terms of list culture and the everyday? I still like the ideas of a web-based conferencing system a la slashdot which Amy Alexander proposed. I think that's gonna be really necessary at some point and I don't see why we can't develop such a thing. It's really not all that difficult anymore. Look what www.autonmedia.org has done with their portal.

Best, Geert

well, this is just a personal point of view, but i found this definition quite prescriptive and a bit restrictive. i'm not sure its accurate to say that we only concentrate on 'eastern european' situations, and given the progress the syndicate made in trying to break down territorial distinctions of identity, i feel that using terminology such as the above might be regressive.

also, if members of [spectre] are from one of '28 european countries', that counts me out already. is it necessary to be _from_ one of 28

European countries, in order to contribute to the list in some way?
anyway

regarding a meeting in Linz - do we still want to do this?

who is available around lunchtime on Tuesday 4 September (sometime between
1200 - 1400)?

shall we stick with the Brucknerhaus bistro? I think that's the easiest
location myself. They always have lots of tables set up in the
Brucknerhaus, just near the bistro so this seems to be a sensible option.

so let's have a textual show of hands - who can come at this time?
if this isn't a good time, feel free to suggest another time.

best

honor

you don't say! I vote (again) for 'deep Europe' for the reasons Honor
outlined, and for the resonances you mention below.

Yes. Also, for me the problem with this and the previous formulation is
that 'trajectory' or 'remapping' implies a relationship with the
'transition studies' industry, as well as, perhaps at a further remove, a
particular narrative of 'development'. We should be open to every possible
perspective on current situations, including going backwards and standing
still...

pretty much sitting still,

D.

DEEP EUROPE AND DISPLACED IDENTITIES

A silent voice comes to life triggered by the deep Europe concepts to
comment about its identity. I speak from an immigrant country, my ancestors
came from Poland. I have friends whose origins are from all over the globe.
I leave in a mixed village by the sea where Moslems, Christians and Jews
leave together. 15 minutes from Tel-Aviv, Israel. The Muasine 6 Muslim
narrator, prays 5 times a day, this sound is overwhelming and punctuates the
days.

I cook Arab food with recipes I get from a woman I know at the local market,
mixed with Eastern European recipes I have from home. The language of my
trade is English, my syntax is weird, but my sense of poetry comes from the
Bible, which is written in my mother tongue.

Life hazards, due to local terrorism attacks, is being reported daily
on TV. Our sense of a safe geographic map had shrunk during the last year,
but my real window is window's nt. The internet had always served as a
strong displacement tool, through which my displaced identity found fellow
voices that shared and enhanced my new media enthusiasm.

Internet communities like real life communities are always trying to
define an 'other', a bad guy, in order to map their boundaries. I find the lost of
boundaries thrilling. My web site design, net.art projects and interactive
installations I dream up, trying hard to realize in a place where the
infrastructure for such a venture is scarce, are all strengthened by info
bubbles the travel through my mailbox, for I'm an artist who found the
virtual reflections a hell of a place to be.

Date: Thu, 11 Jun 1998 23:15:45
+0200 (MET DST)

Culture after the Final Breakdown

A Report from Tirana, Albania
By Geert Lovink

As expected, Tirana offers much more reality than one can cope with. My first encounter was overwhelming and confronting. As Europe's poorest country, deeply Balkan and the most isolated communist regime for decades, the rhythms must have been slow here in this former outpost of the Ottoman empire. Ismail Kadare, Albania's current national writer in exile, is trying to find excuses for this historical inertia. But for Kadare slowness does not equal backwardness. As he writes in *Printemps Albanais*, his report of the 1990 events, "slowness can reveal, as under an unpenetrable armor, ripeness and the inner light." This must be for connoisseurs. Tirana in late spring of 1998 gives a rather different impression—a steamy, grimy intensely balkan 'summer in the city' feeling combined with the sense that the entire country is struggling to get back to or/ move on to normal. The country is visibly recovering from the total breakdown of March 1997, which can be seen its Pointe Omega, the new year zero. In that sense Kadare is right: Albania's '1989' is just over one year old and the world should take this cultural delay into account.

Did Jean Baudrillard ever witness the violent aspects of a concrete, massive, sudden, social implosion? I wonder. Baudrillard, who played so with the model of the implosion, must have sensed something in this direction, but his style is too linear, one-dimensional to describe the multi-layered realities of the balkans. French language games are fading out now because actual history-in-the-making can easily do without such concepts (and intellectuals all together). It is not even about media. In Albania, the slow decay from within (even more disastrous than elsewhere), combined with a collective frustration over missing the historical wave of 1989, finally turned into an explosion of violent disinterest and despair. It is tempting to speak of "post-apocalyptic zones." But this is merely postmodern rhetoric. Which contemporary philosopher is studying the case of Albania? The country is hardly ever mentioned by journalists. Robert Kaplan's widely acknowledged *Balkan Ghosts* (1993) and *The End of the Earth* (1996) travelogues through the world's abandoned places, rust belts and war zones. These books are a usefull starting point but they do not go beyond mere description. Kaplan lacks a theoretical framework that could match the conservative agenda of culturalists like Samuel P. Huntington. In what terms should the situation outside the Fortresses be described? Do we only speak in terms of "exclusion"? Or would you prefer an "exotic" view on the pitoresque Balkan, like in Tintin's album "King Ottokar's Sceptre"?

What puzzled me most about Albania is its delayed, but primal drive to (self)destruction. The roads are in the worst possible condition, sometimes not even existing. Many places lack electricity and running water, not to mention destroyed schools, dilapidated buildings. What is this hatred towards anything public? And there is still no comprehensive analysis of the 'events' of March 1997. The dry overview of Miranda Vickers and James Pettifer ('Albania', New York University Press, 1997), stops in late 1996 and carries a now ironical, perhaps then too optimistic undertitle: 'From Anarchy to a Balkan Identity.' We should now read it backwards. That's dialectics these days. The old one step forwards, two steps back—no synthesis in sight. What we can see is tragic, ultra-modern history in the making, monitored by brand new Euro-cops of the West European Union, half-hearted Italian neo-colonialism to prevent mass escape from the ruined country and plenty of wild electronic media, pirated software, even a tiny bit of Internet, provided by the UN and Soros, via satellites and radio links.

Seen from the dusty, crowded streets of Tirana, filled with its notorious stolen Mercedes cars, Kosova seems a very distant place, despite all the refugees that are now flooding in to the Northern Albania. The Nole government is certainly concerned with the worsening situation, so are all Albanians. But they lack any military option: their army is a joke compared to the well-armed and experienced Yugoslav army with its para-military units. Albania can only call for more foreign involvement, not only in Kosova, but for itself. There is a big need for a capital, infrastructure and human resources from NATO, EU, Soros and other NGOs. Or from Rome, Athens, Istanbul, Saudi Arabia. It actually does not matter where it comes from. At least, that's the impression. It is the time of reconstruction and 'development'. That's the big picture—on a more personal level, daily life goes on...cafe society—thousands of Albanians on the streets and terraces of hastily and illegally erected cafes whiling away the time.

So here we are—the first ever new media arts event in Albania. "Pyramedia", organized by the 'Syndicate' network, a mailinglist of small institutions and individuals from both ex Western and Eastern Europe (for a report, see Andreas Broeckmann in the Syndicate web archive). A small group of 10-20 dedicated Albanian artists, teachers and students have shown up to attend the three days of screenings and presentations. Edi Muka, who is teaching contemporary arts (video, installations, etc.) at the Tirana Arts Academy is the driving force behind many of these events.

I interviewed him twice, at the V2-DEAF festival, September 1996 in Rotterdam and after the fall of Berisha, in July 97 during "Deep Europe" (Hybrid Workspace, Documenta X). This time, I spoke with him on the terrace of Donika Bardha's Gallery XXI, Tirana's first commercial modern art gallery, opened last March, a green (and clean) oasis close to the central Skanderbeg square and surrounded by a decent cafe and restaurant. This quasi-privatised corner of the pavement has palm trees and a fountain. Edi Muka is cool—his dress, sunglasses, the way he's got things in control (except when the lamp of the videobeam breaks, a major catastrophe which happened twice...). Edi Muka is well informed, not only about arts and culture, but about politics and media as well. After he returned from Italy, where he fled in the early nineties, he worked with foreign journalists and in the field of "independant media" and their Western support organizations.

According to Muka, Tirana will sooner or later feel the impact of the influx of refugees in the North. But for the time being it is still recovering from the "anarchy" of March 97, the few days when the state lost its monopoly on violence. Shortly after the incident, a commission of all the political parties represented in Parliament was formed to reconstruct and study the events. But within a few months, controversy between the members broke out and the final report is still pending. So the cause of all the destruction remains vague. Can it be reduced to a plot or conspiracy? According to Muka, Berisha at a certain point decided to let everything go when he found out that he could not use the army to attack the city of Vlora. "He defends himself now by saying that he had to arm the members of his party in order to defend them. Maybe I am wrong. No one knows how reliable the data of this commission is. But a fact is that most of the townhalls were set on fire. There was a lot of corruption under the Berisha government, illegal deals regarding privatization and real estate. A lot of them were done in favour of Berisha's Democratic Party members. So this was a good chance to wipe out the evidence. In Vlora people initially burned the police office and the secret police headquarters. But the burning of townhalls came later." Culture lost too. Museums were looted, even worse than in 1992. Churches too. Most of all it blocked a process, several years of gradual progress. For example, after March 1997 students did not come to school anymore. It was impossible to get them back to the classroom. "If you see such a destruction happening around you, after seven years of supposed 'democracy', the already strong desire of Albanians to leave the country grew ten times."

Since December 1997, things have apparently changed for the better. Edi's students returned to their classes and a number of cultural events took place. In October 1997, eleven artists participated in 'Reorientation', an exhibit in a ruined factory, outside of town, curated by Muka. The show was mainly installations, referring to the state of ruin and was considered a turning point. Gezim Qendro, now the director of the National Gallery, participated, along with Edi Hila, one of Albania's modern post-1990 painters, and some young artists.

Edi Muka: "Despite the fact that it took place in a part which is full of guns, a lot of people showed up. They were eager to see something different." Another landmark was Albania's participation in Ostranenie, the ex-East media arts festival which took place for the third time in Dessau in november 1997. Albanian video artworks were screened there for the first time. Also, an annual visual arts competition took place. Muka: "In the past, everybody just hung some artworks on the wall of the National Gallery, no curatorial work, no critics, just a big chaos. This time there was some selection. But there was still a lack of the ability to experience things. There were only few who reflected on what had happened in 1997. I don't think this is normal. There is the tendency to escape, the young generation leaves the country and the old ones do it in their way. I concentrated my work on a group of young artists, students who do reflect on the situation. In February, 1998, a first show with them followed in the renovated gallery of the Academy of Art. It was really good and a large audience showed up. I gave some lectures about ready-mades and abstraction, which is still not very known here. Students have difficulties understanding what happened historically and epistemologically." And Galeria XXI opened, which is trying to promote the art market in Albania because there is no such thing.

The early revival is evident in other fields as well. The 'Days of New Music' program a few months ago tried to open up the traditional Albanian folk music and elaborate it in a 'modern' way. A proposal to build and staff a new National Theater was approved. But there is still no decision on the future of the 'International Cultural Center' the enormous white pyramid once the Enver Hoxha Memorial Museum. In its most recent reincarnation, it is used for the Italian 'L'Espresso' trade fair, displaying trash consumption goods.

All this is now in Edi Rama's hands, the brand new Minister of Culture. Rama, 34, is an experimental artist who played an important role in the student movement of 1990 and worked and exhibited abroad. His story is telling.—In 1996, he was beaten up by Berisha supporters and he then moved

to Paris where he lived in exile. This spring, when he returned to Tirana for his father's funeral, he was invited to replace Arta Dade, then Minister of Culture, who lacked any vision on revitalizing culture-in ruins with little or no budget. Rama immediately agreed. His first action was a radical reorganization of the ministry, the first one ever in fifty years. Edi Muka has known Rama for years. "He is a charismatic person with a lot of ideas, even though he might not have much experience with administration. He has already left some marks."

I managed to get an appointment with Rama on the fourth floor of the former Central Committee building. Edi Rama: "I inherited an institution still based in the old structures. It is also important to change the physical aspect of the building. It was not functional and there was a lot of dust that needed to be cleaned." Rama would not say how much money he can freely spend. Rama: "The budget is low, but even that is misused. So the first step is to create projects that will make a decent use of the budget possible. Only after that, we can increase pressure on the Ministry of Finance and start to approach NGOs."

Where are your priorities, in film, visual arts, media? Rama: "Until now, the ministry worked as a sponsor of cultural ghettoization. It supported our self-complimentary attitude towards history and the related institutions that we inherited from the past. The Writers Union, in fact all cultural institutions--these old structures are not anymore a threat towards democracy, but they are an obstacle."

Do you see a growing divide between the low-brow media culture and the elite high culture?

Rama: "If I can make a comparison. During the Communist period we were living in a Jurassic Park. Now the dinosaurs have disappeared but we are still in a park where anything can happen. You never know from where the danger is coming from. In that respect, things are very disordered. The new media situation is like a jungle. But I am convinced that the only support we can give to these newcomers is freedom. With the possibility to express yourself in a free space will also come a need to learn and how to deal with this space. Nowadays, here, people are convinced that freedom is much more difficult than isolation. To administrate freedom means to administrate yourself. During the time that you had to pass on the shelf of totalitarianism, you were administrated by someone else. You were not an individual. There was no responsibility and no anxiety. In freedom, all these elements become part of you."

When asked about all those leaving the country, Edi Rama is sending out a permanent invitation to all Albanians to do something for this country. "But it is pretty hard to make invitations because you cannot offer any guarantees. The problem with this community has been that it always worked against its own future. The most paralyzed were the young generations. They were marginalized by the gods of politics and culture. The big challenge now is to listen more carefully to their needs in order to make them feel at home in their own country. To a certain age every Albanian is a refugee in his own country. It is felt as a transit station."

You are not member of a political party. Is it more or less difficult than you expected?

Edi Rama: "I do not need to operate in a political field because my power is not of a political power but a cultural power."

Until now, local Soros Foundation officials have not felt the urgency to open a "Soros Center for Contemporary Art." This might change soon. Like in other countries, the leading 'civil society' intellectuals, mainly writers, were not so sensitive to contemporary art forms let alone 'electronic art'. But there is another, underlying reason for the low priority status of new culture. Understandably, human right violations, food aid and the basic restoration of law and order take highest priority with Western governments and NGOs. But with this comes a very specific, subconscious, definition of 'democratic culture', a formalistic, instrumental and legalistic approach which defines democracy according to its institutional structures, not to its actual lively elements. We can see a similar problem in the field of 'independent media'. What counts is the primacy of frameworks, not initiatives or individual modes of mediated expression.

Edi Muka: "We can see a standardized way of thinking within these NGOs. They are working according to pre-established models, without paying too much attention to the local requests. It is definitely important what they are doing, to promote NGOs that develop democracy. But what is desperately needed in Albania is a 'cultural revolution.' A large program to reach all generations, not only the young. Let's take one example. The main support for translations comes of course from the Soros foundation. They are now mainly doing philosophical books from the fifties and sixties (Nietzsche, Sartre, Camus...) and literature." Contemporary books on visual arts, media and cultural politics are a first requirement in order to spread a comprehensive understanding of the new (media) technologies, their

internal logic, history and potential. And this counts for many fields in culture. Otherwise, the existing divide between Western commercial media trash and post-communistic and nationalistic state-sponsored, folklorism will establish itself, leaving little or no room for contemporary forms of expression.

According to Edi Muka, staying in cafes all day long is nonsense--artists spaces should be created, giving people the possibility to prove themselves. Step by step this will bring the attention to Albania and will take away the desire to leave the country. International exchange also plays an important role in this. Soon, Soros won't be the only source of money. Pro Helvetia (Swiss) is coming, a French Institute will be established and perhaps also a German Goethe Institute. Regional exchange should also increase to avoid ethnic tensions like those experienced with neighboring Macedonia. Muka: "The tendency should be to find common points, as citizens of the world, not as ethnic Albanians."

What is striking is the absence of discourse. There is no Albanian art magazine. Before 1990, art critics were politicized and condemned in the early nineties. Within the discipline of art history, political aims had taken precedence over professional standards. The National Gallery has taken the initiative to start an art magazine and the first issue is due to come out soon. Then there is the magazine *Perpëjësia* (Endeavour), a quarterly cultural journal, edited by Fatos Lubonja. An english anthology appeared in 1997, edited by Fatos Lubonja and John Hodgson. It takes a critical approach to developments in Albania and runs translations that deal with issues common to other former Eastern European countries. A structure needs to be created to train art historians, critics and curators. Muka: "What I am doing now is teaching students to write down their ideas, to arrange a space. But that is not enough. Now it is time to build the educational programs." A year after the total implosion, everything beyond boredom and escape seems possible, first of all a second Piramedia.

<nettime> The Politics of Cultural Memory

From: Eric Kluitenberg

To: nettime-1@bbs.thing.net

Date: Wed, 21 Jul 1999 18:43:28 +0100

Dear nettimers,

This rather long text is the extension of a lecture I presented in Tirana (Piramedia), Tallinn (ACTION - REFLECTION) and Prague (Translocation). Because of the enormous scope of the topic I opted for a rather personal approach. The text will be published in the forthcoming book *MEDIA * REVOLUTION*, edited by Stephen Kovats, Edition Bauhaus #6, published by the Campus Verlag (Frankfurt a/M & New York), and is due for release as a bilingual german/english edition on October 11, 1999. It will be accompanied by the ostranenie 99 CD ROM.

hope it is of interest to a few of you

eric

The Politics of Cultural Memory

Upon her spoon this motto
wonderfully designed:
"Violence completes the partial mind." [o]

Identity, Belonging and Necessity

A visit I made to Tirana (Albania) in April 1998 marked the start of a personal investigation. An investigation into a complicated field.

somewhere between cultural memory and politics. What I wanted to do is to sketch out and map a territory of identity, memory, politics, and media. The need for this was primarily of a personal nature. There was no expectation that I would be able to get any kind of complete understanding of what the relationship of politics and cultural memory entails. Certainly not beyond the excellent writings that have been produced already in this area, most of whom I am quite ignorant of. Yet, feeling the need to do this, if only for myself, seemed enough of an incentive. Since everyone's experience is always different and specific, my findings might even be useful for others grappling with the same questions I wanted to map out.

My need for this investigation originated from an unresolved dilemma. Writing this in July 1999, the dilemma, obviously, remains unresolved, though it still strikes me as something dramatic. One of those crucial experiences you would have gladly dispensed with.

This particular story starts in Tallinn in 1995. I was invited to help put together a conference on the social and cultural impact of digital media and networking technologies on the Baltic states, called 'Understanding - Understanding Interactivity'. The aim of the event was to go beyond the economic and technological perspectives, and develop something of a critical cultural and social point of view.

We were at the end of the second day of the three-day conference. The topic was 'Community and Identity in the Global Infosphere', and a host of speakers was dealing with ways of reconstructing identity and the social sphere in the realm of digital media. At some point the sys-op of the ZAMIR peace network from the former Yugoslavia (who happened to be present in the audience) grabbed the microphone and made a short, clear, and rather devastating comment:

"We've been talking all day about identity issues now, and their value. Our recent experiences, however, have taught us that nothing sets people more apart than identity!"

I had, as I still have, no answer to this objection. It couldn't have pinpointed the dilemma more clearly. The idea we had started from was to question what two simultaneous extraordinary transformations meant for a country like Estonia. On the one hand Estonia was contained in a process of re-inventing its national identity, a few years after breaking free from the former Soviet Empire and Russian rule. At the same time Estonia had entered the information era overnight, depending for its economic survival on a networked international economy that undermined the very notions of national sovereignty it had just retained. The notion of a national Estonian identity is deeply problematic, if only because of the large Russian minority within its borders, which comprises one third of the overall population of the country.

The reconstitution of national identity is a fundamental dilemma that pops up again and again in the aftermath of the revolutionary changes that have taken place in the former 'East'. Identity is belonging, and a basic sense of belonging to me seems indispensable for any kind of social structure to be able to function, for any kind of social cohesion to emerge. The refusal of the identity question in name of a universal ideology (modernism) or materialist system (neo-liberalism), inevitably leads to a reactionary response. Identity forges connection, but it is simultaneously also a principle of separation. This principle of separation is at the heart of the dilemma we suddenly saw ourselves faced with that afternoon in Tallinn.

Deep Europe

Europe is a container of identities. A sedimental layering of cultures past and present, in permanent flux between moments of crisis and tragic sublimity. In this shifting landscape the dilemmas of identity can turn into drama, especially in those regions where Europe is at its 'deepest', i.e. where most identities overlap (and collide). This sedimentary image of the cultural map of Europe derives from the concept of Deep Europe, as put forward by the Bulgarian artist Luchezar Boyadiev. Boyadiev provides a highly original reading of post-wall Europe.

In Boyadiev's explanation of 'Deep Europe', the notion is a metaphor which could be problematic. In the logic of this metaphor, deepness or depth is where there are a lot of overlapping identities of various people. Overlapping in terms of claims over certain historical past, or certain events or certain historical figures or even territories in some cases. It could also be claims over language or alphabet, it could be anything. Europe is deepest, where there are a lot of overlapping identities."

The formation of identity is a fundamentally dynamic process. It is also subject to manipulation. The construction of identity refers to a reading of the past that can be subjective, incomplete. Sometimes it is linked to clear interests of a group. It is often difficult to fully substantiate

the claims made in this formation process. Identity, therefore, is not just belonging, it is clearly also politics.

Identity and memory are connected. Identity at the very least means to remember one's origins. If memory belongs to a group, a time, a region, a nation or any other larger structure, it immediately becomes deeply political. Cultural memory is crucial in the formation of an identity that transcends the merely personal. Cultural memory is not just museums, books and monuments. Cultural Memory rather is politics pur sang! Cultural Memory and Collective Identity

The Estonian philosopher Hasso Krull once remarked in one of his lectures that 'history is a machine going nowhere'. Though he might be right, the idea does not seem very useful to the formation of any particular kind of social order (such as a nation state). Krull's contention will therefore not be likely to gain much approval amongst politicians, whatever their sign may be. It is more interesting for any kind of politics to create a meaningful context, both for the present as well as the past.

This meaningful context can best be understood as a narrative, a way in which material objects, events, documents and descriptions are linked together into a coherent narration of past and present. This narration conveys to its audience how the present derives from the past, and how the signs that structure and signify the world around them, bear witness to this inextricable connection between past and present. What the objects of the past tell their audience is the necessary state of things in the present. A society doesn't just exist, it is an emergent property of a multitude of events that have shaped its current state. Its members are never alone or alienated, rather, they are interwoven in the very historical fabric of that society, which shapes their perceptions and values as much as their immediate physical and social environment.

The objects belonging to the cultural heritage of a given society are never isolated bodies in a decontextualised hyperspace, nor are they self-contained objects in a post-historical era. Their symbolic significance is not contained so much in their artistic or aesthetic qualities as such, but rather in the degree to which they are part of a convincing narrative that binds the object and the viewer together in a shared system of beliefs. What the object and the audience tell each other is that their inalienable connection testifies to a continuity, which transcends the limitations of the merely individual, in time (history) as well as in space (a people).

That is, if you believe in it.

There are various ways to describe this function. The Egyptologist Jan Assmann speaks of cultural memory as a connective structure founding group identity through ritual and a textual coherence [1]. He explains that the past is never remembered for its own sake. Its main functions are to create a sense of continuity and to act as a motor for development. The present is situated at the end of a collective path as meaningful, necessary and unalterable. Assmann defines such cultural narratives as 'mytho-motories'. They motivate development and change by presenting the present as a deficient reflection of a heroic mythological past. A past which should be restored for the future.

What this view implies is that cultural memory acts beyond the founding of group identity and continuity of present and past, into the future. It presents a particular view of the future as necessary, and provides direction for collective action in the present to move towards it. The goal is to recapture and restore the ideals which have been lost in the deficient imperfections of present day-life. Ideals that can be retained through collective action, whether this be in the form of ritual or rather through revolutionary change.

Cultural memory in a living culture is never fixed. It involves a constant reinterpretation of the present in terms of the past to decide on possible actions for the future. Meaning can shift and rituals can take on different forms. Rather than being fixed in an anthropological text book, the cultural memory of living cultures is suspect to manipulation. Since the definition of cultural memory depends on a continuous exchange between the memory objects of a given culture and their interpretation by its members, it is however difficult to reveal the outcome as fraud. Cultural memory simply is the outcome of this interplay. It is the process that counts, and not its arbitrary fixation.

The definition of identity that results from this memory construction, therefore is deeply imaginary. Benedict Anderson has convincingly argued that "all communities larger than primordial villages of face-to-face contact are imagined." Imagined because they deal with how people imagine themselves and one another. Today almost all communities people belong to, are too large to allow for direct face to face contact between all its members. Therefore the modes of imagination employed to imagine one's community must somehow be organised via an inbetween mechanism or apparatus (i.e. media in the broadest sense of the word).

The set of values and ideas that binds people together in a community necessarily have to become mediated values and ideas. There is nothing new in this, nor is it something pertaining specifically to the formation of the nation state. Someone argued with me after a lecture about this topic that if you would have asked a random inhabitant of Western Europe in the late medieval times to define her or his identity, the most likely response would have been: "Christian", clearly illustrating a grand transnational identity-structure. Even more so, the measure of control over the media that dominated identity discourse then and now is probably quite comparable. The era of electronic media does, however, introduce a new dimension of speed to this process; a fatal acceleration towards the immediate.

Location of Memory:

Where is the memory of a culture, of a society located? Principally in the memory objects that hold the traces of the past. As noted before, in a living culture this location is fluid and dynamic. Memory is stored both in material and immaterial forms.

A seemingly stable container of cultural memory is the built environment. The streets of cities and villages, the architecture of the buildings, the artefacts that inhabit the living space, they all testify to the persistence of a culture's and a society's memory. It was hardly a surprise, in retrospect, that an ahistorical, or maybe better anti-historical, cultural movement such as the Italian Futurists hailed the virtues of war to destroy the stifling remains of moulded, bankrupt and corrupted cultural history. The explosive beauty of the modern war machine, ecstatically embraced as a relentlessly powerful tool to break the chains of a suffocating cultural past.

The monument as a physical embodiment of community memory, has, of course, always been a focal point for the struggles over cultural memory.

Cultural memory is also contained in immaterial form. First of all in language, both in spoken language as well as in its written forms. Orality and speech seem to be imbued with a much more subtle connection to history. Speech, through accent and choice of words is usually connected to a regional origin. Accent and dialect are the regional containers of cultural memory par excellence, they are as much part of the narration of past and present, as the stories they convey. It would be interesting to question if the concept of a nation state is conceivable at all without a writing system!

Like the monument, language is an embodiment of community memory, albeit an immaterial one. Language has often become the battle ground for cultural and political conflicts. In part these conflicts revolve around the suppression of a local language or dialect to facilitate the superimposition of a new dominant cultural system. There are also other more hidden forms of assimilation and resistance that can become the object of such clashes.

In Estonia, for instance, the suppression of the Estonian language was quite overt during the Soviet occupation of the country. The Estonian language was stripped of its official use-value and relegated to the personal realm. Russian as the new state language (i.e. the language of bureaucracy) took its place. But exactly through this shift from public life to the personal sphere, the threatened national identity and the personal identification of the Estonians became deeply associated with the use of the Estonian language. For them it was particularly shocking that Estonian officials of the Soviet system started to 'Russify' the Estonian language by importing alien language structures from the Russian language into Estonian. One such example was the introductory phrase most Russians would use, saying "I am X, son of Y", which was then also used by these officials when they introduced themselves in Estonian. By most Estonians these subtle modifications of their native language, were felt as a particularly direct assault on the sovereignty of this last personal sphere.

Music is another strong container of culturally specific memory structures, like rhyme, its formal characteristics ensure a pertinence from one generation to the next beyond and outside of a writing system. In a larger sense, aesthetic and formal design principles are the immaterial principles that structure the awareness of the viewer about the cultural significance of individual objects, even if no explicit story is connected to them. Obviously there are countless art objects and use objects that physically embody these principles, but it seems that their "narration" determines their meaning in a living culture. Cultural memory in these instances is located principally in our heads, rather than in the memory objects themselves.

Today, this memory function is increasingly organised via the media system, of print, electric, electronic and digital media. This media system has become increasingly integrated, both through technological

developments (such as digitalisation), and because of economic integration (mergers and concentration in the media-industries). This integrated media system internalises the main functions of cultural memory, it becomes its principal 'location'. It acts as a documentation system, of current as well as past events. The latter by making use of continuous references to that past with historical media documents. The integrated media-space also acts as a system of symbolic representation; of individuals that represent power (political leadership) or spiritual values (religious leaders), or simply by setting an artistic or interpretative agenda.

What the media system is particularly good at is the creation of collective narratives. TV so far champions this function as Marshall McLuhan already rightfully observed in the mid-sixties, reflecting on the TV coverage of the Kennedy funeral. McLuhan writes: "Kennedy was an excellent TV image. With TV, Kennedy found it natural to involve the nation in the office of the Presidency, both as an operation and as an image. TV reaches out for the corporate attributes of office. Potentially, it can transform the Presidency into a monarchical dynasty. A merely elective Presidency scarcely affords the depth of dedication and commitment demanded by the TV form." [3] (...) "Perhaps it was the Kennedy funeral that most strongly impressed the audience with the power of TV to invest an occasion with the character of corporate participation. No national event except in sports has ever had such coverage or such an audience. It revealed the unrivalled power of TV to achieve involvement in a complex process. The funeral as a corporate process caused even the image of sport to pale and dwindle into punny proportions. The Kennedy funeral, in short, manifested the power of TV to involve an entire population in a ritual process." [3]

Quite recently this enormous power of TV to integrate a public of billions into a collective act of cognitive processing in depth was again strikingly illustrated. First by the televised wedding of Princess Diana, but most of all by the almost global live coverage of her funeral, following her tragic death. In the process of the televised rendition of a royal fairy tale-turned-nightmare, Princess Di became a purely symbolical embodiment of community values and aspirations, making her no more real than Delacroix's liberty, leading the people.

Commodification of cultural memory in the information age

The European Union has identified Europe's cultural heritage as its greatest 'info-asset' for the information economy of the future. It has engaged in a scheme for offering multimedia access to Europe's cultural heritage as a business opportunity. Given that the core of the future information economy is information goods, and given that there is a particular interest in rich "content" for the information and communication structures of the "emerging information society", the EU has declared the commercial exploitation of multi-media access to the cultural heritage of Europe the highest aim of its funding programs in this field.

Through a "Memorandum of Understanding" and the establishment of 'co-operation frameworks' such as MEDICI (Multi Media Access to Europe's Cultural Heritage), this new market sector (cultural content industries) is actively encouraged. The notion of culture as public domain does not seem to have been a consideration when these policies were developed. Even less so does this policy-framework open up any spaces for critical debate.

This failed opportunity may in part be understood as a reluctance on the part of the European Union to give itself a cultural definition, given the great diversity of cultural identities within its (expanding) territory. It is, however, problematic that in a period of European integration, the EU is not willing or able to create a space for critical debate about the urgent questions of the new cultural formations in Europe. Together with the lack of democratic substance the European Union has become an abstract and alienated technocratic and bureaucratic structure, that affords little opportunity for identification to its 'citizens'.

Uncritical Regionalism

Boris Groys has pointed out a more subtle form of commodification of cultural memory. It starts with a strong anti-modern resentment, which is particularly notable in the countries of the "former East" of Europe. Groys notes that modern art does indeed negate the old cultural identities and their perceived historical unicity, originality and authenticity. The defenders of national identity do not appreciate that, but also the "international visitor of the virtual museum of identities", who has no wish to be confused by ambiguous signs, has no appreciation for it.

This postmodern cultural tourist, lost in the decontextualised societies of spectacles and ubiquitous consumerism, is looking for a lost cultural authenticity which she/he hopes to find in the revival of pre-modern identity and sentiment, particularly in 'the former East'. The global, postmodern, flâneur, lacking a clear definition of identity, is certainly sceptical about any claim to a universal truth. But it is exactly this fundamental scepticism that allows the acceptance of any other point of

view, as long as it understands itself as regional and does not claim universal validity", Groy's writes. This attitude results in an unpleasant complicity of a reactionary regionalism and the international cultural tourist industry, where even certain cultural fundamentalisms are uncritically accepted, as long as they manifest their claims to an absolute truth on a regional plane. [4]

Although Groy's acknowledges the museum as a typically modern institution, isolating objects from the specific historical and socio-political context in which they operate, the "museified gaze" of the repressive politics of identity and the international cultural tourist are for him bound together with the museum into a single system. Certain specified memory-objects are charged with meaning by these actors, much in the same way as the museum carefully enacts their display into a coherent narration, to create the deeply desired illusion of a stable identity. The regional fundamentalist dictator is thus seen as a somewhat hyper active, but nonetheless sympathetic kind of curator. [5] A last defence outpost of difference in an ocean of negated signs.

Perversion of memory

"Nobody, either now or in the future, has the right to beat you!"

In the Balkans, where Europe is at its deepest, the battles over identity and memory are the most severe. The clashes over history, territory, belonging, language and religious identity have a traditionally violent character and are linked with some of the most tragic chapters of European history. In the wake of European integration and the emergence of globalisation the regional fundamentalist wars seem to have reached an unprecedented level of intensity and destructiveness.

In March 1989, the Slovenian art collective NSK (Neue Slovenische Kunst) / Laibach staged a chilling performance in Belgrade, called 'Lecture', which was to pre-figure the terrible events to follow. The performance also revealed the dangerous character of one of the most sad perversions of cultural memory of recent history. In the NSK 'lecture' parts of appropriated speeches by the nationalist Serb leader Slobodan Milosevic, Nazi propaganda minister Joseph Goebbels, and the architect of British pre-worldwar II appeasement politics Richard Chamberlain, provided the elements of an explosive mixture.

Three months later, Slobodan Milosevic would speak in almost the exact same words on Kosovo Polje, the Field of Black Birds, commemorating the 600th anniversary of the Serbs' defeat at the hands of the Ottoman Turk Empire in 1389 on that very 'field of black birds'. [6] At this occasion Milosevic used his famous words 'nobody has the right to beat you', referring to the growing animosities between the Serb and Albanian population of Kosovo.

Both ethnic groups disputed their contesting historical claims over the territory of Kosovo. The Serbs stressed their long lived cultural roots in the Kosovar soil, exemplified by the many cultural heritage sites consisting of medieval churches, monasteries and Serbian dominated cities and villages. The Albanians on their part stressed their descendancy of the ancient Illyrians, a people who are believed to have occupied the Balkans some time before the ancient Greeks - and 1,000 years before the Slavs.

In the nationalist rhetoric of the Milosevic regime the cultural heritage sites of Kosovo, such as the famous monasteries of Zica, Decani, and Vansjika, were functionalised to serve a sinister political program. Kosovo was declared the cradle of Serbian culture and the Serbian nation, a theory that had been very popular since the days of the Serbian nationalist of the late 19th century. It had been this nationalist movement that managed to shake of Ottoman rule finally in 1878, after 500 years of occupation. By portraying the cradle of the proud Serbian nation under threat, the right and the need for its territorial defence and ethnic purification was created by the Milosevic regime.

In the ten years this regime has ruled the remains of the former Yugoslavia, it never failed to recognise the importance of the media and the TV in particular. Perhaps Milosevic had read McLuhan with more than an absent minded interest. He and his advisors knew very well how the TV could be employed to create the collective narratives needed to justify his nationalist and ethnically hyper-violent politics, and how to motivate the Serbian people to engage in action.

TV according to McLuhan is a cold medium, it involves in deep cognitive processing, but does not excite the viewer. If this is true, then the motivation of the viewer towards action of required more than the simple exposure to a blatant political message. Goebbels already noted that propaganda requires the creation of an 'optimum anxiety level'; a feeling of threat and unrest that should, however, not transgress the boundaries of panic.

In Serbia the feeling of constant threat was created by the Milosevic

regime in various ways. On state-television a relentless campaign, using the horrific images of forced baptism of orthodox Serbs in Croatian worldwar II death camps hammered home the message of the luring dangers next door. The reports of international criticism reinforced the feelings of being under siege of practically the rest of the world, while mythic stories of the partisan achievements helped to boost moral. In this gruesome media-mix the evening news became the focal point of a national mania, a nation wide brainwash that slowly but surely prepared the grounds for war.

When considering the various contesting claims about history, territory, language and religion, within the terrain of the former Yugoslavia, the current two dimensional maps of the international 'peace' brokering agencies seem hopelessly beside the point. When these claims, Croatian, Serbian, Muslim, (or possibly even Austro-Hungarian), are projected individually onto this terrain, virtually identical maps emerge. Each of these maps would more or less cover the entire terrain of the former Yugoslavia. This layering of contesting claims and identities over the disputed territory is what constitutes the depth of the Balkans and marks its tragedy. Only a three-dimensional map of the terrain of the former Yugoslavia can therefore properly explain the complexity of its cultural history. It is also clear, therefore, that within the current two-dimensional logic of the international peace-brokering agencies, the conflicts on the Balkans cannot be resolved.

Access to cultural memory and participatory identity construction

In his book "The Rise of the Network Society", Manuel Castells, analyses the rise of two diverging spatial logics. One of these spatial logics is close to what we customarily think of when considering the concept of physical space. Castells calls it the 'space of place'. In this spatial logic, experience is located in an embodied existence, here and now. But this experience is heightened, and to some extent estranged, by the emergence of a second spatial logic, which, although connected to the first, seems to evolve outside of the control of the vast majority of the earth's inhabitants; the 'space of flows'. The space of flows consists of the countless disembodied informational and economic interactions within the world's information and communication networks, and is quickly becoming the prime locus of economic power and material wealth.

Given the profound impact the new configurations of the space of flows increasingly will have on most peoples lives, Castells is deeply concerned about the divergence of these two spatial logics. During the preparatory discussions for the program of the third Next 5 Minutes conference on Tactical Media in Amsterdam (march 1999), David Garcia, one of the co-editors on our team felt the need to respond to Castells' call for action. Garcia: (...) I believe we must create a more consciously dialectical relationship between these two realms. (which Manuel Castells describes as the Space of Flows and the Space of Place) because (with Castells) if they are allowed to diverge too widely, if cultural and physical bridges are not built between these two spatial logics we may be heading (we may already be there) towards life in two parallel universes "whose times cannot meet because they are warped into different dimensions of hyper space". (...) I believe that one such bridge or entry point may lie in notions of reclaiming memory through re-imagining the public monument. I still believe that any broad discussion about the public domain can not be separated from the physical embodiments of community memory in the form of public monuments. "The model here is that of the city (the polis) in classical antiquity, and the stress is the memorable action of the citizen, as it publicly endures in narrative".

Public narrative is an activating principle. Memory is never constructed solely for its own sake: It structures the relationship between past and present to formulate a plan for future action. Disputes about public narratives, in the Space of Place are traditionally negotiated non-violently through democratic participation, both in the act of creating memory and the formulation of plans for future action, as well as their continuous revision. The new networked space of flows requires a similar democratic participation, or public access.

More importantly, the new space of networked communications still holds a promise and a more profound potential for public participation than the accustomed modes of participatory decision making. It transcends the limitations of the regional focus of the embodied space of place, but it also decenters the media control over the completely centralised structures of broadcast media (radio and TV). Paradoxically the new Space of Flows simultaneously holds the potential of absolute transparency, making every single operation within the informational environment perfectly traceable. At which point it threatens to become a space of absolute control and observation - the ultimate instrument of authoritarianism.

The decentralised media and communications model that the Internet introduced in the beginning of the nineties, is dissipating quickly under the pressures of commercialisation, and (even worse) government control

over 'harmful content'. Still the best chance for avoiding the dangerous manipulation of memory by an increasingly sophisticated medialised propaganda machine, is the radical opening of the media-landscape for a multiplicity of uses. This consciously opened mediascape will constitute an integrated electronic space of flows, where countless people will engage in the participatory construction of memories and identities, simply by creating their own heterogeneous messages...

Momentarily, three competing models for the future media landscape circulate: a model of complete centralised control, countered by the model of complete privatisation and market regulation, and thirdly the model of the networked public sphere. None of these models are self-evident or inevitable outcomes of the current phase of transformation the networked communication system is going through. Their instigation is a matter of choice, of clear real-world interests, and of policy. These choices are part of a fundamental political struggle, whose outcome will determine whether the new space of flows will be as experientially empty as the technocratic structures of the EU, or whether it can offer the spaces of identification and multiplicity that Europe as a whole at least, so blatantly lacks at the moment.

Epilogue: Liberate the wires - Free the ether - Give us Bandwidth!

Bandwidth is a technical term. It refers to the information transfer rate of an electronic communications system. In social and political terms it embodies the question of access to the international communications networks, in particular to digital networks such as the Internet.

The Bandwidth Campaign, which was held as part of the Hybrid Workspace temporary media laboratory at documents X in Kassel, centred on the demand for a more equal distribution of bandwidth across the earth and within society. It made a radical demand for the creation of structures for public bandwidth to accommodate a host of participatory functions. In the best traditions of the modern art of political propaganda a set of unambiguous slogans was created. A selection of these slogans completes my journey for now...

Bandwidth is the power to speak

Bandwidth is the ability to assert yourself

Bandwidth is the Power of Access

Access to information and communication should be a fundamental democratic right, for all citizens of the world

We want bandwidth now!

Time for justice!

The second round of municipal elections in Serbia turned out in something nobody could expect. After triumphal victory on the federal level for ruling party and its satellites, local municipal elections in their second (and it should be) final round showed totally different picture. In 15 of 18 major sites in Serbia ruling party of Slobodan Milosevich suffered great losses, and opposition coalition "Together" took vast majority of votes. In some cities, like Belgrade, opposition took more then 90% of votes and it turned out to be disastrous debacle for Slobodan Milosevich. The results of elections imply that the opposition should take total control of all major industrial cities in Serbia.

So, after urban population showed its will, the ruling party and its infrastructure of corrupt judges and courts has denied the results of elections, due to "irregularities". So they cancelled results of elections in almost all places where they were in minority and called for a third round that should take place on Wednesday. (For example in Belgrade opposition took 70 mandates of 120, but after "legal intervention" the number was lowered to 27!)

All that caused revolt of people all around Serbia, so huge protests on the streets of cities started. Today is the sixth day of protests, and only in Belgrade more then 200 000 people protested for more then six hours in a very cold winter day. Every day at 15:00 protests start, and people peacefully express their claims so that their will should be respected. Today students from Belgrade University entered into the protest and claimed that they will not go back to classrooms until the government does not obey the results of elections.

The radio B92 is the only electronic independent medium in Belgrade and is the only source of reliable information. During regular protest routine, demonstrators go every day in front of regime's TV station and newspapers and express their revolt and at the end of march they come in front of B92 and show their gratitude for the incredible effort and enthusiasm of B92 journalists.

On several occasions we expected that police will step in and close the radio (as well as its Internet department) but happily we are operational so far.

Nobody could predict how and when this will end. Both sides are firmly on their standpoints. People want justice for their free political will and Milosevich does not want to lose even tiny bit of its ruling power. Until now everything went without incidents, and everybody expects it will stay that way. But, the tension is rising every day, as well as the number of demonstrators on the streets.

Hopping that justice will win in the end
Drazen Pantic

Hello nettimers,

I am really glad about this report from Belgrade, especially since the big german newspapers don't write about it.

Today in "Sueddeutsche Zeitung", which is the biggest "quality" newspaper in Germany there was only a ten line article. Titled "Biggest demonstrations against Milosevic since 1991" it writes in a very vague way about the whole thing, letting it look like some students demonstrations. Also the manipulation of election results by the government are not reported as fact but as "said to be". On the same page there is a rather big article about former Turkish President Yilmaz being beaten on his nose in Hungary. For me this shows that "Western Democratic Media" are not really that democratic or that free, but rather selective. Disinformation can also be created by focusing on some topics and on others not. I don't understand, why big Western media like Sueddeutsche Zeitung don't report in big style about the struggle of Serbian people against anti-democrat powers, but probably they have some

reason. Also the media in Germany didn't complain much about Tudjman ignoring/suppressing the results of the Zagreb elections. So maybe the reason is that the Germans want the Serbians always look like the bad guys. A self-conscious people's revolt doesn't fit into that picture maybe. Or there are any strange deals with Milosevic behind the scene.

The same journal Sueddeutsche Zeitung also didn't report any background information about the riots in Indonesia that summer. All you got to know was, that there is an opposition and there was some fighting, how many people were injured or killed and taken to prison and that most of them (!!!) were released from jail a few days later. But it was never told that the father of the opposition leader was a democratically elected President who was overthrown by a military coup by the now still governing dictator and that this action was supported by the CIA and could happen while the world was fixated on the war in Palestina in 67 (source: Noam Chomsky, Power and Economy). Without this background nobody could know how bad it was for the opposition that the daughter of the former president can now not be a candidate for the elections next year in Indonesia because she was removed from the head of the only opposition party through this government intervention. At the same time Indonesia is considered a "very interesting market" and German companies like Telekom and Siemens are doing very good business there. The German state itself sold between 20 and 30 military landing boats (from former East German Navy) to Indonesia. These boats are ideally fitting for invasions of Islands like East-Timor (but this is not the only suppressed region in Indonesia) because they can call at sandy beaches and spit out light tanks and armed troops through a front hatch. Also these boats are extremely fast, making 60 knots. When the German Government was attacked by (not too many) journalists about the sale of these boats they defended themselves by saying that all weapons were dismantled from the boats. Anyway its easy to install new weapons and better ones then the outdated east german/russian rocket throwers.

So what Chomsky says in "Power and Economy", that bringing democracy to the world is not really the goal of the West, can be found true in the case of Indonesia. It seems to be more interesting for the West to have a strange kind of "stability" even if this means to support totalitarian regimes, because this stability - which is often a stability of graveyards - protects Western investments. The role of media - and not just the real cheap mass media but also the so called quality newspapers - seems to be to find excuses for the acting of governments and multinationals and to spread disinformation by leading the attention of people in the own country to other topics at a given moment.

These are examples for information controll, not totalitarian controll but self controll of capitalist newspapers (or is there a state influence that we cant see). It is something that makes me very angry for a long time also because it is so hard to proof how these things are done purposely. Without well researched backgrounds it often stays very nebulous what is really going on. So I have no clue why German mass media are not reporting about what happens in Serbia right now. Maybe somebody can help me.

[spectre] where is deep europe?

From: Andreas Broeckmann

To: spectre@mikrolisten.de

Date: Thu, 15 Nov 2001 13:57:29 +0200

here is an excerpt from a text that i wrote in 1997 for the third ostranenie catalogue; i think it clarifies at least my understanding of the notion 'deep europe':

For the Syndicate workshop at the Hybrid WorkSpace during the documenta X in Kassel we chose the title "Deep Europe". We were looking for a term that was neither East- nor West-specific, that carried some of the historical baggage of the notion of Europe, and that was at the same time strange enough to be easily understood as ironic. It was an experimental title that turned out to be an interesting focus for thinking about the context of our work. In the end, Luchezar Boyadziev's (Sofia) reading of 'Deep Europe' was accepted by most participants: The notion is a metaphor which could be problematic. In the logic of this metaphor, deepness or depth is where there are a lot of overlapping identities of various people. Overlapping in

terms of claims over certain historical past, or certain events or certain historical figures or even territories in some cases. It could also be claims over language or alphabet, it could be anything, Europe is deepest, where there are a lot of overlapping identities.'

This mapping of culture and of the depth of identities onto the mental and physical geography stands not in contradiction to, but is a condition of the work that is being done in electronically networked translocal environments equipped with all sorts of telematic gear. After the workshop, Branka Milicic Davic wrote: 'what is deep europe? is it real? is it safe? my answer is - yes. deep europe is real. it exists. i do not need visa to be there. i do not need an invitation letter to be there. i can simply sit and think and i am there - in the land without borders, policemen, elections, president, government.... where no radio or TV station will be banned... whose citizens are speaking different languages without shame... and lot more. deep europe is my homeland, my private mental space, which i share with others. deep europe recognizes words like exchanging, sharing, growing, and that's why i believe deep europe exists. because i went there, and i can go there whenever i wish, to exchange, share, grow and understand.'

On the surface, the Syndicate is an informal network and an 'intercom' system for people in the media art community in Europe and beyond. At the same time, this inter-communication effects a re-mapping of cultural and mental territories that transcends the political, religious and territorial separations which we regard as a temporary nuisance, rather than as the last word on this imagined continent/container. Lisa Haskel (London) concludes her Deep European 'letter from home': 'So perhaps, this is what Deep Europe is all about. Not a political position, a utopia or a manifesto, but rather a digging, excavating, tunnelling process toward greater understanding and connection, but which fully recognises different starting points and possible directions: a collaborative process with a shared desire for making connection. There may be hold-ups and some frustrations, quite a bit of hard work is required, but we can perhaps be aided by some machinery. The result is a channel for exchange for use by both ourselves and others with common aims and interests.'

Network Fears and Desires
Some Strategies to Overcome the Malaise

By Geert Lovink

"When I hear the word 'interactive', I grab my gun. And shoot." (Andre Simon)

Once a network, with its loose groupings of individuals and groups has gone through the exciting, initial phase of meeting, discovering each other's new ideas and concepts, and staging common events, it seems boring to continue, engage with the same old persona and read the same arguments again and again. Suddenly, we are discovering our own limitations. There were the short, intensive periods, full of ecstatic collective experience and the dull, stretched years of isolated struggle and survival. The dense time of the small, expanding (inter)networks now seems to reach its vanishing point. Work is being continued in smaller groups which might be more sustainable in overcoming the Long Boom of Boredom. The seamless creative potential of the collective body has ended up in repetition and certain patterns begin to reveal themselves. The Euro-summer of '98 smells like the mid seventies, late eighties. Not dark, rather grey. No paradigm shifts ahead, just business as usual. The web is in place, corporate content now finally dominates and the constant technological inventions keep on surprising, creating an addiction for even more promising updates. Ready for the next disappointment.

Network growth is not a linear process. Once the Net enters the level of the economy-of-scale, it leaves its first inhabitants behind and enters entirely different levels. Even the most ugly, compromised cultural managers, former net pioneers turned exploiters, will, sooner or later, be overruled and poked out by the powers to be. We are now in the latter days of amazon.com, Yahoo!, real.com, Netscape etc. Their success stories will not last forever. Don't believe the market. Widespread neo-liberal market biases makes it hard to make a realistic estimation of their chances - let alone making a critical analysis (or even materialistic theory) of the cyber economy. For the time being we all are still blinded by all the promises, potentials, rumours, hypes. This especially counts for the astronomical, truly virtual stock values.

Growth no longer effects net-related initiatives in the fields of arts, culture and politics, no matter if they are into making money or not. Mega, 'the Art of the Big', Wired's 6.07 cover story by Bruce Sterling, about Hong Kong's new airport, Shanghai's sixty-nine skyscrapers under construction, China's large dams and the tunnels of CERN can also be read as an exotic travelogue for those who have stayed behind, not simply as an appeal to the (tired) community to transcend in order to, once again, re-invent itself. The role of the business avant-garde is played out and they can learn some lessons now from their historical art predecessors. There is, for example, a saturation point for bandwidth, beyond which, more simply does not mean faster. Against all expectations, the Internet is creating a new Mass of 'users' that just shut up and click/listen. They are 'watching Internet', a phrase that would have been impossible to come up with a few years ago. This silent majority in the making, which will only know the red 'Buy' button, was not envisioned by the early adapters and the visionaries of the first hour. 'It is a Mall World, after all,' Wired's Gary Wolf has to admit, not sure whether to be disgusted or to embrace it.

Political economy? Not again! It should have died long ago, stumbling into

some non-linear hole of history. There is a return of the suppressed. Economy is not such a favourite topic in the age of pastel-coloured optimism, despite of the rise of popular capitalism with its junk stocks. We'd better ignore it and keep on tinkering. But this form of economic escapism is not an option anymore. We all have to survive. After the long farewell of the Welfare State and its less successful relative, state communism, neo-liberalism is in place now. It has not been imposed on us but has slowly gained importance, as a bottom-up ideology. Alternative, small scale do-it-yourself projects seem to fit well into this. Even the radical autonomous and anarchistic utopias that had their historical objections against the State.

Everybody is bearing some guilt, expect perhaps for a handfull of analytical Marxists. They have always been right, being in the luxurious position of not having been involved in any struggle for the last 20, 30 years. Their objective Truth is gaining importance as an unbearable wisdom of the fatal destinies ahead of us. With one eye on the screen streaming financial data, FT on the breakfast table, this Friendly Marxism without Subject, has reached its highest stages of scientific alienation. Now it is for a bloody cold dialectical switch, to become what Marxism always was: hardcore economic analysis. This time, made in the United States. No, Monsieur Jospin, the Internet is not one of the Tres Grand Projects, despite the European origin of WWW (Geneva). Your 'Market economy, not market society' phrase is a useful (Euro-French) distinction. But let us not fool ourselves. Marx is at Stanford now, back from the new Berkeley library, studying the dynamics of Microsoft, Silicon Valley and Wall Street, writing on his critique of the global managerial class.

Time to move on. The permanent digital revolution in danger of becoming a reformist project! The System is effectively taking over, even sucking itself into the intimate spheres of friendships and personal aims. The objective Wheel of Net History is taking subjective tolls. Time slips away and we are caught up in something we never really wanted in the first place. Web design for Dummies. Anxiety over nothing. Debates with nothing at stake. Rivalries when there is plenty of loot. But wait a minute. We know all this. The so-called unavoidable process of decay is not God-given or a Law of Nature. It is about time to introduce intelligent social feed-back systems. Indeed, a Collective Intelligence (thanks, Pierre Levy!) that can overcome the rather primitive 20th Century model of birth, rise, success and fall that numerous groups and movements have gone through. It should be possible to resist both historical and technological determinism, or at least play a game with these now predictable forces. This is the search for a media theory, or digital studies in which we can finally fit the charming or rather fatal warfare factor within the larger forces of hardware and software development.

<http://www.cybernetics.su>, where are you, now that we need you! Big silence. Perhaps it is up to us, this time. Next player. It is easy to write down the draft of "The Rise and Decline of the Global Empire". See the stock markets fall. But that's too macro. It is good to gather knowledge about economic forces that are behind the Will to Get Wired. But in the end, they will not tell us much about the psychological processes within smaller networks, which the Internet still consists of, despite the current massification. That is what the marketing gold diggers are looking for: the ultimate secret of the Virtual Community, whatever that may be. We need a network psychology, not in the form of some brilliant observations by academic outsiders, but fast and pro-active social wisdom which can be implemented in groups, small organizations, lists, techno tribes. Not only to prevent conflicts over nothing, but mainly to stage real fights, if there is something at stake.

First of all, there is the Media Question. The Spectacle has entered every possible domain, and its widespread power has made it virtually impossible to imagine a gesture, form of communication or action which is not mediated, digitised, archived. All forms of protests and politics are under its spell. But this tragic reality should not limit ourselves if we are looking for ways out of broadcast misery. Fine, there is still the TAZ, the hacker ethic, models for Electronic Civil Disobedience, tactical media, concepts that might be flexible enough to resist the pressures from the Forces of Simulation. But like all ideas, these Memes have a limited lifespan. They must be updated constantly and renamed in order not to lose their magical attraction. We should not be sad, or even conservative about this. If the Bolo Bolo, TAZ, squat, rave, virtual community is turning up in a new configuration, we should be able to recognize and welcome it. And to witness the birth of such a new entity is certainly a privilege.

After the gold-rush, the We is being questioned, in danger of disintegrating into a thousand lonely hearts, potentially becoming victims of the commodification strategies of the Big players. We are not one, and there has never been unity, specially not these days. The We form in the age of the Net is one of the few possibilities left to address groups, sub-networks and formulate common strategies, (if indeed people are interested in collaboration and exchange...). Heterogeneous policies are always in danger of falling apart, much more than parties, trade-unions and other institutions. One of the tricks to avoid people organising

themselves is to reduce their argument to their Private Opinion which is seen as a contribution to the general (democratic) discourse. In times of consolidation, dispersion and decay, the We is under debate, whilst at the same time more used than ever. It is the time of strategies. At the moment of the short highs there is only the unspoken, ecstatic We feeling. Later on, we do not want others to speak for others. This is anyway a more general tension, a feeling of discontent, between explicit ways of hyper individuality and loneliness on the one side, and the closed, sometimes claustrophobic atmosphere inside groups, collectives, companies and movements on the other side. This should be the starting point for every contemporary debate on new ways of organizing.

Commodify your dissent. Certainly. And you will be commodified too. This fear is even more prominent and destructive these days compared to the unavoidable mediation we have to deal with, (and practice). For some, there is the pleasure of getting to know the rules of the game, understanding the tricks of Doing Business, studying the metaphysics of making money and its ritual, sacral aspects, fooling around with The Suits. But for most, the workers and not executives, commodification means regulation of work, creativity and (soft) subversions. At the first glance, commodification feels like justice, a liberation, a chance to finally get back some of the money for all the efforts that have been invested in the video, music, text or software one has been working on for such a long time. But in most cases this only remains a promise. The famous Sell-Outs seldom pay off, compared to the real money others are making with ordinary jobs. This cheapness, combined with strong, personal feelings of discontent, even guilt is the main reason behind the current wave of paranoia about commodification. It is the fear of betrayal for no reason, being left alone with empty hands, having to work with strangers that have no clue at all. Yes, one can become infected by corporate germs, but this is easy to cure. One good book, documentary or travel will do. We all have to be aware of neo-liberal rhetoric, but ideology is not the issue here. From the political, strategic perspective, the fear we are speaking of here is one of the main obstacles for people to organise themselves and engage with each other in serious way beyond occasional collaborations. Commitment and dedication these days intertwine with business, and this is deadly.

Consciousness Regained. Radical media pragmatism demands that the actors remain Cool. Who can still proclaim to be Multi-media after the monstrous misuse of this term? Yes. It should still be possible to ignore all market forces, cheap trends and keep on playing. There is a state of hyper-awareness, to transform, disappear, give up terrains that have been occupied, and continue at the same time. What now counts is integrity. It is getting easy these days to become resigned. There are a thousand reasons to quit, or to continue on the same grocery level. The world, structured by pre-cooked events, ready to be microwaved and consumed, can be rejected. Downright reality is unbearable these days. "No spiritual surrender", an Amsterdam graffiti says. Colourless digital existence can be softened by self-made utopias, hallucinatory experiences, with or without recreational drugs and technologies. Regular switching to other channels which are outside the cyber realm is an option. There are countless universes. Negroponte's existential reductionism ("In being digital I am me.") is just one of them. "You are only real with your make-up on." (Neil Young)

Here Comes the New Desire. Unknown, forgotten forms of negation, refusal, anger and pleasure are there and will be open (even towards E.T's), whilst still encrypted against the (mentality) police forces and fashion hunters. There are plenty of sadistic traps for the trend researchers and their clientele: Alternative radio, Independent labels, French theory (from twenty years ago), interactive games, on-line events, techno.net This is so cruel: see them buying, the poor bastards, desperate to get an identity, any, which makes them feel alive, for a moment or two. Cybercynical Knowledge g8. So their search engines have to be distrusted, ignored, misled. The people-to-people networks will lead one to the right source, not the databases of the corporations/states. Computers generate useless data, not contextualized information. This should be knowledge.gall.

The postmodern late-leftist discourse of the '68 generation has now closed all its possible options. There is no way out for them, locked up, as they are, in their down-sized, optimised, professional institutions. So let it be. The same can be said of the more recent 'new social movements', with exception of sudden outbursts of un-controlled (and therefore not organized) social-ethnic unrest. Let us not get distracted by ideological pseudo-events such as the Culture Wars or paranoid waves of xenophobia. Some fights are shadow boxing. Others are real. Now it is time for other options, in search for the genuine New that does not fit into known patterns of eternal return, being taken back into the System. Virtual Voluntarism means being able to overcome moods of melancholy, perfectly aware of all possible limits and opportunities, looking for the impossible, on the side, out of reach of both futurists and nostalgics. Being able to present alternative realities, choking the Johnsons, way out of reach of the Appropriation Machines. The market authorities will arrive too late. Yes, this is a dream, but we do cannot survive in a

(digital) environment without options. In order to get at the point, we should reach a level of collective 'self consciousness' to overcome the system of fear and distrust which is now spreading. No attempt to reconstruct what worked once. No glorification of the inevitable. In order not to throw away everything which has been built up we should invent concepts on top of it and not narrow all our options into making the world institutionally legible. The "Next Age", the name of a department store in Pudong/Shanghai, is hybrid: half-clean, somehow dirty, never entirely digitised, stuck between real growth and an even more real crisis. Obsessed with progress, in full despair. But there are other options, and we can realise them. 'Get Organised' (n5m3)

[What follows is a response by Caroline Nevejan of the Society for Old and New Media to Geert Lovink's "Network Fears and Desires." It wasn't written with a larger audience in mind (which in the context of nettime is a good thing: nettime is sinking under the weight of these mailbomb essays, it's like getting classical statuary in your mailbox, entire Italian baroque fountains in ascii art... Think: smaller, faster, lighter). Anyway, Caroline's remarks point up a whole range of issues that tend to get lost when "Theory" decks itself out as a Science: the map is not the terrain, and the terrain is human relations--as in children, friends, allies. A good thing to meditate on in these hot summer days (apologies to those down under"), because it isn't going to get any colder in the long run. There's too much heat, too little warmth.

I've cleaned it up some, so mistakes are my own not Caroline's. -T]

>>not fool ourselves. Marx is at Stanford now, back from the new Berkeley
>>library, studying the dynamics of Microsoft, Silicon Valley and Wall
>>Street, writing on his critique of the global managerial class.

>
> Guilt is a deep thing, not really the matter here. I'd be very happy, if
> it could happen, people would study for over 30 years. I am looking forward
> to reading it. Missed Marx for quite a while. Do you think he'll get a
> debate this time around?

>
>>Time to move on. The permanent digital revolution in danger of becoming a
>>reformist project? The System is effectively taking over, even sucking
>>itself into the intimate spheres of friendships and personal aims. The
>>objective Wheel of Net History is taking subjective tolls. Time slips away
>>and we are caught up in something we never really wanted in the first
>>place. Web design for Dummies. Anxiety over nothing. Debates with nothing
>>at stake. Rivalries when there is plenty of loot. But wait a minute. We
>>know all this. The so-called unavoidable process of decay is not God-given
>>or a Law of Nature. It is about time to introduce intelligent social
>>feed-back systems. Indeed, a Collective Intelligence (thanks, Pierre
>>Levy!) that can overcome the rather primitive 20th Century model of
>>birth, rise, success and fall that numerous groups and movements have gone
>>through. It should be possible to resist both historical and technological
>>determinism, or at least play a game with these now predictable forces.
>>This is the search for a media theory, or digital studies in which we can
>>finally fit the charming or rather fatal wetware factor within the larger
>>forces of hardware and software development.

>
>>
>><http://www.cybernetics.su>, where are you, now that we need you? Big
>>silence. Perhaps it is up to us, this time. Next player. It is easy to
>>write down the draft of "The Rise and Decline of the Global Empire". See
>>the stock markets fall. But that's too macro. It is good to gather
>>knowledge about economic forces that are behind the Will to Get Wired. But
>>in the end, they will not tell us much about the psychological processes
>>within smaller networks, which the Internet still consists of, despite the
>>current massification. That is what the marketing gold diggers are looking
>>for: the ultimate secret of the Virtual Community, whatever that may be.
>>We need a network psychology, not in the form of some brilliant
>>observations by academic outsiders, but fast and pro-active social wisdom
>>which can be implemented in groups, small organizations, lists,
>>techno tribes. Not only to prevent conflicts over nothing, but mainly to
>>stage real fights, if there is something at stake.

>

> Here I agree very much with you. Network psychology is what I missed in in
> what I read of the works of Castells. But is also what I miss in your text
> here. Psychologically speaking, there are no Dummies, there is no anxiety
> over nothing, decay does not exist, the system is part of you but you are
> not the system, history always demands subjective tolls, collective memory
> is a fundamental root for knowledge, collective intelligence a driving
> force in the development of human kind.

>

> I agree we need fast and pro-active wisdom, but wisdom is not something one
> can implement. And even more so I would never talk about implementing
> wisdom to prevent conflicts (even over nothing, because that is only
> perception) or stage fights. Wisdom has to do with sensitivity and
> endurance in "let it be", without loosing your energy or connections. "An
> implementing wisdom" machine sounds like a contradiction in terms, but
> maybe an interesting sort of wishful thinking that may generate useful
> insights for designing networks in a different way.

>

> Cybernetics as far as I know, has always been inspired by the knowledge
> (or and wisdom) embedded in nature or indigenous societies. The notion of
> not copying the brain, but seducing or triggering the brain to work
> differently by using its own powers. I know of some brain and entropy
> stories, but how does wisdom fit in? Many of the cybernetics people of
> those days ended up in Physics and Bhuddism, or artificial intelligence,
> or net design. It would be interesting to look into this again.

>>First of all, there is the Media Question. The Spectacle has entered every
>>possible domain, and its widespread power has made it virtually impossible
>>to imagine a gesture, form of communication or action which is not
>>mediated, digitised, archived. All forms of protests and politics are
>>sunder its spell. But this tragic reality should not limit ourselves if we
>>are looking for ways out of broadcast misery. Fine, there is still the
>>TAZ, the hacker ethic, models for Electronic Civil Disobedience, tactical
>>media, concepts that might be flexible enough to resist the pressures from
>>the Forces of Simulation. But like all ideas, these Memes have a limited
>>lifespan. They must be updated constantly and renamed in order not to lose
>>their magical attraction. We should not be sad, or even conservative about
>>this. If the Bolo Bolo, TAZ, squat, rave, virtual community is turning up
>>in a new configuration, we should be able to recognize and welcome it. And
>>to witness the birth of such a new entity is certainly a privilege.

>

> The forces of simulation and the collective amnesia that goes with it are a
> serious problem of our time. In the sixties there was a connection between
> thinking and doing--one of the crucial elements, inspired by the good and
> wrong of the second world war. In our days now this ethic of a person's word
> is a person's deed, is sort of drifting in the air. In the juridical systems
> this confusion is very present (international tribunal in the Hague on
> Yugoslavia, Rodney King, OJ Simpson and Clinton, the Truth commission in
> South Africa, Singapore's hard-line). What surprises me is that so many
> people take it seriously. Actually in the field of juridical philosophy
> something is happening in this regard--between states and also in the
> public arena.

>

> The rewriting of history all the time is fundamental to human history. The
> strange thing is that now we have all these data stored. Will they make a
> difference? To keep history alive it has to be rewritten all the time. The
> change is that we have this huge outside data storage, fact-filing system.
> How can they inspire the stories we tell children?

>

>>After the gold-rush, the We is being questioned, in danger of
>>disintegrating into a thousand lonely hearts, potentially becoming victims
>>of the commodification strategies of the Big players. We are not one, and
>>there has never been unity, specially not these days. The We form in the
>>age of the Net is one of the few possibilities left to address groups,
>>sub-networks and formulate common strategies, (if indeed people are
>>interested in collaboration and exchange...). Heterogeneous policies are
>>always in danger of falling apart, much more than parties, trade-unions
>>and other institutions. One of the tricks to avoid people organising
>>themselves is to reduce their argument to their Private Opinion which is
>>seen as a contribution to the general (democratic?) discourse. In times of
>>consolidation, dispersion and decay, the We is under debate, whilst at the
>>same time more used than ever. It is the time of strategies. At the moment
>>of the short highs there is only the unspoken, ecstatic We feeling. Later
>>on, we do not want others to speak for others. This is anyway a
>>more general tension, a feeling of discontent, between explicit ways of
>>hyper individuality and loneliness on the one side, and the closed,
>>sometimes claustrophobic atmosphere inside groups, collectives, companies
>>and movements on the other side. This should be the starting point for
>>every contemporary debate on new ways of organizing.

>

> Most organization happens (if not all) because people feel a necessity to
> do so. Most organization happens without the organization itself as a
> notion, but because people want to get something done (households, streets,
> villages). In the Big Society--with so many people here--schools, parties

> and movements require people to be able to transcend their issues of
> survival and believe systems to the notion of being part of an
> organization. Compromise (or entropy) and strategy (insight in dynamics) is
> part of any system. In the Big Society strategy and organization has become
> a goal in itself; so the radicals have made a goal in itself of not being
> part of that. I would argue that we should leave these notions behind and
> become Dummies who organize a household. Perception, compromise,
> mildness,
> realization where your love is, is crucial. Especially now in the Big
> Society since many people are open to creating "sense". Courage is needed
> for "coming out".

>

> In other words get out of this THEM versus WE feeling, we are them and
> they are us--and no guilt.

>

>>Commodify your dissent. Certainly. And you will be commodified too. This
>>fear is even more prominent and destructive these days compared to the
>>unavoidable mediation we have to deal with, (and practice). For some,
>>there is the pleasure of getting to know the rules of the game,
>>understanding the tricks of Doing Business, studying the metaphysics of
>>making money and its ritual, sacral aspects, fooling around with The
>>Suits. But for most, the workers and not executives, commodification means
>>regulation of work, creativity and (soft) subversions. At the first
>>glance, commodification feels like justice, a liberation, a chance to
>>finally get back some of the money for all the efforts that have been
>>invested in the video, music, text or software one has been working on for
>>such a long time. But in most cases this only remains a promise. The
>>famous Sell-Outs seldom pay off, compared to the real money others are
>>making with ordinary jobs. This cheapness, combined with strong, personal
>>feelings of discontent, even guilt is the main reason behind the current
>>wave of paranoia about commodification. It is the fear of betrayal for no
>>reason, being left alone with empty hands, having to work with strangers
>>that have no clue at all. Yes, one can become infected by corporate germs,
>>but this is easy to cure. One good book, documentary or travel will do. We
>>all have to be aware of neo-liberal rhetoric, but ideology is not the
>>issue here. From the political, strategic perspective, the fear we are
>>speaking of here is one of the main obstacles for people to organise
>>themselves and engage with each other in serious way beyond occasional
>>collaborations. Commitment and dedication these days intertwine with
>>business, and this is deadly.

>

> When I know a song and I teach it to you, do I have half a song after that?
> Or does my song sound less beautiful? Commodification can also mean that
> more people, or other people, have access. The fear of betrayal, of empty
> hands is true, but it always has been. I think you confuse general behavior
> with the need to be alert. I agree that sharing knowledge and means is
> harder at the moment, in this particular period when we live, but the
> conclusion I would draw is that we need to formulate better the reasons why
> we want to share, what is at stake. And even demand business models in which
> the sharing is reflected. Commodification is not the problem, blind money
> drive is. Exploitation is. But money as an exchange medium in itself is not.
> Doing good business generates possibilities, and to do good business does
> not always have to mean one gets into exploitation. Most people actually
> did not. The intertwining of business and dedication and commitment
> acquires our attention but is not deadly by nature, it is as much a force
> for conviviality.

>

>>Conciousness Regained. Radical media pragmatism demands that the actors
>>remain Cool. Who can still proclaim to be Multi-media after the monstrous
>>misuse of this term? Yes. It should still be possible to ignore all market
>>forces, cheap trends and keep on playing. There is a state of
>>hyper-awareness, to transform, disappear, give up terrains that have been
>>occupied, and continue at the same time. What now counts is integrity. It
>>is getting easy these days to become resigned. There are a thousand
>>reasons to quit, or to continue on the same grocery level. The world,
>>structured by pre-cooked events, ready to be microwaved and consumed, can
>>be rejected. Downright reality is unbearable these days. "No spiritual
>>surrender", an Amsterdam graffiti says. Colourless digital existence can
>>be softened by self-made utopias, hallucinatory experiences, with or
>>without recreational drugs and technologies. Regular switching to other
>>channels which are outside the cyber realm is an option. There are
>>countless universes. Negroponte's existential reductionism ("In being
>>digital I am me.") is just one of them. "You are only real with your
>>make-up on." (Neil Young)

>>

>>Here Comes the New Desire. Unknown, forgotten forms of negation, refusal.
>>anger and pleasure are there and will be open (even towards E.T's), whilst
>>still encrypted against the (mentality) police forces and fashion hunters.
>>There are plenty of sadistic traps for the trend researchers and the first
>>clientele: Alternative radio, Independent labels, French theory (from
>>twenty years ago), interactive games, on-line events, techno.net This is
>>so cruel: see them buying, the poor bastards, desperate to get an
>>identity, any, which makes them feel alive, for a moment or two.

>>Cybercynical Knowledge 98. So their search engines have to be distrusted,
>>ignored, misled. The people-to-people networks will lead one to the right
>>source, not the databases of the corporations/states. Computers generate
>>useless data, not contextualized information. This should be knowledge4all.
>>
>>The postmodern late-leftist discourse of the '68 generation has now closed
>>all its possible options. There is no way out for them, locked up, as they
>>are, in their down-sized, optimised, professional institutions. So let it
>>be. The same can be said of the more recent 'new social movements', with
>>exception of sudden outbursts of un-controlled (and therefore not
>>organized) social-ethnic unrest. Let us not get distracted by ideological
>>pseudo-events such as the Culture Wars or paranoid waves of xenophobia.
>>Some fights are shadow boxing. Others are real. Now it is time for other
>>options, in search for the genuine New that does not fit into known
>>patterns of eternal return, being taken back into the System. Virtual
>>Voluntarism means being able to overcome moods of melancholy, perfectly
>>aware of all possible limits and opportunities, looking for the
>>impossible, on the side, out of reach of both futurists and nostalgics.
>>Being able to present alternative realities, chocking the Johnsons, way
>>out of reach of the Appropriation Machines. The market authorities will
>>arrive too late. Yes, this is a dream, but we do cannot survive in a
>>(digital) environment without options. In order to get at the point, we
>>should reach a level of collective 'self consciousness' to overcome the
>>system of fear and distrust which is now spreading. No attempt to
>>reconstruct what worked once. No glorification of the inevitable. In order
>>not to throw away everything which has been built up we should invent
>>concepts on top of it and not narrow all our options into making the world
>>institutionally legible. The "Next Age", the name of a department store in
>>Pudong/Shanghai, is hybrid: half-clean, somehow dirty, never entirely
>>digitised, stuck between real growth and an even more real crisis.
>>Obsessed with progress, in full despair. But there are other options, and
>>we can realise them. 'Get Organised' (n5mj3)

'Organised Networks Institutionalise to give Mobile Information a
Strategic Potential'

Ned Rossiter, Centre for Media Research, University of Ulster
<N.Rossiter [AT] ulster.ac.uk>
Abstract

This paper is interested in how networks using ICTs as their primary
mode of organisation can be considered as new institutional forms.
The paper suggests that organised networks are emergent
socio-technical forms that arise from the limits of both tactical
media and more traditional institutional structures and architectonic
forms. Organised networks are peculiar for the ways in which they
address problems situated within the media form itself. The
organised network is thus one whose socio-technical relations are
immanent to, rather than supplements of, communications media. The
paper argues that the problematics of scale and sustainability are
the two key challenges faced by various forms of networks. The
organised network is distinct for the ways in which it has managed to
address such problematics in order to imbue informational relations
with a strategic potential.

Introduction

The question motivating this paper is this: what is the relationship
between institutions, networks and the mobility of information? In
recent months I've been looking at what various research centres in
the UK are up to in the areas of media studies, communications,
sociology and cultural studies. I've been doing this because I've
just moved from Monash University in Melbourne to the University of
Ulster, Northern Ireland and I needed to get a sense of what's going
on. The lasting impression I have after idling through a dozen or so
websites is that everyone proudly claims to be pursuing activities
that consist of building networks. Yet very few of these sites ever
explain how their activities constitute a network formation, and I
can't recall any that bother to define what a network might be. They
must have done this at some stage, however, because many of these
research centres and programs delight in informing the reader of how
much money they've been able to attract in research funding. I get
the strong impression that many of these programs are responding to
the latest directive set forth by the command-economy of government
funding agencies. One can only presume that somewhere along the line
these projects made some attempt at defining their activities in
terms of networks.

I would suggest that there is little about the activities of these
various centres and programs that correspond with a logic of
networks. And here, I am talking specifically about networks that
are immanent to the Internet - the primary socio-technical
architecture that enables the mobility of data within a logic of
informationalism. Really, what the networked university offers all
its believers is something akin to what Bourdieu calls 'circuits of
legitimation' that enable the reproduction of 'state nobility' (1996:
382-389). I wouldn't begin to deny that I'm also caught up in this
process.

It almost goes without saying that the networked university is
conditioned by the advent of new ICTs which enable connections
between a range of institutional entities and individuals that are no
longer bound by the contingencies of place. Equally, the effects of
neoliberalism in terms of shrinking budgets for higher education and
a gradual deregulation of education as a commercial service have
played a strong conditioning force in decomposing the traditional
university form. These days it is the norm rather than the exception
to find that the movement of knowledge and information is restricted
by authentication firewalls and IP policies underpinned by a hybrid
paranoid-blue-sky discourse. Within such architectures, the

networked university is hardly conducive to radical information critique or creative intellectual work (although there are of course cracks that do of course allow such practices). Moreover, there aren't too many projects being produced out of all this networking beyond the final report that's submitted to funding authorities who understand no other language than that of counting beans. As the state continues its process of de-institutionalisation, to what extent is a new institutional form emerging that does provide conditions for critical Internet research and culture? How is this form manifesting within on- and off-line practices associated with the Internet?

The Network Problematic

A spectre is haunting this age of informationality - the spectre of state sovereignty. As a modern technique of governance based on territorial control, a 'monopoly of violence' and the capacity to regulate the flow of goods and people, the sovereign power of the nation-state is not yet ready to succumb to the system of internationalism. The compact of alliances between nation-states over matters of trade, security, foreign aid, investment, and so forth, substantiates the ongoing relevance of the state form in shaping the mobile life of people and things. As the Internet gained purchase throughout the 1990s on the everyday experiences of those living within advanced economies in particular, the popular imagination became characterised by the notion of a 'borderless' world of 'frictionless capitalism'. Such a view is the doxa of many: political philosophers, economists, international relations scholars, politicians, CEOs, activists, cyber-libertarians, advertising agencies, political spin-doctors and ecologists all have their variation on the theme of a postnational, global world-system inter-linked by informational flows.

Just as the nation-state appears obsolete for many, so too the term 'network' has become perhaps the most pervasive metaphor to describe a range of phenomena, desires and practices in contemporary information societies. The refrain one hears on networks in recent years goes something like this: fluidity, ephemerality, transitory, innovative, flows, non-linear, decentralised, value adding, creative, flexible, open, risk-taking, reflexive, informal, individualised, intense, transformative, and so on and so forth. Many of these words are used interchangeably as metaphors, concepts and descriptions. Increasingly, there is a desperation evident in research on new ICTs that manifests in the form of empirical research. Paradoxically, much of this research consists of methods and epistemological frameworks that render the mobility of information in terms of stasis (see Rössiter, 2003a, 2003b).

Governments have found that the network refrain appeals to their neoliberal sensibilities, which search for new rhetorics to substitute the elimination of state infrastructures with the logic of individualised self-formation within Third Way style networks of 'social capital' (Latham, 2001: 62-100; Giddens, 1998).^[1] Research committees at university and federal levels see networks as offering the latest promise of an economic utopia in which research practice synchronically models the dynamic movement of finance capital, yet so often the outcomes of research ventures are based upon the reproduction of pre-existing research clusters and the maintenance of their hegemony for institutions and individuals with ambitions of legitimacy within the prevailing doxas (Cooper, 2002; Marginson and Considine, 2000). Telcos and cable TV 'providers' revel in their capacity to flaunt a communications system that is not so much a network but a heterogeneous mass of audiences-consumers-users connected by the content and services of private media oligopolies (Flew, 2002: 17-21; van Dijk, 1999: 62-70; Schiller, 1999: 37-88). Activists pursue techniques of simultaneous disaggregation and consolidation via online organisation in their efforts to mobilise opposition and actions in the form of mutable affinities against the corporatisation of everyday life (Lovink, 2003: 194-223; Lovink and Schneider, 2004; Meikle, 2002). The US military-entertainment complex enlists strategies of organised distribution of troops and weaponry on battlefields defined by unpredictability and chaos, while maintaining the spectacle of control across the vectors of news media (Der Derian, 2001; De Landa, 1991; Wark, 1994: 1-46). The standing reserve of human misery sweeps up the remains of daily horror.

Theorists and artists of new media are not immune to these prevailing discourses, and reproduce similar network homologies in their valorisation of open, decentralised, distributed, egalitarian and emergent socio-technical forms. In so doing, the discursive and socio-technical form of networks is attributed an ontological status. The so-called openness, fluidity and contingency of networks is rendered in essentialist terms that function to elide the complexities and contradictions that comprise the uneven spatio-temporal dimensions and material practices of networks.

Similarly, the force of the 'constitutive outside' is frequently dismissed by media and cultural theorists in favour of delirious discourses of openness and horizontality. 'Immanence' has been a key metaphor to describe the logic of informationalisation (see Rössiter, 2004). Such a word can also be used to describe networks. To put it in a nutshell, the technics of networks can be described as thus: if you can sketch a diagram of relations in which connections are 'external to their terms' (Deleuze), then you get a picture of a network model. Whatever the peculiarities the network refrain may take, there's a predominant tendency to overlook the ways in which networks are produced by regimes of power, economies of desire and the restless rhythms of global capital.

How, I wonder, might the antagonisms peculiar to the varied and more often than not incommensurate political situations of informationality be formulated in terms of a political theory of networks? A processual model of media theory inquires into the movement between the conditions of possibility and that which has emerged within the grid of signs, codes and meanings - or what Deleuze understands as the immanent relationship between the plane of consistency and the plane of organisation. How might the politics of consistency as they operate within informationalised institutional settings be understood in terms of a processual democracy?

Conditions of possibility are different in kind from that which comes to be conditioned. There is no resemblance or homology between the two. External forces are not grids whose stabilising capacity assures the temporary intelligibility of a problematic as it coalesces within a specific situation. Yet despite these dissonances, networks are defined by - perhaps more than anything - their organisation of relations between actors, information, practices, interests and socio-technical systems. The relations between these terms may manifest at an entirely local level, or they may traverse a range of scales, from the local to the national to the regional to the global. Whatever the scale may be, these fields of association are the scene of politics and, once they are located within institutional settings, are the basis of democracy in all its variations. This isn't to say that in and of themselves these components of networks somehow automatically result in democracy. But it is to suggest that the relationship between institutions and the sociopolitical habitus of the state continues to be a primary influence in conditioning the possibility of democratic politics.

The persistence of state sovereignty within the immanent logic of informationality presents an invitation to transdisciplinary theorists to invent new techniques of deduction, appraisal, and critique. Indeed, the task of invention is an inevitable one for creative critical theorists inasmuch as they, along with other actors, subvert reflexively within the logic of informationalism. The relationship is a reflexive one because the theorist encounters problems that are presented by the tensions within the triad of networks, institutions, democracy. Problems emerge in the form of feedback or noise peculiar to the socio-technical system. Critical theorists are not, of course, alone in this engagement; it is one they share with many whose labour-power is subject to the constitutive force of networks-institutions-democracy.

My primary interest in bringing the terms networks-institutions-democracy together is to develop a conceptual assemblage with which to think the emergence of organised networks as new institutions of possibility. From a theoretical and practical point of view how might organised networks be defined as new institutional forms of informationalism? Given that institutions throughout history function to organise social relations, what distinguishes the organised network as an institution from its modern counterparts? Obviously there are differences along lines of horizontal vs. vertical, distributed vs. contained, decentralised vs. centralised, bureaucratic reason vs. database processing, etc. But what else is there?

Networks and Translation

All communication is a process of translation. Networks are uneven, heterogeneous passages and combinations of communication in and through which translation is intrinsic to the connectivity of information as it encounters technical, social, political, economic and cultural fields of articulation, negotiation and transference. Translation, then, is about making connections between seemingly incommensurate things and objects. Translation conditions the possibility of communication, transversality, transduction, intensity and individuation between different systems (Mackenzie, 2002; Murphie, 2004). From the connection emerges a new logic, a new sensibility, and new capacities. At a very basic level, the logic of networks is the process of connectivity.

Networks have the capacity of transduction, which Adrian Mackenzie, via Gilbert Simondon, describes as a process of ontogenesis 'in which a metastability emerges' within biological and socio-technical systems (2002: 16-19). Or as Andrew Murphie puts it, 'transduction *translates intensities* so that they can be brought into individuating systems' (2004). The form of organised networks provides a mutable architecture in which matter is temporarily arrested within a continuum of differentiation and individuation. Transductive forces subsist within the relation between form and matter. The organised network can be considered as a new institutional actor whose political, economic and expressive capacities are shaped and governed by the metastability of the network system. The intelligibility of such arrangements, relations and informational flows is thus most accurately summarised by a theory of translation which incorporates processes of transduction. Translation is truly a concept of praxis. It is part and parcel of every network. Transduction conditions the possibility of organised networks as emergent institutional entities.

Modernity ushered in experiences of mobility, for people and things, in ways hitherto unexperienced. With mobility came all sorts of connections. Railways moved people and merchandise from the country to the city, troops and armaments to the front (Schivelbusch, 1977). Telegraphy transmitted code from the metropole to the antipodes and back again (Wark, 1997). The penny novel accompanied workers on their journey to the office, the evening newspaper or racing guide on their trip back to the suburbs. People, ideas and things came to occupy a shared space and time of motion. In so doing, the experience of movement is at once made possible and defined by new combinations of elements. This is translation at work.

With the onset of the Enlightenment, industrial capitalism and modernity, new disciplines emerged in the hard and human sciences. The discipline of anthropology set itself the task of cataloguing human habits and attributes within a language system that translated in various ways into policy initiatives, geographic survey reports, academic monographs, economic prospectives, architectural forms, museological displays, and cultural exchanges. This too is translation at work. Elements previously without relation, are combined in such a manner that something new is invented (see Brown, 2002: 6).

What I have discussed elsewhere as a processual media theory (Rossiter, 2003a) is derived from research in cybernetics, biology and systems theory that is interested in information as it relates to the problem of calculation, control and determination in order to enhance efficiency. The primary question for first-order cybernetics was how to impose stability and order over the entropic tendencies of information, as witnessed, for example within biological systems and their transmission of DNA code or radio signals and their interference by 'noise'. The preoccupation with efficiency in first-order cybernetics denies the relational character of communication. Second-order cybernetics saw the necessity of not banishing noise from the system, but establishing a balance between order and disorder: noise or feedback was 'rehabilitated' as a 'virtue' of communication within a system (Mattelat and Matherlart, 1992: 45).

Within anthropology, for example, the observer impacts upon that which is observed and changes what might otherwise have transpired in the course of the event, had the observer not been a part of the system. Second-order cybernetics and systems theory thus adopts a reflexive understanding of the relationship between observer and observed. Feedback - what Bateson termed the 'difference that makes a difference' - is acknowledged as fundamental to the functioning of the system. Moreover, communication is more properly understood as not a unilinear channel of transmission, but rather a non-linear system of relations. Corresponding with this conceptual development is a shift from an instrumental view of communication to an understanding of communication as a social system.

When information is located within a capitalist economic system and its practices of production, circulation and exchange, one can speak of the logic of informationalism. The conceptual developments within cybernetics and systems theory correspond with shifts in the logic of informationalism. The logic of informationalism is characterised by various sociologists and political economists as heralding a shift from an industrial age of manufacturing, manual labour, Fordism, surveillance and internationalisation to an informational age of services, knowledge workers post-Fordism, control and globalisation. Christopher May writes that a central assumption to this change is a belief that 'New ICTs will transform the relations of production of the economies in which they appear, promoting fluid networks rather than ossified hierarchies' (2002: 51). My argument is that in order for networks to organise mobile

information, a degree of hierarchisation, if not centralisation, is required. The point is that such organisation occurs within the media of communication. Herein lies the difference between the organised network and the networked organisation - a point Lovink reiterates in the newspaper for the Free Cooperation conference that's about to start (<http://freecooperation.org>). Let's not forget that for all the anti-state rhetoric of anarchists, they, like many 'radical' outfits, are renowned for being organised in highly hierarchical ways - typically around the cult of the alpha-male. Organised Networks as New Institutional Forms

The challenge for a politically active networked culture is to make strategic use of new communications media in order to create new institutions of possibility. Such socio-technical formations will take on the characteristics of organised networks - distributive, non-linear, situated, project-based - in order to create self-sustaining media-ecologies that are simply not on the map of established political and cultural institutions. As Gary Genesko writes, 'the real task is to find the institutional means to incarnate new modes of subjectification while simultaneously avoiding the slide into bureaucratic sclerosis' (2003: 33). Such a view also augurs well for the life of networks as they subsist within the political logic of informationality that is constituted by the force of the outside (Rossiter, 2004).

The organised network that co-ordinates relations through the socio-technical form of the networked institution imbues information with a strategic potential. In this respect, the organised network can be distinguished from what David Garcia and Geert Lovink (1997), Josephine Berry (2000), Joanne Richardson (2002), McKenzie Wark (2002), Konrad Becker (2002), Lovink and Schneider (2002), and others on nettime have called 'tactical media'. Characterised by temporary political interventions, tactical media activism builds on the legacy of counter-cultures, protest movements, the Situationists, independent media activities and hacker culture.[2] Lovink and Schneider (2002) provide the following short history of tactical media:

'The term "tactical media" arose in the aftermath of the fall of the Berlin Wall as a renaissance of media activism, blending old school political work and artists' engagement with new technologies. The early nineties saw a growing awareness of gender issues, exponential growth of media industries and the increasing availability of cheap do-it-yourself equipment creating a new sense of self-awareness amongst activists, programmers, theorists, curators and artists. Media were no longer seen as merely tools for the Struggle, but experienced as virtual environments whose parameters were permanently "under construction". This was the golden age of tactical media, open to issues of aesthetics and experimentation with alternative forms of story telling. However, these liberating techno practices did not immediately translate into visible social movements. Rather, they symbolized the celebration of media freedom, in itself a great political goal. The media used - from video, CD-ROM, cassettes, zines and flyers to music styles such as rap and techno - varied widely, as did the content. A commonly shared feeling was that politically motivated activities, be they art or research or advocacy work, were no longer part of a politically correct ghetto and could intervene in "pop culture" without necessarily having to compromise with the "system". With everything up for negotiation, new coalitions could be formed. The current movements worldwide cannot be understood outside of the diverse and often very personal [battles] for digital freedom of expression'.

RTmark's web co-ordinated campaigns against global corporate capitalism, the live webcasting and 'Help B92' campaign of Belgrade independent radio station B92 following its banning by Serbian authorities during the Kosovo War of 1999, Adbusters' culture jamming campaigns against media oligopolies, the electronic civil disturbance activities and 'virtual sit-ins' undertaken by the likes of Critical Art Ensemble, the Electronic Disturbance Theater and the Mexican Zapatistas, and the Indymedia campaigns against the Woomera detention centre in South Australia are just a few of the many examples of tactical media.[3] Tactical media differ from alternative media, which is typically concerned about consolidating a 'better' option for existing media forms (Lovink, 2002: 258; Meikle, 2002: 119). Alternative media are frequently underpinned by moral and politico-aesthetic discourses of 'quality culture'. The paradox of alternative media, when it assumes to embody such discourses, is that its 'alternative' agenda is rendered in terms of stasis and conservatism rather than change and transformation. Whereas tactical media, as Graham Meikle notes, 'is about mobility and flexibility, about diverse responses to changing contexts ... It's about hit-and-run guerrilla media campaigns ... It's about working with, and working out, new and changing coalitions' (119). Tactical media, then, are about rapidly organised, at times even spontaneous,

short-term interventions. Certainly, such interventions resonate over time - some even become mythical, as has been the case with the Zapatistas. Diverse skills accumulate and are shared across networks; in so doing, they hold the potential for deployment as techniques that address specific situations. Nevertheless, tactical media have for the most part been unable to address the problematic of sustainability.

A primary challenge for tactical media concerns the question of scale. With their focus on creating "temporary autonomous zones" (Bey, 1991), tactical media run the risk of fading out before their memes reach a global scale. And when they do reach a level of globality - as in the case of the B2 streaming media reports, and the refrain of "anti-globalisation" protests centred around WTO meetings - the question of scale becomes focussed around the challenge of sustainability. How are tactical media to create effects that have a purchase beyond the safe-haven of the activist ghetto? As Lovink writes: 'Grown out of despair rather than conviction, tactical media are forced to operate with the parameters of global capitalism, despite their radical agendas. Tactical media emerge out of the margins, yet never fully make it into the mainstream' (2002: 257). This is a problematic clearly recognised by Lovink and Schneider (2002):

'We face a scalability crisis. Most movements and initiatives find themselves in a trap. The strategy of becoming "minor" (Guattari) is no longer a positive choice but the default option. Designing a successful cultural virus and getting millions of hits on your weblog will not bring you beyond the level of a short-lived "spectacle". Culture jammers are no longer outlaws but should be seen as experts in guerrilla communication. Today's movements are in danger of getting stuck in self-satisfying protest mode. With access to the political process effectively blocked, further mediation seems the only available option'.

Various treatises and commentaries on tactical media note the distinction Michel de Certeau (1984: 29-44) makes between tactics and strategies. Graham Meikle makes the important point that strategies, with their exploitation of place, are about permanency over time, whereas a tactic 'exploits time - the moments of opportunity and possibility made possible as cracks appear in the evolution of strategic place' (2002: 121). In one of the many essays associated with the fourth Next 5 Minutes festival of tactical media (2002-2003), Joanne Richardson suggests that tactical media departs company with Certeau over the production of meaning: 'Maybe the most interesting thing about the theory of tactical media is the extent to which it abandons rather than pays homage to de Certeau, making tactics not a silent production by reading signs without changing them, but outlining the way in which active production can become tactical in contrast to strategic, mainstream media' (2002).

I would argue that it's time to make a return to and reinvestment in strategic concepts, practices and techniques of organisation. Let's stop the obsession with tactics as the modus operandi of radical critique, most particularly in the gross parodies of Certeau one finds in US-style cultural studies. Don't get me wrong - I'm not suggesting that the time of tactical media is over. Clearly, tactical media play a fundamental role in contributing to the formation of radical media cultures and new social relations. What I'm interested in addressing is the "scalability crisis" that Lovink and Schneider refer to. If one starts with the principle that concepts and practices are immanent to prevailing media forms, and not somehow separate from them, it follows that with the mainstream purchase of new media forms such as the Internet come new ways in which relations of production, distribution and consumption are organised. An equivalence can be found in the shift from centralised Fordist modes of production to de-centralised post-Fordist modes of flexible accumulation. Strategies within the spatio-temporal peculiarities of the Internet are different from strategies as they operate within broadcast communications media. The latter ultimately conceives the "audience-as-consumer" as the end point in the food-chain of media production, whereas the former enable the "user" to have the capacity to sample, modify, repurpose and redirect the social life of the semiotic object. Moreover, there are going to be new ways in which institutions develop in relation to Internet based media culture. How such institutions of organised networks actually develop in order to obtain a degree of sustainability and longevity that has typically escaped the endeavours of tactical media is something that is only beginning to become visible.

The Delhi-based media centre Sarai is one exemplary model of an emergent institution designed along the lines of an organised network. Fibreculture - a network of critical Internet research and culture in Australasia - is another. In their own ways, the conditions of possibility for the emergence of these organised

networks can be understood in terms of the constitutive outside. Both networks address specific problems of sociality, politics, and intellectual transdisciplinarity filtered - at least in the case of fibreculture - through a void created by established institutions within the cultural industries and higher education sector.

Take the case of fibreculture. In many ways the fibreculture network is quite centralised: list facilitators, journal editors, book series editors, website management, conference organisers, etc. Hierarchies prevail. The facilitator's group has endeavoured to make the structure of the network as transparent and public as possible. Even so, the list is not privy to most of what is discussed in these various 'backrooms'. And to a large extent, that has to be accepted - trust has to be assumed - if the network is to develop in the way that it has. So, a degree of centralisation and hierarchisation seems essential for a network to be characterised as organised. Can the network thus be characterised as an 'institution', or might it need to acquire additional qualities? Is institutional status even desirable for a network that aspires to intervene in debates on critical Internet research and culture? How does an organised network help us redefine our understanding of what an institution might become?

One of the key challenges that networks such as fibreculture present is the possibility of new institutional formations that want to make a political, social and cultural difference within the socio-technical logic of networks. It's not clear what shape these institutions will take, but we get a sense of what they might be in cases like fibreculture and Sarai. To fall back into the crumbling security of traditional, established institutions is not an option. The network logic is increasingly the normative mode of organising socio-technical relations in advanced economies, and this impacts upon both the urban and rural poor within those countries as well as those in economically developing countries. So, the traditional institution is hardly a place of escape for those wishing to hide from the logic of networks.

It's important to distinguish the organised network as a new institutional form from traditional institutions that have become networked through their use of new ICTs. As Lovink and Schneider (2004) have recently noted, the maintenance of hierarchical forms of power within hegemonic networked institutions 'is part of a larger process of "normalization" in which networks are integrated in existing management styles and institutional rituals'. Traditional institutional forms - corporations, cultural industries, and the higher education sector - are increasingly appropriating many of the techniques of tactical media: you can have your pap experience (but at a price) and who isn't advocating the merits of open source? Think IBM and opensource.mit.edu. There's a distinct whiff of new age refashioning in many of these projects as they seek to recapture a 'spirit' of sharing and experiences of collaboration - the kinds of things that were swept into the dustbin in the hard-nosed culture of unit-driven corporatism. Ultimately, the networked organisation is distinguished by its standing reserve of capital and its exploitation of labour-power. Such institutions are motivated by the need to organise social relations in the hope of maximising 'creativity' and regenerating the design of commodity forms that have long reached market saturation. It'll be interesting to see the extent to which the Creative Commons license is adopted by big business - I'm guessing it'll create a suitable amount of havoc, enabling service variation and consolidate an even brighter future for the legal sector.

By contrast, the kind of emergent organised networks that I'm referring to are notable for the ways in which information flows and socio-technical relations are organised around site specific projects that place an emphasis on process as the condition for outcomes. The needs, interests and problems of the organised network coincide with its emergence as a sociotechnical form, whereas the traditional modern institution has become networked in an attempt to recast itself whilst retaining its basic infrastructure, clunky as it is. Strangely enough the culture of neoliberalism conditions the emergence of the organised network. The logic of outsourcing has demonstrated that the state still requires institutions to service society. Scale and cost were the two key objections econocrats and servants to neoliberalism objected to. Forget about ideology. These bureaucrats are highly neurotic, obsessive-compulsive types. They hate any trace of disorder and inefficiency, and the welfare state embodied such irritations. The organised network can take advantage of such instituted pathologies by becoming an educational "service provider", for instance. The key is to work out what values you have that distinguish your network from the MIT model. The other factor is to work out a plan for sustainability - a clear lesson from the dotcom era.

As Phil Agre (2002) has noted, 'Institutions persist in part because of the bodies of skill that have built up within them'. This idea of institutions as accumulations of skills strikes me as a perfect way of describing what goes on within organised networks such as fibreculture and sarai. Yet why do so many networks fail to persist? What does it take for a network to become sustainable as an organised form? What's the 5 year business plan going to look like? And how might it do this without sliding in to 'bureaucratic sclerosis', as Genosko puts it. Lovink and Schneider (2004) suggest that a large reason for the transience of networks has to do with the factors of information overload, inadequate software and interface solutions, and socio-cultural impasses in online communication.

To this I would add the need for networks to address situated problems if they are to develop into an organised form. I'm not speaking of flamewars on mailing lists or people who don't express themselves in the correct lingua franca of a particular list - these are features of pretty much every mailing list with a substantial number of subscribers who have a bit of life in them. Rather, I'm talking about problems associated with undertaking projects that require an organised response in order to realise activities such as conferences, publishing in different formats and platforms, educational workshops and training, accredited provision of educational packages to the traditional education sector, new media art exhibitions, software development, online translation of foreign language books, etc. Networks like nettime used to do some of these kind of things in the past, but it seems that eventually their size put an end to that. This doesn't mean individual subscribers to nettime don't get together and organise things (they frequently do this!), but it does mean that the 'brand' of nettime is no longer a continuum of relations beyond list culture. Scale, in the case of nettime, has been the impasse to organisation.

Conclusion

In order for tactical media and list cultures to organise as networks that have multiple institutional capacities, there has to be - first and foremost - a will, passion and commitment to invention. There has to be a desire for socio-technical change and transformation. And there needs to be a curiosity and instinct for survival to shift finance capital to places, people, networks and activities that hitherto have been invisible. The combination of these forces mobilises information in ways that hold an ethico-aesthetic capacity to create new institutional forms that persist over time and address the spectrum of socio-political antagonisms of information societies in a situated fashion.

Notes

'Virtuosity, Processual Democracy and Organised Networks' [short version]

I am a Stalinist - everyone should do as I say and think; I have no idea what I am - I don't exist... The contradiction between these two statements signals a tension between identity politics and the politics of desubjectification. Identity operates within a regime of coding; desubjectification is a process of subjectivisation and transversality in which 'relations are external to their terms' (Deleuze-Hume). There is nothing intrinsic about the relationship between the object, subject or thing that determines some essential attribute or identity. The identity of the Stalinist emerges from a milieu of radical contingencies. The Stalinist is thus a potentiality that subsists within the plane of immanence. The logic of coding is part and parcel of the unforseen capacities that define the externality of immanence.

The relationship between the overcoded subject and the process of desubjectivisation is one of movement. The movement between the two comprises the force of processuality, and a politics of contingency and potentiality. Stalinist subjects are everywhere - we are all Stalinists, and we also don't exist. The force of relations external to their terms operate in a manner that continuously destabilises the authoritarianism of the Stalinist subject. The process of desubjectification corresponds with the plane of immanence. This is the common from which exodus, flight, and exit subsist as potentialities - potentialities that can also be found in the co-operation that is common to the surplus value of labour-power. The analysis of these relations is a practice of radical empiricism.

Surplus value is based on excess - an excess of labour-power. With a surplus of labour-power (unemployment), the cost of production decreases, profit rises. Labour-power, however, is predicated on co-operation, and herein lies the potential for transformation, since co-operation subsists in the plane of immanence, the common. The capacity for the articulation of other values, and the mobilisation of other affects is immanent to the surplus value of labour-power. Surplus value can also be understood as an individuation transduced from the pre-individuality of co-operation, of the "general intellect". This is what Negri (2004) identifies as the 'ontology of the multitudes'. The co-operation peculiar to the surplus value of labour-power grants what Hardt and Negri identify, and had previously dismissed, as the class dimension to the emergent socio-technical form of the multitudes, since exploitation conditions the possibility

of co-operation (Hardt and Negri, 2004; Negri, 2004).

Through techniques of co-operation, collaboration and a distribution of capacities, the multitudes are showing signs of becoming organised. The problems of scale and sustainability are being addressed. The at times self-valourising movements of "tactical media" are beginning to adopt a strategic outlook on how to situate their activities within socio-technical systems in more secure ways. Indeed, the organised network is composing itself as a new institutional form. This transformation is not something to be suspicious of. There is no return here to institutions that subordinate what Paolo Virno calls the "pure potential" of labour-power to the conformist unity of "effective labour", "the people" or "the citizen". Institutions (coded formations) consist of practices and affects, techniques and sensations. Institutions emerge within the interplay between the plane of immanence and the plan of organisation. Within the co-operation common to surplus value's exploitation of labour-power resides the potential for new relations, new institutions, new socialities.

The organised network is a potentiality coextensive with the process of becoming instituted. Virtuosity, as the absence of an "extrinsic product" (Virno, 2004: 52), institutes the political potential of organised networks. The virtuosos' activity without an end product is at once ordinary and exceptional: ordinary in the sense that 'the affinity between a pianist and a waiter', as anticipated by Marx, comprises the common of wage labour insofar as 'the product is inseparable from the act of producing' (68); exceptional in the sense of the potential that subsists within performances with no end-product holds the capacity of individuation - of transformation of the common - into singularities with their own distinct universes of sensibility, logics of sensation, regimes of codification.

Virno suggests that the communicative performance of the multitudes constitutes 'the feasibility of a "non-representational democracy"' (2004: 79). Virno is elusive when it comes to developing that proposition. A non- or post-representational democracy is one that no longer operates within the constitutive framework of the nation-state and its associated institutions and civil society organisations. This is something Mouffe's (2000) "agonistic democracy" is not able to confront. While Mouffe correctly wishes to go beyond rational consensus, deliberative models of liberal democracy, her proposition that agonistic democracies negotiate the antagonisms that underpin sociality is nevertheless one that is predicated on the maintenance of the state as a modern complex of institutions. Mouffe has not made the passage into the post-Fordist state and its connection with capital's flexible modes of production and accumulation. The informatisation of social relations is nowhere to be found in Mouffe's thesis on agonistic democracy. As such, Mouffe is unable to describe the new modes of sociality, labour, and politics as they are organised within network societies and information economies. Even so, her notion of an agonistic democracy - like Virno's non-representational democracy - can be retained, but only, I would suggest, when they are recast in terms of what I call a "processual democracy".

=4first of all, the potential of processual democracies are underpinned by the informatisation of social relations. Franco "Bifo" Berardi's model of the Infosphere and the Psychosphere is a useful one to describe the complex settings within which new polities may emerge. Bifo's conception of the Infosphere as a technical, digital coding of data whose unilinear flows 'intermingle' with the unstable, recombinatory filter of the Psychosphere is, however, only partially right. The Infosphere is of course much more complex. Think of the uneven geography of information, the political economy of root servers and domain names, the competing interests surrounding Internet governance debates and policy making, etc. The Infosphere thus not only "intermingles" with the Psychosphere, it is inseparable from it: put it in different terms, the Real is always inscribed or present within the Symbolic as an antagonism or trauma. The Infosphere is shaped by background noise, which Serres defines as the 'absence of code'. Processuality - the relationship between coding and conditions of possibility - incorporates background noise as a constitutive outside.

Organised networks, as they subsist within the material and immaterial dimensions of new communications media such as the Internet, activate the possibility of processual democracy. Such a political formation de-ontologises the media of communication, creating media-information systems that are conditioned by the empirics, labour and affects of "trans-individual collectives" (Deleuze, 2004: 89). A processual democracy is one that unleashes the unforseen potential of affects as they resonate from the common of labour-power. A processual democracy is one that goes beyond the state-civil society relation. That relation is one that no longer

exists. Processual democracies necessarily involve institutions, since institutions function to organise social relations.

Processual democracies also continue to negotiate the ineradicability of antagonisms. Their difference lies in the affirmation of values that are internal to the formation of new socialities, new technics of relations. Certainly, they go beyond the limits of resistance and opposition - the primary activity of tactical media and the "anti-corporatisation" movements. This is not to dispense with tactics of resistance and opposition. Indeed, such activities have in many ways shaped the emergence of civil society values into the domain of supranational institutions and governance, as witnessed in the recent WSIS debates. A radical adaptation of the rules of the game is a helpful way of thinking the strategic dimension of processual democracies.

Ultimately, what is at stake is the ethico-aesthetic potential of the multitudes to engage with the antagonistic foundations of "the political". A processual democracy institutes a socio-technical network with the capacity to create conditions that sustain needs, interests and passions.

<nettime> limits of networks...

From: Kristoffer Gansing

To: nettime-l@kein.org

Date: Mon, 1 Jul 2019 16:24:35 +0200

Dear all,

Maybe I can take the opportunity to plug in to the running discussions by shamelessly plugging the announcement of the next transmediale festival which aims to deal exactly with the topics of networks, as it appeared here as a recurring common concern.
<https://2020.transmediale.de/festival-2020>

I think its quite interesting how the thread on nettime being in a bad shape and the one Rachel O'Dwyer started on net-art is converging around questions that have to do with how the limits of networks have become more tangible today, technically as well as in the form of "network idealism".

Molly Hankwitz wrote:

> The question comes up more and more - where is the whole idea of networks
> that was once? Answer: sorry, social media has everyone blissed out on
> their own screen.
>
> The great debates that enlivened networks of the 90s, have become muddled
> to the point that "networks" per se don't seem to carry much weight online

> effective in the current political and economic context?

I would not agree with David Garcia that these meta-discussions is a sign of the decline of nettime however, rather that the discussion of networked forms seems to be returning at the moment, maybe especially also on a list like nettime, because it seems as if it disappeared from the big "digitalisation" debates that are now anyway everywhere. (except for the breaking up of THE social network) Meanwhile, users are returning to smaller networked forms in the form of the fediverse or in other intimate constellations taking their cue from safe spaces and intersectional practices online, offline or rather in between. Maybe we need new ways of modeling networks also beyond the canonical Baran diagram of centralized, decentralized and distributed, along with nodocentric visualizations that have been so prevalent from the 1990's and basically up until today?

best,

Kristoffer

I don't usually comment, but the issue of networks vs social media is of personal interest. So much if the web is a commercialization of what were originally public, open spaces, now rendered as private property. A parallel could be drawn to the enclosure movement. What lurks in the background is the commercialization of human action and association, not just the "maker movement," but all of social relationships. This is the real issue, even surveillance/agnotogy is just symptomatic.

It's striking how these dynamics emerge, create responses and then commercially assimilate them. This valorization seems to me to be the structural driver that's cresting the current discontent.

Dear Kristoffer, et al,

Yes, you have hit on it for me...<Maybe weneed new ways of modeling networks also beyond the canonical Barand diagram of centralized, decentralized and distributed, along with nodocentric visualizations that have been so prevalent from the 1990's and basically up until today?> Very important - as it is not the tools per se or the platform, but now, possibly new contexts in which even tactical media or "community-based" networks occur, which utilize varied tools.

I have been doing both artistic/curatorial research and community-based work with non-profits around these overlaps. With waterwheel.net, a team of 30 curators programmer online performance and events for a week with 120 artists from all over the world. This project, the branchchild of Suzanne Fuks and James Cunningham, utilized popular online tools such as Skype and Facebook and email - along with a custom designed media archive and online performance space. Suzanne kept this network in close connection for 3 years. We integrated

our work remotely with the Balance/Unbalance festival at Arizona State. For me, this project about water and art was, in addition to the art, ingenious for a) it's utilization without apology of everyday social media b) it's capacity to connect in person and online via online performance space - for conferences/panels such that we all actually "saw" and "met" and heard each other. I am still connected to many of the artists I worked with!

Local "campaigns", for instance, for safe walking streets - from senior citizen groups - use Twitter, FB, etc and more to "network" —while neither art nor sophisticated, these campaigns do represent living communities with "interest in common" - condition of the old online communities AND, importantly, blur distinctions between virtual spaces and "real" spaces.

The latter point may seem crude, but it's possible that social networks such as these are an historical advancement on communities which put the network before the flesh meet, or never had a flesh meet and died OR never had the "real" profile pic at least to color and pepper the imagination.

I'm no fan of Facebook per se...but it's not FB alone, but a helpful feature of FB to have visuals...So talking theory...I throw this bone...with bandwidth depletion out of the way and compression technologies vastly superior, network practices have been able to better color-in their members...add more graphics...enrich and make robust vision of community. This may be an important development in network practice and one to assist radical practice...as well as a reason why we are occasionally depleted by text-only communication.

I will post later a link to Haraway interview where she talks about making networks now

Exciting that the next Transmediale will look at the re-emergence of discussions of "networked forms" which I suppose would include a reassessment of the sociological concept of the "network society" at the point when there is a strong movement away from the Castells' depiction of the net as a "universal space". This was always a vision that flew in the face of many highly situated socio/political movements for whom there is no such thing as any universal categories, principles, or experiences. Does recuperating "autonomous zones" and "safe spaces" of smaller networks represent effective resistance to the new technological formalism of big tech's computational social scientists? Or does it simply highlight the fact that the twin ideals of autonomy and participation that

were once seen as not only related but actually entailing one another have proved themselves to be all too frequently incommensurable as to be a participant is always to be enrolled in some kind of infrastructure?

<nettime> The Limits of Networking
From: Alexander Galloway
To: nettime-l@bbs.thing.net
Date: Wed, 24 Mar 2004 09:26:40 -0500

[This was originally posted to nettime-l on March 15, 2004, and is being resent due to a glitch in the web archive.]

THE LIMITS OF NETWORKING
A reply to Lovink and Schneider's "Notes on the State of Networking"

by Alexander Galloway and Eugene Thacker

The question we aim to explore here is: what is the principle of political organization or control that stitches a network together? Writers like Michael Hardt and Antonio Negri have helped answer this question in the socio-political sphere using the concept of "Empire." Like a network, Empire is not reducible to any single state power, nor does it follow an architecture of pyramidal hierarchy. Empire is fluid, flexible, dynamic, and far-reaching. In that sense, the concept of Empire helps us greatly to begin thinking about political organization in networks. But like Lovink and Schneider, we are concerned that no one has yet adequately answered this question for the technological sphere of bits and atoms.

To this end, the principle of political control we suggest is most helpful for thinking about technological networks is "protocol," a word derived from computer science but which resonates in the life sciences as well. Protocol abounds in techno-culture. It is a totalizing control apparatus that guides both the technical and political formation of computer networks, biological systems and other media. Put simply, protocols are all the conventional rules and standards that govern relationships within networks. Quite often these relationships come in the form of communication between two or more computers, but "relationships within networks" can also refer to purely biological processes as in the systemic phenomenon of gene expression. Thus by "networks" we want to refer to any system of interrelationality, whether biological or informatic, organic or inorganic, technical or natural—with the ultimate goal of undoing the polar restrictiveness of these pairings.

In computer networks, science professionals have, over the years, drafted hundreds of protocols to govern email, web pages, and so on, plus many other standards for technologies rarely seen by human eyes. The first protocols for computer networks were written in 1969 by Steve Crocker and others. If networks are the structures that connect people, then protocols are the rules that make sure the connections actually work.

Likewise, molecular biotechnology research frequently makes use of protocol to configure biological life as a network phenomenon, be it in gene expression networks, metabolic networks, or the circuitry of cell signaling pathways. In such instances, the biological and the informatic become increasingly enmeshed in hybrid systems that are more than biological: proprietary genome databases, DNA chips for medical diagnostics, and real-time detection systems for biowarfare agents. Protocol is twofold: it is both an apparatus that facilitates networks and also a logic that governs how things are done within that apparatus.

From the large technological discourse of white papers, memos, and manuals, we can derive some of the basic qualities of the apparatus of organization which we here call protocol:

+ protocol facilitates relationships between interconnected, but autonomous, entities;

+ protocol's virtues include robustness, contingency, interoperability, flexibility, and heterogeneity;

+ a goal of protocol is to accommodate everything, no matter what source or destination, no matter what originary definition or identity;

+ while protocol is universal, it is always achieved through negotiation (meaning that in the future protocol can and will be different).

+ protocol is a system for maintaining organization and control in networks:

We agree wholeheartedly with Lovink and Schneider's observation that "networks are the emerging form of organization of our time." And we agree that, due to this emerging form of organization, "networking has lost its mysterious and subversive character."

Yet they also note that, despite being the site of control and organization, networks are also the very medium of freedom, if only a provisional or piecemeal liberation. They write that networking is able "to free the user from the bonds of locality and identity." And later they describe networking as "a syncope of power."

In this sense, Lovink and Schneider posit power as the opposite of networking, as the force that restricts networking and thus restricts individual freedom:

"Power responds to the pressure of increasing mobility and communications of the multitudes with attempts to regulate them in the framework of traditional regimes that cannot be abandoned, but need to be reconfigured from scratch and recompiled against the networking paradigm: borders and property, labour and recreation, education and entertainment industries undergo radical transformations."

Our point of departure is this: Lovink and Schneider's "Info-Empire" should not be defined in terms of either corporate or state power, what they call "the corruption of state sovereignty." Instead it must be defined at the level of the medium itself. (Otherwise we are no longer talking about Info-Empire but about the more familiar topics of corporate greed, fascism, or what have you.) Informatic control is something different and thus it must be defined differently. It must be defined via the actual technologies of control that are contained within networks, not the content carried by those networks, or the intentionality of the people using them. This position resonates with the "media archaeology" approach mentioned in Lovink's recent nettime interview with Wolfgang Ernst. This is why we propose the basic principles of protocol above.

Networks are often seen to be advantageous in political struggles, for there is presumed to be something about the structure of networks that enables forms of resistance to take place against more centralized power structures. The characteristics of multiple sites of locality, many-to-many communications channels, and a self-organizing capacity (local actions, global results) are some of the aspects that are cited as part of the network structure. Indeed, analysis of computer virus attacks, distributed political protests, and other forms of what John Arquilla and David Ronfeldt call "netwar" all mention these aspects of networks.

But we find it curious that networks in this characterization are rarely contextualized—or rendered historical, archaeological. On the one hand, the centralized structure of "Empire" is assumed to emerge out of a long history of economically-driven imperialism and colonialism. On the other hand, the various "networks" which resist Empire seem to suddenly appear out of nowhere, despite the fact that the technologies which constitute these networks are themselves rooted in governmental, military, and commercial developments. We need only remind ourselves of the military backdrop of WWII mainframe computing and the Cold War context of ARPAnet, to suggest that networks are not ahistorical entities.

Thus, in many current political discussions, networks are seen as the new paradigm of social and political organization. The reason is that networks exhibit a set of properties that distinguishes them from more centralized power structures. These properties are often taken to be merely abstract, formal aspects of the network—which is itself characterized as a kind of meta-structure. We see this in "pop science" books discussing complexity and network science, as well as in the political discourse of "netwars" and so forth. What we end up with is a "metaphysics of networks". The network, then, appears as a universal signifier of political resistance, be it in Chiapas, Seattle, Geneva, or online. What we question is not the network concept itself, for, as a number of network examples show, they can indeed be effective modes of political struggle. What we do question is the undue and exclusive reliance on the metaphysics of the network, as if this ahistorical concept legitimizes itself merely by existing.

An engaged, political understanding of networks will not only pay attention to networks generally, but to networks specifically. If there are no networks in general, then there are also no general networks. (Marx: "If there is no production in general, then there is no general

production.") Networks can be engaged with at the general level, but they always need to be qualified—and we mean this in technical as well as socio-political terms. The discourse surrounding "Empire" has been very good at contextualizing globalization; it has not done so well at contextualizing "the movement," "the multitude," or "networks" (which are arguably, three different concepts).

Biological or computational, the network is always configured by its protocols. We stress this integrative approach because we cannot afford to view "information" naively as solely immaterial. Negri notes that "all politics is biopolitics," and to this, we would add that all networks are not only biopolitical but biotechnical networks. Protocological control in networks is as much about networks as "living networks" as it is about the materiality of informatics.

Thus we are quite interested in a understanding of political change within networks. What follows might be thought of as a series of challenges for "counterprotocological practice," designed for anyone wishing progressive change inside of biotechnical networks.

First, oppositional practices will have to focus not on a static map of one-to-one relationships, but a dynamic diagram of many-to-many relationships. This is a nearly insurmountable task. These practices will have to attend to many-to-many relationships without making the dangerous mistake of thinking that many-to-many means total or universal. There will be no universals for life. This means that the counterprotocols of current networks will be pliant and vigorous where existing protocols are flexible and robust. They will attend to the tensions and contradictions within such systems, such as the contradiction between rigid control implicit in network protocols and the liberal ideologies that underpin them. Counterprotocological practice will not avoid downtime. It will restart often.

The second point is about tactics. In reality, counterprotocological practice is not "counter" anything! Saying that politics is an act of "resistance" was never true, except for the most literal interpretation of conservatism. We must search-and-replace all occurrences of "resistance" with "impulsion" or perhaps "thrust." Thus the concept of resistance in politics should be superseded by the concept of hypertrophy. Resistance is a Clausewitzian mentality; the strategy of maneuvers teaches us instead that the best way to beat an enemy is to become a better enemy. One must push through to the other side, rather than drag one's heels. There are two directions for political change: resistance implies a desire for stasis or retrograde motion, but hypertrophy is the desire for pushing beyond. The goal is not to destroy technology in some neoluddite delusion, but to push technology into a hypertrophic state, further than it is meant to go. We must scale up, not unplug. Then, during the passage of technology into this injured, engorged, and ungarded condition, it will be sculpted anew into something better, something in closer agreement with the real wants and desires of its users.

The third point has to do with structure. Because networks are (technically) predicated on creating possible communications between nodes, oppositional practices will have to focus less on the characteristics of the nodes, and more on the quality of the interactions between nodes. In this sense the node-edge distinction will break down. Nodes will be constructed as a byproduct of the creation of edges, and edges will be a precondition for the inclusion of nodes in the network. Conveyances are key. From the oppositional perspective, nodes are nothing but dilated or relaxed edges, while edges are constricted, hyper-kinetic nodes. Nodes may be composed of clustering edges, while edges may be extended nodes.

Using various protocols as their operational standards, networks tend to combine large masses of different elements under a single umbrella. The fourth point we offer, then, deals with motion: counterprotocol practices can capitalize on the homogeneity found in networks to resonate far and wide with little effort. Again, the point is not to do away with standards or the process of standardization altogether, for there is no imaginary zone of non-standardization, no zero-place where there is a ghostly, pure flow of only edges. Protocological control works through inherent tensions, and as such, counterprotocol practices can be understood as tactical implementations and intensifications of protocological control.

+0100

Quoting Alex Galloway and Eugene Thacker:

> Protocol abounds in techno-culture. It is a totalizing control apparatus
> that guides both the technical and political formation of computer
> networks, biological systems and other media.

[...]

The problem with the word "protocol" seems to me that computer science has given it a meaning quite different from common English. Other examples are the words "transparent" (which is used in software design in practically opposite sense to common understanding, as a mapping of two or more different symbolic systems into a simulated one, like the "transparent" access of FTP servers directly in a desktop PC file manager), "code" (used not in the common sense of "codifying system", but as "codified symbols"), "interpretation" (understood in the C.S. as the formal execution/translation of an instruction at runtime, whereas in philosophy, literary studies and music interpretation it means non-formal translation of [un]structive or non-instructive signs), and so on.

What computer science and network engineering call "protocol" could just as well, or better perhaps, be named [a simple, formal] "language" because they simply serve the purpose that two connected entities can talk to each other. Yet another word, which you use yourself, is "standard". It is a virtue of the Internet that its standards are open and designed to be as agnostic to the information transported as possible; it seems to me that preserving this design (with DRM schemes, patents etc. on the horizon) is the issue rather than, as you at the end of the paper, pushing the protocols.

Of course it is right to say that "protocols", "standards", "languages" or whatever we call them are systems of control in the sense of what theoreticians such as Lacan and Foucault have called "symbolic order" or "discourse"; if this applies to common human language, it no doubt applies to formal languages as well. But in praxis, it boils down to the question how the standard is designed, i.e. how much freedom it allows and who controls it in which way; see Lawrence Lessig's analysis of the Internet vs. AOL.

But as with any play, consisting of a ruleset and its free execution, control is never total to the extent that it wouldn't permit freedom, a paradox best seen in Oulipo writing with its self-imposed formal restraints (like: writing a novel without a single occurrence of the letter "e", as Perec's "La Disparition"). Freedom and control thus are not mutually exclusive, but mutually dependent on each other. To envision communication systems without control - i.e. languages without rules, networks without protocols - and find them desirable, would be utterly an infantlist vision of a pre-language paradise. (And to read Freud, Lacan or Foucault in this way, would be no less naive.)

> Put simply, protocols are all the conventional rules and standards
> that govern relationships within networks.

Yes, but the reality is more complex because network protocols can be layered onto each other and thus used in quite unpredictable ways.

To stick with the example of the Internet, it would be false to assume that because http is a "hypertext transportation protocol", it would force everything under its "totalizing control apparatus" (to quote your paper) into hypertext format. - The counter-examples are abundant and well-known, but even topped by the fact that any imaginable network language can, with the right software tools, be steganographically tunnelled through http, just as you can subvert the "totalizing control system" English by using it merely as a cryptographical container for a text written, for example, in the cosmic Zaum language of futurist poet Velemir Chlebnikov - apart from the fact that you can still use it to write novels like Joyce's Ulysses, or in the case of http, web sites like www.jodi.org.

> We need only remind ourselves of the military
> backdrop of WWII mainframe computing and the Cold War context of ARPAnet,
> to suggest that networks are not ahistorical entities.

Yet the history is more complex as popular media history reductionism tells it. The Arpanet/Internet was funded by the military, but designed by academics - many of them with hippie backgrounds - who used the rhetoric of the "nuclear-strike resistance" to get the money for it. Today, you probably have to write something about "e-commerce opportunities in a globalized world" or "terrorist-proof network design" if you run a C.S. lab and want a grant for your work. (Or, if you do humanities research on

the subject, don't miss to write the word "interdisciplinary cultural research" into your application letter, at least here in Germany.)

> and so forth. What we end up with is a "metaphysics of networks". The

Agreed, for which to not a small extent Deleuze/Guattari and their popular perception must be blamed. An aspect of D/G where most clearly their indebtedness to vitalist philosophy [and hence right-wing philosophy] shines through. I wonder if that critique could be applied to the now-fashionable term "multitudes" (which I plainly [mis]read as a Deleuze-Guattarian update on the classical Marxist "masses") as well.

> Biological or computational, the network is always configured by its
> protocols. We stress this integrative approach because we cannot afford to
> view "information" naively as solely immaterial. Negri notes that "all
> politics is biopolitics," and to this, we would add that all networks are

> networks is as much about networks as "living networks" as it is about the
> materiality of informatics.

I may not quite grasp this argument, but it seems to me that here you fall into the trap of misreading the map for the territory, or the signifier for the signified, by reading the sloppy engineering terminology of "protocol" too seriously.

> Thus we are quite interested in a understanding of political change within
> networks. What follows might be thought of as a series of challenges for
> "counterprotocological practice," designed for anyone wishing progressive
> change inside of biotechnical networks.

While you later disclaim neo-luddite tendencies, "counterprotocological practice" is a term which almost screams for being misread as desire for pre-linguistic status quo.

> but to push technology into a hypertrophic state, further than it is meant
> to go. We must scale up, not unplug. Then, during the passage of
> technology into this injured, engorged, and unguarded condition, it will
> be sculpted anew into something better, something in closer agreement with
> the real wants and desires of its users.

This, in my view, reverberates a "media archeology" you might not have been aware of, that of language utopias since at least medieval kabbalism. But, to stay in the previous metaphor, should a French person who read Lacan and Foucault focus all her/his subversive energy on the Académie française?

I also note that your own push for a "counterprotocological practice" solely happens on the level of the signified, not the signifier - or, in other words: the transported data, not the transport protocols. Would you consider the grammar of the English language, the Latin alphabet encoded into ASCII whose bits then are distributed via the SMTP and POP3/imap protocols over TCP/IP to Nettime subscribers issues as well?

Alexander

Hi, I am glad this got posted again as it helps me get back to trying to put a line of thought together.

I have been trying to think through these two points you raise. They resonate with me in a way that doesn't seem to have been picked up in the discussion to date.

> The second point is about tactics. In reality, counterprotocological
> practice is not "counter" anything! Saying that politics is an act of

> the network. Conveyances are key. From the oppositional perspective,
> nodes are nothing but dilated or relaxed edges, while edges are
> constricted, hyper-kinetic nodes. Nodes may be composed of clustering
> edges, while edges may be extended nodes.

Both of these points to me seem to be building upon two ideas that I have been tossing around in relation to "the power of life" and the idea of "ease" that Agamben talks about in *he Coming Community*.

In your Protocol article from rethinking Marxism you quoted Deleuze quoting Foucault. ...

[1] power takes life as its aim or object, then resistance to power already puts itself on the side of life, and turns life against power.

...[2] Life becomes resistance to power when power takes life as its object ... [3] When power becomes bio-power resistance becomes the power of life, a vital power that cannot be confined within species, environment or the paths of a particular diagram"

Now I have been playing with this and with things that came out of difference and repetition for some time, trying to grapple with legal things and ways of re-imagining relationships and law. I started out thinking about this in respect of work I had done with Aboriginal artists in Australia and the way the courts accommodated "communal production" within the law of copyright using principles of equity.

Here is a snip from the paper I gave back then at UF (<http://openflows.org/%7Eauskadi/shapeoflaw.html>) which cited that part of Protocol:

To go back to Deleuze "If exchange is the criterion of generality, theft and gift are those of repetition. There is, therefore, an economic difference between the two".[46] Similarly, the idea of equity acts, in personem, on the conscience and conduct of people towards an end, where the concept of law acts in rem, on property, based upon rules. Thus there is an economic difference between a law that acts over property and an equitable idea that acts on the person's conscience. Equity's language, like repetitions, is also of gift and theft. Equity deals with gifts (fiduciaries, trusts, wills, intention) and with theft (undue influence, unconscionability, restitution and other breaches of equitable duties). It may be here that in their economic and quality and in their language, equity and repetition are most closely related. Equity can be said not to be about the concept of rules but about an idea, a behaviour. It not only looks to substance, over form it regards as done, what ought to have been done, thus one who seeks equity must come with clean hands, they must have done equity themselves to be entitled to equity's relief. It will not reward those that it regards as scoundrels, those lacking in conscience or virtue. Equity builds its body of law, its "artifact" and testament"[47] not through the creation of rules but through the idea of repeating behaviour over time. The singular repetition of equity is the "singular subject, the interiority and the heart of the other"[48], its "artifact" the "other is only the external envelope, the abstract effect"[49]

Now the problem with my equity argument here is that it can easily be read as saying lets just adopt this aspect of the positive legal system in our tactics some have seen it like that. But the more I have done my research on FLOSS, the GPL etc the more I have become convinced that like so many aspects of law today they exist within a state of exception. My rough thinking at the moment is that like the current state of international law or the way in which positive law treats indigenous

law the current state of intellectual property law in relation to software I think can also fairly be described as existing in such a "state of exception". On the constitutional side or that of "positive law" there exists a state whereby many of the modernists underpinnings of legal theory are up in the air. This explains why I think many of the U.S. legal academics (eg Lessig) and those within the open source movement (eg Moglen etc) have great difficulty in explaining why legal decision making by courts and governments is at odds with their understanding of the basis of the law. It also positions their inability to move out of this discourse and I think the failings of their approach. As I keep arguing what is important for law now appears to be its economic functionality and not modernist legal theory. On the other hand the main legal response by the free software movement, the GPL or General Public Licence itself seems to exist with this state of exception, that is it only has validity whilst it retains the appearance of the force of law. One point is that this seemingly discrete area of law in fact reflects (and could even be central, tied as it is to new forms of production, i.e. to immaterial labour) the broader state of exception and tendency toward imperial society. Another point and maybe more relevant here is that rather than "pushing through to the other side" the GPL etc remains within that side and in my view (as outlined in my recent article <http://openflows.org/~auskadi/foreigner.html>) risks being firmly entrenched on that side.

So I suppose my question is, or my observation is, that does one "push through to the other side" by adopting what (even though now you reject the term resistance - I can see why) you described or took as resistance before - "resistance becomes the power of life"? Secondly to focus "more on the quality of the interactions between nodes" raises with me (as I allude to above) what Agamben talked about when he discusses "ease". In line with the "the power of life" this quality of interaction seems to involve the "substituting (yourself) for someone else, that is, to be Christians in the place of others" (Agamben at 23).

Frankly what worries me with lots of our talk of new media, intellectual property, information etc etc is that in some ways they seem to reject the idea of the possibility of "separate" commons. That is that there is a call for "universals of communication" which in some ways are bland

and shallow attempts to claim to be pursuing forms of life or pushing through to the other side. After reading a fairly recent Negri piece on the commons (<http://mozambique.twiki.us/twiki/bin/view/Main/NegriAndVirmoOnTheCommons>) I felt a little heartened that maybe the commons of which we speak is not a universal commons a "free" (as in freedom) commons but one that requires us to treat others with "ease" and act with the "power of life".

Maybe what I am getting at here is that we are all pretty clear now that networks et al are the new way of doing things but the question is for what do those networks exist - over or of life? To continue just to laud networks and free information to me gets us nowhere (hence my fairly negative piece recently). But this question that I see in your piece seems to be in many ways a core issue. But we need to start to really grapple with how to act 'of life' how to act with "ease" without just repeating the mantras of freedom which really are pretty meaningless for me.

I hope somehow what I toying with is not lost in this muddle of thought.

Thanks

Martin

The Ghost in the Network

In discussing the difference between the living and the nonliving, Aristotle points to the phenomena of self-organized animation and motility as the key aspects of a living thing. For Aristotle the "form-giving Soul" enables inanimate matter to become a living organism. If life is animation, then animation is driven by a final cause. But the cause is internal to the organism, not imposed from without as with machines. Network science takes up this idea on the mathematical plane, so that geometry is the soul of the network. Network science proposes that heterogeneous network phenomena can be understood through the geometry of graph theory, the mathematics of dots and lines. An interesting outcome of this is that seemingly incongruous network phenomena can be grouped according to their similar geometries. For instance the networks of AIDS, terrorist groups, or the economy can be understood as having in common a particular pattern, a particular set of relations between dots (nodes) and lines (edges). A given topological pattern is what cultivates and sculpts information within networks. To in-form is thus to give shape to matter (via organization or self-organization) through the instantiation of form--a network hylomorphism.

But further, the actualized being of the living network is also defined in political terms. "No central node sits in the middle of the spider web, controlling and monitoring every link and node. There is no single node whose removal could break the web. A scale-free network is a web without a spider" [1]. Having-no-spider is an observation about predatory hierarchy, or the supposed lack thereof, and is therefore a deeply political observation. In order to make this unnerving jump--from math (graph theory), to technology (the Internet), to politics ("a web without a spider")--politics needs to be seen as following the necessary and "natural" laws of mathematics; that is, networks need to be understood as "an unavoidable consequence of their evolution" [2]. In network science, the "unavoidable consequence" of networks often resembles something like neoliberal democracy, but a democracy which naturally emerges according to the "power law" of decentralized networks. Like so, their fates are twisted together.

Rhetorics of Freedom

While tactically valuable in the fight against proprietary software, open source is ultimately flawed as a political program. Open source focuses on code in isolation. It fetishizes all the wrong things: language, originality, source, the past, status. To focus on inert, isolated code is to ignore code in its context, in its social relation, in its real experience, or actual dynamic relations with other code and other machines. Debugging never happens through reading the source code, only through running the program. Better than open source would be open runtime which would prize all the opposites: open articulation, open iterability, open practice, open becoming.

But this is also misleading and based in a rhetoric around the relative openness and closedness of a technological system. The rhetoric goes something like this: technological systems can either be closed or open. Closed systems are generally created by either commercial or state interests--courts regulate technology, companies control their proprietary technologies in the market place, and so on. Open systems, on the other hand, are generally associated with the public and with freedom and political transparency. Geert Lovink contrasts "closed systems based on profit through control and scarcity" with "open, innovative standards situated in the public domain" [3]. Later, in his elucidation of Castells, he writes of the opposite, a "freedom hardwired into code" [4]. This gets to the heart of the freedom rhetoric. If it's hardwired is it still freedom? Instead of guaranteeing freedom, the act of "hardwiring" suggests a limitation on freedom. And in fact that is precisely the case on the Internet where strict universal standards of communication have been rolled out more widely and more quickly than in any other medium throughout history. Lessig and many others rely heavily on this rhetoric of freedom.

We suggest that this opposition between closed and open is flawed. It unwittingly perpetuates one of today's most insidious political myths, that the state and capital are the two sole instigators of control. Instead of the open/closed opposition we suggest the pairing physical/social. The so-called open logics of control, those associated with (non proprietary) computer code or with the Internet protocols, operate primarily using a physical model of control. For example, protocols interact with each other by physically altering and amending lower protocological objects (IP prefixes its header onto a TCP data object, which prefixes its header onto an HTTP object, and so on). But on the other hand, the so-called closed logics of state and commercial control operate primarily using a social model of control. For example, Microsoft's commercial prowess is renewed via the social activity of market exchange. Or, using another example, Digital Rights Management licenses establish a social relationship between producers and consumers, a social relationship backed up by specific legal realities (DMCA). Viewed in this way, we find it self evident that physical control (i.e. protocol) is equally powerful if not more so than social control. Thus, we hope to show that if the topic at hand is one of control, then the monikers of "open" and "closed" simply further confuse the issue. Instead we would like to speak in terms of "alternatives of control" whereby the controlling logic of both "open" and "closed" systems is brought out into the light of day.

Political Animals

Aristotle's famous formulation of "man as a political animal" takes on new meanings in light of contemporary studies of biological self-organization. For Aristotle, the human being was first a living being, with the additional capacity for political being. In this sense, biology becomes the presupposition for politics, just as the human being's animal being serves as the basis for its political being. But not all animals are alike. Deleuze distinguishes three types of animals: domestic pets (Freudian, anthropomorphized Wolf-Man), animals in nature (the isolated species, the lone wolf), and packs (multiplicities). It is this last type of animal--the pack--which provides the most direct counter-point to Aristotle's formulation, and which leads us to pose a question: If the human being is a political animal, are there also animal politics? Ethnologists and entymologists would think so. The ant colony and insect swarm has long been used in science fiction and horror as the metaphor for the opposite of Western, liberal democracies. Even the language used in biology still retains the remnants of sovereignty: the queen bee, the drone. What, then, do we make of theories of biocomplexity and swarm intelligence, which suggest that there is no "queen" but only a set of localized interactions which self-organize into a whole swarm or colony? Is the "multitude" a type of animal multiplicity? Such probes seem to suggest that Aristotle based his formulation on the wrong kinds of animals. "You can't be one wolf," of course. "You're always eight or nine, six or seven" [5].

Ad Hoc

Unplug from the grid. Plug into your friends. Adhocracy will rule.

Autonomy and security will only happen when telecommunications operate around ad hoc networking. Syndicate yourself to the locality.

I wasn't sure until the end if these guys were on Aristotle's side or not. But their resounding call to "stop the world, I want to get off" makes it clear that they share his reactionary conservatism. It is worth recalling that the great philosopher was tutor to the leader of those Macedonian thugs who finally pulled the plug on the first millennium BC's drive towards urban commercial civilisation and was the godfather of catholic apologists for the military agrarian complex like Aquinas. European socialism has long been in thrall to their anti-market ideology and this repudiation of an open source approach to network society is no different.

Incidentally, graph theory has been pronounced out-of-date by the sources they cite -- for its assumptions of stasis, randomness and atomism which can't make sense of network growth with preferences.

I think this equation of "protocol = control", which is also the core of Galloway's stimulating book [1], is fundamentally flawed, because it mixes terms in ways that is not helpful to a critical political analysis.

A protocol, technical or social, is a series of standards which regulate how different entities can interact without the establishment of a formal hierarchy. Remember, the term originated in the context of exchanges between the king and foreign diplomats. The key about this relationship was that the diplomats were not the king's subjects, yet the diplomats were the equal to the king. They were different. The purpose of a protocol was to allow them to interact without the establishment of a formal hierarchy.

To argue that the protocol now, somehow, controlled the king and the diplomats seems strange. The same problem occurs when arguing that the Internet Protocol is somehow the ultimate controlling mechanism of the Internet. The fact that communication takes place within certain constraints, which enable communication in the first place, does not equate control. Rather, constraints on one level (the protocol of communication) can provide the grounds for freedom on another level (content of communication). This is social theory 101.

The whole argument of protocol = control seems to rest on a somewhat unimaginative reading of Foucault's micro physics of power, in which he argued that language itself is a main source of power and that the establishment of categories (e.g. madness) was itself a supreme act of power. To transfer this one-on-one to protocols of communication networks, yields yet another control fantasy (or nightmare, depending on your agenda). The only choice it leaves you is to jump into a some sort of 'pre-social' state. And this is precisely what Galloway & Thacker offer us:

> Unplug from the grid. Plug into your friends. Adhocracy will rule.
> Autonomy and security will only happen when telecommunications operate
> around ad hoc networking. Syndicate yourself to the locality.

What we have here is the 'social' vs. the 'technical', and the 'unplanned' vs. the 'planned'. Why this should lead to more freedom is dubious. Unless we understand freedom as absence of rules and control as presence of rules. This, however, is a very misleading understanding of these concepts, as has been argued often, not the least by in the feminist critique of the anti-authoritarian social movements of the late 1960s. [2] PS: I am not arguing that protocols cannot be used as mechanism of social control. Rather, this has to be established on a case-by-case basis, rather than pronouncing protocols as means of control per se.

RE: <nettime> The Ghost in the Network

From: Dirk Vekemans

To: nettime-l@bbs.thing.net

Date: Wed, 18 May 2005 13:57:33 +0200

I am new to this list, please forgive my ignorance and my clumsy wordings, i read this stimulating text by Galloway & Thacker on Rhizome (thanks to Geert). I wanted to respond, tried first on Rhizome, made a mailing mistake there, but i suppose this is the place to do so...

On the Ghost in network part, on the rhetoric of freedom in particular (I quote the authors first):

"Later, in his elucidation of Castells, he (=Lovink, dv) writes of the opposite, a 'freedom hardwired into code' [4]. This gets to the heart of the freedom rhetoric. If it's hardwired is it still freedom? Instead of guaranteeing freedom, the act of 'hardwiring' suggests a limitation on freedom. And in fact that is precisely the case on the Internet where strict universal standards of communication have been rolled out more widely and more quickly than in any other medium throughout history. Lessig and many others rely heavily on this rhetoric of freedom."

As with any rhetoric, this may be beside the point, and therefore pointing towards it: regardless of the how's why's of software development, regardless of its supposedly 'open' or 'closedness', all software i know has too much artificiality 'hardwired' into it, not because it efficiently reflects a mechanic ontology and because therefore it is too much of a machine to deal with organic processes, but because it isn't machinic enough (cfr. Deleuze on Leibniz' critique of Descartes, Le Pli, p12) : we are now noticing matter-shape interactions on macro levels (supra human if you want, i hate these metaphores) such as the selforganisation of internet as well as on micro levels ('below' our field of perception, although that topology isn't sustainable either) that point towards a dissolution of that old dualism in favour of multiplicity and Deleuze's 'becoming'.

Matter unfolding into its shape and shape folding into its matter. Difference=absence=diffence.

In the self-inflicted urgency that is very much the essence of software development (we need better software faster to 'regain' control of a global process running wild, or at least to radically slow down some processes that lead to quasi immediate annihilation), we are perhaps too much focussed on the immediate results the object-oriented approach gives us. In doing so we have ***rightfully***, i do want to stress that, disregarded alternatives. Because we need results fast, ever faster. But in doing so, we are now in a stage where systems need to be developed to run systems to run systems to infinity: we are stuck in a hysteresis of developing cycles feeding itself with ever more need.

The 'solution' or escape route offered here ('Unplug from the grid.' 'Adhocracy will rule') is one that i have given considerable thought in the past but always rejected. I have seen beautiful artistic results come off it. I appreciate its inherent beauty, the arcadian attraction of it. But I do not like the defeatism that goes with it.

It is as much a solution as taking out your tent and go camping near the Rocky Mountains for the rest of your life. You cannot unplug from the grid, the grid is taking shape within you, within the micro-economics of your friendly circles, within the micro power balancing within the machine-you. It is not a malignant ghost. It has nothing to do with good or evil and certainly nothing to do with transcendence, although many religious organisations base their very worldly power on that interpretation. Mechanical machines will give us mechanical results, if left running by themselves, i don't see anything 'bad' or devilish there.

Machinical machines, on the other hand, in the Deleuzian sense of 'machine', would give us machinical results, and take the 'natural' flow of matter-shape (in)formation along with them into the technology that enables them.

I don't see anything 'good' or messianistic there either. It's just that everything i can observe points in that direction, i wouldn't presume to say anything like this with my limited knowledge if that weren't the case. Heck, I just noticed mr Sondheim's work deals with some of the questions i'm working on...

So somehow I believe alternatives can be developed into working information systems that could supplement and even unhinge our current critical condition. I'm making some very modest efforts towards that with what i know of programming and the semantical to ontological implications of poetry.

Before today, i didn't see where these things were being researched, but i am entertaining hunches that process thought as expressed in the work of the Leibniz-Deleuze-Whitehead trail in ontology could find its reflection in working models of such alternatives and that our current practice of object-oriented programming should be subjected to a critical analysis, not because it's bad or malfunctioning, but because we need to understand how the shape of it turns to matter there. And these programmatic approaches didn't come into being all of a sudden, they built upon a dominant ontology themselves (as Philip E. Agre points out in The Practical Logic of Computer Work at <http://polaris.gseis.ucla.edu/pagre/practical.html>) and they are modelled after them.

So we need to know how the transcoding process that Lev Manovich explains in his 'The Language of New Media', the way how our daily interaction with computer (networks) influences our strains of thoughts on every level, how that really works, how it affects us and more importantly, how we could affect it.

I think IT matters, if you want a slogan. Or computers need sex, if you want a provocative one. And i think a lot of people should be doing this kind of research, not just some halfwit poet from kessel-lo without any resources, although of course i know a thing or two about how poetry works and how semantical processes at work there could be correlated to basic concepts in programming like recursive definition and garbage collection to name a few directions my own wreckage is floating in. I'm happy to notice some people are doing it here and with much more of the expertise required to do so. One would need to take another go at AI from the point before it went pragmatism, disassemble that and start rebuilding on, why not, a better phenomenology of analogic/discrete (referring to mr Sondheim's last post) although my guess is you do _not_ need to actually 'solve' any deep ontological and epistemological issues to get anywhere: if you allow the process of machine-building sufficient 'air-space' the 'text' will write itself, much like a poem goes ding-dong when it has finished being written and starts writing itself into reality. It is a process that dissolves time and space altogether, in a way, anyone who's had the experience will testify to a sense of timelessness while writing/being ridden by and waking up afterwards without any memory of the actual writing. There's nothing mystical/romantic/visionary involved there, i think, it's just nature having its way. Very deterministic in the end, i'm afraid, inasmuch as that freedom is, epistemologically, a rather irrelevant question, only of (ab)use in rhetorical games of power after the fact, post-mortem if you want and mostly going on in equal bad taste as asking how it was after having intimate sex. Anyway, i've noticed programming doing the very same chemistry in my cranky brain...

In a modest way i am steering my shaky Cathedral of erotic Misery, a net arty project at <http://www.vilt.net/nkdee> towards these goals. Just please don't ask me how i propose to realize such alternatives, i'm just in the middle of trying to formulate some notes that could lead towards a possibly workable hypothesis in the best of scientific tradition, eventually. Anyone is invited to join in the process of theory building, although at this stage for the actual authoring stuff, i hang on to a very male and as yet tyrannical core authoring process, collaboration is nice but impossible when there's nothing to collaborate on...

Very theoretically it could lead to results, following it's own recursively defined flow or growth. Notes towards a supreme fiction, if you want Wallace Stevens in the game, although his poetry unfolds far beyond his ontology.

greetings,
dv

Yes, I agree. The static graph of the network map is what leads, via the dynamic figure of the swarm, to a certain kind of complexity theory as a possible way to understand emergent behavior in the real world.

On the one hand, the use of social network analysis tools is giving us pictures of very complicated interlinkages between individuals and groups. These pictures are quite simply fascinating, because they aggregate lots of data and allow one to glimpse patterns, or at least, the possibility of patterns, of regularities. But the maps are not enough. One needs an understanding of the quality of the links themselves, of what encourages a group to cooperate even when its membership is atomized and dispersed in space. Older sociological and anthropological studies tell a lot about how institutions organize a group (church, firm, disciplinary organization, etc) and they also tell a great deal about how family structures and status hierarchies organize people in stable localities. However, when the grip of institutions and of place-bound hierarchies declines, as is happening today, and when society largely becomes a matter of dispersions of mobile individuals in anonymous spaces - the big city; the world; the telecommunicational space - the only behavior that has really been understood very well is market behavior. We know A LOT (too much I would even say) about how price signals serve to structure the economic behavior of dispersed and mobile individuals, who are always portrayed as rationally calculating in order to maximize their accumulation strategies (this is called "methodological individualism"). But is individual economic behavior the only kind that can be witnessed in the world today? Obviously not! Or let us say, rather, that within the space of very weakly determined social relations constituted by the market and price signals - the space of what the network sociologist Mark Granovetter famously called "weak ties" - other subsets or relational forms have started to appear.

This is where the questions asked by complexity theory become so interesting and timely. What gives form and pattern to emergent behavior? How can we understand the internal consistency of self-organized groups and networks? The first answer seemed to be offered by the figure of the swarm. The word "swarming" describes a pattern of self-organization in real time, which seems to arise out of nowhere (or to be emergent) and yet which is recognizable, because it repeats in a more or less rhythmic way. Swarming is an initial image of self-organization. It is basically a pattern of attack, and here it's worth recalling the classic definition given by the military theorists Arquila and Ronfeldt in their book on "The Zapatista 'Social Netwar' in Mexico": "Swarming occurs when the dispersed units of a network of small (and perhaps some large) forces converge on a target from multiple directions. The overall aim is sustainable pulsing--swarm networks must be able to coalesce rapidly and stealthily on a target, then disperse and redispense, immediately ready to recombine for a new pulse."

What the observation and description of swarming has done is to give us a temporal image of emergent activity, decisively adding a dynamic aspect which was absent from the static network maps. This is very suggestive for anyone looking to understand the kinds of behavior that seem to be associated with networks, and indeed, with a "networked society." But does the dynamic image of swarming really tell us how self-organization occurs? No, I don't think so. The proof is that the American and Israeli military theorists have made dynamic models of what they see as the swarm tactic, and they now claim to use it as what they call a doctrine (see, for this, the important and sobering text by Eyal Weizman, "Walking through Walls," published in the current issue of *Radical Philosophy*). However, I do not believe that the military can engage in anything approximating

self-organization, where individuals spontaneously coordinate their actions with others. This is antithetical to its hierarchical structure of command. Again, the "picture" can be misleading, even when it is a dynamic one. What is interesting, and perhaps essential to understand, is the way individuals and small groups spontaneously coordinate their actions, without any orders. This is self-organization, this is emergent behavior. But from what "ecology" does it emerge - to use Albert's term?

I am beginning to think that there are two fundamental factors that help to explain the consistency of self-organized human activity. The first is the existence of a shared horizon - aesthetic, ethical, philosophical, and/or metaphysical - which is patiently and deliberately built up over time, and which gives the members of a group the capacity to recognize each other as existing within the same referential universe, even when they are dispersed and mobile. You can think of this as "making worlds." The second is the capacity for temporal coordination at a distance: the exchange among a dispersed group of information, but also of affect, about unique events that are continuously unfolding in specific locations. This exchange of information and affect then becomes a set of constantly changing, constantly reinterpreted clues about how to act in the shared world. The flow aspect of the exchange means that the group is constantly evolving, and it is in this sense that it is an "ecology," a set of complex and changing inter-relations; but this dynamic ecology has consistency and durability, it becomes recognizable and distinctive within the larger environment of the earth and its populations, because of the shared horizon that links the participants together in what appears as a world (or indeed as a cosmos, when metaphysical or religious beliefs are at work).

Maurizio Lazzarato set me off on this line of thinking, with an article that we published in issue 15 of *Multitudes* and for which I suggested this title (just excerpted from important phrases in his text): "Creating Worlds: Contemporary capitalism and aesthetic 'wars.'" (Since then, all that work has been published in French under the title "Les révolutions du capitalisme," and bits have appeared in English all over the net.) Lazzarato pursues the Deleuzian concept of "modulation" to show how corporations strive to create worlds of aesthetic perception and affect for their producers and consumers, in order to bind them together into some semblance of coordinated communities under the dispersed conditions of contemporary life. They do so via the media, which create aesthetic environments that are internalized within us in the form of recurring "refrains," or rhythmically recurring memories of a sounds, colors, words, etc. Lazzarato shows how these worlds, even in their difference and plurality (Coca-Cola, Nike, Microsoft, Macintosh...) conform to a "majority model" which is precisely that of capitalist production and consumption as structured by the bureaucratic state apparatuses and the transnational institutions that have formed between them. Nonetheless, the important thing to note is that in hyperindividualized societies, even these normalized forms of behavior are no longer directly shaped by institutional structures. Instead, there are multiple efforts and veritable aesthetic battle to create and maintain the referential universes within which choices are constantly made.

But this creation of worlds is not only done by corporations, and not only at the degree of simplicity and sterility that examples from the commercial realm inevitably suggest. To describe the specific contents out of which richer and vaster worlds of meaning are made, and to detail the effects of the specific tools and procedures that make it possible to continuously transform them and to coordinate actions within their horizons, are the tasks of a complexity theory which seeks to understand how groups organize their own behavior, when they are no longer decisively influenced by traditional institutions. Bateson pointed the way to this possibility of a cybernetic understanding, an understanding of feedback processes, with his "Steps to an Ecology of Mind." Guattari tried to create even more dynamic models of such human ecologies, particularly in his great and strange book "Cartographies schizoanalytiques." These are still probably the most important references for the art of composing mutable worlds, where the goal of the participants is to carry out continuous transformation of the very parameters and coordinates on which their interactions are based (this is also understood as 3rd-order cybernetics,

where the system produces not just new information, but new categories of information). Today, however, it is the sociologist Karin Knorr Cetina (thanks, by the way, to the several people who sent me her recent article!) who has expressed all this most clearly and in the most mainstream language, which can't just be ignored or tossed off as the work of a kook. Her ideas bring us back to networks and their concrete operations, with the concept of 'global microstructures.' As she writes in "Complex Global Microstructures":

"Modern, industrial society created 'complex' forms of organizations that managed uncertainty and task fulfillment through interiorized systems of control and expertise. But complexity was institutional complexity; it meant sophisticated multi-level mechanisms of coordination, authority and compensation that assured orderly functioning and performance. A global society leans towards a different form of complexity; one emanating from more microstructural arrangements and the rise of mechanisms of coordination akin to those found in interaction systems... The basic intuition that motivates the concept of a global microstructure is that genuinely global forms, by which I mean fields of practice that link up and stretch across all time zones (or have the potential to do so), need not imply further expansions of social institutional complexity. In fact, they may become feasible only if they avoid complex institutional structures. Global financial markets for example, where microstructures have been found, simply outrun the capacity of such structures. These markets are too fast, and change too quickly to be 'contained' by institutional orders. Global systems based on microstructural principles do not exhibit institutional complexity but rather the asymmetries, unpredictabilities and playfulness of complex (and dispersed) interaction patterns; a complexity that results, in John Urry's terms, from a situation where order is not the outcome of purified social processes and is always intertwined with chaos. More concretely, these systems manifest an observational and temporal dynamics that is fundamental to their connectivity, auto-affective principles of self-motivation, forms of 'outsourcing', and principles of content that substitute for the principles and mechanisms of the modern, complex organization."

Knorr Cetina stresses the creation of shared horizons in much the way that I described it above, focusing for this particular article on the religious horizon of a shared orientation to "transcendent time" (eschatology). As in previous articles on the microstructures of global finance, she also shows how networked ITCs allow participants of the microstructure to see and recognize each other, and to achieve cohesion by coordinating with each other in time, observing and commenting on the same events, even though the microstructure is very dispersed and not all the participants or even a majority of them are necessarily living anywhere near the particular event in question at any given moment. Cetina very suggestively reinterprets the usual idea of networks as a system of pipes conveying contents, to insist instead on the visual or scopical aspect of contemporary ICTs: from "pipes" to "scopes." Information is important for coordinating action; but it is the image that maintains the shared horizon and insists on the urgency of action within it (especially through what Barthes called the "punctum": the part that sticks out from the general dull flatness of the image and affectively touches you).

To understand how all this works, one essential thing is to realize that it is different in each case: the "ecologies" are very different, depending on the coordinates or parameters that give rise to the particular microstructure. For one example, take the case of the open-source software movement. One the one hand you have a shared ethical horizon which is constituted by texts and exemplary projects: Stallman's declarations and the example of the GNU project; Torvald's work; the General Public License itself and all the principles it is based on, particularly the indication of authorship (permitting recognition for one's efforts) and the openness of the resulting code (permitting widespread cooperation); as well as essays like *The Hacker Ethic*; projects like Creative Commons; the relation of all that to older ideals of public science; etc. Then on the other hand you have concrete modes of coordination via the Internet: Sourceforge and the innumerable forums devoted to each free software project (which I've been getting to know as I

struggle with my Ubuntu distro, ha ha!). The whole thing has as little institutional complexity as possible (nobody is really compelled to do anything in any particular way), but instead is a situation full of self-motivation and auto-affectation between dispersed members of a nonetheless very recognizable network, coordinated temporally around the development of specific projects, where order is obviously intertwined with chaos! And clearly, this particular global microstructure is influential in the world.

Another great example, though more diffuse and complex, is the development of the counter-globalization movements. Again you can see the shared horizons of social justice, ecological awareness, resistance to hierarchical power (of the state and corporations), with reference to a constellation of texts and a number of great mythical moments of exemplary events (Seattle, Genoa, Cancun, etc). Then you see the coordinating systems, including Internet channels (indymedia, a myriad of web sites and mailing lists), but also forums and meetings (Zapatista encuentros; PGA meetings; counter-summits; social forums; activist campaigns). Even more clearly than the open-source projects, the counter-globalization movements are a universe of universes: the entire set of movements tries to distinguish itself from so-called "capitalist globalization", while a myriad of other, more specific horizons are established and maintained within that larger distinction.

Both the open-source software movements and the counter-globalization movements have been capable of swarming behaviors. Indeed, the very idea of swarming arose from the particular form of solidarity between international NGOs and the Zapatists. In terms of open-source, one can consider all the peer-to-peer projects that emerged after the illegalization of Napster as successive swarm attacks on the content-provider industries. There is that classic pattern of converging, striking (in this case by producing new content-sharing programs), then disengaging, only to converge again at a different point (a new program, perhaps for video-sharing like Bit Torrent, or a hack of a DRM system, etc). Of course, different individuals are involved each time, different groups, differences of philosophy and mode of action; but a shared horizon makes all those differences also recognizable as somehow belonging together. This is the complexity of self-organization. You would again see such processes in action if you traced the history of the Mayday processes around flexible labor. But it is clear that by looking at these things in "ecological" terms you get a much richer picture, which is not limited to the visible dynamics of swarming.

Now, I think these tendencies toward the emergence of global microstructures in a weakened institutional environment have been going on for decades. But it is clear that a turning-point was reached when one microstructure with a particularly strong religious horizon and a particularly well-developed relational and operational toolkit - Al Qaeda - was able to strike at the centers of capital accumulation and military power in the US (WTC and Pentagon). Suddenly, the capacity of networks to operate globally, independently and unpredictably, began to appear as a crisis affecting the deep structures of social power. At that point, the figure of the swarm rushed to the forefront of all the military discussions; and in a broader way, the question of whether complexity theory could really predict the emergent behavior of self-organizing networks became a kind of priority in social science. Knorr Cetina's article on microstructures is subtitled "The New Terrorist Societies," and it is about Al Qaeda (though her earlier work on microstructures is about currency-trading markets). But at the same time as the interest in swarming and complexity theory moved to the forefront of official social science, one gradually became aware (I did anyway) that all over the world, serious attempts were underway to "overcode" and stabilize the dangerously mobile relational forms that had been unleashed by the generalization of the market and its weak ties.

On the one hand there is an attempt to enforce the rules of the neoliberal world market by military force, and thus to complete an Imperial project which has now shown itself to be clearly Anglo-American in origin and in aims. This attempt is most clear in the book "The Pentagon's New Map" by Thomas Barnett, where he explains that the goal of American military policy must be to identify the "gaps" in

the world network of finance and trade, and to "close the gap," by force if necessary. The thesis (on which the Iraq invasion was partially based) is that only a continuous extension of the world market and of its deterritorializing technologies can bring peace and prosperity, rooting out the atavistic religious beliefs on which terrorism feeds, and in the process, rationalizing the access to the resources that the capitalist world system needs to go on producing "growth for everyone."

On the other hand, however, what we see in response to this extension of the world are market are regressions to sovereignist or neofascist forms of nationalism, and perhaps more significantly, attempts to configure great continental economic blocs where the instability and relative chaos of market relations could be submitted to some institutional control. These attempts can also be conceived as "counter-movements" in Karl Polanyi's sense: responses to the atomization of societies and the destruction of institutions brought about by the unfettered operations of a supposedly self-regulating market. They can be listed: NAFTA itself; the European Union, which has created its own currency; ASEAN+3, which represents East Asia's so-far abortive attempt to put together a stabilized monetary bloc offering protection from the financial crises continuously unleashed by neoliberalism; the Venezuelan project of "ALBA," which is raising the issue of possible industrial cooperation programs for a left-leaning Latin America; and of course, the "New Caliphate" in the Middle East, which is being proposed by Al-Qaeda and the other Salafi jihad movements. Perhaps people with more knowledge than I could talk about what is happening on this level in the Russian confederation, on the Indian subcontinent and in Africa.

I think that in years to come, everyone will increasingly have to take a position with respect both to the Imperial project of a world market, and to the regressive nationalisms and the more complex processes of bloc formation. All these things are contradictory with each other and their contradictions are at the source of the conflicts in the world today. In this respect, Guattari's perception, at the close of the 1980s in "Cartographies schizoanalytiques," has proved prophetic:

"From time immemorial, and in all its historical guises, the capitalist drive has always combined two fundamental components: the first, which I call deterritorialization, has to do with the destruction of social territories, collective identities, and systems of traditional values; the second, which I call the movement of reterritorialization, has to do with the recomposition, even by the most artificial means, of individuated frameworks of personhood, structures of power, and models of submission which are, if not formally similar to those the drive has destroyed, at least homothetical from a functional perspective. As the deterritorializing revolutions, tied to the development of science, technology, and the arts, sweep everything aside before them, a compulsion toward subjective reterritorialization also emerges. And this antagonism is heightened even more with the phenomenal growth of the communications and computer fields, to the point where the latter concentrate their deterritorializing effects on such human faculties as memory, perception, understanding, imagination, etc. In this way, a certain formula of anthropological functioning, a certain ancestral model of humanity, is expropriated at its very heart. And I think that it is as a result of an incapacity to adequately confront this phenomenal mutation that collective subjectivity has abandoned itself to the absurd wave of conservatism that we are presently witnessing."*

The question that complexity theory allows us to ask is this: How do we organize ourselves for a viable response to the double violence of capitalist deterritorialization and the nationalist or identitarian reterritorialization to which it inevitably gives rise? It must be understood that this dilemma does not take the form of Christianity versus Islam, America versus the Middle East, Bush versus Bin Laden. Rather it arises at the "very heart" of the modern project, where human potential is "expropriated." Since September 11, the USA - and tendentially, the entire so-called "Western world" - has at once exacerbated the abstract, hyperindividualizing dynamics of capitalist globalization, and at the same time, has reinvented the most archaic figures of identitarian power (Guantanamo, fortress

Europe, the dichotomy of sovereign majesty and bare life). Guattari speaks of a capitalist "drive" to deterritorialization, and of a "compulsion" to reterritorialization. What this means is that neither polarity is inherently positive or negative; rather, both are twisted into the violent and oppressive forms that we now see developing at such a terrifying and depressing pace. The ultimate effect is to render the promise of a world without borders strange, cold and even murderous, while at the same time precipitating a crisis, decay and regression of national institutions, which appear increasingly incapable of contributing to equality or the respect for difference.

So the question that arises is whether one can consciously participate in the improvisational, asymmetrical and partially chaotic force of global microstructures, making use of their relative autonomy from institutional norms as a way to influence a more positive reterritorialization, a more healthy and dynamic equilibrium, a better coexistence with the movement of technological development and global unification? The question is not farfetched, it is not a mere intellectual abstraction. Knorr Cetina's strong point is that global unification cannot occur through institutional process, because it is too complex to be managed in that way; instead, the leading edge is taken by lighter, faster, less predictable microstructures. Clearly, nothing guarantees that these are going to be beneficial. The forms that they will take remain open, they depend on the people who invent them. In his recent book, Lazzarato writes:

"The activist is not someone who becomes the brains of the movement, who sums up its force, anticipates its choices, draws his or her legitimacy from a capacity to read and interpret the evolution of power, but instead, the activist is simply someone who introduces a discontinuity in what exists. She creates a bifurcation in the flow of words, of desires, of images, to put them at the service of the multiplicity's power of articulation; she links the singular situations together, without placing herself at a superior and totalizing point of view. She is an experimenter."

The close of the book makes clear, however, that what should be sought is not just a joyous escape into the unpredictable. The point of this experimentation is to find articulations [agencements, which might also be translated as microstructures] that can oppose the literally death-dealing powers of the present society, and offer alternatives in their place. My guess is that in most cases, this can happen not at the local level of withdrawal (though that may be fertile), nor at the level of national institutions and debates (though these will be essential for holding off the worst), but most likely at the regional or continental level, particularly where the core economies overflow into their peripheries and vice-versa. This is the level where the most important policy is now being made, the level at which the major economic circuits are functioning and at which massive social injustice and ecological damage is happening all the time. What's really lacking are all kinds of border-crossing experiments, ways to subvert the macrostructures of inclusion/exclusion and to redraw the maps of coexistence. Ultimately, new kinds of institutions and new ways of relating to institutions will be needed, if there is to be any hope of stabilizing things and surviving the vast transition now underway. But we're not there yet, and it doesn't seem likely that any upcoming election will start the process. Instead it seems that much of the danger and the promise of the present moment can be found in the complex relations between network, swarm and microstructure. best, BH

Note

*I've altered the (relatively poor) translation of Guattari's text "Du post-modernisme à l'ère post-média," which is on pp. 53-61 of *Cartographies schizoanalytiques*, and on pp. 109-13 of *The Guattari reader*, under the title "The Postmodern Impasse." The key phrase, "un certain modèle ancestral d'humanité qui se trouve ainsi exproprié au cœur de lui-même," becomes "is appropriated from the inside"! The reverse of the original! No wonder people think Guattari is so hard to read...

Wow! What an essay. It took me two days just to read it, and I think I'll have to read it a few more times.

For the time being, I'll stick to half a paragraph, which is key in my view.

- > I am beginning to think that there are two fundamental
- > factors that help to explain the consistency of
- > self-organized human activity. The first is the existence of
- > a shared horizon - aesthetic, ethical, philosophical, and/or
- > metaphysical - which is patiently and deliberately built up
- > over time, and which gives the members of a group the
- > capacity to recognize each other as existing within the same
- > referential universe, even when they are dispersed and
- > mobile. You can think of this as "making worlds." The second
- > is the capacity for temporal coordination at a distance: the
- > exchange among a dispersed group of information, but also of
- > affect, about unique events that are continuously unfolding
- > in specific locations. This exchange of information and
- > affect then becomes a set of constantly changing, constantly
- > reinterpreted clues about how to act in the shared world.

All networks can be defined by their protocols, formal rules that set the terms of engagement of otherwise independent agents. Protocols enable interaction without a hierarchy. Indeed, the protocol creates the space of the possible (or, the shared horizon, to use Brian's term) and in order to participate in a network, actors have to adhere to the dominant protocols. Without a protocol, there is no network.

Now, networks have multiple dimensions, and on each of those protocols operate. Most readily distinguishable are technical and social protocols, even though there are obvious interrelations between them. Technical protocols are things like TCP/IP, Bittorrent, SMTP or others. Social protocols are styles of communication, shared assumptions and values, common projects etc.

Protocols are not fixed, they can be adapted, but since they are what makes a network a network, they are very hard to change from the inside. It's difficult to cooperatively transform the very condition of cooperation. Hence, it's often easier to create new networks, rather than transform old ones, particularly since there can be overlap between the two in terms of some agents agreeing on new protocols. Networks can fork, particularly if the resource of the network is digital information.

The reason why we are all speaking about networks now is that information and communication technology (ICT) has decisively affected balance between flexibility and coordination in social organizations. Until very recently, these two aspects stood in an inverse negative relationship to one another. As coordination increased, flexibility went down. Large projects (think of states, armies, major companies etc) tended to be highly structured in order to manage scale (the history of this development is analyzed in Alfred Chandler's classic 'The Visible Hand. The Managerial Revolution in American Business.'). This was, to a large degree, a function of their information processing. Vertically integrated hierarchies are relatively information-poor forms of organization. Thus they can handle large coordination tasks by passing around slips of paper with information printed on them, at the price of turning inflexible (an 'iron cage' as Max Weber saw it at the height of the bureaucratic model, 100 years ago).

ICTs are enabling (just enabling, not determining) people and organizations to handle much, much more information efficiently, hence they still can scale, but to not need to accept inflexibility as the trade-off. In other words, even large organizations, or, perhaps to be more precise, large projects undertaken by multiple entities, some as small as individuals, are now organized as networks (or at least face competition from networks).

This ability of multiple entities to undertake very large projects, loosely

coordinated, is what is fuelling the renaissance of notions such as "multitude" which aim to express this still hard-to-grasp combination flexibility (agents remain semi-autonomous) and coordination (they do something larger than themselves).

Such large scale networks, or large scale projects carried by multiple smaller networked organizations, are highly communicative, not just because their coordination requires lots of exchanges, but also their output is, to a large degree, communication as well (new cultural codes, new scientific discoveries and procedures, new management methods etc etc). Indeed, geographically dispersed networks are held together by nothing but communication. It provides their shared horizon.

When stressing the importance of communication, this should not be understood as somehow taking place on a different level than production. In fact, the activity of communication and production are more and more merging. The attempt to expand the proprietary logic of capitalist production into the shared space of social communication creates one of the fundamental tensions characteristic of informational societies.

In other words, in order to communicate and be productive, one has to join, by choice or coercion, a particular networks (or several, more likely), thus accept their protocols and have one's view of the world defined by a shared horizon. Only within the network, one has access to the resources of communication/production. Outside a network, there is nothing but isolation and inaction. Hence, Brian, wanting to use Ubuntu, has to join the Ubuntu community, and learn how to cope with its particular culture. There's no way around it.

Thus, as Brian writes, networks create their own world, by creating a unique array of resources enabling entities to become actors, that is, to communicate and produce. However, they do so on the basis of particular and specific protocols defining the particular character of the network's world.

The notion of a network's world is not metaphorical, but actual, even physical. For example, networks create their own geography of closeness and distance. They create their own physical environment (think airports, or radical community centers, etc.). They create their own time scale, defining the rhythms of interaction, and, more importantly, the temporal horizons which bind their actions. And in terms of making worlds, of creating your own coordinates of time and space, it goes any further than this. There is, literally, nothing behind it.

So much for now, Felix

Felix,

I'm really surprised you persist with the idea that networks (as protocols) are without hierarchies:

- >
- > All networks can be defined by their protocols. [...] Protocols enable
- > interaction without a hierarchy.
- > Because in that same first paragraph you contradict yourself:

- > in order to
- > participate in a network, actors have to adhere to the dominant

- > to join, by
- > choice or coercion, a particular networks (or several, more
- > likely), thus
- > accept their protocols and have one's view of the world defined by
- > a shared
- > horizon

adherence is another word for submission, and in the case of networks it's submission to social/technical protocols that is done willingly, although often with tensions of one kind or another (thus the politics of networks). Another way of understanding this is that in order to participate within a network, one must accept the prevailing hierarchies (modalities of governance/protocols). But this isn't to say that hierarchies can't be changed or shifted, only that they exist.

As a moderator of nettime, you know all too well the way in which hierarchies are played out.

So let's accept that hierarchies are essential to networks, and the question of governance is going nowhere for as long as we persist to speak of networks in terms of absolute horizontal relations (or in the case of communes example, spaces of consensus). That's simply incorrect, and your own text demonstrates that.

Ned

While I agree that new kinds of organisations have appeared in which protocols play a more important role than in the past, I think it would be a mistake to see them as alternatives to older structures, because in reality they depend completely on these older structures for their existence. Internet protocols can function because "states, armies, major companies, etc." control the land and the energy resources, produce the hardware, lay the cable, launch the satellites, and so on, on which the whole network relies. The same goes for airports. Thus networks don't "create their own physical environment"; they exist in an environment that traditional organisations allow them to use.

Similarly, the financial markets, so often cited as an example of spontaneous, self-structuring collective behaviour, depend on states to provide a reliable regulatory environment in which they can operate. More importantly, they are ultimately subject to the authority of those states' central banks. Since banks do business with central banks only at the latter's pleasure, the US government, for example, is fully capable of imposing practically any sort of regulations on the world's financial markets.

If anyone has proposed a theory explaining how a network could control territory through military power and take over the functions of the state, I'd like to hear about it.

A "network" as is being discussed can also be an element within otherwise hierarchal systems (and indeed as I wrote before you can think of hierarchies as themselves being just one type of network structure) but for this discussion consider the following.

- network relationships can (and indeed usually are) just ONE of the relationships that people (or organizations) are a part of. In other aspects of their life/business they may be in a more ordered relationship.

- the US military (and many other militaries I'm sure) is looking deeply at what they term "network centric warfare" - this is not just how to deal with an enemy that is organized loosely as a network, it is also a rethinking of many, perhaps most aspects of how the military works - especially in the battlefield - to function more like a network than a hierarchy. But it is important to recognize that this is all within a framework of a hierarchy.

See <http://www.mors.org/publications/phalanx/decoo/feature.htm> (John Gartska the author of this article spoke at MeshForum 2005 - I'll try to get his audio up online if I can)

Some of the most complex areas of research today into Networks is looking at how different networks (and even different types of networks) interrelate and interact. The markets example mentioned below is just one example, others are the interrelations of transportation systems and communications networks, or of people within organizations (which might be "networks" or structured as hierarchies) with other organizations such as cities, states, countries, political parties, religions in which they may also participate but which may have dramatically different structures.

Internet protocols function not because of military might but because the providers of the underlying tools have all agreed to build on top of a set of tools. The Internet, which is different than Internet Protocols, functions because a few set of key authorities are agreed to by many (ICANN, the main "root" dns servers, the underlying routing and DNS protocols). These are a mix of public and private effort. The pipes which much of the traffic now goes through are likewise a mix of public and private work - microwaves, fiber, cable, and some satellites.

In terms of the question "could a 'network' take over the functions of a state"? I think it would be important to be very clear what you mean by a "network" and to consider how (and if) you account changes in structures over time.

i.e. if by "network" you mean a structure where connections are diffuse, where there is no single node through which information/power has to flow - then no, such as system probably does not match up with the requirements of running a state of nearly any significant size - i.e. a system where at some point the cost of interactions between the nodes is vastly higher than the value of the decisions that need to be made, so they have to be able to be implemented quickly by some "authority"

But it also is a matter of much interpretation - if you think about current states - in many respects they are better represented by complex networks than by "simple" hierarchies - think about terms such as "spheres of influence" often used to describe the people in a given government. Or consider then multiplicity of authority in the US Government - the at least theoretical checks and balances between the parts of government and the many groups of people behind each part of the government (the cabinet of a President, their staff, the political parties). It is certainly very possible to look at network maps of all of these various people - to look at the formal and informal ties between them (family ties, financial ties, reporting authorities under the law, committees that they serve together on, the states they represent etc) and to from that build up a very complex web that shows how everyone is interconnected.

Very likely such a map or better yet series of maps over time would also

show differences between the theory (how the formal structures are laid out) and the practice, it likely would also show how there are a variety of types of ties and links between people - deciding what (and if) to represent would result in very different diagrams. These intersections could be highly revealing.

(for example in the US government you could look at mapping out formal ties to political parties - for most politicians this would be easy, for many of the people who serve under them via political appointments it would also be relatively easy, but for many public officials and some people such as some Judges, this might be much trickier) And the resulting map might need to be supplemented with other overlays - such as geographical ties, religious ties, voting patterns, common service/employment/school ties - all of which might show other groupings and structures - even across "party" lines.

The point is that networks are both vital and very complex - it is an overloaded term - with too many meanings.

That is also precisely my own interest in the area - this multiplicity of meanings and perspectives, the bringing together of people across very different backgrounds is an area of thought that is vital to many different fields - from politics to economics to technology - and each field that thinks about and works with (and within) networks can and does offer unique insights and perspectives.

First, networks and hierarchies are different modes of organization. The fact that real-life organizations tend to be hybrids of various sorts does not mean that these modes are not distinguishable on the basis of their differences. It just means that they can be combined. The fact that there are endless shades of grey also does not mean that black and white are the same.

Second, adherence to a protocol is not the same as submission under a hierarchy. One of the origins of the term protocol is in diplomacy and it designated the rules that govern the interaction between the sovereign, say a king, and the foreign diplomats stationed at his court. The reason why a protocol was necessary was, and still is, precisely because the foreign

diplomats were, and are, not subjects of the king. In fact, they were outside the hierarchy, independent of the king. Hence, they needed a set of rules that governed their interaction. The king could not simply impose his rules.

When we speak about social protocols, it's comparable. We write here in English. One can say that the grammar is the protocol of language. In order to be able to have a conversation here, I must adhere to the conventions of English grammar, a foreign language. But must I submit to the conventions of grammar? And for this to be a hierarchical situation, who, exactly, would be my superior. Is there someone who effectively regulates the English language? And who will punish me for my ESL mistakes?

Now, social protocols are often fuzzy, and some rules can be bent, but still, try arranging your words randomly, conversation will stop.

> As a moderator of nettime, you know all too well the way in which

Of course, but nobody ever said that nettime was a pure network. Indeed, there are those who think it's fast dictatorship.

> speak of networks in terms of absolute horizontal relations (or in
> the case of communes example, spaces of consensus). That's simply
> incorrect, and your own text demonstrates that.

Hierarchies are not essential to networks, even if they are often combined. There is a difference between a conceptual discussion of ideal types, and concrete analysis of empirical examples.

The fact that networks are not the space of absolute freedom (whatever that would be), but that there are rules that cannot be easily ignored, does not mean that it's a hierarchy. The fact that it's not a hierarchy, on the other hand, does not mean that there is no power in networks. It just operates differently. In hierarchies, power operates through coercion. In networks, it works through exclusion. These are different modes, and it helps to acknowledge such difference when we want to understand the particular character of novel combinations.

Some thoughts about power

Foucault conceived a mode of sovereign power, related to the functioning of law in the Middle Ages (transcendent power of life and death, power to banish); a mode of disciplinary power, related to the functioning of institutions from the 16th century onward (collective power to train, to correct, to reshape behavior at both sensory-motor and psychological levels); and a mode of liberal power, related to a capacity to evaluate the potential benefits, to oneself and/or the state, of circulations of all kinds (power to induce self-maximizing strategies that make behavior predictable and modifiable, without having to dictate it).

Finally, he also came somewhat reluctantly to admit and theorize the coexistence of all these forms of power, their hybridization in specific admixtures. An approach which has not been sufficiently developed imho.

I think the word "network" is a better descriptor of hardware and of protocols, than of forms of power (ie, regular and constraining patterns of social relations). A lot of confusion arises because of the desire to make one word, network, say much more than it can all alone.

I also happen to think (and this is where I do differ slightly from Felix) that the most common contemporary

networks, though not all networks of course, have very weak and open protocols. Not particularly binding, somewhat exclusive of course, but not intensely exclusive either. The Internet can convey words, images, sounds. You can do it all for free with pirated Microsoft bullshit that takes thirty seconds to learn. Similarly, you can put a lot of different things on a train, and you can say a lot of different things over a telephone. This is massively done all around the world by people with incredibly different motivations, entangled in very different sets of constraints, disciplines, hierarchies, systems of law and so on. You can convey a tremendous amount of cultural attitudes, behavioral cues, conceptual structures via the net, the train or the phone, all of which don't have practically anything to do with the specific protocols of those technologies. It would be sort of strange not to notice that important permeability of the most widespread networks, with the most basic protocols. However, the fact that these cultural attitudes etc. do pass through the net, and through Microsoft, or through the train and the SNCF, or the phone and Mobistar, does have its real importance too. The forms of power are reorganized by the ones that are dominant.

In the world today, the liberal form of power is dominant. It is articulated by money first of all. The telos of money is to circulate. Its circulation is calculable with statistical methods. People can be expected to follow the cues of that circulation, and institutional and control functions can be built which make that expectation into a self-fulfilling prophecy. All this has an incredible effect both on discipline and on one's experience of transcendence. But it doesn't get rid of the influence of inherited disciplines or symbolic divides between the holy and the base, the includable and the excludable.

What money with its telos of circulation does do, however, is elicit a very clear ethos of resistance among certain minorities, an ethos which can and has gone very far in erecting all kinds of incitements and constraints to keep you from acting for profit. And so we do, in reality and when we're lucky, have cooperative networks as well.

What's needed is to understand very precisely the large number of social dynamics that have reconfigured themselves, for better and worse, according to the last great deterritorializing expansion and multiplication of the circulation of money, which has been accompanied and facilitated, even decisively reshaped, by the implementation of hyperindividualizing electronic networks.

Study the expansion of the American currency (or financial techniques), accompanied by the Internet, comsats and TVs, and you will learn a lot about the dominant structures of power articulated by the underlying logic of liberalism. Study the expansion of the vertically integrated American corporation and you will learn a lot about what discipline means in the world today. Study the expansion of American military bases and you will learn a lot about what sovereign power means today. The word American recurs three times in the sentences above because the currently dominant ways of articulating all the three forms of power were invented there, from about 1890 onwards. But that doesn't cancel out deep and strange hybridizations of the type we see all the time, both between the three contemporary (ie dominant) forms, and between other kinds of power, sets of behaviors, concepts, values and world views, that have held historical sway elsewhere and at different times and that continue to reproduce themselves partially in circulating human beings.

The useful gain that could be made out of this conversation is to quit saying a network is this, a network is that. I definitely don't think you can specify networks to collaboration. Hierarchy can be conveyed perfectly by network technology; possessive individualism can express itself even better through network technology. However, if you start trying to talk about a specific set of values, goals, world visions and truth claims, and then you delineate the relation between those "worlds" and specific technical functions and logical protocols that enhance people capacity to act within them, then you can start to describe some of the great variety of microstructures that have proliferated over the past thirty years.

great to hear so many ideas on this subject!

I has been working a lot with power and powerstructures. Lived in an anarchist collective in the 80s and we studied our own structures, how we did take decisions, what kind of "social matrix" we developed, etc. We did a year long workshop with some French psychoanalitics adressng the issue of the power and how the power is reproduced. I don't know how many on the list are familiar with the work of Cornelius Castoriadis, one of Europes most important theories in the 50s, 60s and 70s, pivotal for the 68s movement in France. He was one of the founders of the magazine "Socialisme et Barbarie", <http://www.agorainternational.org/index.html>, where intellectuals as Jean Francois Lyotard wrote.

One of Castoriadis main work, "The Imaginary Institution of Society", coined the expression "imaginary structures of the society", the corpus of myths and "memes" where the knowledge and the shapes of a society is written, implemented and transmitted with the aim of reproducing itself. The reading of the Oedipus myth as a fundational myth is very relevant to understand how the state is reproduced in the nuclear family. Pierre Clastres, an anarchist anthropolog, spent many years living with the Guarani, a indigenous nation of several thousands individes, living maily in Brazil, Paraguay and Venezuela. The Guarani developed a very clever form of selfgestion based on rotatory chiefs and avoid any structure related to stateship or central administration.

Clastres book "Society Against the State" is a very interesting complement to Castoriadis work and show the pattern where the power and it's metaphors, state, patriarchy, god, act in the level of our subconscious and internalizes in us.

We reproduce a society based on values such as private property, nuclear family, heterosexual normativity, stateship, and we became the power's allies and complexes.

Without our cosent and complicity the power can't be exercised or reproduced.

Recently, I have been very interested in this question. Being an architect, my interest has been in how collective decisions are made regarding aesthetic objects - traditional cities, traditional crafts, etc. - all decision making systems that are far removed from the way designers and artists are currently trained in a model predicated on avant-garde individual introspective genius.

Some speculation on the subject is in:

Crafting the Public Realm: Speculations on the Role of Open Source
Methodologies in Development by Design
http://www.thinkcycle.org/tc-filesystem/?folder_id=37457

I draw attention to a reference in the paper regarding a distinction drawn by John Seely Brown and Paul Duguid (*The Social Life of Information*) where they distinguish between "networks of practice" and "communities of practice" (although both are forms of networks). Members of a network of practice have functional or occupational links constituted by electronic and other networks that bring them together. They come together within the narrow horizons of these links and otherwise lead lives that are separate from the network. Communities of practice are more tied to geographical place, depend more on face to face encounters, and collectively carry out practices that are beyond functional or occupational concerns. The members of the community depend on the network a great deal to construct their everyday lives. I would emphasise the importance of this distinction, particularly in reference to the word "commune" that was brought in earlier in this discussion.

Although it has not been explicitly stated so far, I suspect a great deal of interest in networks expressed in such forums is to tackle a fundamental contradiction in the concept of democracy (and someone did express interest in the links between 'networks' and 'governance'). The premise of democracy is to provide power to the people, through mechanisms such as universal adult franchise. However for its day to day functioning, democracy has to resort to top-down control structures of governance. This is further complicated by the fact that decision making swirls around sporadic events called "elections", and elections tend to be dominated by the successes achieved in the mobilisation of single cause constituencies. Network theory can then lend itself to the development of forms of organisation which are more egalitarian, and handle complexity and nuances without trying to artificially force issues into single unities descriptions or concepts.

The first issue to be tackled is that networks are not inherently egalitarian and tend to function according to power laws (as pointed out by Barabasi in "Linked"), where a large percentage of the traffic tends to always move through a small percentage of nodes. This by itself is not a problem - it all depends on how the hubs behave with reference to transparency of information - do they immediately pass it on to the public domain of the network, or are they selective in what they pass on - retaining something for personal gain. It appears that two fields of study need to come together on this: network theory (especially power laws and how hubs form) on the one hand and legal and ethical theory on property rights on the other hand. If anyone knows of any study where this intersection has been explored, please do let me know.

The second issue I am concerned with is linked to emergence theory, which explores how bottom up development constructs macro-intelligence in complex organisations. Since I do not possess any expertise on this, I can only speculate (based on some readings oriented towards the layperson), and I list below some speculations on characteristics that an emergent network needs to possess:

- close grained high-synchrony neighbour interaction
- a major percentage of the interactions are characterised by high levels of information symmetry
- random interaction - a high potential for serendipity
- indirect control
- low level of concern for explicit definitions of the macro picture at the level of the individual unit (as Steven Johnson says in his book on emergence - you would not want one of the neurons in your brain becoming individually sentient)
- an impulse towards pattern recognition where patterns are collectively rather than individually owned.
- pattern recognition is based on systems of tacit knowledge rather than explicit knowledge (as Michael Polanyi defines it).

The last point is especially important when we come to human networks, for unlike the world of insects, human networks are also reflexive - they can think about themselves. When this thinking relies on explicit knowledge then there is a tendency for the individual to pull away from the network (keeping things at the level of 'networks of practice'). On the other hand, tacit knowledge encourages the individual to orient towards the network (allowing for the potential of emergent 'communities of practice'). To explore this further I have just ordered Walter Ong's book "Orality and Literacy", but I cite below the quotation that piqued my interest, from Chris Barlas' essay "The End of the Word is Nigh" (While Barlas does not mention it, I interpret orality belonging more to tacit knowledge, whereas literacy relies on explicit knowledge):
http://rememberingwalterong.com/2004/05/from_1994_writer_chris_barlas.html

"As Walter Ong, the Jesuit scholar, points out, oral creation is totally different from literate creation. It relies not on interiorisation, but on

community. In his book, *Orality And Literacy*, he traces the development of language through oral to literate cultures and on into the computer culture that may exist in the future. Orality, he suggests, acts like glue within society. It draws people into groups. It promotes a type of communication that is communal and open. It also encourages a certain way of thinking. Orally generated characters tend to the heroic, the generalised, the larger than life. This can be seen in the early classics of Western literature, *The Iliad* and *The Odyssey*.

What orally composed epic does not have is a more particularising, individuating tendency that is so crucial in literate society. A written culture favours the interior, the personal, the reflective. For instance, unlike our pre-literature ancestors who sat round campfires to share stories, we do not read in groups. The oral human is caught in a web of timelessness, almost an unconscious state, where the distinction between 'I' and 'you' is not nearly so well delineated. Literacy, on the other hand, is modernist, productive of an in-built existential loneliness. Without literacy, says Ong, there can be no continued deepening of consciousness, no progress towards individuation. So where does all this point? It focuses on our ability to use language in different ways and the way in which our thinking is formed by the way we use it. How many people would think of writing itself as a technology? Yet writing is tool-using, a kind of knife and fork for the mind. As Ong points out, we are born into orality from the moment we open our mouths. But literacy, or, to use the word coined by the computer expert and child psychologist Seymour Papert, literacy, is an acquired technology, which has to be painfully learned. Compared to anything else we are conscious of learning in our lives, reading and writing constitute the most complicated achievement. And being most complicated, reading and writing tend to dominate our senses. The task is so great that for the literate, the capacity is rated above all others. What is written is always valued above the spoken. The written word has a permanency the spoken lacks. You can possess a book, but not a speech.

It is for this reason that Papert suggests a distinction between literacy, our particularised ability to read and write, and literacy. It is perhaps the innate and particularised loneliness of literacy that prompted Thatcher to make her famous remark that there is no such thing as society. While her representation of this was clearly deviant and presumably unwitting, she was exemplifying a truth. Modern literate society, in which life is increasingly inner, is about conflict rather than co-operation. It is a society that excludes rather than includes, that has consistently narrowed its focus. It is this type of speculation that could lead a literate individual to question the health of a commuting society that buries its collective nose in a newspaper. Wouldn't it be better if travellers on the 8.13 talked to one another, rather than take refuge in the privacy of interior worlds? While one cannot wish away the world of literacy, and to seek return to a happy oral world is nothing but a romantic fantasy, this issue does merit further thinking - and it is perhaps more useful to use the opposition of 'tacit/explicit' rather than 'oral/literate' for further exploration of networks (remaining alert to the distinction that one is dealing with reflexive networks).

While the tacit centres on the local, it does not mean that larger horizons are absent. I illustrate this by citing a discussion I attended a couple of years ago. This was a meeting between a group of local architects and Dinkar Kaikini (a well known vocalist in Indian classical music). The purpose of the discussion was to hear Kaikini's views on parallels between music and architecture. The first thing that struck me was that the architects in the group all considered themselves modernists, and would have rebelled against the label "classical" being applied to their way of thinking. Kaikini, on the other hand, rooted himself firmly within a classical tradition, yet was comfortable with modernity. But it was a point that Kaikini made that was most revelatory to me, and to cite it I must first explain some of the principles of Indian classical music (and I refer here to the Hindustani rather than the Carnatic tradition). Unlike Western classical music, the Indian classical tradition does not rely on composers. The foundation is called 'raga'. There is no direct translation of this word into English, but the closest would be "scale". The raga delineates the set and sequence of notes that may be used in a musical composition. The raga has no strong sense of authorship - in that sense it is open source, for even though a particular raga may at one point in time have an individual creator, it belongs to a tradition rather than a person. But unlike a scale, the raga also has links with emotion and states of being. Each raga has strong associations - for example "Durbari" is associated with the regal, and "Basant" is associated with the seasons. Each raga is also linked with a temporal context and has a particular time of day in which it is to be performed. Dawn, morning, mid-day, evening, night all have their own raagas.

Given all this, I was always under the impression that the raga determined the emotive depth of the music. However, Kaikini said that the raga only defines a space. The enclosure that constructs the space sets some limits - it determines where one can go. But it does not determine how one moves across the space - do you hop and skip with happiness, or do you drag your feet with head bowed, or do you stay close to one spot in contemplation.

It is not the delineation of the space that is important as much as the manner in which one inhabits it. Kaikini placed the emotive depth in music by the level of expressiveness one can put into two concepts: 'Meend' which is the glide from one note to the next, and 'Laya' which is the interval of time between one note and the next. When one manages this one is transported into a world that is beyond any sense of self or time (and do we not all lose our sense of self and time when we are caught up in a beautiful piece of music).

To me, the power of Kaikini's observations lay in:

1. The transcendent can be found in what is immediately adjacent.
2. We inhabit a reality that does not exist only on one level. Reality is multi-leveled and complex, and our sense of being shifts between mundane, terrestrial and transcendent levels. All art recognised this, and perhaps this is why art has sat so comfortable next to religion over several centuries. Polanyi goes so far as to say that the more tacit the knowledge is, the more transcendent it is likely to be.
3. We tend to assume that tacit knowledge, because it cannot be verbalised, is not shareable - and is therefore less tangible and real. But the world that Kaikini (or any other gifted musician) constructs through his music, even though it is purely tacit, is tangible, shareable and real enough to have commercial value, allowing the musician to earn a living through it.

While all this may seem far away from the realm of network theory, I believe it is crucial. Emergent networks build on close-grained local links, and movement between mundane connections and higher levels of being understood through collectively owned patterns. When one comes to reflexive networks, those patterns hold a sense of transcendence that binds communities. A theory of reflexive networks must include a theory of knowledge and the links between epistemic systems and social cohesion.

So if I summarise the propositions that interest me:

1. It would be useful to situate network theory within a theory of sites of practice.
2. We must distinguish between "networks of practice" and "communities of practice"
3. What are the base conditions required for emergence to occur?
4. Human networks are also reflexive, and we must be alert to the special issues involved with reflexivity.
5. A theory of reflexive networks must include a theory of knowledge and the links between epistemic systems and social cohesion.

Cheers,
Prem

Your text was very interesting, Prem. Particularly the above, which is exactly the point that I was trying to get at. I think that the behavior of people, and therefore the way they use networks and their specific protocols, is greatly influenced by many factors of aesthetic tastes, value orientation, cosmology and feeling of community. The affective dimension where a musician intervenes is fundamental to the kind of orientation I am thinking of. The affective dimension is, almost by definition, a realm of the proximate, the nearby, closeness.

The orality/literacy distinction that you mention (Ong) is a binary that took different forms in the twentieth century. One is the distinction by the German sociologist Toennies, between community and society (or Gemeinschaft und Gesellschaft, which is the name of the book). That distinction was subsequently taken up and reworked by the French anthropologist Louis Dumont, in his *Homo Aequalis* books (which, interestingly enough, were written after Homo Hierarchicus, a study of the Indian caste system). Dumont observes that interpersonal relations in most societies until around the 16th-17th century in Europe were hierarchically structured - where the root "hierro," meaning sacred, holy, indicates an orientation to transcendence. In Europe this gave the notion of a "great chain of being" in which everyone, including both animals and spirits, supposedly occupied a rightful place. What we call the "symbolic" are all the structures of feeling associated with this traditional notion of rightful places. However, Dumont also believed that since the Enlightenment and the French revolution, "modernity" is synonymous with the domination of individualism and the ascendancy of equal-to-equal relations, as expressed not only in constitutional law (human rights), contractual relations, the money economy and so on, but also in the symbolic realm. The notion and the feeling of right changes. He thought that elements of a hierarchically structured society, oriented to transcendence, could persist but would be (and must be) subordinated to the order of individualism and equality.

Now, my own view is that this subordination, on which the modern and modernizing projects have been founded, does not sufficiently explain our relations to each other, the earth and the stars, to put it briefly. It is too brutally simplifying, and so it makes much "tacit knowledge" into unconscious, unexpressed and unavowed sentiment or resentment. It does dictate the conditions of universal law that have achieved the widest distribution across the planet, but it is subject to such tremendous stresses that it has now produced yet another huge and violent outburst of the repressed hierarchical demons, in the form of racism, fundamentalism and war.

Another version of the binary mentioned above has been rootedness or uprootedness, which is the kind of word that mid-twentieth century fascists would use (Dumont saw Fascism and Nazism as resistance to the universals of individualism and equality). Michael Polanyi's brother, Karl, produced a more interesting reading of this with the distinction between "embeddedness" and "disembeddedness." Karl Polanyi's subject was the market. In his view, a larger set of social institutions was broken down by the liberal, laissez-faire notion that markets are self-regulating, i.e. that the operations of selling for a profit and buying at best price can ensure all the social and ecological conditions needed for their own functioning and reproduction over time. In this way, the specialized domain of the economy was disembedded from the larger domain of society, on which it ultimately depended. Polanyi too saw Fascism and Nazism as desperate and deadly attempts to reconstruct a social ecology. He believed this reconstruction of closer social ties and ecological balances had to be done, but with a more careful understanding of the checks and balances required to sustain the individual's "freedom in a complex society."

It's very interesting to learn that Michael Polanyi, the epistemologist, developed this binary of the tacit and the explicit. It seems to provide a quite different opening than

the previously stated ones, which all derive from the fundamentally tragic idea of tie/broken tie, or traditional/modern. The tacit/explicit distinction does not seem to be freighted with such dark teleology. The complementarity of deterritorialization/reterritorialization has a similar openness. I don't think Guattari's point is to oppose a modern, uprooted, disembedded, deterritorialized society as superior to an archaic, rooted, embedded, territorialized community. Rather the question is to see how everything defamiliarizing (such as technology, money, networks, mathematics, abstract art, universal law, and so forth) will shake up the coordinates of our lives, which tend to become oppressive under the influence of forms of concentrated power, whatever social system we live under. The question is then how to reterritorialize again, each time, how to constitute a play of discourses and qualities that do not so much reinforce the symbolic law of "everyone in their right place" as open up a kind of simultaneous affirmation and questioning of the places that each one is in, and of the system of places through which we relate to each other. The qualities developed through the use of "Laya" and "Meend," for example, can be ways to touch persons where they are (through the experience of the note's duration) and in a second moment, accompany them in a process of displacement (through the modulated shift to another note).

Networks can be conceived and imposed as structures of universalization, where the system of places (including supposedly egalitarian systems) is built into the hardware and the protocols. But I think such conceptions and impositions give an impoverished and often repressive idea of what really happens. Social relations within microstructural networks are being played out collectively, in forms ranging from the poetic to the cooperative to the terroristic, but always with the same kind of subtle attention to the modulation of aesthetic qualities, affective relations and cosmic horizons that Kaikini accords to the quality of his musical notes. Perhaps this is why Kaikini, a classical musician, feels at home in modernism. He knows how to make it into a moving territory.

best, BH

regarding hierarchies and networks, with regard to protocols, etc:

is it possible that network interactions can be 'weighted' with regard to different variables, as to how they function (in terms of vertical/horizontal management of flow or routing of interactions through some kind of decision-tree or charting of the way the interaction exists in the network itself, between nodes)

this is an attempt to say, could 'the router' or 'hub' in some way be a physical modeling of this same questioning of hierarchy and how decision-making exists with regard to certain dynamics? and thus a star network may interact differently than a linear bus network topology, etc.

Network Topologies
<http://www.dclmar.edu/Courses/ITNW2313/network.htm>
<http://fcit.usf.edu/network/chaps/chaps.htm>

(i am not exactly sure what i am trying to get at here, only that it would seem that there are many 'dimensions' involved, and in this, it would seem possible that there is a different weighting of a given situation, in terms of its dynamic relationship within/without a given network and its mediation, which would seem to be dynamically addressed -- i.e. as it is related to how the network itself

constitutes/models/governs itself and its interactions -- it also makes me wonder if it is somewhat akin to 'layers' as Pit Schultz once wrote about on nettime, etc. that is, some things happen on one layer and there may be multiple higher/lower level things going on (dimensions) simultaneously, though I am not sure if this is how IP actually works or not...) brian

> quit saying a network is this, a network is that.

there is a long, fruitful history of people doing just that, so perhaps this thread suffers not from a desire to define the term, but from a lack of specificity in our vocabulary.

a brief, unorganized survey might help:

centralized network--a single hub connected to multiple peripheral nodes; little to no interconnection between nodes.
 examples: web server, software security updates, the panopticon prison, sovereign (royal) fiat, LAN router, pyramidal hierarchy

decentralized network--multiple hubs, each with their own sets of peripheral nodes; hubs are connected to other hubs.
 related concept: scale-free network (Barab=Eisi)
 examples: Domain Name System (DNS), airline transportation routes, municipal governments

distributed network--a flat mesh in which there is no distinction between hubs and peripheral nodes (Baran)
 related concept: rhizome (Deleuze and Guattari)
 related concept: random network, a network having a random distribution of links (Barab=Eisi).
 examples: TCP/IP, peer-to-peer, national highway systems

chain network--a linear input/output transfer system
 examples: smuggler trade routes, IP routing

all-channel network--a star in which every node is connected to every other node
 examples: Ethernet, kin groups, collectives

(note, this list only approaches the topological/structural qualities of networks. we would have to supplement the list greatly if we wish to address the topic of network actors [example: the nomad, the virus] and/or networked tactics of struggle [example: swarming, exploits, nonexistence].)

we can and should say what networks are, otherwise networks sink into the landscape as inscrutable, natural forms, such is the trick of power.

**<nettime> Institutionalization of
computer protocols (draft chapter)**
From: Alexander Galloway

To: nettime-l@bbs.thing.net
Date: Sun, 12 Jan 2003 11:54:34 -0500

Nettimers--I'm preparing a book manuscript on computer protocols and how they establish control in the seemingly anarchical Internet. I'm hoping that some of you will be able to read my draft chapter below on the institutionalization of protocols via standards bodies. Please point out my mistakes before i send it to my editor! :-) thanks. -ag

+ + +

In this day and age, technical protocols and standards are established by an self-selected oligarchy of scientists consisting largely of electrical engineers and computer specialists. Composed of a patchwork of many professional bodies, working groups, committees and subcommittees, this technocratic elite toils away, mostly voluntarily, in an effort to hammer out solutions to advancements in technology. Many of them are university professors. Most all of them either work in industry, or have some connection to it.

Like the philosophy of protocol itself, membership in this technocratic ruling class is open. "Anyone with something to contribute could come to the party,"[1] wrote one early participant. But, to be sure, because of the technical sophistication needed to participate, this loose consortium of decision-makers tends to fall into a relatively homogenous social class: highly educated, altruistic, liberal-minded science professionals from modernized societies around the globe.

And sometimes not so far around the globe. Of the twenty-five or so original protocol pioneers, three of them--Vint Cerf, Jon Postel and Steve Crocker--all came from a single high school in Los Angeles's San Fernando Valley.[2] Furthermore during his long tenure as RFC Editor, Postel was the single gatekeeper through whom all protocol RFCs passed before they could be published.

Internet historians Katie Hafner and Matthew Lyon describe this group as "an ad-hocracy of intensely creative, sleep-deprived, idiosyncratic, well-meaning computer geniuses." [3]

There are few outsiders in this community. Here the specialists run the show. To put it another way, while the Internet is used daily by vast swaths of diverse communities, the standards-makers at the heart of this technology are a small entrenched group of techno-elite peers. The reasons for this are largely practical. "Most users are not interested in the details of Internet protocols," Vint Cerf observes, "they just want the system to work." [4] Or as former IETF Chair Fred Baker reminds us: "The average user doesn't write code. [...] If their needs are met, they don't especially care how they were met." [5]

So who actually writes these technical protocols, where did they come from, and how are they used in the real world? They are found in the fertile amalgamation of computers and software that constitutes the majority of servers, routers and other internet-enabled machines. A significant portion of these computers were, and still are, Unix-based systems. A significant portion of the software was, and still is, largely written in the C or C++ languages. All of these elements have enjoyed unique histories as protological technologies.

The Unix operating system was developed at Bell Telephone Laboratories by Ken Thompson, Dennis Ritchie and others beginning in 1969 and continuing development into the early 70s. After the operating system's release the lab's parent company, AT&T, began to license and sell Unix as a commercial software product. But, for various legal reasons, the company admitted they "had no intention of pursuing software as a business." [6] Unix was indeed sold by AT&T, but simply "as is" with no advertising, technical support or other fanfare. This contributed to its widespread adoption by universities who found in Unix a cheap but useful operating system that could be easily experimented with, modified and improved.

In January 1974, Unix was installed at the University of California at Berkeley. Bill Joy and others began developing aspin-off of the operating system which became known as BSD (Berkeley Software Distribution).

Unix was particularly successful because of its close connection to networking and the adoption of basic interchange standards. "Perhaps the most important contribution to the proliferation of Unix was the growth of networking," [7] writes Unix historian Peter Salus. By the early 80s, the TCP/IP networking suite was included in BSD Unix.

Unix was designed with openness in mind. The source code--written in C, which was also developed during 1971-1973--is easily accessible, meaning

a higher degree of technical transparency.

The standardization of the C programming language began in 1983 with the establishment of an American National Standards Institute (ANSI) committee called "X3J11." The ANSI report was finished in 1988 and subsequently accepted as a standard by the international consortium ISO in 1990.[8] Starting in 1979, Bjarne Stroustrup developed C++, which added the concept of classes to the original C language. (In fact, Stroustrup's first nickname for his new language was "C with Classes.") ANSI standardized the C++ language in 1990.

C++ has been tremendously successful as a language. "The spread was world-wide from the beginning," recalled Stroustrup. "[I]t fit into more environments with less trouble than just about anything else." [9] Just like a protocol.

It is not only computers that experience standardization and mass adoption. Over the years many technologies have followed this same trajectory. The process of standards creation is, in many ways, simply the recognition of technologies that have experienced success in the market place. One example is the VHS video format developed by JVC (with Matsushita), which beat out Sony's Betamax format in the consumer video market. Betamax was considered by some to be a superior technology (an urban myth, claim some engineers) because it stored video in a higher-quality format. But the trade off was that Betamax tapes tended to be shorter in length. In the late 70s when VHS launched, the VHS tape allowed for up to two hours of recording time, while Betamax only one hour. "By mid 1979 VHS was outselling Beta by more than 2 to 1 in the US." [10] When Betamax caught up in length (to three hours) it had already lost a foothold in the market. VHS would counter Betamax by increasing to four hours and later eight.

Some have suggested that it was the pornography industry, who favored VHS over Betamax, that provided it with legions of early adopters and proved the long term viability of the format. [11] But perhaps the most convincing argument is the one that points out JVC's economic strategy which included aggressive licensing of the VHS format to competitors. JVC's behavior is pseudo-protocological. They licensed the technical specifications for VHS to other vendors. They also immediately established manufacturing and distribution supply chains for VHS tape manufacturing and retail sales. In the meantime Sony tried to fortify its market position by keeping Betamax to itself. As one analyst writes:

Three contingent early differences in strategy were crucial. First, Sony decided to proceed without major co-sponsors for its Betamax system, while JVC shared VHS with several major competitors. Second, the VHS consortium quickly installed a large manufacturing capacity. Third, Sony opted for a more compact cassette, while JVC chose a longer playing time for VHS, which proved more important to most customers. [12]

JVC deliberately sacrificed larger profit margins by keeping prices low and licensing to competitors. This was in order to grow their market share. The rationale was that establishing a standard was the most important thing, and as they approached that goal, it would create a positive feedback loop that would further beat out the competition.

The VHS/Betamax story is a good example from the commercial sector for how one format can beat out another format and become an industry standard. This example is interesting because it shows that protocological behavior (giving out your technology broadly even if it means giving it to your competitors) often wins out over proprietary behavior. The Internet protocols function in a similar way, to the degree that they have become industry standards not through a result of proprietary market forces, but due to broad open initiatives of free exchange and debate. This was not exactly the case with VHS, but the analogy is useful nevertheless.

This type of corporate squabbling over video formats has since been essentially erased from the world stage with the advent of DVD. This new format was reached through consensus from industry leaders and hence does not suffer from direct competition by any similar technology in the way that VHS and Betamax did. Such consensus characterizes the large majority of processes in place today around the world for determining technical standards.

Many of today's technical standards can be attributed to the Institute of Electrical and Electronics Engineers, or IEEE (pronounced "eye triple e"). In 1963 IEEE was created through the merging of two professional societies. They were the American Institute of Electrical Engineers (AIEE) founded in New York on May 13, 1884 (by a group which included Thomas Edison) and the Institute of Radio Engineers (IRE) founded in 1912.[13] Today the IEEE has over 330,000 members in 150 countries. It is the world's largest professional society in any field. The IEEE works in conjunction with industry to circulate knowledge of

technical advances, to recognize individual merit through the awarding of prizes, and to set technical standards for new technologies. In this sense the IEEE is the world's largest and most important protocological society.

Composed of many chapters, sub-groups and committees, the IEEE's Communications Society is perhaps the most interesting area vis-a-vis computer networking. They establish standards in many common areas of digital communication including digital subscriber lines (DSLs) and wireless telephony.

IEEE standards often become international standards. Examples include the "802" series of standards which govern network communications protocols. These include standards for Ethernet [14] (the most common local area networking protocol in use today), Bluetooth, Wi-Fi, and others.

"The IEEE," Paul Baran observed, "has been a major factor in the development of communications technology." [15] Indeed Baran's own theories, which eventually would spawn the Internet, were published within the IEEE community even as they were published by his own employer, the RAND Corporation.

Active within the United States are the National Institute for Standardization and Technology (NIST) and American National Standards Institute (ANSI). The century old NIST, formerly known as the National Bureau of Standards, is a federal agency that develops and promotes technological standards. Because they are a federal agency and not a professional society, they have no membership per se. They are also non-regulatory, meaning that they do not enforce laws or establish mandatory standards which must be adopted. Much of their budget goes into supporting NIST research laboratories as well as various outreach programs.

ANSI, formerly called the American Standards Association, is responsible for aggregating and coordinating the standards creation process in the US. They are the private sector counterpart to NIST. While they do not create any standards themselves, they are a conduit for federally-accredited organizations in the field who are developing technical standards. The accredited standards developers must follow certain rules designed to keep the process open and equitable for all interested parties. ANSI then verifies that the rules have been followed by the developing organization before the proposed standard is adopted.

ANSI is also responsible for articulating a national standards strategy for the US. This strategy helps ANSI advocate in the international arena on behalf of United States interests. ANSI is the only organization that can approve standards as American national standards.

Many of ANSI's rules for maintaining integrity and quality in the standards development process revolve around principles of openness and transparency and hence conform with much of what I have already said about protocol. ANSI writes that:

- * Decisions are reached through consensus among those affected.
- * Participation is open to all affected interests. [...]
- * The process is transparent — information on the process and progress is directly available. [...]
- * The process is flexible, allowing the use of different methodologies to meet the needs of different technology and product sectors. [16]

Besides being consensus-driven, open, transparent and flexible, ANSI standards are also voluntary, which means that, like NIST, no one is bound by law to adopt them. Voluntary adoption in the marketplace is the ultimate test of a standard. Standards may disappear in the advent of a new superior technology or simply with the passage of time. Voluntary standards have many advantages. By not forcing industry to implement the standard the burden of success lies in the marketplace. And in fact, proven success in the marketplace generally preexists the creation of a standard. The behavior is emergent, not imposed.

On the international stage several other standards bodies become important. The International Telecommunication Union (ITU) focuses on radio and telecommunications, including voice telephony, communications satellites, data networks, television and in the old days, the telegraph. Established in 1865 they claim to be the world's oldest international organization.

The International Electrotechnical Commission (IEC) prepares and publishes international standards in the area of electrical technologies including magnetics, electronics and energy production. They cover everything from screw threads to quality management systems. IEC is comprised of national committees. (The national committee

representing the US is administered by ANSI.)

Another important international organization is ISO, also known as the International Organization for Standardization.[17] Like the IEC, ISO grows out of the electro-technical field and was formed after World War II to "facilitate the international coordination and unification of industrial standards." [18] Based in Geneva, but a federation of over 140 national standards bodies including the American ANSI and the British Standards Institution (BSI), their goal is to establish vendor-neutral technical standards. Like the other international bodies, standards adopted by the ISO are recognized worldwide.

Also like other standards bodies, ISO standards are developed through a process of consensus-building. Their standards are based on voluntary participation and thus the adoption of ISO standards is driven largely by market forces. (As opposed to mandatory standards which are implemented in response a governmental regulatory mandate.) Once established, ISO standards can have massive market penetration. For example the ISO standard for film speed (100, 200, 400, etc.) is used globally by millions of consumers.

Another ISO standard of far-reaching importance is the Open Systems Interconnection (OSI) Reference Model. Developed in 1978, the OSI Reference Model is a technique for classifying all networking activity into seven abstract layers. Each layer describes a different segment of the technology behind networked communication, as described in various chapters above.

Layer 7 Application
Layer 6 Presentation
Layer 5 Session
Layer 4 Transport
Layer 3 Network
Layer 2 Data link
Layer 1 Physical

This classification helps organize the process of standardization into distinct areas of activity, and is relied on heavily by those creating standards for the Internet.

In 1987 the ISO and the IEC recognized that some of their efforts were beginning to overlap. They decided to establish an institutional framework to help coordinate their efforts and formed a joint committee to deal with information technology called the Joint Technical Committee 1 (JTC 1). ISO and IEC both participate in the JTC 1, as well as liaisons from Internet-oriented consortia such as the IETF, ITU members, IEEE members and others from other standards bodies also participate here.

Individuals may sit on several committees in several different standards bodies, or simply attend as ex officio members, to increase inter-organizational communication and reduce redundant initiatives between the various standards bodies. JTC 1 committees focus on everything from office equipment to computer graphics. One of the newest committees is devoted to biometrics.

ISO, ANSI, IEEE, and all the other standards bodies are well established organizations with long histories and formidable bureaucracies. The Internet on the other hand has long been skeptical of such formalities and spawned a more ragtag, shoot from the hip attitude about standard creation.[19] I will focus the rest of this chapter on those communities and the protocol documents that they produce.

There are four groups that make up the organizational hierarchy in charge of Internet standardization. They are the Internet Society, the Internet Architecture Board, the Internet Engineering Steering Group, and the Internet Engineering Task Force.[20]

The Internet Society (ISOC), founded in January 1992, is a professional membership society. It is the umbrella organization for the other three groups. Its mission is "[t]o assure the open development, evolution and use of the Internet for the benefit of all people throughout the world." [21] It facilitates the development of Internet protocols and standards. ISOC also provides fiscal and legal independence for the standards-making process, separating this activity from its former US government patronage.

The Internet Architecture Board (IAB), originally called the Internet Activities Board, is a core committee of thirteen nominated by and consisting of members of the IETF.[22] The IAB reviews IESG

appointments, provides oversight of the architecture of network protocols, oversees the standards creation process, hears appeals, oversees the RFC Editor, and performs other chores. The IETF (as well as the Internet Research Task Force which focuses on longer term research topics) falls under the auspices of the IAB. The IAB is primarily an oversight board, since actually accepted protocols generally originate within the IETF (or in smaller design teams).

Underneath the IAB is the Internet Engineering Steering Group (IESG), a committee of the Internet Society that assists and manages the technical activities of the IETF. All of the directors of the various research areas in the IETF are part of this Steering Group.

The bedrock of this entire community is The Internet Engineering Task Force (IETF). The IETF is the core area where most protocol initiatives begin. Several thousand people are involved in the IETF, mostly through email lists, but also in face to face meetings. "The Internet Engineering Task Force is," in their own words, "a loosely self-organized group of people who make technical and other contributions to the engineering and evolution of the Internet and its technologies." [23] Or elsewhere: "the Internet Engineering Task Force (IETF) is an open global community of network designers, operators, vendors, and researchers producing technical specifications for the evolution of the Internet architecture and the smooth operation of the Internet." [24]

The IETF is best defined in the following RFCs:

* "The Tao of IETF: A Guide for New Attendees of the Internet Engineering Task Force" (RFC 1718, FYI 17)

* "Defining the IETF" (RFC 3233, BCP 58)

* "IETF Guidelines for Conduct" [25] (RFC 3184, BCP 54)

* "The Internet Standards Process -- Revision 3" (RFC 2026, BCP 9)

* "IAB and IESG Selection, Confirmation, and Recall Process: Operation of the Nominating and Recall Committees" (RFC 2727, BCP 10)

* "The Organizations Involved in the IETF Standards Process" (RFC 2028, BCP 11)

These documents describe both how the IETF creates standards, but also how the entire community itself is set up and how it behaves.

The IETF is the least bureaucratic of all the organizations mentioned in this chapter. In fact it is not an organization at all, but rather an informal community. It does not have strict bylaws or formal officers.

It is not a corporation (nonprofit or otherwise) and thus has no Board of Directors. It has no binding power as a standards creation body and is not ratified by any treaty or charter. It has no membership, and its meetings are open to anyone. "Membership" in the IETF is simply evaluated through an individual's participation. If you participate via email, or attend meetings, you are a member of the IETF. All participants operate as unaffiliated individuals, not as representatives of other organizations or vendors.

The IETF is divided up by topic into various Working Groups. Each Working Group [26] focuses on a particular issue or issues and drafts documents that are meant to capture the consensus of the group. Like the other standards bodies, IETF protocols are voluntary standards. There is no technical or legal requirement [27] that anyone actually adopt IETF protocols.

The process of establishing an Internet Standard is gradual, deliberate, and negotiated. Any protocol produced by the IETF goes through a series of stages, called the "standards track." The standards track exposes the document to extensive peer review, allowing it to mature into an RFC memo and eventually an Internet Standard. "The process of creating an Internet Standard is straightforward," they write. "A specification undergoes a period of development and several iterations of review by the Internet community and revision based upon experience, is adopted as a Standard by the appropriate body [...] and is published." [28]

Preliminary versions of specifications are solicited by the IETF as Internet-Draft documents. Anyone may submit an Internet-Draft. They are not standards in any way and should not be cited as such nor implemented by any vendors. They are works in progress and are subject to review and revision. If they are deemed uninteresting or

unnecessary, they simply disappear after their expiration date of six months. They are not RFCs and receive no number.

If an Internet-Draft survives the necessary revisions and is deemed important, it is shown to the IESG and nominated for the standards track. If the IESG agrees (and the IAB approves), then the specification is handed off to the RFC Editor and put in the queue for future publication. The actual stages in the standards track are:

- 1) Proposed Standard—The formal entry point for all specifications is here as a Proposed Standard. This is the beginning of the RFC process. The IESG has authority via the RFC Editor to elevate an Internet-Draft to this level. While no prior real world implementation is required of a Proposed Standard, these specifications are generally expected to be fully-formulated and implementable.
- 2) Draft Standard—After specifications have been implemented in at least two “independent and interoperable” real world applications they can be elevated to the level of a Draft Standard. A specification at the Draft Standard level must be relatively stable and easy to understand. While subtle revisions are normal for Draft Standards, no substantive changes are expected after this level.
- 3) Standard—Robust specifications with wide implementation and a proven track record are elevated to the level of Standard. They are considered to be official Internet Standards and are given a new number in the “STD” sub-series of the RFCs (but also retain their RFC number). The total number of Standards is relatively small.

Not all RFCs are standards. Many RFCs are informational, experimental, historic, or even humorous^[29] in nature. Furthermore not all RFCs are full-fledged Standards—they may not be that far along yet.

In addition to the STD subseries for Internet Standards, there are two other RFC subseries that warrant special attention: the Best Current Practice Documents (BCP) and informational documents known as FYI.

Each new protocol specification is drafted in accordance with RFC 1111, “Request for Comments on Request for Comments: Instructions to RFC Authors,” which specifies guidelines, text formatting and otherwise, for drafting all RFCs. Likewise, FYI 1 (RFC 1150) titled “FYI on FYI: Introduction to the FYI. Notes” outlines general formatting issues for the FYI series. Other such memos guide the composition of Internet-Drafts, as well as STDs and other documents. Useful information on drafting Internet standards is also found in RFCs 2223 and 2360.^[30]

The standards track allows for a high level of due process. Openness, transparency and fairness are all virtues of the standards track. Extensive public discussion is par for the course.

Some of the RFCs are extremely important. RFCs 1122 and 1123 outline all the standards that must be followed by any computer that wishes to be connected to the Internet. Representing “the consensus of a large body of technical experience and wisdom,”^[31] these two documents outline everything from email and transferring files to the basic protocols like IP that actually move data from one place to another.

Other RFCs go into greater technical detail on a single technology. Released in September 1981, RFC 791 and RFC 793 are the two crucial documents in the creation of the Internet protocol suite TCP/IP as we know it today. In the early 70s Robert Kahn of DARPA and Vinton Cerf of Stanford University teamed up to create a new protocol for the intercommunication of different computer networks. In September 1973 they presented their ideas at the University of Sussex in Brighton and soon afterwards completed writing the paper “A Protocol for Packet Network Intercommunication” which would be published in 1974 by the IEEE. The RFC Editor Jon Postel and others assisted in the final protocol design.^[32] Eventually this new protocol was split in 1978 into a two-part system consisting of TCP and IP. (As mentioned in earlier chapters TCP is a reliable protocol which is in charge of establishing connections and making sure packets are delivered, while IP is a connectionless protocol that is only interested in moving packets from one place to another.)

One final technology worth mentioning in the context of protocol creation is the World Wide Web. The Web emerged largely from the efforts of one man, the British computer scientist Tim Berners-Lee. During the process of developing the Web, Berners-Lee wrote both the Hypertext Transfer Protocol (HTTP) and the Hypertext Markup Language (HTML), which form the core suite of protocols used broadly today by servers and browsers to transmit and display web pages. He also created

the web address, called a Universal Resource Identifier (URI), of which today’s “URL” is a variant, which is a simple, direct way for locating any resource on the Web.

Tim Berners-Lee:

The art was to define the few basic, common rules of “protocol” that would allow one computer to talk to another, in such a way that when all computer everywhere did it, the system would thrive, not break down. For the Web, those elements were, in decreasing order of importance, universal resource identifiers (URIs), the Hypertext Transfer Protocol (HTTP), and the Hypertext Markup Language (HTML).

So, like other protocol designers, Berners-Lee’s philosophy was to create a standard language for interoperation. By adopting his language, the computers would be able to exchange files. He continues:

What was often difficult for people to understand about the design was that there was nothing else beyond URIs, HTTP, and HTML. There was no central computer “controlling” the Web, no single network on which these protocols worked, not even an organization anywhere that “ran” the Web. The Web was not a physical “thing” that existed in a certain “place.” It was a “space” in which information could exist.^[33]

This is also in line with other protocol scientists’s intentions—that an info-scape exists on the net with no centralized administration or control. (But as I have pointed out, it should not be inferred that a lack of centralized control means a lack of control as such.)

Berners-Lee eventually took his ideas to the IETF and published “Universal Resource Identifiers in WWW” (RFC 1630) in 1994. This memo describes the correct technique for creating and decoding URIs for use on the Web. But, Berners-Lee admitted, “the IETF route didn’t seem to be working.”^[34]

Instead he established a separate standards group in October 1994 called the World Wide Web Consortium (W3C). “I wanted the consortium to run on an open process like the IETF’s,” Berners-Lee remembers, “but one that was quicker and more efficient. [...] Like the IETF, W3C would develop open technical specifications. Unlike the IETF, W3C would have a small full-time staff to help design and develop the code where necessary. Like industry consortia, W3C would represent the power and authority of millions of developers, researchers and users. And like its member research institutions, it would leverage the most recent advances in information technology.”^[35]

The W3C creates the specifications for Web technologies, and releases “recommendations” and other technical reports. The design philosophies driving the W3C are similar to those at the IETF and other standards bodies. They promote a distributed (their word is “decentralized”) architecture, they promote interoperability in and among different protocols and different end systems, and so on. In many ways the core protocols of the Internet had their development heyday in the 80s. But Web protocols are experiencing explosive growth today.

The growth is due to an evolution of the concept of the Web into what Berners-Lee calls the Semantic Web. In the Semantic Web, information is not simply interconnected on the Internet using links and graphical markup—what he calls “a space in which information could permanently exist and be referred to”^[36]—but it is enriched using descriptive protocols that say what the information actually is.

For example, the word “Galloway” is meaningless to a machine. It is just a piece of information that says nothing about what it is or what it means. But wrapped inside a descriptive protocol it can be effectively parsed: “<surname=Galloway/>”. Now the machine knows that Galloway is a surname. The word has been enriched with semantic value. If one makes the descriptive protocols more complex, then one is able to say more complex things about information, i.e. that Galloway is my surname, and my given name is Alexander, and so on. The Semantic Web is simply the process of adding extra meta-layers on top of information so that it can be parsed according to its semantic value.

Why is this significant? Before this, protocol had very little to do with meaningful information. Protocol does not interface with content, with semantic value. It is, as I say above, against interpretation. But with Berners-Lee comes a new strain of protocol: protocol that cares about meaning. This is what he means by a Semantic

Web. It is, as he says, "machine-understandable information."

Does the Semantic Web, then, contradict my principle above that protocol is against interpretation? I'm not so sure. Protocols can certainly say things about their contents. A checksum does this. A file-size variable does this. But do they actually know the meaning of their contents? So it is a matter of debate as to whether descriptive protocols actually add intelligence to information, or if they are simply subjective descriptions (originally written by a human) that computers mimic but understand little about. Berners-Lee himself stresses that the Semantic Web is not an artificial intelligence machine.[37] He calls it "well-defined" data, not interpreted data—and in reality those are two very different things. I promised in the Introduction to skip all epistemological questions, and will leave this one to be debated by my betters.

As this survey of protocological institutionalization shows, the primary source materials for any protocological analysis of Internet standards are the Request for Comments (RFC) memos. They began circulation in 1969 with Steve Crocker's RFC "Host Software" and have documented all developments in protocol since.[38] It was a modest and entirely forgettable memo," Crocker remembers, "but it has significance because it was part of a broad initiative whose impact is still with us today." [39]

While generally opposed to the center-periphery model of communication—what some call the "downstream paradigm"[40]—Internet protocols describe all manner of computer-mediated communication over networks. There are RFCs for transporting messages from one place to another, and others for making sure it gets there in one piece. There are RFCs for email, for webpages, for news wires, and for graphic design.

Some advertise distributed architectures (like IP routing), some hierarchical (like the DNS). Yet they all create the conditions for technological innovation based on a goal of standardization and organization. It is a peculiar type of anti-federalism through universalism—strange as it sounds—whereby universal techniques are levied in such a way as ultimately to revert much decision-making back to the local level.

But during this process many local differences are elided in favor of universal consistencies. For example, protocols like HTML were specifically designed to allow for radical deviation in screen resolution, browser type and so on. And HTML (along with protocol as a whole) acts as a strict standardizing mechanism that homogenizes these deviations under the umbrella of a unilateral standard.

Ironically, then, the Internet protocols which help engender a distributed system of organization are themselves underpinned by adistributed, bureaucratic institutions—be they entities like ICANN or technologies like DNS.

Thus it is an oversight for theorists like Lawrence Lessig, despite his strengths, to suggest that the origin of Internet communication was one of total freedom and lack of control.[41] Instead, it is clear to me that the exact opposite of freedom, that is control, has been the outcome of the last forty years of developments in networked communications. The founding principle of the net is control, not freedom. Control has existed from the beginning.

Perhaps it is a different type of control then we are used to seeing. It is a type of control based in openness, inclusion, universalism, and flexibility. It is control borne from high degrees of technical organization (protocol), not this or that limitation on individual freedom or decision making (fascism).

Thus it is with complete sincerity that Web inventor Tim Berners-Lee writes:

I had (and still have) a dream that the web could be less of a television channel and more of an interactive sea of shared knowledge. I imagine it immersing us as a warm, friendly environment made of the things we and our friends have seen, heard, believe or have figured out.[42]

The irony is, of course, that in order to achieve this social utopia computer scientists like Berners-Lee had to develop the most highly controlled and extensive mass media yet known. Protocol gives us the ability to build a "warm, friendly" technological space. But it becomes warm and friendly through technical standardization, agreement, organized implementation, broad (sometimes universal) adoption, and

directed participation.

I stated in the introduction that protocol is based on a contradiction between two opposing machines, one machine that radically distributes control into autonomous locales, and another that focuses control into rigidly defined hierarchies. This chapter illustrates this reality in full detail. The generative contradiction that lies at the very heart of protocol is that in order to be politically progressive, protocol must be partially reactionary.

To put it another way, in order for protocol to enable radically distributed communications between autonomous entities, it must employ a strategy of universalization, and of homogeneity. It must be anti-diversity. It must promote standardization in order to enable openness. It must organize peer groups into bureaucracies like the IETF in order to create free technologies.

To be sure, the two partners in this delicate two-step often exist in separate arenas. As protocol pioneer Bob Braden puts it, "There are several vital kinds of heterogeneity"[43] That is to say, one sector can be standardized while another is heterogeneous. The core Internet protocols can be highly controlled while the actual administration of the net can be highly uncontrolled. Or, DNS can be arranged in a strict hierarchy while users's actual experience of the net can be highly distributed.

In short, control in distributed networks is not monolithic. It proceeds in multiple, parallel, contradictory and often unpredictable ways. It is a complex of interrelated currents and counter-currents.

Perhaps I can term the institutional frameworks mentioned in this chapter a type of tactical standardization, in which certain short term goals are necessary in order to realize one's longer term goals. Standardization is the politically reactionary tactic that enables radical openness. Or to give an example of this analogy in technical terms: the Domain Name System, with it's hierarchical architecture and bureaucratic governance, is the politically reactionary tactic that enables the truly distributed and open architecture of the Internet Protocol. It is, as Barthes put it, our "Operation Margarine." And this is the generative contradiction that fuels the net.

[11] If not VHS then the VCR in general was aided greatly by the porn industry. David Morton writes that "many industry analysts credited the sales of erotic video tapes as one of the chief factors in the VCR's early success. They took the place of adult movie theaters, but also could be purchased in areas where they were legal and viewed at home." See Morton's *A History of Electronic Entertainment* since 1945, http://www.ieee.org/organizations/history_center/research_guides/entertainment, p. 56.

http://www.vwl.uni-muenchen.de/ls_komlos/pathe.pdf, p. 5.

[13] IEEE 2000 Annual Report (IEEE, 2000), p. 2.

[14] IEEE prefers to avoid associating their standards with trademarked, commercial, or otherwise proprietary technologies. Hence the IEEE definition eschews the word "Ethernet" which is associated with Xerox PARC where it was named. The 1985 IEEE standard for Ethernet is instead titled "IEEE 802.3 Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications."

[15] Paul Baran, Electrical Engineer, an oral history conducted in 1999 by David Hochfelder, IEEE History Center, Rutgers University, New Brunswick, NJ, USA.

[16] ANSI, "National Standards Strategy for the United States," <http://www.ansi.org>, emphasis in original.

[17] The name ISO is in fact not an acronym, but derives from a Greek word for "equal." This way it avoids the problem of translating the organization's name into different languages, which would produce different acronyms. The name ISO, then, is a type of semantic standard in itself.

[18] See <http://www.iso.ch> for more history of the ISO.

[19] The IETF takes pride in having such an ethos. Jeanette Hofmann writes: "The IETF has traditionally understood itself as an elite in the technical development of communication networks. Gestures of superiority and a dim view of other standardisation committees are matched by unmistakable impatience with incompetence in their own ranks." See "Government Technologies and Techniques of Government: Politics on the Net," <http://duploxx.wz-berlin.de/final/jeanette.htm>

[20] Another important organization to mention is the Internet Corporation for Assigned Names and Numbers (ICANN). ICANN is a nonprofit organization which has control over the Internet's domain name system. Its Board of Directors has included Vinton Cerf, co-inventor of the Internet Protocol and founder of the Internet Society, and author Esther Dyson. "It is ICANN's objective to operate as an open, transparent, and consensus-based body that is broadly representative of the diverse stakeholder communities of the global Internet" (see "ICANN Fact Sheet," <http://www.icann.org>). Despite this rosy mission statement, ICANN has been the target of intense criticism in recent years. It is for many the central lightning rod for problems around issues of Internet governance. A close look at ICANN is unfortunately outside the scope of this book, but for an excellent examination of the organization see Milton Mueller's *Ruling the Root* (Cambridge: MIT, 2002).

[21] <http://www.isoc.org>.

[22] For a detailed description of the IAB see Brian Carpenter, "Charter of the Internet Architecture Board (IAB)," RFC 2850, BCP 39, May 2000.

[23] Gary Malkin, "The Tao of IETF: A Guide for New Attendees of the Internet Engineering Task Force," RFC 1718, FYI 17, October 1993.

[24] Paul Hoffman and Scott Bradner, "Defining the IETF," RFC 3233, BCP 58, February 2002.

[25] This RFC is an interesting one because of the social relations it endorses within the IETF. Liberal, democratic values are the norm. "Intimidation or ad hominem attack" is to be avoided in IETF debates.

Instead IETFers are encouraged to "think globally" and treat their fellow colleagues "with respect as persons." Somewhat ironically this document also specifies that "English is the de facto language of the IETF." See Susan Harris, "IETF Guidelines for Conduct," RFC 3184, BCP 54, October 2001.

[26] For more information on IETF Working Groups see Scott Bradner, "IETF Working Group Guidelines and Procedures," RFC 2418, BCP 25, September 1998.

[27] That said, there are protocols that are given the status level of "required" for certain contexts. For example the Internet Protocol is a required protocol for anyone wishing to connect to the Internet. Other protocols may be given status levels of "recommended" or "elective" depending on how necessary they are for implementing a specific technology. The "required" status level should not be confused however with mandatory standards. These have legal implications and are

enforced by regulatory agencies.

[28] Scott Bradner, "The Internet Standards Process -- Revision 3," RFC 2026, BCP 9, October 1996.

[29] Most RFCs published on April 1st are suspect. Take for example RFC 1149, "A Standard for the Transmission of IP Datagrams on Avian Carriers" (David Waitzman, April 1990), which describes how to send IP datagrams via carrier pigeon, lauding their "intrinsic collision avoidance system." Thanks to Jonah Brucker-Cohen for first bringing this RFC to my attention. Brucker-Cohen himself has devised a new protocol called "H2O/IP" for the transmission of IP datagrams using modulated streams of water. Consider also "The Infinite Monkey Protocol Suite (IMPS)" described in RFC 2795 (SteQven [sic] Christie, April 2000) that describes "a protocol suite which supports an infinite number of monkeys that sit at an infinite number of typewriters in order to determine when they have either produced the entire works of William Shakespeare or a good television show." Shakespeare would probably appreciate "SONET to Sonnet Translation" (April 1994, RFC 1605) which uses fourteen line dasyllabic verse to optimize data transmission over Synchronous Optical Network (SONET). There is also the self-explanatory "Hyper Text Coffee Pot Control Protocol (HTCPCP/1.0)" (Larry Masinter, RFC 2324, April 1998), clearly required reading for any under-slept webmaster. Other examples of ridiculous technical standards include Eryk Salvaggio's "Slowest Modem" which uses the US Postal Service to send data via diskette at a data transfer rate of only 0.002438095238095238 kb/s. He specifies that "[a]ll html links on the diskette must be set up as a href='mailing address' (where 'mailing address' is, in fact, a mailing address)" ("Free Art Games #5, 6 and 7," Rhizome, September 26, 2000), and Cory Arcangel's "Total Asshole" file compression system that, in fact, enlarges a file exponentially in size when it is compressed.

[30] See Jon Postel and Joyce Reynolds, "Instructions to RFC Authors," RFC 2223, October 1997, and Gregor Scott, "Guide for Internet Standards Writers," RFC 2360, BCP 22, June 1998.

[31] Robert Braden, "Requirements for Internet Hosts -- Communication Layers," RFC 1122, STD 3, October 1989.

[34] *Ibid.*, p. 71.

[35] *Ibid.*, pp. 92-94.

[36] *Ibid.*, p. 18.

[37] Tim Berners-Lee, "What the Semantic Web can represent," <http://www.w3.org/DesignIssues/RDFnot.html>.

[38] One should not tie Crocker's memo to the beginning of protocol per se. That honor should probably go to Paul Baran's 1964 RAND publication "On Distributed Communications." In many ways it serves as the origin text for the RFCs that would follow. Although it came before the RFCs and was not connected to it in any way, Baran's memo essentially fulfilled the same function, that is, to outline for Baran's peers a broad technological standard for digital communication over networks.

Other RFC-like documents have also been important in the technical development of networking. The Internet Experiment Notes (IENs), published from 1977 to 1982 and edited by RFC editor Jon Postel, addressed issues connected to the then-fledgling Internet before merging with the RFC series. Vint Cerf also cites the ARPA Satellite System Notes and the PRNET Notes on packet radio (see RFC 2555). There exists also the MIL-STD series maintained by the Department of Defense. Some of the MIL-STDs overlap with Internet Standards covered in the RFC series.

[39] Steve Crocker, "30 Years of RFCs," RFC 2555, April 7, 1999.

[40] See Nelson Minar and Marc Hedlund, "A Network of Peers: Peer-to-Peer Models Through the History of the Internet," in Andy Oram, Ed., *Peer-to-Peer: Harnessing the Power of Disruptive Technologies* (Sebastopol, CA: O'Reilly, 2001), p. 10.

[41] In his first book, *Code and other Laws of Cyberspace* (New York: Basic Books, 1999), Lessig sets up a before/after scenario for cyberspace. The "before" refers to what he calls the "promise of freedom" (6). The "after" is more ominous. Although as yet unfixed, this future is threatened by "an architecture that perfects control" (6). He continues this before/after narrative in *The Future of Ideas*:

The Fate of the Commons in a Connected World (New York: Random House, 2001) where he assumes that the network, in its nascent form, was what he calls free, that is, characterized by "an inability to control" (147). Yet "[t]his architecture is now changing" (239), Lessig claims. We are about to "embrace an architecture of control" (268) put in place by new commercial and legal concerns.

Lessig's discourse is always about a process of becoming, not of always having been. It is certainly correct for him to note that new capitalistic and juridical mandates are sculpting network communications in ugly new ways. But what is lacking from Lessig's work, then, is the recognition that control is endemic to all distributed networks that are governed by protocol. Control was there from day one. It was not imported later by the corporations and courts. In fact distributed networks must establish a system of control, which I call protocol, in order to function properly. In this sense, computer networks are and always have been the exact opposite of Lessig's "inability to control."

While Lessig and I clearly come to very different conclusions, I attribute this largely to the fact that we have different objects of study. His are largely issues of governance and commerce while mine are technical and formal issues. My criticism of Lessig is less to deride his contribution, which is inspiring, than to point out our different approaches.

In flux: New Media and Mediation in 2014

Recently while surfing the net I ran across Geert Lovink's intriguing article, "Hermes on the Hudson: Notes on Media Theory after Snowden" on the e-flux journal site. (For links to these publications see below.)

Lovink asserts that Edward Snowden's exposures represent the finality of new media as we know it. "The NSA scandal has taken away the last remains of cyber-naivety and lifted the 'internet issue' to the level of world politics." The egalitarian and utopian hopes and possibilities of the networked internet is lost." Citing a recently collaboratively published book, *Excommunication: Three inquiries in Media and Mediation* by Alexander Galloway, Eugene Thacker, and McKenzie Wark, Lovink appropriates Galloway's first mode or model of mediation "Hermes" for his title. Hermes is the communication god of messaging, "circulation", and "exchange" as Galloway begins his proposal for media and its mediations, one that looks back to history first. Geographically pinning Galloway, Thacker, and Wark as the New York's triumvirate of media theory conspirators, Lovink spins a relatively geographically distinctively different global view on new media's demise or otherwise.

Galloway, Thacker and Wark's collective claim in their Introduction expresses, "One of the things the trio of us share is a desire to cease adding 'new media' to existing things..." Lovink responds, "The 'three inquiries in media and mediation' open with the widely shared discontent that 'new media' has become an empty signifier. This leaves us with the question of the mandate and scope of today's media theory—if there is anything left."

Lovink continues with a question, "Are you ready to hand over the 'new media' remains to the sociologists, museum curators, art historians, and other humanities officials? Can we perhaps stage a more imaginative 'act of disappearance'? Are we ready to disguise ourselves amidst the new normality?"

What do you think?

**[-empyre-] Surfing: new discussions
about new media and theory**
From: Simon Biggs
To: <empyre@lists.cofa.unsw.edu.au>
Date: Tue May 6 09:52:26 EST 2014

I'd just like to make a short observation at the start of this discussion - noting that I've not yet read any of the texts mentioned by Renate.

Vladimir Putin recently stated that the internet is a CIA plot. The comment attracted headlines around the world as people speculated whether this was the case and what Putin was trying to suggest (eg: that different countries might initiate their own internets).

Whilst Putin's comment, and much of the analysis that followed, was premised on an erroneous understanding of what the internet is Putin was correct about the CIA plot part. The internet was, as is popularly known, initiated at Pentagon request by one of the USA's key military research quangos, ARPA (later renamed DARPA). ARPA and DARPA were part of the core infrastructure of US defence and intelligence, along with the NSA and CIA. The history on this is not surprisingly a little foggy, given the murky character of the defence and intelligence sector, but ARPANET was probably commissioned during the presidency of Lyndon Baines Johnson and realised during that of Richard Nixon. This was high-Cold War time and the function of the network was to be a defence communications network that would work in a nuclear war during severe infrastructure attrition. It's ironic that the president who 'gave the internet away' to the public was Ronald Reagan, the most bellicose of cold-warriors.

The point here is that the internet was not founded as a utopian vehicle. It was conceived as an instrument of war. It's true that during the late 1980's and into the 1990's political progressives exploited the infrastructure and protocols the internet offered to develop new ideas about social responsibility and liberty (so did pornographers, gun-runners and drug dealers). Swords into ploughshares (or other implements), I suppose. The same sort of things happened when the printing press became widely available and it is probably appropriate to consider the internet as something like the printing press (with its ancillary techno-social systems).

The Hermes metaphor aside, the internet has never been an egalitarian or utopian system. It's a military communications system that has morphed into a key part of the public domain (in all its complexity). Perhaps for some it seemed to be something else for a little while - but it wasn't.

best

Simon

[-empyre-] effusion and essence

From: Geert Lovink

To: <empyre@lists.cofa.unsw.edu.au>

Date: Fri May 9 00:54:57 EST 2014

Dear all,

thanks for the opportunity to discuss my essay here. The 'spirit' of the text is in particular directed by the great public response in Europe, and in particular Germany, to the Snowden affair. Many actively involved activists, geeks, designers and artists see the revelations as a watershed. For me this goes in two directions: on the first hand back to the days before 1984, which Simon has further elaborated upon, the military origin of the Net (and as many of you might agree, roots are also destiny...). The other direction in which this development is going is that of the 'Vergesellschaftlichung' of the Net, the becoming-society, the generalization of net standards and protocols, the penetration (if you wish) of internet (of things) into every aspect of life, every object and (social) relation, to control and monitor any movement of any person or object.

It could be that not every society, not every corner of the globe is sensing these two parallel and paradox developments in a same way. In his response Ken Wark wrote that inside the USA 'Snowdon' is not felt as a big deal. I respect that point of view. However, this is not the same in Central Europe. Maybe there the first movement (back to the origin) is felt more stronger than the second one. Certainly here in the Netherlands it is true that the generalization theses is more obvious here than the military aspect. However, in my view it remains important to discuss the two tendencies as one: effusion and essence.

Yours, Geert

[-empyre-] Excommunication

From: Alexander R. Galloway

To: <empyre@lists.cofa.unsw.edu.au>

Date: Fri May 9 01:49:30 EST 2014

Greetings all, particularly to all the email list veterans. This book is definitely a product of the net criticism scene from the old rhizome and nettime days, so it's nice to be back on empyre and see some familiar faces. (And incidentally I agree entirely with the spirit of Simon's post--regardless of who made it and for what reason, the internet is the most highly controlled mass media hitherto created. And here I disagree a bit with Geert: I don't see Snowden as a turning point; we've known this about the 'net for years.)

As for the book, where did "Excommunication" come from? The idea grew out of a conversation Eugene had been having with his editor, and it quickly gelled after that. We wanted to explore the more theological wing of philosophical thought -- hence our crude chronology with me focusing on a series of archaic divinities, Eugene inspired by the heretical monotheism of medieval mysticism, and Ken working on a more modern and post-secular form of heresy.

And so the concept of "excommunication," with both its theological and media-theoretical connotations, seemed like a fitting framework. We wanted to push the term excommunication a bit further: not just exile or exclusion, but a more radical sense of what lies beyond the human entirely, toward what Quentin Meillassoux has called "the great outdoors."

And all three of us quickly gravitated to excommunication as a theme, particularly this counter-intuitive promise of mediation with the radically non-human. In essence, we're hoping to skirt the classic metaphysical questions about worlds opening up to solicitous subjects. This book is not about the world "for us," and not the world "in itself," but what Eugene calls "the world without us."

[-empyre-] Digital Delirium revisited

From: Renate Terese Ferro

To: <empyre@lists.cofa.unsw.edu.au>

Date: Fri May 9 14:38:11 EST 2014

The essence of Edward Snowden's revelations within the political fabric of the states is a fascinating one. Snowden's activities were initially painted by the US Government and most of the conservative media machinery as criminal even terroristic. As time has past the possibility of Snowden's heroism has slowly invaded alternative and other communication streams. Just a few days ago Tim and I received a piece of junk mail that was soliciting money for some political cause and inside the request was a letter "signed" by Edward Snowden. I am not sure that folks here in the US think that the effects of Snowden's leakage is no big deal. Edward Snowden's escapades could not have happened without the help of the network generalization and speed, viral media, our 24 hour news coverage and the effusion that Geert feels is at the crux of understanding media theory today.

Media theory appears to evolve, to be IN FLUX according to who is writing it, where, and when. But what Excommunication posits us to do is to imagine the future:

Alex wrote:

"...This book is not about the world "for us," and not the world "in itself," but what Eugene calls "the world without us."

At this rather late hour of the evening I am inspired to reach for the 1997 publication edited by Arthur and Marilouise Kroker, Digital Delirium. In the contents I find Geert's interview with Žižek, Alex's writing on fonts and slogans and at the very end of the collection an article by Critical Art Ensemble, "The Technology of Uselessness" the last paragraph reads as such:

"All things must be subordinated to neutrality-to uselessness. One major difference between the age of the virtual and the more primitive times is that the contemporary idols have no metaphysical referent. The ones that have been constructed are not the mediating points between person and spirit, or life and afterlife; rather, they are end-points, empty signs...As this mythic narrative continues to play itself out, the suggestions of Arthur and Marilouise Kroker begins to make more and more sense. We are not witnessing the decline of late capital, but instead, its decline into its own delirious death trance."

Good Night. Renate

[-empyre-] Digital Delirium revisited

From: Soraya Murray

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sat May 10 03:16:35 EST 2014

I am intrigued by this discussion, and would like to acknowledge the posts by Alex Galloway, Geert Lovink and Renate Ferro. Greetings to all of you.

I keep circling back to the notion of strategic withdrawal, alluded to several times in the last few posts, as well as somewhat enigmatically toward the end of Alex's recent lecture here at UC Santa Cruz. For example, from his post:

"This book is not about the world "for us," and not the world "in itself," but what Eugene calls "the world without us.""

This, in relation to Geert's recent essay in e-Flux ("Hermes on the Hudson"): "This leaves us with the question of the mandate and scope of today's media theory—if there is anything left. Are you ready to hand over the "new media" remains to the sociologists, museum curators, art historians, and other humanities officials? Can we perhaps stage a more imaginative "act of disappearance"? Are we ready to disguise ourselves amidst the new normality?"

...and which seemed to betray a similar anxiety around obsolescence of theory -- or a strategy of withdrawal? With respect, is this to be seen as an act of battenning down the hatches? Is this disappearance/disguise a radical strategy to shift perspective as a means to generate new possibility? Something conceded, or something new gained?

-Soraya

12.2

[-empyre-] Digital Delirium revisited

From: Alexander R. Galloway
To: <emyre@lists.cofa.unsw.edu.au>
Date: Mon May 12 00:25:52 EST 2014

Dear Soraya & Co.,

I guess part of the impetus is that I'm surprised--if not unnerved--by the way in which networks have captured and eclipsed other ways of thinking. A new pantheon of dot-com philosophers reigns supreme today, ready to proclaim at every turn that "everything is a network." Mark Zuckerberg: people are networks. Donald Rumsfeld: the battlefield is a network. Bruno Latour: ontology is a network. Franco Moretti: Hamlet is a network. David Joselit: Art is a network. Guy Debord: the post-capitalist city is a network. John Von Neumann: computation is a network. Konrad Wachsmann: architecture is a network.

Ladies and gentlemen, postmodernism is definitively over! We have a new meta-narrative to guide us.

We might label this a kind of "reticular pessimism." And here I'm taking a cue from the notion of "Afro-pessimism" in critical race theory. Just as Afro-pessimism refers to the trap in which African-American identity is only ever defined via the fetters of its own historical evolution, reticular pessimism claims, in essence, that there is no escape from the fetters of the network. There is no way to think in, through, or beyond networks except in terms of networks themselves. According to reticular pessimism, responses to networked power are only able to be conceived in terms of other network forms. (And thus to fight Google and the NSA we need ecologies, assemblages, or multiplicities.)

By offering no alternative to the network form, reticular pessimism is deeply cynical because it forecloses any kind of utopian thinking that might entail an alternative to our many pervasive and invasive networks.

This is part of the mandate of this book, as I see it: to articulate a logic of being that is not reducible to a metaphysics of exchange, to a metaphysics of the network. This to me is the promise of excommunication: the message that says "there will be no more messages"; a logic of relation, without the tired, old model of exchange.

So, yes, strategic withdrawal is at the heart of what interests me most. Some are a bit skeptical about this notion of withdrawal -- often because they see in a negative light as alternatively a surrender monkey position (i give up! i'm outta here!), or a position of privilege (the political equivalent of opening a bank account in the Cayman Islands). But I see it very differently. I see it more as a withdrawal from representation. A structural withdrawal. I see it as a way to conceive of a kind of practical utopia in the here and now. "You don't represent us." "No one is illegal." "I would prefer not to." "We have no demands." Yes

I realize utopian thinking is very unfashionable today; that's precisely why we need so much more of it. So perhaps less a bunker mentality and more about the reclaiming of a new experience of life and activity.

Re: obsolescence of theory -- perhaps it hinges on *which* kind of theory? I don't agree with Latour and the notion that "theory has run out of steam." Marxism, feminism, psycho-analysis -- they all still work great if you ask me. But I do think that a kind of "vulgar 1968" style of theory has run its course. Nancy Fraser has it exactly right: capitalism co-opted many of the demands of '68-style theory. So now we have to reassess and recompile a new kind of theoretical method. Because of this I'm much more interested in a slightly different spin on the theoretical tradition.

[-empyre-] Digital Delirium revisited

From: simon
To: <emyre@lists.cofa.unsw.edu.au>
Date: Mon May 12 07:16:30 EST 2014

Dear Alexander Galloway and empyreans,

I enjoyed your letter, particularly for the notion of 'reticular pessimism' as the /en abyme/ of a socio-cultural dispensation mirror-struck by its own mental processes. I even like the idea of the network as meta-narrative and proof that pomo's over. However, the strategies in play here rather than those of escape - blueprints of the prison studied in preparatory lucubration - seem to belong to the mentality of the captors - from the viewpoint of the cell, in clear sight of the tower, or power.

Albert-László Barabási attributes the invention of network theory to Leonhard Euler in the 1780s. I don't think either would agree with Mark Zuckerberg, Donald Rumsfeld, Bruno Latour, Franco Moretti, David Joselit, Guy Debord, John Von Neumann or Konrad Wachsmann that the complex fields of the respective engagements of this strangely fascinating (uncanny - reticularly depressing) roll-call ought to be or can be reduced to what may be considered /network effects/. And, in some cases, /affects/ - where network is the nomination of a brand endorsement: Facebook is neither truly a network nor social.

In the same way, corporatic concerns rhapsodise on the now highly recognisable formula /Big Data/ - an object that has as much affinity with a meta-narrative network as any of the individual cases adduced. Then there is the authorial tick of periodisation: after post-modernism (nostalgia for the post- or non-human?); and the obsolescence of the '68ers - the vulgarity of theoretical products reaching their use-by dates. Neither brand theory nor brand network provide any clue as to how to make a map that lets us get the hell out Dodge, or dodge the oncoming traffic of the imminent - and in the name of brand immanence each holds a pasteboard halo.

In the light of the network effects that theoretical dissipation - its current /dispositif/ - elevates by the mechanism of reduction to /networks/ (pure, simple, unreal thing) or networkism - as that theoretical cul-de-sac that ought at least be avoided - 'strategic withdrawal' were better called 'statistical withdrawal' - a term less pregnant with cognitive content.

Best,
Simon Taylor

Date: Tue May 13 12:36:14 EST 2014

Thanks Alex for talking a bit more about your usage of the word excommunication. Also thanks to Christina for posting the interesting theological intersections. My thoughts were running more in parallel with political theory in listening to your last post, most particularly Martin Luther King's notion of non-violent resistance or perhaps Gandhi's. Put simply resistance by not participating, exiting the system, not "playing" any longer. I realize that in the book you conduct a pretty lengthy discussion about the use of the word "excommunication" a strategically theologically implicit word but what do you think about Excommunication as resistance?

Renate

Date: Sun May 25 14:03:57 EST 2014

Hi all,

as a story teller not a theorist.

I've been loving the lateral directions these conversations have taken.

yet they feel like new growth on a tree, reaching towards different strong lights strong potential, but sparse as foliage and flowers are still in their formative stages.

I think it would be telling to revisit in a year or so.

but for now

my branch is of truncation

- physical and geographic excommunication.

Is this a "natural" evolution - a generational love affair with the network that has matured and dwindled.

a set of circumstance, a natural hiatus, a time to move on?

For me it writing stories about people for print books made from trees,

of interest to only a tiny fragment of society.

the narrowest of narrowcast.

It could be seen as a privileged withdrawal... the Duchampian retreat,

or it could be seen as a form of situated resistance... living local.

Renate writes:

> Lovink insists that it is not necessary or important to parse new media theories through comparative geographic distributions.

>

Yet it is particularly European perspective to Snowden. 1st rule of fight club is that you dont talk about fight club.

If one doesn't live in the gated network of USA, we already live in a states of excommunication, or perhaps ecstatic ex-stasis.

Of course im saying all of this without having read excommunication

a position I take perhaps because I cant buy it in e-edition due to my geographical location in Australia.

Of course I do have a copy ive dipped into because the internet if for routing around..

but u know.. who we are,

and who we are routing around has changed.

We knew the end was coming when

the moddr_lab at WORM in Rotterdam developed

the fabulous web2.0 Suicide machine..

<http://suicidemachine.org>

"sign out forever"

what a promise.

5 years ago when I saw my 1500 best Facebook friends disappear before me

I knew everything had changed.

some non-artist/academic contacts, contacted me to see if I was emotionally ok?

was I really suicidal?

why would I deliberately unjoin the network?

6 months ago I moved to a mostly abandoned industrial area quiet close to the city centre,

toxins buried deep, being gentrified with creatives as the shock troops.

Interestingly I have no fixed network connection.

I have been extra excommunicated by lack of infrastructure in a first(?) world

city of 1 million.

The fat optical rollout goes right past my suburb

and its previously sparse low income politically unimportant demographics.

After the shock of being denied what I felt like was my god given right to fast connection,

I started to like my very physical excommunication.

I choose to tether to get on,

to jack in, as they used to say.

a delicious nostalgia for the 14.4k baud modem

the sound of which will forever generate excitement

and the deliberate act of communing

rather than the constancy of familial relationship.

x-comm

[-empyre-] effusion and miscommunication

From: Johannes Birringer

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sat May 10 03:42:59 EST 2014

dear Geert, Alexander, Renate and all

the public response in germany and several other european countries was the expected mix of outrage, analysis, critique, puzzlement, astonishment, anger at the US (and Britain?), laughter at Angela Merkel's cell phone being monitored, etc. etc (just observe the equally predictable mixed and vigorous reaction to the Russia-Ukraine crisis), and I am sure you noted all the facets (after what should not have come as a surprise); nor did the reactions in the media and public sectors in the US follow an unusual pattern; watershed moments and revelations aside - and I doubt that the effusion is ever as total as you assume Geert (your total penetration theory, into every aspect of life and every corner of the planet), what exactly are we meant to do with the (catholic? mystic?) notion of excommunication...?

>"...we pursue not so much a post-media condition but rather a non-media condition, not so much the extensions of man but the exodus of man from this world. Our task is not so much a reinvigorated humanism no matter how complicated or qualified it might need to be, but rather glumpse into the realm of the non-human. We seek not so much a blasphemy but a heresy, not so much a miscommunication but an excommunication."

what realm of the "non-human" do you propose for our social and political and personal activities? and how do you intend to get rid of media or convince others to join your sect?

Just wondering.

respectfully

Johannes Birringer

[-empyre-] effusion and miscommunication

From: Geert Lovink

To: <empyre@lists.cofa.unsw.edu.au>

Date: Mon May 12 00:26:54 EST 2014

On 9 May 2014, at 7:42 PM, Johannes Birringer <Johannes.Birringer@brunel.ac.uk> wrote:

> What exactly are we meant to do with the (catholic? mystic?) notion of excommunication...? (...) What realm of the "non-human" do you propose for our social and political and personal activities? and how do you intend to get rid of media or convince others to join your sect?

Thanks, Johannes. These questions are geared towards the authors, I guess.

I can only say what I make of it, and what I can see what we can do with these notions, in my case, the context of net criticism, media theory, tactical media, new aesthetics activism of artists, geeks, designers etc.

There is an urgency to study and understand the non-human. I can see that. I really started to 'dig it' and apply it to my own context when I got familiar with the work of Stuart Geiger (<http://stuartgeiger.com/wordpress/>) who studies the role of bots in Wikipedia. These days there are the social bots that people like you and me employ... resulting in a recent figure that 61.5% of internet traffic is 'non-human' (source: incapsula).

There are people making millions of this by tooling and ticking companies like Google. And this brings me to the humans behind the non-human. In the end I am more interested in them. Robots can be cute, or cruel, they are here to stay and will gain influence etc., all that is true, but I would like to know who profits from them, who built them, what their inner architecture is, which values and ethics they inhabit and spread... It is not so hard to delegate power and trust to machines. We can get used to that, and in some cases even benefit from it, but in the end I prefer full-employment for humans first. No sympathy for the machines.

On Hacker News this weekend a related article was popular:

<http://www.bainbrdg.demon.co.uk/Papers/Ironies.html>

It is from 1983, so before 1984...:)

The article "suggests that the increased interest in human factors among engineers reflects the irony that the more advanced a control system is, so the more crucial may be the contribution of the human operator."

Greetings, Geert

[-empyre-] networks and reticular pessimism

From: roger malina

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun May 18 19:51:23 EST 2014

Alex

I guess I would like to bring a mathematical topology point of view to the discussion on networks- I also have been intrigued by how the science of networks has been transversing discipline after discipline and we have even been helping through the leonardo arts humanities and complex networks projects (<http://ahnccompanion.info/>)

over the past centuries there have been a number of waves of new ideas on how to understand the structure of things- and of topological tools - statistical mechanics and say the work of understanding the mathematics of the random walk had cultural influence in the early 20c - in the 50s and 50s cybernetics and then general systems theory- then complexity science and emergence of structures from low level rules and now the science of networks

what is new of course is that we are now accumulating data on human behaviour in the same way that physicists accumulate data on what collections of atoms do

my colleague at UT dallas max schich has named his lab the 'cultural science' lab because people are now bringing to cultural analysis trans disciplinary tools like network analysis- but many others also

over the coming decades we can expect other new insights that help analyse and understand how things are structured and organised- and indeed one has to be careful not to over theorise a la post modernism each way of appropriation= mathematics and topology are continually developing new ideas and tools and complex networks science is not the end of the story

roger malina.

[-empyre-] excommunication

From: warkk

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed May 28 11:01:47 EST 2014

Sorry to come in late. Just done with the end of semester. Have been reading the various empyre threads for the month of May with interest. I won't be able to keep straight who said what, and lists are a sort of smeared authorship anyway.

The space of technology is always both blu-tack and duct tape, both a space of things intentionally created for an instrumental purpose and things hacked out of that intentionality for no purpose, or counter-purposes. Tech is slightly exogenous to the social order.

So i don't see the current state of the tech ensemble that is the net as pervaded by any particular essence. It isn't entirely of militarization, or the commodity form, or whatever. Its not an expressionist totality. We might be losing our toe-holds, but that's no reason to start imagining it as bad totality.

Here i don't see how Snowden changes much, other than perhaps cloaking in some publics in things that have surely been obvious all along! Surely listserv veterans remember the revelations about Echelon? One only had to follow the evolution of technical capacity from that point to grasp what was feasible. And if a tech is feasible, one should assume the security state already has it.

The Snowden moment happened when i was finishing The Disintegrating Spectacle, and simply confirmed the theses about the state of the state to be found in the late Debord. That (1) the security apparatus had achieved autonomy from a state which had (2) lost its capacity to know and act *historically*. That seems to describe the present quite well.

Its too crude to think that one could simply withdraw from such a situation. That's why in that book i wrote about the tactics of the 'devil's party', which is neither hidden nor transparent, but pursues the tactics of obscure presences, readable by those who need to know.

It is surely the case that the 'network' is at one and the same time *both* a reality and pure ideology. Like the sun, it actually exists, it just lacks the divine powers that its priests would attribute to it. Pointing this out is no great breakthrough, but it seems to be where pop netkritik is at the moment.

So one withdraws from representation, but to what? Are we not here still playing out the tactics of modernism. That may be no bad thing, but here i think there's more continuities than any grand break. Foucault once warned of the dangers of always trying to see oneself as at the fulcrum of history. This is now what counts as ordinary times.

I think i need to point out that for me (can't speak for Alex and Eugene) excommunication is a *structural condition*, not something one chooses. Communication needs to excommunicate in order to communicate. It has to appear to sever the link to those who would take it upon themselves to be their own authority. Authority over what i call xenocommunication, or communication with the absolute.

Excommunication may now be an everyday thing, maybe a micro thing. The discussion of bots on the net makes me wonder if a spam filter is what excommunication is today. That which decides which communication can be considered authorized.

Where i perhaps part company with Alex and Eugene is that i think there's other paths besides the via negativa. Rather than a non-relation to the absolute, one can have an absolute relation. This is the 'other path' out of correlation signaled by Meillassoux: empirio-criticism, and its descendant, the empirio-monism of Alexander Bogdanov, on whom i am working now.

I think its time to end the attempts by philosophy to control xenocommunication, the communication to the absolute. Rather, i think media

theory is that theory of the reality of media itself, of how media make sensation, not out of nothing, not totally determined by the social or the political or the discursive or whatever. But rather the media that are of interest now are those which render the nonhuman perceptible via an inhuman apparatus.

Here the techniques of climate science might be a good example. Without the satellites and computers of the cold war (those inhuman media) the nonhuman real of the Anthropocene is not visible -- even though, ironically enough, our collective labor is what produced it. Strange how climate change knowledge is produced by inhuman technical media that are duct tape in origin but put to a blu-tack purpose. tech is always a strange space in that way.

I disagree.

In the field, where a group of us is trying to give a political dimension to neighborhood projects, "x" is the point where a person fails to take into account or convey information or act upon a lead (i.e. a gift).

The "x" is what turns projects into simple "events".

Everyone of my colleagues is tempted by "x".

The locus of "x" shifts from person to person and project to project. Yes, it can be built-into "structures", it can seem anonymous...

If each project's "x" becomes every person's responsibility, we have a crack at political "authority".

February 2013 Theme of the Month: 'Curating the Network as Artwork'

From: Roddy Hunter

To: <new-media-curating@jiscmail.ac.uk>

Date: Mon, 4 Feb 2013 02:39:36 +0000

Dear List,

It is my pleasure to announce the February 2013 Theme of the Month.

'Curating the Network as Artwork'

In 1968, artists George Brecht and Robert Filliou co-created 'The Eternal Network'. Arguably, this network was itself an artwork and vice versa. Filliou in particular explored how this network-as-artwork could enable collaboration, exchange and dialogue across space and time. More than solely a means of distribution or medium of production, 'The Eternal Network' became for him a conceptual context for 'permanent creation' (Filliou 1996). Filliou's project is one example of many in which artists inhabit networks as systems of communication and exchange (Grundmann 1984; Saper 2001). These networks are attractive to artists as decentralised or distributed environments bypassing institutional curatorial spaces. There is then often a political as well as aesthetic dimension to the attractiveness of networks-as-artworks. This may now, however, be undermined by a dependence of these networks upon the internet which has been argued to be 'the most material and visible sign of globalisation' (Manovich 2001, 6). Lovink (2002) has cited the view that the 'pace [of globalisation] has increased with the advent of new technologies, especially in the area of telecommunications' and so artists, activists and commercial, corporate players alike have employed online networks in search of their respective 'utopias'. Lovink elaborates on this irreconcilability later that 'we need to develop a long-term view on how networked technologies should and should not be embedded in political and cultural practices'. (Lovink 2012, 160) How far has the 'globalism' of communication sought by Filliou and others been supplanted

by 'globalisation' in its neoliberal, doctrinal sense? (Chomsky 1999). Can the network as artwork be effective beyond conceptualisation in material terms? How can we rethink curatorial strategies in respect of the network-as-artwork's media of production, means of distribution and experience of reception? In short, how can we find ways to curate 'The Eternal Network' after globalisation?

Invited respondents are:

Annie Abrahams

Artist who questions the possibilities and the limits of communication in general and more specifically investigates its modes under networked conditions.
<http://bram.org/info/aa.htm>

Zeigam Azizov

Artist born in Azerbaijan, based in London. Studied art and philosophy in Russia, France and UK. His work addresses the question of cross-circulations of knowledge through images. Exhibitions include Venice Biennale, Tate Modern, Haus der Kunst, München, Grazer Kunstverein, TN Probe, Tokyo, ICA London and Lakeside Kunstraum, Klagenfurt.
<http://zeigamazizov.com/>

Mideo M. Cruz

Cross-disciplinary artist-organizer based in Manila and Southeast Asia. Network projects critiquing globalisation include *New World Disorder* in addition to performances internationally.
<http://www.mideo.tk/>

Barnaby Dicker

Artist-filmmaker, researcher, lecturer and curator. He holds a doctorate in experimental stop-frame cinematography and teaches on BA Film Production at University for the Creative Arts, Farnham and the Royal College of Art, London. He is a founder member of *Art's Birthday* Wales, which annually celebrates Robert Filliou's fifty year-old proposition.
<http://artsbirthdaywales.tumblr.com>

Ken Friedman

University Distinguished Professor at Swinburne University in Melbourne, Australia. Since 1966, Friedman has been active in Fluxus. Theory, Culture, and Society recently published Friedman's reflections on Fluxus at the 50-year mark. The full text is available free at: <http://tcs.sagepub.com/content/29/7-8/372>

Marc Garrett

Artist, curator, writer, activist, educator and musician. Co-Founder & Co-Director, Furtherfield, London and currently doctoral researcher in Art, Technology and Social Change at Birkbeck, University of London.
<http://www.furtherfield.org/user/marc-garrett>

Ingo Günther

Artist and journalist based in New York. Studied Ethnology and Cultural Anthropology in Frankfurt, graduated from Kunstakademie Düsseldorf. Founded Eastern Europe's first public access non-commercial TV station. The social geography project *Worldprocessor* is now in its 24th year.
<http://ingogunther.com>

Ilyana Nedkova

Curator and writer. Creative Director (Contemporary Art) at Horsecross, Perth and Research Curator at CCA, Glasgow
<http://www.horsecross.co.uk/about/threshold-artspace>

Helen Pritchard

Artist and researcher exploring ideas of co-research, co-production and co-operation. Currently doctoral researcher at 'HighWire', Lancaster University and visiting researcher at City University, Hong Kong.
<http://www.helenpritchard.info>

Clive Robertson

Performance and media artist, curator and critic teaching art history, performance

and cultural studies at Queen's University, Kingston, Canada.
<http://www.queensu.ca/art/arthistory/faculty/cRobertson.html>

Scott Watson

Head and Professor of Art History, Visual Art and Theory and Director/ Curator of the Morris and Helen Belkin Art Gallery at the University of British Columbia, Vancouver.
<http://www.ahva.ubc.ca/facultyIntroDisplay.cfm?InstID=19&FacultyID=1>

Looking forward to a good conversation,

Best wishes

Roddy

Re: Intro

From: Ken Friedman

To: <new-media-curating@jiscmail.ac.uk>

Date: Tue, 5 Feb 2013 08:08:00 +0000

Friends,

While I plan to return with my own statement, I want to tip my hat to Clive Robertson for his intro.

This addresses several of the profound challenges in the concept of the Eternal Network, especially as Robert Filliou and George Brecht conceived it.

Robert ultimately withdrew into the monastic life of Buddhism, dying on a five-year retreat. George withdrew to a nearly monastic life, answering his phone only when someone made an appointment by postcard, and nearly never going out. In the early 1970s, Dick Higgins suggested that I find a way to make a living outside the art world – I dipped in and out of the art world for some years, but I found a day job that suited me in the 1990s: it suited me so well that I have mostly stayed away from the art world, doing my art privately. The issues involved are quite complex – nearly everyone needs to make a living, so we all do something, and it sometimes touches on art. This is the case for Clive, too. He teaches art and art history to make a living.

There are several questions I plan to address, dealing with networks and network effects, and globalism as distinct from globalization. Clive is in essence raising a question that Robert (Filliou, 2004[1966]: 16) asked in his 1966 manifesto, "A Proposition, a Problem, a Danger, and a Hunch." Robert called for a "A refusal to be colonized culturally by a self-styled race of specialists in painting, sculpture, poetry, music, etc..."

You can get it in PDF format at this URL:

<http://www.ubu.com/historical/gb/manifestos.pdf>

But there are many sides to this coin. I don't know if there is a good answer, or even a happy one.

Clive ran one of the loveliest spaces, projects, and publishing entities in the not-quite-eternal network of the early 1970s, W.O.R.K.S. in Calgary. I'm always amazed at how much more intelligent and free things are when we don't need to fund them through the governments and governmental systems that require us to become professional artists. This is what leads to the problem that Clive identifies so well: "The network as shared in the early 1970s preceded the formalization of artists spaces that confronted / was confronted itself by network issues. The network itself was open to abuse as an alternative or oppositional disguise for self-promotion but remains I think a very different concept than what often poses now as reforms or improvements to a re-established hierarchical and exclusionary art system." That, in essence, is the price in a world where professionalization and the submissive role are quite close to the same thing.

My day job turned out to be quite a good thing – I was good at it, and it suited me better than I could have imagined. No life is perfect, but the next best thing to living the life of a monk is working as a scholar and researcher.

Two or three times in the past few days, I have had occasion to think of another Zen monk, Han-Shan (1666: 49), a 9th century Buddhist and poet. I'll close with

his words for now:

When men see Han-shan
They all say he's crazy
And not much to look at -
Dressed in rags and hides.
They don't get what I say
And I don't talk their language.
All I can say to those I meet:
"Try and make it to Cold Mountain."

Ken

From: Dorothee Richter

To: <new-media-curating@jiscmail.ac.uk>

Date: Tue, 5 Feb 2013 08:35:57 +0000

Dear Friends and Colleagues,

I have published my dissertation on Fluxus recently (Fluxus! Art and Life! Mythes about Authorship, Production, Gender and Community.--- Fluxus. Kunst gleich Leben Mythen um Aturoschaft, Produktion, Geschlecht und Gemeinschaft.) Alas it is in German. But I have also done many many video interviews and did make a film out of it together with historical material. So thanks a lot to Ken Friedman to start with Fluxus as a network. As many of you will know it is always a battle about the power to define what is this and that, and mostly art market and art history are generating a view that is centered around just some single authors. Therefore the film also tries to show the big network, the fights, the political aspects, the star attitudes of some, gentrification and so on. The film premier will be at Staatsgalerie Stuttgart at 13th of April. We will also put up a website, (everything is always later as one plans) and we would be very very happy to show it elsewhere. So- I totally agree with Ken to see Fluxus as a network (and as a battleground). The film is in English; a collage of some sort: Best, Dorothee

To: <new-media-curating@jiscmail.ac.uk>

Date: Tue, 5 Feb 2013 10:39:30 +0000

Hi all,

Firstly, I wish thank Roddy for inviting me to share ideas and (possible) revelations with others on the Crumb list.

Before I get into the flow of the discussion I would like to pre-empt the hopefully 'interesting' noise by letting people on here know about one of my latest adventures in writing. However, regarding the context of this discussion, I think it's also necessary to say that I am working class, and I have only begun my PhD at Birkbeck, London at the age of 48 (my 1st time in University), and I have a history in art, activism,

street art, hacking in the late 80s/early 90s - analogue, networked and urban. All the things I do are driven by the idea or spirit of initiating some form of 'self & peer' emancipation. Whether this relates to co-curating at the Furtherfield space, our online communities, or our media ecology projects and more...

Here is a short intro from my recent paper called 'Disrupting The Gaze. Part 1: Art Intervention and the Tate Gallery.'

"The word "art" can conjure up a vision of objects in an art gallery, showroom or museum, that can be perceived as reinforcing the values and machinations of the victors of history as leisure objects for elite entertainment, distraction and/or decoration - or the narcissistic expression of an isolated self-regarding individual." [1] (Garrett & Catlow 2012)

We live in a world riddled with contradictions and confusing signals. Our histories are assessed, judged and introduced as fact yet there are so many bits missing. We accept what is given through sound bite forms of mediation and end up using misinformation as our cultural foundations, and then we build on these 'acquired' assumptions as our 'imagined' guidelines. This critique studies how contemporary artists are challenging these defaults through their connected enactments and critical inquiries of the existing conditions. It highlights a continual dialogue involving a historical struggle between what is condoned as legitimate art and knowledge, and what is not. It looks at a complexity, embedded in our culture and its class divisions in Britain. And draws upon struggles going as far back as the enlightenment, the industrial revolution, colonialism and slavery, to present day concerns with neoliberalism and its dominance. The Tate gallery is used as a reference point and a site of focus for these various historical and contemporary, political and societal conflicts.

The artists' and art groups featured, such as Graham Harwood, Platform, IOCOSE, Tamiko Thiel, and Mark Wallinger; has each delivered a particular (unofficial and official) mode of art intervention at the Tate Gallery. Whether these artistic activities concern economic, ecological, historical, political or hierarchical conditions, they all connect in different ways. They meet, not through style or as part of a field of practice, but as contemporary artistic practitioners exploring their own states of agency in a world where our 'public' interfaces are as much a necessary place of creative engagement, as is the already accepted physical 'inner' sanctum of the gallery space. However, their work has become equally significant (perhaps even more) than, the mainstream art establishment's franchised celebrities.

In keeping with Gregory Sholette's recently published vindication for those artists hidden away where the art establishment's light rarely shines, "when, the excluded are made visible, when they demand visibility, it is always ultimately a matter of politics and rethinking history." [2] (Sholette 2011) This paper draws upon a wider, contemporary art culture and audience existing out there. Yet, the artistic discoveries and discourse coming out of this independent art culture, is not reflected back to us. Instead, we receive more of the same, marketed franchises. The central, mainstream version of contemporary art has found its allies within a global and corporate culture, where business dictate's art value. However, there is a spirit of artistic emancipation that exists and is thriving out there. It is self styled, self governed and liberated from the restrictive norms that dominate our mediated gaze, and this is what this paper is mainly about.

end of intro...

extract from paper...

"Institutions are in themselves sacred. If you challenge what is sacred you not only question the institution's posture, but also what it symbolizes to all those who receive the benefits of its reputed position of authority. Power is also sacred, and myths are bound up in procedures and presentations engaging in the currency of cultural 'importance'. The Tate's power comes from accumulation; its success is in managing and maintaining its vast collection of pictorial and sculptural objects for all to see. This is why the institution is cherished and seen as significant, culturally and nationally. From its collection it presents a 'finely tuned' version of Britain's 'artistic' identity. The Tate is the protector of collected, artistic memories and an ambassador of history and time, our history and time. The psychoanalyst, O. Brown insightfully describes this endeavour as archaic, "Archaic man conquers death by living the life of his dead ancestors." [15] (O. Brown 1959). The safeguarding of this 'curated' history fashions a situation where we are asked to trust its status as 'specialized', in issuing forth a viable definition of our national, artistic past. This power presents us with other implications. Because historical and cultural weight is given to the 'managed' entities within its collection - our gaze for lesser-known artists is diverted with an added presumption they are also

not as significant. The prevailing ideological governance of what is seen, determines our perceptions of what is of cultural value and significance, due to what is produced as visible and invisible. What is visible through the gaze of the dominant hegemony is then assumed as merit for 'special' attention, lessening the cultural presence of emergent forms of consciousness and more diverse, artistic pursuits."

I was very interested in Roddy's reference to Robert Filliou's notion of 'permanent creation,' which came up recently in an essay by Janet Sarbanes: "The Poiegg and the Mickeymaushaus: Peedagogy and Spatial Practice at the California Institute of the Arts." In this essay, Sarbanes describes CalArts as influenced by the Bauhaus in its approach to the "building" as structure for the development of new radical pedagogical techniques in arts education as well as the synthesis of the arts. More specifically, she points to Filliou's "Institute of Permanent Creation where anybody might make suggestions about what kinds of things might be investigated or looked at" as a transparent and open source approach to teaching and learning. The idea of "education as dialogue rather than as a transmission of knowledge" was a fundamental concept I employed in the online course I taught at CalArts last semester entitled Open Source Studio. (several participants of this community, including Marc Garrett, Ruth Catlow, Annie Abrahams, and Helen Varley Jameson, were guest speakers in the course)

Like Roy Ascott's reference to the 'gesamtdatenwerk' in his seminal essay, "Is There Love in the Telematic Embrace," I believe more than ever after teaching Open Source Studio, that the network and its tools can be used to shift art education into a less hierarchical and more peer-to-peer, collective experience; precisely where it belongs. In this sense, Roddy's suggestion of the political nature of networks-as-artworks also applies to the idea of the network-as-art-school.

My own 'utopia' in this regard is the post-institutional approach to teaching. I gave up on the idea of being "institutionalized" in my academic career several years ago, and now freelance for several Universities and art schools around the world. It is through this developing network that I see the potential of bringing students into an "open university" setting - no longer tethered to a single institution - through video-conferencing and other forms of networked learning tools. It is my hope that art students can reach out inter-institutionally and inter-culturally to engage in a form of collaborative research and production that is underutilized, but well within our reach conceptually and technologically.

I would be interested in related work in this area.

Hi all,

I'd like to pick up on a couple of things Randall mentioned.

For the (1,000,0)50th anniversary of Art's Birthday, following Filliou's dating, Art's Birthday, Wales (of which I am one of the organisers), was fortunate to have Joachim Pfeuffer come to Swansea to discuss his work with Filliou. Their principal project was the Poipoidrome - which is also 50 this year. The 'co-architects' describe the Poipoidrome as 'an artistic proposition for a centre for permanent creation.' At its centre is the Poipoiegg (mentioned in Randall's post). Joachim described how he introduced the idea of 'poipoi' to Robert, having himself heard about it from anthropologist Herman Hahn, whom himself had heard it from the Dogon tribe of Mali for whom it is a salutation marking an end or renewal of an exchange. Joachim and Robert visited the Dogon while an incarnation of the Poipoidrome was installed in the Pompidou in the late 70s. They wanted to discuss and show images of their project to the Dogon people. Apparently the Dogon described it as 'the house of good weather' or 'the house of weather luck'. Joachim mentioned that Robert often signed off his letters with 'weather luck', but that he only realised relatively recently that this was Robert's translation of the Dogon people's response to the Poipoidrome.

The Poipoidrome very much embodies the principles of Filliou's 'eternal network of permanent creation,' being a place for interaction, discussion, reflection, displaying, storing, creating, accessing and so on.

I was very surprised when Joachim stated that he never used the Poipoidrome as a pedagogical exercise or model during his time as a teacher. For me, the Poipoidrome stood precisely as an alternative model of pedagogy. If I recall correctly, Joachim was/is hesitant about presenting it as something that can be taught. I appreciate and respect his concern, but still hold on to my view that the Poipoidrome embodies an important alternative site and approach to learning. Of additional interest, Joachim, mentioned how he considers their work to address political issues that have yet to emerge.

Picking up on a thread from Ken: I certainly feel that the 'academy' provides a possible space for artworks that are not 'artworld' artworks (i.e. carry no market value). I say 'possible' because it's not about 'isolationist', 'pure' strategies that need totally avoid the artworld or market value. Rather, I am suggesting that the academy legitimizes and provides a support - network - (I think someone else brought this topic up too. I forget who, apologies), to say nothing of alternative funding streams, for such practices. Thus, keeping such ideas/practices in play. It also allows many people to feel comfortable being minor artists, producing minor artworks (best perhaps if I claim to be speaking for myself here). Afterall, one of the key features of 'the network' is its inclusion of the 'little people' - too much superstar activity would sink the ship. No room for masterpieces. And presumably the budget (if there is one) should be spread appropriately, as opposed to disproportionately. It is dialogical, not monological.

And on that note...

Hi Randall,

Glad to see you here, thanks for your comments. I really enjoyed participating in your recent Open Source Studio Global Concept Exchange on the work of Marc and Ruth at Furtherfield (<http://www.randallpacker.com/?p=2798>). It was there I encountered Annie Abrahams for the first time and have invited her as a respondent to this discussion here. We could talk about that event as an example of how your particular networked-pedagogic methodology works in terms of production, distribution, perception. I have some notes somewhere, if you'd like.

I asked a question then about Cal Arts in relation to cross-interdisciplinary pedagogy in relation to my own experience at Dartington College of Arts from 1998-2007, where there was a comparably experimental approach. There is a good relationship too between your Open Source Studio model and Filliou's interest in pedagogy in art. His artists' book 'Teaching and Learning As Performing Arts' (<http://www.leftmatrix.com/teachingandlearning.html>) is similarly dialogic in tone. Yours is digitally networked, his is materialistically analogue!

Best wishes

Roddy

Welcome Barnaby,

Glad of your comments. The Poipoidrome is an extraordinary example of conceptual-architecture. I've even thought it, in all its conceptual-ness, as somewhere between imaginary, freemasonic architecture and a virtual space similar to the online. There seems something something modernist about the identification of the Dogon in the work that I think deserves ethnological interpretation. It was fantastic that you had Joachim Pfeuffer in Swansea teaching but yes, why not as a pedagogical space? Would seem obvious.

Have you seen Jean-Jacques Lebel's 'Homage à Robert Filliou' at Artpool, Budapest? <http://www.youtube.com/watch?v=HhuVrRxoHo>. Filliou and Pfeuffer had constructed the Poipoidrome at the Young Artists' Club, Budapest in 1976 (<http://www.artpool.hu/Florus/Filliou/Poipoidrom4.html>) Making contact then with Filliou, György Galántai (whom I interviewed last year for this research) collaborated with him on 'Telepathic Music' at same place in 1979.

This contact with Galántai ultimately led to the reconstruction in 1998 of the earlier structure. (<http://artpool.hu/Installation/documents/Lebel-w.html>) and the curating of an programme that saw Lebel and other artists such as Istvan Kántor (<http://www.youtube.com/watch?v=frfcVJagtrzc>) develop intervention in the space. I think Istvan's 'Séance Filliou' is well worth watching.

Here is the online / offline divide once more though. If you watch the Lebel interview to the end, you'll hear him talk in English about the network 'without / before internet': a 'human network of and between artists from all around the world'. Other terms Lebel uses: 'autonomous', 'independent', 'critical', 'creative'. Also the Dogon seem replaced somehow by the gypsy ensemble, which again I find interesting. Is this the quality of 'independence', of 'autonomy' (presumably from discourses of the state and/or other institutionalised power structures) that needs protection from online instrumentalisation. Is the network better to exist invisibly and evade recuperation? Is the visibility politics of dissent within neoliberal democracy the wrong kind of participation and opposition?

Best wishes

Thanks Roddy!

I completely forgot you had attended the Open Source Studio (OSS) class with Mark, Ruth, et al last fall. My interpretation of Filliou's notion of the institute for permanent creation was to think of my graduate seminar as a permanent record in the database. Too often, education is a transient experience, with scant traces left behind in the personal notebooks of students and faculty. (Even more frightening is the proprietary system of Blackboard.) However, in the age of digital networks, everything can be preserved (ideally): every post, discussion, comment, reply, etc. In OSS, we used a Wordpress site to aggregate discussion, research, and production. What is particularly powerful about this in terms of the network, is that everything is indexible. Years from now, anyone who participated (or not) can retrieve some aspect of the work/dialogue and employ it as a link in a subsequent publication or project. In my limited exposure to Filliou, I had interpreted his idea as a digitally networked act of permanent creation in the context of pedagogy. Of course, this can be applied to any activity, but it is well within our means to engage education as a permanent knowledge base that is open and transparent and accessible.

For anyone interested, the Open Source Studio Website from fall 2012 is located at:
<http://oss.calarts.edu>

OSS was offered by Tom Leiser and his renowned Integrated Media Program at CalArts. And to add to Roddy's citation of one of my blog posts, here are all my posts detailing the project:

Does it matter if the network had / has a "common direction" that in any way, shape or form might be called 'political' ?
From: Clive Robertson
To: <new-media-curating@jiscmail.ac.uk>
Date: Mon, 11 Feb 2013 13:13:28 +0000

In considering what the network is or was – even before calling its project organizing an “artwork” (and what is the hoped for gain of this description – for whom is it being described as such: for artists, critics, research funders, taxpayers, etc.) it might be good to admit that Filliou’s concept of a an artists network as it gained popularity always looked different from the time and place of observation. Its signification was predictably altered by cultural change and by institutionalization. That is only to suggest that it meant something different for Brecht and Filliou, a lot of different things when employed by Filliou-inspired artist collectives and spaces of the 1970s, and so on along its paths to “re-discovery” and/or recapturing in the 21st century.

For me it matters that Filliou’s statements came prefaced with what amounts to a social critique. So when Roddy quotes Filliou saying, “Everytime we turn our attention to what we don’t know, we are doing research” the statement is missing its preface which is, “Research is not the domain of those who know; on the contrary it is the domain of those who do not know.” Was Filliou poking at scholarly specialists (that now includes many of us as respondents) / Probably. The set-up for announcing the Eternal Network/La Fete est Permanent is similar. “There is always someone making a fortune, someone going bankrupt – we in particular.” Does this suggest that artist poverty or precarity is a pre-condition for being a network member? Of course not. Filliou wrote, “As you can see, we included the fact of our being bankrupt as part of La Fete Permanente. To us, this an important element of the Eternal Network: including in it the harmful, painful or disagreeable things in life, as well as the pleasant, profitable ones.” (Teaching and Learning as Performing Arts, Verlag Gebr.König, Köln, 1970) It was (he writes) supposed to help wean artists off of their allotted competitiveness. But was it what we would now call a “safe space”? Was the network brought into being with any socially operational effects in mind? Think of Facebook, not as a corporate string pulling, but how we try to use it with our “friends.” What works and doesn’t work when we try to interact? We have some general sense of what gets approval in our specific node but not much else. Do we describe our earliest use of FB as an “artwork”? Speaking of and to the history of the network, I now want to detour via what Stuart Hall (co-founder of British Cultural Studies) wrote about that project’s history and the “will to connect” (“Cultural Studies and its theoretical legacies,” 1992). (This was v. useful for me when I was seeking a way to trouble my view of the history of artist spaces as a doctoral project.)

So while Hall acknowledges that cultural studies as a project is open-ended, “always open to that which it does not know yet, to that which it can’t yet name,” he also argues against pluralism and for the stakes (something at stake) of cultural studies. It will probably take a second post to get to the core of what I think the stakes of an collective artist practice could / might be in relation to a network and that has something to do with a present that appears to accept that the merging of functions of artist, curator, critic, and patron works out for the best of all involved. That collegial management is perhaps the only way forward for a brighter future!

Like our view of art (on good days) Hall reviews c.s. as “a serious project, that is inscribed in what is sometimes called the “political” aspect of cultural studies,” not he adds, “that there’s one politics inscribed within it.” The tension, Hall says, is “between a refusal to close the field, to police it, and fluency.”

So what if any is the significance of artists formulating and maintaining a network? Hall cites Raymond Williams who wrote that “the relation between a project and a (discursive) formation is always decisive because they are different ways of materializing...and then describing a common disposition of energy and direction.” (Raymond Williams, “The Future of Cultural Studies, 1989). So I guess from this follows a question of whether or not (or at least in what sense) in this discussion are we bothered whether the “discursive formation” we are hailing is about “art” or “artists”? And in its vagueness, does it matter if the network had / has a “common direction” that in any way, shape or form might be called ‘political’?

Date: Sun, 17 Feb 2013 18:22:00 +0000

Dear all,

This post is loosely intended as a response to some aspects of Clive’s lucid and meaty post of last Monday.

Clive opens by stating that we should ‘consider what the network is or was [...] before calling its project organizing an ‘artwork’ (and what is the hoped for gain of this description – for whom is it being described as such: for artists, critics, research funders, taxpayers, etc.)’.

On one hand this is absolutely right and necessary, and yet, at the same time, this makes a severance where there should perhaps not be one. i.e. for our discussion we are considering the curation of the network as artwork. We do well to remember that Filliou’s Eternal Network of Permanent Creation connects all artists across time and space. Just as we also do well to remember Filliou’s (amongst others’) project of ‘decommissioning’ the artist (the name, the role, the) and making time and space for everyone to see their activities in creative terms.

Personally, for better or worse, I was immediately pleased to see Roddy’s unabashed use of the word ‘artwork’ in the discussion topic title. While I have a lot of time for ‘decommissionist’ / revisionist antics and ideas, I also feel that we stray into the realm of delusion when we call our activities something other than art. However dose our work might come to political activism, social regeneration, therapy, philosophy, free market capitalism, etc. it is still art. If it wasn’t, we simply couldn’t frame it in these terms. I feel we can, and should, take some pride in art. Just as those in other fields should take pride in what they do. Art is only a dirty word if we make it one.

The way I approach my ‘network’ work is as an artist/curator. It means generating particular forms of creative/meaningful exchange with other people that might be different to other creative/meaningful exchanges. Eg. for Art’s Birthday this year we approached a local ‘specialist cake designer’ to make 12 cake designs chosen at random from 150+ designs that we had received following an open call. The ‘novelty’ (possibly the wrong word) of this nichochets through all levels (including Council Health and Safety regulations). So, something that might seem superficial can actually carry great complexity and substance – defined by and through the contributors and contributions over and above the concept. The importance of the concept, then, lies in generating something that can structure or frame or inspire the activities that really form the work. Needless to say, the cakes were eaten by all those who attended the Art’s Birthday celebration.

I suppose I have decided that I would like to spend a significant portion of my life taking part in creative exchanges. Sometimes I initiate them, sometimes I am invited to take part. Sometimes they go somewhere, sometimes they don’t. Sometimes I enjoy them, sometimes I don’t. I can either think of creative exchange as a whole, in general or I can break it down to a project by project basis. I see Filliou’s system playing on this tension between perceiving an endless stream of creativity and a compartmentalised, rationalised collection of things done and felt.

To end. An interesting issue thrown up by Clive’s post concerns what we consider ‘official’ theory/philosophy and how we legitimate ‘unofficial’ theory/philosophy through ‘official’ theory/philosophy. Clive brings in Hall and Williams to reiterate/support/substantiate Filliou. Following Clive’s intervention (as but one example), does this now mean that Filliou can be used in the same way as we do Hall and Williams? Are Hall and Williams now open to accusations of copying Filliou (given the sequence of presentations)? Or are they seen to be working in such separate fields that the congruence is merely coincidental, and purely affirmative of the shared project? Considering ‘La fete permanente,’ it occurs to me presently that what is at stake is the degree of importance we ascribe the ‘carnival’ to the ‘normal’ running of society and the terms of their relationship. Does ‘cultural theory’ et al belong to the carnival or to ‘normal’ society? And what kind or degree of impact do we acknowledge the two sides have on each other? Can we cleanly split these two realms? Is it inappropriate to do so? Should we look to Filliou and his collaborators for answers? Or to their inheritors? Or to other theorists and historians? Or to society directly?

...lurking on the edges...and just travelling back from the opening of

*"YES MAN DOES WHAT IT IS"

The editions of Galerie Erhard Klein

1972 - 2006*

<http://www.bonner-kunstverein.de/ausstellungen/aktuell/sieht-man-ja-was-es-ist-die-editionen-der-galerie-erhard-klein/>

highly recommended and hopefully can travel to the uk

a testament to a social network (rhineland) and one which influences such so much of our practice - be it new media or performative ...in the situation and encouraging new forms of social democracy

klein was is a clever fella and at the time had the curiosity to befriend-learn-deal: Polke, Beuys, Kippengberger, Klauke and so on

today's event was full of middle aged artists friends and family - but what i took from the event (apart from seeing wonderful artwork) was *family* and a reminder of how things just happen through groups of people swarming

and then of course there is the digital stuff....

more on that another day

Hi Mike (and all)

Glad to see the discussion tempted you out from lurking around the edges. I'm very aware that I've not been catalysing the discussion this week. Too many issues off-list at present. Apologies for neglected correspondence, I will catch up. I am still trying to find time to collate a list of things we might consider as 'networks-as-artworks' already referenced here and others elsewhere. Please do send links and perhaps a few words, needs be nothing more than that.

In the meantime, in preparing a lecture for first year undergraduate students on Duchamp, postmodernism and appropriation I was quickly searching for Filliou's view on how The Eternal Network 'replaced the concept of the avant-garde which has become obsolete' because:

"If it is true that information about the knowledge of all modern art research is more than any one artist could comprehend, then the concept of the avant-garde is obsolete. With incomplete knowledge, who can say who is in front, and

who ain't. I suggest that considering each artist as part of an Eternal Network is a much more useful concept." (<http://www.franklinfurnace.org/research/projects/flow/mailart/mailartf.html>)

Steven Harris has noted that Filliou 'equates art with knowledge here, and still retains a notion of art as research.' I am not sure I agree with this link with knowledge entirely, particularly in the case of practice-led research, unless it also refers to unconscious knowledge which I assume it does. Does this production of knowledge generate value, hence our scholarly interest? Does that institutionalise the practice as a form of capital? What then is its capacity for radicality, for critique ... what does this mean for notions of critical art practice?

In any case, while quickly searching for references I came across this information regarding the 'Digital Legacies of the Avant Garde' conference in Paris, April, 2012 (<http://digitallegacies.org/parispapers.html>) which I am kicking myself for not noticing earlier (i have to accept incomplete knowledge again). All good angles on the subject from a slightly different perspective but maybe Stephen Voyce's 'The Eternal Network: Avant-Garde Activism and the Cultural Commons' is particularly useful!

Have a look, perhaps it helps us expand our discussion. Anyone know of this conference?

Best wishes

Roddy

Re: Does it matter if the network had / has a "common direction" that in any way, shape or form might be called 'political' ?

From: Gary Hall

To: <new-media-curating@jiscmail.ac.uk>

Date: Sat, 23 Feb 2013 13:56:24 +0000

Maybe I can contribute by looping back to Clive Roberston's comments about Stuart Hall in relation to what the network is or was.

'So while Hall acknowledges that cultural studies as a project is open-ended, "always open to that which it does not know yet, to that which it can't yet name," he also argues against pluralism and for the stakes (something at stake) of cultural studies.'

As someone who still thinks of what they do in relation to various networks and curatorial activities as coming out of the history of cultural studies, at least in part (although my work these days has moved away from that, and I suspect is probably now unrecognisable to most in the field as cultural studies, and more or less deliberately so, for reasons I'm about to hint at), there are a couple of things that interest me about Hall's 'Cultural Studies and its Theoretical Legacies' essay.

1) First, there's Hall's acknowledgment in the same essay that the boundary line he is attempting to mark out around cultural studies by means of its politics is an 'arbitrary' one. 'I don't believe knowledge is closed', he writes, 'but I do believe politics is impossible without what I have called the "arbitrary closure".'

2) And second, the way there's a risk in Hall's use of the word 'tension' when describing these two aspects of cultural studies (what he's thinking here in terms of it's theoretical and political projects) of implying that each side in this relationship retains a more or less unified and stable identity which is equally valid; or that 'intellectual theoretical work' and politics exist in some kind of dialectic. Whereas I wonder if a more interesting way of seeing this relation is not as one of mutual transformation, where notions of 'theory' and 'politics' (and indeed 'cultural studies') are pushed beyond their traditional delimitations and forced to rework their relationship with one another.

If so, then it seems to me that we can't say, as Hall did at the 2007 'Cultural Studies Now' conference at the University of East London, that cultural studies is capable of questioning everything... except the

relation to the social formation; that what cultural studies does is analyse culture in relation to its connection to the wider social formation and that this connection is therefore sacrosanct. For Hall, theory is a detour from a larger question in this respect, which concerns rethinking the role of culture and its articulation with other structures and processes in each time and place, each conjuncture. This, for him, is cultural studies' real connection with politics, its political mission or 'common disposition of energy and direction' (Williams).

(Can we see a similar 'arbitrary closure' at work in the way that the intellectual theoretical work that is most acceptable and feted today is often quite materialist in tenor?)

Moreover, if, to quote Clive quoting Filliou, "Research is not the domain of those who know; on the contrary it is the domain of those who do not know." "I wonder if we can't also say the same of politics. In which case the trick, perhaps, would be to find ways of actually assuming what this means when it comes to politics and being 'political'.

Hope this helps.

Gary

Curating the Network as Artwork
From: Annie Abrahams
To: <new-media-curating@jiscmail.ac.uk>
Date: Sun, 10 Feb 2013 17:05:44 +0100

Hi list members,

As an artist living in France, I had to come across Filliou. It is hard not to. All art students learn about his work. But I did art school in Holland and it was only later on, when, living here in France, I met Ben Vautier, Jean Dupuy and Pierre Tilman, who are all somehow influenced by him, that I got interested in his work. But I am not very familiar with it.

My first question is what is the Eternal Network? On the internet it is translated as La fête permanente ??? (the permanent party?).

I have difficulties understanding what you mean by a network as artwork. I imagine projects like DIWO done by Furtherfield, their mailinglist netbehaviour, global communities like the ones around Upstage, Waterwheel or videoortex, to name but a few, might apply for this "title". Also probably some of my own activities like the Angry women and Huis Clos / No Exit projects and my involvement with the Cyposium touch on this...

I am also not sure I understand what a network-as-artwork is, and I ask myself (and you) what is interesting about considering networks as artworks?

I feel kind of uncomfortable with the idea that networks can be curated. I am not sure that is the right word to use, I think I would rather like to use the word care taking (I think Clive suggested that in his first mail), but there might be a much better word. Curating is a word anchored in the existing landscape of thinking and activating art as a commodity. As soon as we enter the global networks and want to think about these as possible artworks we can no longer use "old" terminologies if we want to understand what is happening. You can not understand communication using the internet by known standard and analytical tools. When I need to explain this in a simple way, I do that by showing, talking about, and acting out my piece A Big Kiss (online kissing is drawing with a tongue, exciting too, as all drawing can be exciting, but if you could look at me doing it, you would just see some strange, foolish gesticulations in the void)

I am interested in collaborative groupdynamics using internet technologies. I have no other goal with this than to understand and to experiment these. I am not sure as Randall seemed to be that these practices will lead automatically to less hierarchical, more peer-to-peer based relations. It depends on intentions, of the users, of the properties of the interface used and on how it is controlled, but maybe I am missing something and I

would be glad if someone pointed that out to me.

Maybe, maybe describing some facets of one of my projects might trigger others to write about other concrete, maybe more appropriate examples.

Angry Women started in 2011. ** It is an artistic research project on remote communication and collaboration using anger as a pretext, and, in the beginning it was also a project on female anger using webcam performances as a facilitator.

So far, besides a lot of email exchange, we had 5 performances with only ladies, one with only men, two mixed gender performances, but also several technical test and 2 online evaluation sessions. You can find videos, texts, performance protocols, analyses and written reaction on <http://www.bram.org/angry/women>. 48 People from different professional and cultural backgrounds (13 different mother tongues), participated, some only once others up to 6 times.

We are all very much interested in finding out how to communicate in a situation where we have technological advanced equipment, that makes it possible to be together in a shared environment while staying on our own, alone at home; we want to research our contemporary status quo of lonely togetherness.

This is related to exploring how a sense of "we" can exist in a group of very different individuals, what it means to think a "to be with" based on singularities. I hope to find a radical, plastic new interpretation of "we".

In our latest evaluation session we discussed the status of the project. For the moment it is my project. It needs a lot of caring, and for the needs of each participating individual, and for the overall context, for the "network". So, I am the who drives this network, it needs my attention, more attention than creativity, I guess, and it wouldn't exist if I had been a party animal. But during the online meetings and the performances, the creation is continuous, the party goes on and the relations between us have an eternal feeling (Filliou would probably like to participate) - only during - afterwards you feel as going home alone under a starry night ready for another periode of caring.

Yours
Annie Abrahams

Date: Sun, 10 Feb 2013 20:41:22 +0000

Hi all

Good to be swinging into the second week of the discussion. Thanks, Johannes and Annie for focusing minds on particular issues and questions. Also good to see we are beginning to see 'concrete examples' of network practice to discuss and evaluate. I will take a look a closer look at examples you offer, Annie, as well as work of other respondents and write in a later post. The main questions/issues you both raise seem to concern the usefulness or otherwise of thinking about networks-as-artworks, how to determine their success or failure and what role curating might have in these respects. These still seem to be areas needing conceptual clarification so we can move forward.

I think it can be useful to conceive of a network-as-artwork where production, distribution and reception integrate as closely as possible in the creative process. Typically, the institutional artworld conceives of these separately, often involving different agents of mediation: the artist being one, the curator being another, the critic and hypothetical 'ideal' spectator another still. This economy is well known of course and summarized usefully in Alloway, L. (1984) 'Network: The Art World Described as a System'. In: Alloway, L. 'Network: Art and the Complex Present'. Ann Arbor, MI, UMI Research Press, pp. 3-15. Hakim Bey has also equated increasing 'degrees of mediation' with corresponding interventions of 'Capital' (Bey 1994. Available at: http://hermetic.com/bey/radio_sc.html)

Clearly, this system places 'artists in a submissive role' as Clive notes and it's also not surprising that artists have regarded curating 'as a very corrupt discourse.' (O'Neill & Wilson, 2009. Available at: <http://www.ica.org.uk/Emergence%20>

by%20Paul%20O'Neill%20&%20B%20Mick%20Wilson+17186.twl). More than this, I remember reading recently – but cannot locate the reference! – of an artist or curator who realised that while for Marx the issue was ownership of the means of production, their own preoccupation was with ownership of the means of distribution/reception or something like that. If anyone can help me re-locate that reference that would be great!

In any case, the case for the network-as-artwork becomes clearer when regarded from this position. The historical backdrop of the 'dematerialisation of the art object', which while a somewhat erroneous term, does expand possible interfaces of aesthetic exchange to encompass always increasingly accessible communications technologies as well as discrete, bounded objects of beauty, fax machines as well as paintings. The communications interface, just as a conversation, requires co-presence and co-production of the aesthetic experience. This sense is typical of the 1960s and found too in Allan Kaprow's 'no audience, only participants' approach to the Happening (Kaprow 1968. Available at: <http://www.ubu.com/sound/kaprow.html>).

Much of this work clearly takes advantage of any and all communication technologies, especially those that could have global reach. Extending the capacity to be together in different places in the same liminal moment seems aesthetically to be the driver. There is an 'aesthetics of distance' here which actually depends on being separate from each other in space and time. The experience of this relationship, the intersubjective exchange across space and time, becomes itself the aesthetic 'object'.

Manovich (2001) already points out that Benjamin defines aura 'as the unique phenomenon of a distance' (224) not of proximity. We shouldn't necessarily assume an authentic desire to overcome physical, geographical separation between networkers: it is the romance of their geographical separation that becomes exotic and perhaps even an act of aesthetic love. Aesthetic experience, in my view and found I believe in Bakhtin, requires difference (non-coincidence) rather than synthesis of respective consciousnesses. Synthesis is often confused with empathy and thus thought of as an aesthetic event, where it is arguably more ethical. When the network-as-artwork 'fails' as Ken suggests and Johannes questions, is this failure understood in terms of aesthetic or ethical efficacy/sustainability? The difference between poetical and political economy?

These conditions all taken together mean arguably that Filliou and others becoming interested in the artist-networker position were in fact becoming engaged with curating. I was struck with Clive's view that 'curating (caring for) the network (as mutually authored projects) made sense as an artwork' which was very well put. I like this because it refers to curating as an activity as opposed to a job or career. I think Filliou and other networkers (e.g. H.R. Fricker and 'The Decentralised Network Congress') were behaving curatorially in setting/integrating the context of production, distribution, reception as an 'open system' in which to participate.

Two useful views on rethinking curatorial activity in the context of network-as-artwork:

For artists, Paul O'Neill again:

"The term 'artist curator', which once simply referred to exhibitions curated by artists, is applied by [Gavin] Wade to those practitioners using exhibition design, architectural structures, and curatorial strategies as a way of presenting themselves, alongside other artists, to create composite public outcomes". O'Neill, Paul. (2012): *The Culture of Curating and the Curating of Culture(s)*. MIT. p. 105

And for curators, CRUMB's very own Beryl and Sarah:

"Curators who are truly interested in the decentralised, dematerialized activity of network-based arts have tried to change their curatorial tactics to be more in line with the artists, even if that means being increasingly misaligned with the traditional institutions for the presentation of art." Cook, Sarah & Graham, Beryl. (2010): *Rethinking Curating*. MIT. p. 84

Rethinking relationships between production, distribution, reception (or at the risk of more hyphenating: production-as-distribution-as-reception, etc., etc.) is important and should welcome interventions from any perspective of hybridity and indeterminacy.

Hope I've explained my grounds for asking the question better!

Best wishes all,

Roddy

From: Johannes Birringer
To: <new-media-curating@jiscmail.ac.uk>
Date: Mon, 11 Feb 2013 13:41:31 +0000

just wanted to say thank you to Katja Kwastek for her illuminating review of the Transmediale, your sharp observations seemed to make good sense in the context of this discussion, and I was sorry of course to learn that Pluto was not elevated but remained confirmed-demoted, a poor post-planet.

as to your comment on PAPER, you mention the Post Digital Publishing workshop. >> A highlight of this was the keynote by Kenneth Goldsmith on conceptual writing, with the provocative thesis: "with the rise of the web writing has met its photography" - I don't think I really agree, but it is worth thinking about it - goes into the whole discourse of computability which was also represented by David Berry. >>

I'd like to learn more about this, could you elaborate or send me a follow up link? And how is this connected to the "discourse on computability" or to the theme that Annie Abrahams brought forward, on caring for/sustaining a possibly on-going creation (across/with network) or project involve both site and remote site collaboration.

I liked the example of "Angry Women", with its organizational and productive dimensions; and it reminds me of a small project a theatre friend of mine, Angeles Romero, started up in Houston, last year with young Latinas who were encouraged to use their cellphones to make short films working with the restrictions of the medium but developing a craft of the short film (one task was to do the scripting/story-boarding, shoot/edit in one day and upload to YouTube by the end of the day)...

... see an example here: <http://www.youtube.com/watch?v=DWdGgI3yGik&feature=youtu.be>

<http://www.youtube.com/watch?v=dn4gHbJkcZU>
or
<http://www.youtube.com/watch?v=ZltCSIEV8ag>

I think these wonderful, humorous and sometimes ironic yet also politicized "tiny" productions are part of a pedagogy of 'teatro espontaneo' that Romero developed in her theatre workshops in the Latino/a community, and they are now also testing the "re-mediation" possibilities of working with new media or social media networks. Now sure whether the group has developed a policy about "curating" the quick work on YouTube.

And why should they bother?

What is there is no role for curating in this connection? (Katja, did you not mention something about "Curating Youtube" in regard to Transmediale?) certainly for the young mobile-video-makers in Houston the curatorial question is irrelevant, i think. The creative production model, on the other hand, is not.

Hi Johannes

As I said, my fault. Too many serious work/life issues off-list. Am trying to catch up now. Apologies.

I'd welcome contributions from invited respondents especially those who have not introduced themselves.

Again links to relevant projects to build a resource list welcome - doesn't have to be essays.

Thanks all for patience with your faulty moderator.

Best wishes

Roddy

Curating the Network as Artwork
From: Tom Sherman
To: <new-media-curating@jiscmail.ac.uk>
Date: Mon, 25 Feb 2013 12:44:17 +0000

I met Robert Filliou somewhere in the 1970s, could have been Vancouver or Toronto. He had a lot of presence in his unassuming way. When he made reference to the Eternal Network I thought at the time he was referring to the spirit of curiosity and creativity that will always glow or bubble up or erupt around the planet. No matter how sour and stiff and roboticized our societies would become, there was always hope in youth and all those who refuse to stop playing. Filliou was one who joked around as if his and everyone else's life

depended on a sense of irreverence and frivolity and invention. I was fortunate to know Clive Robertson who had managed to fix and firm up Filliou's spirit in media, video and other deceptively modest media, including audiocassette editions, and later audio CDs.

I understood the practicality of Filliou's obsession with travel and connection and networking because I had interned as a boy sending out messages in Morse code as a ham radio operator from my bedroom in a small town in Michigan. I spent even more time DXing short wave and medium wave radio stations around the world and setting up 'tapespondence' networks through which locally originated reel-to-reel audio recordings were exchanged through the postal networks. We didn't have long-distance telecom access in late 1950s or early 1960s (the use of telephones was financially prohibitive). I figured out how to find out what was going on everywhere else and to manifest my own voice and participate in and invent global networks because I had to in order to survive. In rural Michigan there were few cultural options at the time: hunting and fishing, sports, car culture, alcohol, pop music and three television networks. I didn't know there were people like Robert Filliou and horizontal networks like Fluxus forming at that time, but I was starving for information and desperate to find others who weren't satisfied with the mass media culture of Ed Sullivan or Elvis Presley or Walter Cronkite.

Later I would realize that Filliou and artists of like-minds would understand that the sparks of curiosity and discovery could be amplified and highlighted through networks. I saw artist-run centres spring up and floods of mail art begin to circulate through and beyond this constellation of alternative institutions in parallel to commercial galleries and museums. Horizontality flattened verticality and became for many an ideal. Postal networks gave way to bicycled videocassettes and slow-scan television and photocopy and fax and primitive e-mail systems. Telephony, just a whisper of what it would become, was enlarging at an incomprehensible rate, kicked into light speed by analogue to digital conversion. Satellites and later fibre-optic undersea cables fired this mushrooming connectivity. The idea of 'communities of interest' became more and more apparent and necessary. Communities of common interests were forming concretely, suddenly, without the necessity of physical, in the flesh, communities. Kindred spirits were connecting ethereally and interactivity was arising like Brownian motion around the foundations, the ruins, of mass media. The phenomena of distributed authorship were becoming tangible. The economy of goods and services was shifting into the information economy—economies based on scarcity were collapsing as gift economies were emerging in rich cultures of abundance.

The weak signals of unpopular culture gained enough strength to form clear alternatives to mainstream cultures through networked exchanges. The electronic and eventually digital telecommunication networks accrued in layers of webs over obscure galleries and clubs, universities and town halls, those places were people actually meet. Everyone aspired to create difference. Anomaly was actually the norm for a while. But as culture was atomized into rivers and seas of individual voices (as we have become full transceiver cultures), differences have become less significant and people have become less interested in being different and more interested in being the same. Don't ask me why, I just know that this is true. Young people want to be part of a set of emergent identical behaviors, moving this way and that like schools of fish. Maybe this results from more and more consistent prompts from the mediated environment—a kind of engineered roboticism, the behavioral response to endlessly consistent instruction sets—or maybe there is simply too much risk associated with being different? (maybe it is only acceptable to internalize, to 'secrete' 21st century individualism?) One thing for sure, the connective tissues of networks are far more elaborate and comprehensive than ever before. We are flush with channels for trading messages. Telecom is simultaneously personal and institutional and evolving at unprecedented speed. Kindred spirits are no longer isolated by distance and time. Kindred spirits find themselves jam packed in overcrowded networks.

Where is Robert Filliou when we need him? 'We need artists with miners' hats, the helmets with probing lights mounted on them, to comb the clogged networks for signs of copious curiosity and playfulness. (Baseline inventiveness.) Where are those flaunting ignorance for a chance to celebrate what they don't know? Risky takers of chance. Lovely eccentrics. People who make our head hurt just being themselves. I think things have changed more than we think they have over the past fifty or sixty years. The kids are playing in seclusion with intelligent artifacts and far too many people are humanizing cats and watching dogs speaking in affected voices in the English language on their Apple telephones.

Dear list,

Armin: I appreciate your comment on the impossibility or otherwise of curating the net as if it were a giant ready-made. It may well have been possible to approach it from this angle at the time of Cosic, Shulgin, Lialina et al. Galloway expressed similar when he says net.art 'is dirty aesthetic deeply limited, but also facilitated, by the network [...] a type of art making that is a mapping of the network's technological limitations and failures' [1]. The pervasiveness of Web 2.0, particularly social media, has meant the network is more likely a spectacle, in the Debordian sense of 'a social relation between people that is mediated by images'. [2] I am not sure that curating the network-as-artwork is the same as curating the net as artwork, in the way I mean to explore it. I was ashamed of myself that prior to this discussion I had not read Tatiana Bazzichelli's 'Networking: The Net as Artwork' [3] but will soon try to resolve the question of whether there is a difference. Essentially, in my view currently, the Net is one network - perhaps the paradigmatic apogee of networking - but there needs to be a way the 'network-as-artwork' can affirm critique of its post-Web 2.0 pre-eminence. I agree entirely then with your view that 'We need to move beyond this situation and not just invent a new aesthetics but new forms of living, of co-operation, of exchange. Technologies will play a role in this, but not such a privileged anymore.' [4] This moves us closer back onto Filliou's territory of 'The Eternal Network' where we need to contend then, however, with the problems of materialisation again. I see you trying to do that with your FIELDS project and while I won't be able to take part would like to know how that turns out.

Ken: I also appreciate your attempt to think through different meanings of 'network'. If I follow, you seem to suggest one sense lies in artists' manipulating communications technologies for aesthetic ends (Nam June Paik, 'Art by Telephone', 'Omaha Flow Systems') - network as tool, perhaps - and the other being the broader context of networked communication itself, which in many ways transcends specifically art production. If this careful differentiation stands, then it probably benefits Filliou's conception of 'art being what makes like more interesting than art'. It is useful to think of your differentiation of networks-as-tools and networks-as-systems. Sure, The Eternal Network would need to fall into the latter category as an artwork as an ongoing system of relations rather than an as a networked 'artefact'. Your point of sustainability is valid to raise given the apparently 'permanent' nature of 'la fête permanente' ... but really how did Filliou mean this 'permanence' to be interpreted? I think his definition of 'The Eternal Network' - again from Clive's 'Porta Filliou' tape - refers to the 'eternal' aspect as 'la fête permanente' of the post-avant-garde, as what happens whenever 'through the collective efforts of artists ... artistic activity becomes just one of the elements.' [5] If artists collectively succeed in escaping the fixed positioning of the avant-garde as a dialectically-bound reaction and recoverable antidote to mainstream hegemony, then needing to circumvent the regulation of their activities as art could be important. The issue then is how to employ whichever criteria decide the efficacy of such a network or not. To move toward Clive and Gary's discussion of Stuart Hall elsewhere, I wonder if 'The Eternal Network' is a puzzle which resists the moment of 'regulation' in the circuit of culture that 'comprises controls on cultural activity'. There is also 'play' here as a critique of instrumentalisation and yes: I think Filliou is making mischief that's keeps us talking now. Maybe working out what 'la fête permanente' is a koan? Thanks for making 'The Wealth and Poverty of Networks' available [6]. I read it earlier in my research and it certainly works well as critique of Filliou that needs to be responded. Maybe the problem is in sticking to 'network' - we could argue whether Art's Birthday is a 'network' or not. I guess I am interested in it as a 'formation' and a 'networked formation' at that. Problem?

Gary: I really appreciate your excursus on Cultural Studies and Hall [7] and do sense there is an answer from that perspective to these problems - as I hint at in a very literal, uninformed way above - but I am going to have spend longer working through those issues of research and politics you raise - is Rancière useful in relation to finding ways to consider 'being political'?

Clive: "ideals Die" totally gets into the annotated bibliography - you know we all want to hear it! Upload a MP3 please, just for us! I also completely appreciate your idea of printing a small and cheap - as you say - edition reflecting the discussion that we can put up as a PDF on the CRUMB site, maybe? That'll also give us a reason to keep talking once this month is over and see where this current network formation can lead us. Brilliant idea, thanks very much for proposing. Everyone else happy with that, anyone want to join in particularly?

My hard dive is slowing down and I am getting unresponsive script warnings trying to filter the wonderful further material Helen, Gary, Ken, Clive and Tom contributed to the list discussion. This will form part two of my response within the next couple of days but there is certainly a wealth of links that we can add there to our bibliography of 'network-as-artwork' research. Thank you for your generosity, all.

Oh, Filliou, why are you one of those 'People who make our head hurt just being

themselves'? [8] Thanks for that in particular, Tom.

Network greetings,

Roddy

What is a Network?

From: Ken Friedman

To: <new-media-curating@jiscmail.ac.uk>

Date: Sat, 23 Feb 2013 06:26:17
+0000

Friends,

The question on why the conversation went quiet is a good one. I've been puzzled that many of those who agreed to contribute have not done so.

For myself, I can explain my silence. I've been thinking. It seems to me that there have been two meanings of the word "network" in use here.

One meaning applies to art works that use and mirror networked systems. Examples would be Nam June Paik's spectacular use of television networks in projects such as the 1984 television project titled "Good Morning, Mr. Orwell," the elegant 1969 exhibition at the Museum of Contemporary Art in Chicago titled "Art by Telephone," or my 1973 mail art exhibition at the Joslyn Art Museum titled "Omaha Flow Systems."

The other meaning is that of networks in the larger sense of ongoing systems that permit interactions of many kinds - networks such as postal systems, the World Wide Web, the Internet, or the global telephone network, as well as networks for news transmission, publications, or regular social and economic interaction. This is the kind of network that I was referring to in my somewhat pessimistic statement about the failure of artists to generate durable, functioning networks.

On February 7, Johannes Birringer asked me about a comment in an earlier post. I had written, "most of the projects, networks, and systems that artists try to build fail. I wanted to know why, and how to do better. This led me to questions in human behavior, sociology, and economics. I found general history and world history useful in examining how people have addressed different kinds of issues at other times and places."

Johannes wrote, "nothing could be further from the truth I think, it surprises me really that you claim this overwhelming failure. Ken, which is historically not accurate at all I'd think. (well, maybe I should speak from my perspective: most of the projects and networks that I tried to help build and sustain did work, and even if there are adaptations and modifications needed, they can be accomplished). I am sure many here know examples of organizational networks that worked."

What I meant, though, was not specific projects or art works using networks, but actual network systems that thrive and develop for longer than a year or two.

Any network can be made to function if one pours enough resources and funds in. The challenge is to develop networks that generate true networks effects, becoming more valuable and more effective as more nodes affiliate. Examples of networks that function and grow successfully have - at times - included the telephone and telegraph systems, canal networks, railroad networks prior to the

advent of trucking and then cheap air transport.

Robert Filliou and George Brecht's concept of The Eternal Network was a concept of community, not a concept for an art work. Projects such as Art's Birthday continue and flourish – but these use a network, they are not in themselves networks, and the constituencies and communities that generate them change, die, and flourish through revivals rather than the continuity the describes a network.

Johannes asked, “What did you have in mind, Ken? what projects, networks and systems?” I’d feel inappropriate describing the particular details of projects and systems that don’t work or didn’t. There is too little time and room for a robust, detailed analysis in a list conversation such as this. In a conversation where key participants are unwilling to post a first entry, I’m not prepared to launch a sociological and economic analysis of projects to which, in many respects, I was and remain sympathetic.

If artists have indeed created social and economic networks that function for more than short periods supported by massive external subsidies, it would be interesting to know of them.

In 2005, The MIT Press published Anne-Marie Chandler and Norie Neumark’s book *At A Distance: Precursors to Internet Art and Activism*. I wrote a chapter for the book titled “The Wealth and Poverty of Networks.” This chapter describes some of the issues that I feel describe networks, and I give examples of networks that succeeded and failed.

Interested list members can download a PDF copy of the chapter – produced with permission of the publisher – at URL:

<http://swinburne.academia.edu/KenFriedman>

One aspect of all networks is that they are lodged in a culture and a technological era. They are also subject to the laws of biology, chemistry, and physics. Therefore, all networks eventually vanish. The Sumerian civilization began nearly 8,000 years ago. A king named *Culgi* who rule 4,000 years ago was quite proud of his sophisticated network of roads with a postal service and rest stops:

“I, *Culgi*, the mighty king, superior to all, strengthened the roads, put in order the highways of the Land. I marked out the double-hour distances, built there lodging houses. I planted gardens by their side and established resting-places, and installed in those places experienced men. Whichever direction one comes from, one can refresh oneself at their cool sides; and the traveller who reaches nightfall on the road can seek haven there as in a well-built city.”

The Sumerian road system went the way of Ramses II and his works – as Shelley wrote, “Of that colossal wreck, boundless and bare The lone and level sands stretch far away.” One expects that Eisenhower’s Interstate Highway System will follow, along with most networks we humans have built.

The main difference between these and the networks I noted is that they flourished longer by giving rise to successful network effects with a smaller proportional inflow of external energy applied relative to the economic and social value they spin off.

For now, I’m happy to make “The Wealth and Poverty of Networks” available at:

<http://swinburne.academia.edu/KenFriedman>

Yours,

Ken Friedman

Reading the Network

From: Helen Pritchard

To: <new-media-curating@jiscmail.ac.uk>

Date: Sun, 24 Feb 2013 00:10:59 +0800

Hello,

Thankyou Roddy for the invitation to be part of this discussion and also thanks to the other respondents for their comments and thoughts so far...I have a few

tentative notes and responses and I want to start first of all with the notion of diffraction...

What is interesting about the questions you are posing is that in a way it sets up a space for productively reading ‘network culture’, ‘curating’ and ‘Fluxus’ through each other – as an affirmative process. Which could perhaps be thought of as the process that Donna Haraway and Karen Barad have described as ‘diffraction’.

[1] As Barad explains diffraction is a productive methodology and

“a method of diffractively reading insights through one another, building new insights, and attentively and carefully reading for differences that matter in their fine details, together with the recognition that there intrinsic to this analysis is an ethics that is not predicated on externality but rather entanglement. Diffractive readings bring inventive provocations; they are good to think with. They are respectful, detailed, ethical engagements.” [2]

Diffraction as a methodology is something we are currently exploring in the work I am undertaking with Jane Prophet [3], Winnie Soon [4] and Fran Perona [5] at the School of Creative Media, City University Hong Kong. In our research we have become increasingly interested in considering not just ‘reading’ the blind spots of theory against each other but also diffracting ‘practices’ through each other such as diffracting arts practice through the practice of nano science or the practice of archiving through the practice of network art.

Diffraction as Iris Van der Tuin explains, “is meant to disrupt linear and fixed causalities, and to work toward “more promising interference patterns” [6]. It is practiced by reading one text through another text and the rewriting. Disrupting the temporality of the piece and opening up meanings in new contexts.

I bring up this idea of diffracting practices through one another in response to Clive’s earlier comments about the possibility for curating as the network as a practice of ‘caring’ for the/a network/s and Marc’s suggestion that much of the work they engage with at furtherfield, artists/collectives such as YOHA and Platform, “meet, not through style or as part of a field of practice, but as contemporary artistic practitioners exploring their own states of agency in a world where our ‘public’ interfaces are as much a necessary place of creative engagement”. It also relates to Ken’s comments outlining the question “what is a network?” and perhaps - how we begin to become attuned to what a network is/ and or might be otherwise. The matter of becoming attuned - is something I was alerted to recently in discussion with Kathryn Yusoff [7].

It seems to me that many artists that engage with network ecology often use the methodology of diffraction to become attuned to its performativity - to what it includes or excludes in what Adrian McKenzie might describe as the processes of circulation [8]. Artists often diffract one practice through another to expose its blind spots - such as in the network reading group work “Common Practice” initiated by Magda Tyzlik-Carver [9]. In this work online reading practices are diffracted through the practice of curating and the practice of “commoning”. Not in order to control, order or stabilise these reading practices but as a way to become attuned to both limitations and the indeterminate possibilities of both networks and curating.

As Magda explains “the subject of my research which proposes to understand curating in/as common/s. If the common, as Hardt and Negri say (356), is discovered and produced through joyful encounters, then perhaps writing about curating in/as common/s should be also done with others. [10]

- more soon :)

Re: Reading the Network

From: Gary Hall

To: <new-media-curating@jiscmail.ac.uk>
Date: Sat, 23 Feb 2013 22:02:05 +0000

While we're waiting for Clive's remake of 'Ideals Die', perhaps I can attempt some speculations (one could almost call them 'inventive provocations' if they were more detailed) on what it might mean to think both research and politics as 'the domain of those who do not know' in the context of some of the contributions to the discussion so far. In particular, I'd like to try to find a way of thinking this idea affirmatively together with:

Clive's concern about having a 'common direction';
Ken Friedman's comments about the concept of The Eternal Network being a concept of community, and about the apparent failure of artists to create network systems that thrive and develop for longer than a year or two;
and Helen Pritchard's reference to the common, for Hardt and Negri, being discovered and produced through joyful encounters.

The latter brought to mind Nick Mirzeoff's disappointment with their book Declaration, on the basis that, for Hardt and Negri:

"'living information' is said to be gained by physical proximity. Thus, at the encampments "the participants experienced the power of creating new political affects through being together." While that seems clearly true, there's a hint of Romantic nostalgia in the evocation of the letter over the email and the distaste for social media. Entirely absent here... is any mention of the role of photography and moving image distribution. From the al-Jazeera feeds of Tunisia and Tahrir to the Livestreaming of Occupy, web-disseminated video has indeed created a new way of being together without which it's hard to understand the formation of global affinities that we've witnessed over the past 18 months.[1]

That in turn made me think of how - as we know from the work of Dymitri Kleiner and others [2] - the idea of the commons is a place where the interests of a large number of diverse groups, movements, organisations and constituencies - including network technologists, media theorists, artists, activists and curators - come together, but also exist in a state of 'tension' and are often demonstrably incompatible and incommensurable. For example, some in the Free Software community argue for copyleft which is a use of copyright law, but one that's designed to serve the opposite ends to those such a copyright or Creative Commons license is usually put. Instead of supporting the ownership of private property, copyleft defends the freedom of everyone to copy, distribute, develop and improve software or any other work covered by such a licence. Meanwhile, others question just how left politically copyleft actually is. Rather than preventing access to information and source code from being restricted, those on the political left tend to be more concerned with developing a free, common culture, and promoting the equal and just distribution of wealth among the creative workers who produce it. To this end, Kleiner himself advocates for copyleft to be transformed into copyfarleft, in which creative workers themselves own the means of production, and only prevent use of their works which is not based in the commons. Then again, many anti-intellectual property advocates in the Pirate movement argue against copyright and the use of licenses altogether, regarding them as remnants from a previous age.

Now all this could of course be taken as providing one illustration as to why it is difficult for network technologists, media theorists, artists, activists and curators to create durable, scalable network systems that thrive and develop for longer than a year or two - especially if we are attempting to understand the politics of the common in terms of a known 'arbitrary closure' (such as 'continuity' possibly?). Or, it could be taken as suggesting we should perhaps approach the question of community, of being together and holding something in common, a little differently - in terms of a certain conflict, antagonism and incommensurability, and thus as being not the domain of those who already know what community and the common are in advance, but more 'the domain of those who do not know'. It is something of this kind that Michael Bauwens seems to be pointing toward when he talks about the larger cultural and social shift: he associates with peer-to-peer networks of production:

'The fact that the commons interfaces with capital is not necessarily negative. It can be, but it is not necessarily so... Critics ask you to choose one or the other, and what I am trying to say is that it is not either or, but both. They are both happening at the same time, we are de-commodifying and we are commodifying, ... I find it really interesting that, within the system we already have, communal dynamics are actually happening. My point of view is not to take an

anti-capitalist view, but to take a post-capitalist view... I think that is what happened in the past as well. I do not think that the Christians fought the Roman Empire or fought Feudalism as such; they just created a world based on their new logic The people no longer believe in the mainstream system. They may not know what they want, but people in the French Revolution did not know what they want, and people in the Russian Revolution did not know what they want.[3]

All of which appears to provide another way of thinking community together with performativity. For (and I'm just speculating here remember) how might we set about creating such an (as yet) unknown community or world - especially if we're concerned to try to avoid the situation we've seen Stuart Hall fall into, where we're open to questioning everything... except certain 'arbitrary closures' that establish boundary lines around what we supposedly do know, such as politics and the relation to the social formation in Hall's case. Wouldn't we have to try to performatively create such a community via how we act as network technologists, media theorists, artists, activists and curators? And do so 'without any guarantees' (Stuart Hall again) that this would happen[4]

Let me try to illustrate what this might involve with the example of Graham Harman and his book on Bruno Latour, Prince of Networks (and I'm referring to authors and texts that are part of the networks of networks I help to curate and care for quite deliberately here)[5] Harman of course is known for advocating a 'new logic' via Latour and others, based on the argument that 'there is no privilege for a unique human subject', and that with this 'a total democracy of objects replaces the long tyranny of human beings in philosophy'.[6] However, even though Prince of Networks is available open access through re.press[7] that doesn't mean a network of people, objects or actants can take Harman's text, rewrite and improve it, and in this way produce a work derived from it that can then be legally published. Since Harman has chosen to publish his book under a Creative Commons BY-NC-ND licence, that would still be to infringe his claim to copyright: both the right Harman wishes to retain to be identified as the author of Prince of Networks, and to have it attributed to him precisely as a unique human subject; but also Harman's right of integrity, which enables him as a human being to claim it as his intellectual property, and which grants him the privilege of refusing to allow the 'original', fixed and final form of Prince of Networks to be modified or distorted by others, be they humans or objects.

So how might we begin to think about how we could act differently in this respect? Well, one starting point for doing so is perhaps offered by Lawrence Liang's troubling of the 'distinction between an agent who performs an action and the action that the agent performs'. Here, 'an agent is constituted by the actions that he or she performs, or an agent is the actions performed and nothing more. Interestingly, what this means when it comes to written texts - and this brings us back neatly to Helen's mention of joyful encounters - is that: to assert "This is my poem" within the social imaginary of intellectual property is to make a claim that sounds very much like "This is my pen", whereas in fact, it might be more accurate to think of its claim as the same as "This is my friend".'

txt from C-front 2001 (Plovdiv, Bulgaria)

Ana Peraica

A friend's three-year-old child was screaming into the toilet bowl, 'graaaandmother, graaandmother', while the parents sitting with guests in the living room were quite shocked, and slightly embarrassed. It took them time to understand that, if a child still in nappies saw that every apartment has almost the same toilet, and they all have holes, it logically concluded - they are all connected. And what is connected are not only toilet bowls [but, sorry for vocabulary but asses, shits, and sewers...].

A year ago, during the informal lecture of Andreas Broeckman on Oreste and Syndicate, a visitor, artist Rod Summers handed me an unpublished transcribed Robert Fillou speech, 'Eternal Network', dated precisely thirty years before, and speaking on the same topic. The text [1] spoke romantically about pre-existing networks, such as solar, biological, and others in pan-psychic terms of Nature as the One; divine, sublime, glorious... Then it shifted to the even more primitive religion related terms, of 'meditation', 'feeling'... a kind of a hippy 'being well with it', at the same time covering the other part of the phenomenon: its horror element 'of being included unwillingly', 'being absorbed', 'being small', 'being only a particle imprisoned'. It was not precisely, but nearly a version of the Shreber's anus-centric version of the solar network [2]. The speech was actually about the art of mailing, finding reasons for it not in art history, but within the theory of the Sublime. Established as a chain, after the death of the author, the network itself unfortunately ended up in the closed and therefore anti-networked circle of inner mailings, still active among forty-year-old artists, who were raised on marijuana on the shores of Maastricht, or around.

Humans can only be consumed in networks, as flies can in those of spiders' webs. And usually they are absorbed without knowing, without giving their real name. As, for the network the name is less important than the name of the network itself. The name simply is only a dot that holds the tension of the link, rope, of the road.

But after the time of fascination with the Network, with the own program network, a period of disappointment arrives... As in the net held by many of them after some time nothing is caught, only the garbage left behind by the activity of the network itself, its own digestion. Fragile due to holes, they all intersect, intervene each other, still holding own names. Good and bad networks: networks in the sky, sewer networks, street networks, spider networks, networks of the spreading of the pediculum pubis and other venereal diseases, spamming networks... They morph and become one another. If you are in the communal network of the city, necessarily you are also in the state system of communal activities, but also of all countries that direct the sewers to the sea.

But, the myth of the Network suddenly ended up in a variety of networks, rising and falling down. But then, as information flows, each of them at some period turns into an appendix, a footnote, a chapter of the other, in a different constellation.

Why don't you post it on the Syndicate? Did you read that on Nettime? Meeting with Faces? Well, wasn't it on the Rhizome Raw? X-change, 7-11... Report! Report! as in the army, the network asks for constant attention, constant care... It seems that the relation is inevitable. All networks sort people: into heroes, receptors and locally politically-correct subscribers. Emancipated e-mail heroes [as a parallel to the toilet network ones Zizek was writing on] form their own territories, their own enclaves, and then send their own programs, party posters all around... Other kind of existing people are passive, not posting, only reading and trying to catch up, use, find some sense... That is why networks die becoming parties, as Internacionala did, becoming a sort of 'being politically-correct', being pre-programmed, and establishing routes that one not only cannot escape, but must not. Party marriages, party suicides...

Is there a place for Icarus in Shreber's case? It is obvious on mailing - event lists: Oreste, Balkania... Once an interesting project, the Balkania list became one of those devastated territories of paradoxical actions of commercial advertisement, spamming, petitions etc... Brian, Nokia telephones, the Dalai Lama on life [2] visit it regularly. The once-interesting curatorial project Oreste became a closed daily report of individuals still having time for such a narrative, and posting html e-mails, and attachments. Digestion...

The scenario is the same - after exchanging some decent e-mails a list starts to slowly die and serves as a sub-list of the personal announcement list, there is no communication, no addressing. Everyone escapes, and finally - an abandoned list, a heaven from spamming. Collapsed networks, abandoned mailing lists, territories of the vampire spam artists as Integer, enjoying the political incorrectness, et.al. But even without being abandoned... mailing lists are open. Just subscribe and send a 'who' command to Majordomo that lacks protection, as happened to the McLuhan-list in 1997. Evacuation from the mailing list seems to be a general move of the networked society. Who gave you my e-mail address? [Unsubscribe... Please, please remove me from this list. Stop spamming!!!]

But a spammed individual net citizen should not be shocked. Wasted contacts, redundant greetings, are normal in any kind of network, although the frequency and dimensional problems of the electronic ones only underline the principle already existing: Networks raise and collapse. They are only events. Cohesion and dispersion are its phenomena. The absence of the networked individual from their own 'forced working place' is similar to Kafka's stories. After only seven days of absence either a computer crashes or the server... 'Receiving 25 out of 765 e-mail messages'. Subscribe before the summer holidays, that is the rule, - the server will not survive. In other days, fortunately Inbox assistants encountered this impossibility: just adding an e-mail address or the heading of the e-mail if it is a mailing list can release us from pressing Delete. And those individuals, always deleted are not noticed ... [or someone says 'You are on my Inbox assistant Delete from the server list, you are in my address book under the letter S, I reserved only for the 'Shit people'?' She told me that if you call she is not at home'.]

How to organize the universe of information and not to be killed by it. Some of the communication and total control freaks fear that something will happen when they are away and subscribe to the free SMS message solution, noting the arrival of e-mail. With every e-mail a mobile shakes, beeps, screams... Nettime, Nettime... Syndicate... Syndicate... Once, a long, long time ago, people were still saving newspapers even those bad ones, to wrap the fish, to use when cleaning potatoes, to put in the summer shoes cleaned up for winter storage. Still then, back on the streets of peaceful towns where colporters are selling the daily city newspaper... shouting, [BRIAN, BRIAN, SOLIDARIDAE COOOON BRIAAAAAAAAAN! Stop SHOUTING AT ME, Stop SCREAMING!]. With junk e-mail one can do nothing. But finally, they do not make such a waste as the plastic bags one gets in every shop as shopping is about getting rid of the plastic.

Robert Filliou published together with George Brecht the Eternal Network text in 1968 as a project of the La Cédille qui sourit.
Since then it was many times published, and circulated as manuscript as well. He coined many other largely known terms such as Poetical Economy, Fete Permanente, Création Permanente, still largely circulating. 'Snail mail goes on the web' - that was the slogan of mail artists already in the early nineties, and accordingly most of them migrated on the net. Maybe some mailing lists hold discussions about irrelevant questions, but Filliou's network seems to be eternal.

'Il n'ya plus de centre de l'art. Chaque artiste doit se considérer comme faisant partie d'un réseau' Robert Filliou - Eternal Network

Dear Ana, folks, auto replyer,

One of the fantastic aspects of the net is the immediate accessibility to the texts, sources, works, people. One minute search on the web is enough to acknowledge the context of a text, and find out that the Eternal Network text was published. One more minute is enough to overcome the impression that mail art circles were ever closed. For people with theoretical interest in mailing lists, networks, netart - the net will probably be a minimum reference.

Unfortunately I did not find your text in the nettime archives, as it is very raw and inefficiently organised. Contrary to such net archives, mail art archives already developed archiving, filtering strategies, and methods for organise information.

Art and media concerned BBSs, mailing lists owe a lot to the correspondence networks and movements, even the mailing list technique was developed in mail art circles, it goes back to the newsletter of Dick Higgins and the New York Correspondence School of Ray Johnson. Besides technical aspects, on the content level even nettime reproduced and interfered with many of the mail art and fluxus phenomena - intermedia, collaborative work, the multiples, the anticopyright movement, much of the netart, media art, visual poetry, copy art, censorship questions, radio art, sound poetry, fanzines, video art, computer art, alternative music, alternative galleries, museums, comes from the correspondence art and fluxus.

When about bulky correspondence art materials, many theories and concepts cover them very well, mail art theories in the first place, but the library of Borges as well, some notions of Flusser, the palimpsest (of Hakim Bey as well), heteroglossic forms of Michael Bakhtin - his theory of reverse culture covers your original text as well - hypertext, and so on.
When about legacy of ideas, would it be a coincidence that one of the moderators of this list comes from the American Fluxus circles, the other from the Advancement for the Illegal Knowledge group, the third close to the Marshall MacLuhan heritage - connected with Fluxus, as Marshall MacLuhan was first published by Something Else Press?

The concepts, theories, practices and attitudes of the correspondence art infiltrated not only mailing lists, but contemporary art practices - the call for artworks and papers for instance, its morality, its rules. The idea, the illegal knowledge which circulated through postal network on a global level became much more known and legitimate on a larger scale due to the net. Though many things originating in the correspondence art became more visible, some still wait to be discovered. Topics, methods as well. For instance correspondence artists adored trash, crab and junk, they very much explored and recycled it.

When about empty places in mailing lists, the squatters logic works, what's wrong in that? That logic brought up alternative spaces, alternative radios, alternative tv's, alternative art, alternative idea. Nokia is a spammer? Great! We found out! The Dalai Lama is spamming? Good that somebody reminds

me the question of who the Dalai Lama is! Integer was banned from the syndicate, nettime, rhizome and infowar list at the same time! First of all we all learn that these lists were connected, their moderators control (too much) and they lack humour. Her messages are overwhelming? Did we know before that messages can mix private and public, did we know so much about private and public feed-back, did we question content, language, filtering before? Didn't we learn something about hidden and visible aspects of the email? Did some mailing lists die out? Great! New ones come, and we will find out what is eternal.

There is already much said about spatiality of the net, many people explore utopia and atopia, virtual space, spatiality in general. Much less is discussed the notion of temporality, though some artists, theoreticians already struggle with this concept. At this moment my personal time perceiving is very much determined by the commercial s/censors of net-works, as the Hungarian Telecommunication Company lets me to work in the night with less costs. Robert Filliou did not wait the raise of the internet to formulate his theories, maybe we still need time, to properly understand his notion of time with the help of the new medium. Eternity is a religious notion! Which concept is not?
bests regards,
Anna Balint

Dear Ana Peraica,

I hesitate to write this in a way, but on the other hand, maybe it helps you.

If one pans through your Unsubscribe-text, one can not avoid to notice a certain number of words of hate and anger and so forth. Please do not lightly heartedly enclose people, who spent their life with ideas and beliefs, and over all materialised works, you might not agree to. I mean leave the Dalai Lama and Robert Filliou out of this first of all. It is so easy to play with words and so hard to live them. They both did or do. Robert, a friend of mine for 25 years (he exhibited his last work before his death in 1988 in our place <http://home.snafu.de/ruine-kuenste.berlin>), and the Tibetans, for which I am working since 1980 <http://home.snafu.de/ruine-kuenste.berlin/members.htm>, they have a complete

different idea of networks on this planet, which cannot be mixed up with 'your' materialistic one. And it is no argument to disqualify theirs with a disbelief in the eternal in general, as you propose. Roberts idea of the Eternal Network is so much wider and philosophical than any other existing or disappearing network in the net (and other media!) and so full of humour, that your feelings of a frightening underdeliberately being connected situation are just a surfacial misunderstanding. Read again and not only this text. I invited Robert for example to exhibit his Research of the Origine here in Berlin in 1974, there is a very good 'catalogue on it published in Düsseldorf and Berlin (Aktionen der Avantgarde, ADA, Akademie

der Künste Berlin) that year. Read, if you are interested my text on Roberts (Tibetan buddhist) philosophy, which can be clearly seen and proven in his works by the one, who know buddhism. (Wolf Kahlen: Une chose en t'e te ou piece qui s'effilochent. A propos de EIND.UN.ONE.... du point de vue bouddhiste de Robert Filliou, in: Robert Filliou, poet, Galerie der Stadt Remscheid 1997).

It is the same background as Brancusis, who believed all his life, he was a reincarnation of Milarepa. Anyway, to make it short. Your connotations and associations regarding Filliou's network-idea have absolutely nothing in common with your main issue, the other kind of networking. And by the way: I had a strange feeling, as if your sewer story was (perfectly fitting but) invented, it fits more to the mood of the rest of your words...or am I mistaken?

With good wishes
Wolf Kahlen

Dear Wolf and others,

| I mean leave the Dalai Lama

so, I am sending spam bibliography. I thought 'Dalai Lama on life' was known in net circles... But there are always people that are black holes in the network.

So Wolf - delete message / otherwise bad luck or try to find the list with subscribers as on the Nettime, and you are happy till the end of the life :)

Others, sorry for spamming!

ana

In need of some improvements in your life? If so read on...

A Message from the Dalai Lama
Just a short Buddhist outlook on life. Do not keep this message. The mantra must leave your hands within 96 hours. You will get a very pleasant surprise. This is true, even if you are not superstitious.

Take into account that great love and great achievements involve great risk.

When you lose don't lose the lesson.

Follow the three R's: Respect for self, Respect for others and Responsibility for all your actions.

Remember that not getting what you want is sometimes a wonderful stroke of luck.

Learn the rules so you know how to break them properly.

Don't let a little dispute injure a great friendship.

When you realize you've made a mistake, take immediate steps to correct it.

Spend some time alone every day.

Open your arms to change, but don't let go of your values.

Remember that silence is sometimes the best answer.

Live a good, honorable life. Then when you get older and think back, you'll be able to enjoy it a second time.

A loving atmosphere in your home is the foundation for your life.

In disagreements with loved ones, deal only with the current situation. Don't bring up the past.

Share your knowledge. It's a way to achieve immortality.

Be gentle with the earth.

Once a year, go someplace you've never been before.

Remember that the best relationship is one in which your love for each other exceeds your need for each other.

Judge your success by what you had to give up in order to get it.

Approach love and cooking with reckless abandon.
FORWARD THIS MANTRA E-MAIL TO AT LEAST 5 PEOPLE AND YOUR LIFE WILL IMPROVE.

0-4 people: Your life will improve slightly.
5-9 people: Your life will improve to your liking.
9-14 people: You will have at least 5 surprises in the next 3 weeks.
15 people and above: Your life will improve drastically and everything you ever dreamed of will begin to take shape.

Dear Ana,

please make the source of the mentioned Dalai Lama 'chain letter' public, of course I received such a letter by several people. I just smiled about the chain method, text itself is good, but to me it does not fit into His Holiness' way of teaching to give promises like the Popes of Rome at Luther times, so please open your archive and I am the first to start tracing the spource and finding out myself and if necessary to apologize. I must not tell you how easy it is to forge messages in the net, right? By the way, was it really you writing the last response?
Good wishes Wolf

Hi Wolf,

I don't know the source of the chain letter, but it really striked me that in the same context (as my friend who is analysing and collecting spams, Darko Fritz, noted) that so nice sentences are mixed with cursing. I received it a long time ago, of course deleted it, and it took me time to find it again (I found it published on the commercial page <http://www.thefunside.com/lama/> not in the spams archive (usually there are only those market ones).

I don't think anyone can trace who wrote it (and I would recommend you not to border with that), as with each re-sending not only the e-mail address, but also the server name of the sender changes). But surely I don't think Dalai Lama wrote it himself, but it is a kind of a bad new age phenomenon, that combined with the childish form of a luck chain letter. I saw many of them in my childhood in a paper format.

I just send it to show I was not writing on Dalai Lama (as I already wrote it in reply to Anna Balint) but on this spam in particular, whose title is Dalai Lama on Life. As you might follow in the text, it is appearing only in context with Solidaridae con Brian (which is one of the most cruel spams I ever saw), and Nokia telephones (the one spread recently around). I didn't feel like writing again the defence - I did not wrote Dalai Lama, but Dalai Lama on Life (that most of people on the net know what it is).

Yes, it was my message, the last one (if you think with this spam copied). I was joking... Don't take it seriously... I just felt uncomfortable sending it in real on the Nettime that has thousands of subscribed people, and the message itself writes:

of 15 people and above: Your life will improve drastically and everything you ever dreamed of will begin to take shape.

so I wanted them to know how happy I might be, that I might become a witch that if dreams a nightmare can produce a harm around.

The same refers to your defence of Fillou (I was not writing on him also... but on the materialisation of a model of all - including networks, that might have problems with all-inclusion, that is highly theoretical and known in theory of metaphysics; if God is all-including, he is also including Evil and so on...).

[Once I spent hours enjoying Ben Vautier's work called 'The Postman's Choice'. It was a postcard with two different addressees on each of its sides.]

'Il n'ya plus de centre de l'art. Chaque artiste doit se considérer comme faisant partie d'un réseau' Robert Filliou - Eternal Network

Dear Ana, folks, auto replyer,

One of the fantastic aspects of the net is the immediate accessibility to the texts, sources, works, people. One minute search on the web is enough to acknowledge the context of a text, and find out that the Eternal Network text was published. One more minute is enough to overcome the impression that mail art circles were ever closed and kill roots without appropriate understanding of the context. For people with theoretical interest in mailing lists, networks, netart - the net will probably be a minimum reference and relevance. Unfortunately I did not find your text in the nettime archives, as it is very raw and inefficiently organised. Contrary to such net archives, mail art archives already developed archiving, filtering strategies, and methods for organise information.

Art and media concerned BBSs, mailing lists owe a lot to the correspondence networks and movements, even the mailing list technique was developed in mail art circles, it goes back to the newsletter of Dick Higgins and the New York Correspondence School of Ray Johnson. Besides technical aspects, on the content level even nettime reproduced and interfered with many of the mail art and fluxus phenomena - intermedia, collaborative work, the multiples, the anticopyright movement, much of the netart, media art, visual poetry, copy art, censorship questions, radio art, sound poetry, fanzines, video art, computer art, alternative music, alternative galleries, comes from the correspondence art and fluxus.

When about bulky correspondence art materials, many theories and concepts cover them very well, correspondence art theories in the first place, but the library of Borges as well, some notions of Flusser, the palimpsest (of Hakim Bey as well), heteroglossic forms of Michael Bakhtin - his theory of reverse culture covers your original text as well - hypertext, and so on. When about transmission of idea, would it be a coincidence that one of the moderators of the nettime list comes from the American Fluxus circles, the other from the Advancement for the Illegal Knowledge group, the third close to the Marshall MacLuhan heritage - of course connected with Fluxus, as Marshall MacLuhan was first published by 'Something Else Press'? The concepts, theories, practices and attitudes of the correspondence art infiltrated not only mailing lists, but contemporary art practices - the call for artworks and papers for instance, its morality, its rules. The

idea, the illegal knowledge which circulated through postal network on a global level became much more known and legitimate on a larger scale due to the net. Though many things originating in the correspondence art became more visible, some still wait to be discovered. Topics, methods as well. For instance correspondence artists adored trash, crab and junk, they very much explored and recycled it. They very much liked to recycle idea as well. When about empty places in mailing lists, the squatters logic works, what's wrong in that? That logic brought up alternative spaces, alternative radios, alternative tv's, alternative art, alternative idea. Nokia is a spammer! Great! We found out that they traced the list or they sponsored it? The Dalai Lama is spamming? Good that somebody reminds me the question of who the Dalai Lama is! Integer was banned from the syndicate, nettime, rhizome and infowar list at the same time! First of all we all learn that these lists were connected. Their moderators control (too much) and they lack humour - or the time did not come when people accept no censorship, no jury rules. Her messages are overwhelming! Did we know before that messages can mix private and public spheres, did we know so much about private and public feed-back, did we question content, language, filtering before? Didn't we learn something about hidden and visible aspects of the email? Did some mailing lists die out? Finally! New ones come, and maybe we will find out what is eternal. It might be anything which breaks everyday routines. There is already much said about spatiality of the net, many people explore utopia and atopia, virtual space, spatiality in general. Much less is discussed the notion of temporality, though some artists, theoreticians struggle with this concept. At this moment my personal time perceiving is very much determined by the commercial s/ censors of net-works, as the Telecommunication Company where I am connected lets me to work in the night with less costs. Robert Filliou did not wait the raise of the internet to formulate his theories, maybe we still need time to properly understand his notion of time with the help of the new medium. Eternity is a religious notion! Which concept is not?

bests regards,
Anna Balint

Hi Anna, and others...

I am receiving so much of e-mail reactions.... Unfortunately interesting writings arrive to my own address, not to lists, and seems the problems of censorship, moderation et. al. are very hot, at least on two lists (Syndicate and Nettime the first). Censorship seems to still be the topic people prefer to discuss in private... I would try to write the reply and ideas I have got in one single e-mail as replying this would take some time... (of summer).

For myself, though I didn't want to get involved in the historical development of networking, the ideas of creators etc. as my interest was not at all to point on its artistic or others rhouties, but to go a step further, which I found interesting - critique of the network, fallen promises and end of the hype. For the de/scralisation of it, because of using only a single way of interpretation (which I tried to avoid more literally by comparing networks of the veneral diseases, urbanistic ones et. al) many were not ready.

But in this reply of Anna I found several topics that were of my interest; bulk e-mail and (self - if taken as an independent body) organization. Maybe this discussion is now too particular (located) for the theory, but nevertheless...

Anna wrote:
> Integer was banned from the syndicate, nettime, rhizome and infowar list at the same time!

As far as I know Syndicate is unmoderated; of course, question is how this democracy of all-can-post becomes at one point the tyranny of a single person, and suffers from the reversal of the quality. Two days ago I got the reply of Andreas as my e-mails were not getting through; and I made a joke on

>> either seems someone unsubscribed me in real, or there is a censorship on the Syndicate, but my e-mails (UN-art and
>> Unsubscribe texts) are not passing to the list since yesterday. I checked the archive, and they are not there too. And I was >> thinking also how to send something entitled Unsubscribe in the body of message, so I put the star* before the title, >> hoping Majordomo will not recognize as a command. But seems a human agent did... They like to be commanded probably!

Andreas wrote:

> the syndicate has no moderation but admins who help people who are too lazy to adjust to the technical rules of
> majordomo to get their stuff on the list.

Michael Benson wrote:

> Maybe, as with nettime, we can make two lists -- one featuring 8/10ths posts by whatshername and one without. That
> way people don't have to go to the trouble of filtering out the crap, they can just freely choose, and meanwhile accusations > of censorship won't have to be slung so freely around.

Anna wrote:

> First of all we all learn that these lists were connected. Their moderators control (too much) and they lack humour - or the > time did not come when people accept no censorship, no jury rules.

Now, I am again not sure on this point; whether it means connections of moderators (and then a kind of conspiracy) or the connection of subscribers / subscriptions, and then merging of networks... For the first I think it is totally the opposite, but the second one is the truth.

Anna wrote:

> Didn't we learn something about hidden and visible aspects of the email? Did some mailing lists die out? Finally!

That is what i think too.

(end that falls out the discussion)

> Eternity is a religious notion! Which concept is not?

I would rather say which one is not political; maybe it is a matter of interpretation, so I don't quite consume religion, or its notions.

Note: Nokia telephones and Dalai Lama on Life are spams... First one is a commercial spam, and the second a spiritual one (chain letter that ends up with a course).

Re: <nettime> On the state of net ar
From: Florian Cramer
To: nettime-l@bbs.thing.net
Date: Wed, 4 Dec 2002 14:12:35 +0100

Since many people responded to me off-list, I should write a postscript to my posting. Everyone seems to have overlooked that the correspondence between John Berndt (a Neoist and experimental musician from Baltimore) and Lloyd Dunn (editor of the Mail Art/anticopyright zine PhotoStatic/Retrofuturism and member of the Plunderphonics collective Tape-beatles) was taken, to quote myself...

> From: PhotoStatic no. 37/Retrofuturism no. 10, August 1989
xxxx

There's of course no point in denying my prankish intentions. Still, I didn't alter the wording of the original correspondence, but only bracketted out parts which referred to non-digital media (such as audio tapes and print magazines).

By the late 1980s, the term "Network" (via Robert Filliou's coinage of "The Eternal Network") had largely overcome the older label "Mail Art", thus embracing all kinds of fringe activities and (to use a term by Inke Arns and Andreas Broeckmann) "small media" which mainly circulated via

personal snail mail.

Practical proofs are book titles like "The Magazine Network" by Géza Pernecky [1991] or "Networking Currents" [1986] and "Eternal Network" [1995] by Chuck Welch. The whole range of pre-Internet network culture comes better across, though, in Ivan Stang's book "Heigh Weirdness by Mail" [Simon & Schuster, 1988] and in back-issues of the review zine Factsheet Five, or, respectively, the book "The World of Zines" compiled by Factsheet Five editors Mike Gunderloy and Cari Goldberg Janice [Penguin, 1992].

So it's perhaps not too accidental that internal debates on "network culture" and "network art" from 1989 could be easily recycled into contemporary net culture/net art discourse.

-F

Another postscript concerns McKenzie Wark's Nettime review of the Ray Johnson exhibition and his mention of the COPY LEFT | COPY RIGHT in particular. In my private archive, I found a 10-volume Mail Art edition published in Zurich in 1985 under the title "copy-left, work in progress, pornographic - erotic - body art". The cover emblem is a copyright sign flipped horizontally:

```

"How are you finding net/web.art in comparison to mail art?"

My dear Jim,

Accidentally I have some memorandums on the topic that you ask me. I prepared them in order to respond to my dear friend's FAGAGAGA comment. If you permit me I send you them so that you pass it to the net of our friends.

--

Mail Art and Web Art

"Reading the commendations of nowadays to the Internet and investigating the individual websites, we remembered that the mailartists has been making the same activity 10, 20 and, sometimes, from 30 years ago. The decentralization of the art and the communication to distance from the art centers of the world, in charge of the artist-s-mail, they happened many before the World Wide Web".

Fagagaga, 15 of Nov. '99, personal letter to me

The things don't happen scatteredly, all are linked. The art in the Net of nowadays is not casual and it is originated, certainly, in Mail Art. Who have been the objectives of the art mail from its beginnings in the first

experiences of Ray Johnson of half-filled of the 60s, but the communication and the interaction? Ray sent uncompleted works to his friends so that they ended them. Born from that original project, nowadays the Mail Art, already at the end of century, preserve with great difficulty its force and its impulse in spite of the changes caused by the scientific and technological advances and the foregone absorption of the market. It is true that so much years of validity have weakened that remotion of values and that today a growing institutionalization, absorption and banalization are attended, on the part of the stablishment, of the principles that consecrated to the communication like only representative of our art, above the inconstant and whimsical artistic fashions, the more than the times imposed by the market of the art. The decentralization of the art is an implicit phenomenon in the art mail because a current of artistic specific expression centralized in an is not "ism" (like Surrealism or Abstractionism, etc.) but of an artistic form that admits any half or support and any aesthetic well-known current and by knowing: "The Eternal Network" of Robert Filliou, the utopian project, perhaps unreachable, of the permanent communication of all through all the available means.

Even we suffer the confusion or false contradiction between art and communication. The artistic product is, above all, a product of communication and therefore part inseparable of the social production. On the other hand, the same as the rest of the products that the man creates, is constituted in aiding of that same production (upon favoring or hinder its processes). In some contexts its nature "artistic" will prevail (museums, galleries, classes, etc.). In another one its nature of instrument of communication will prevail. But, both facets are inseparable. In this particular form of art (since it is a symbolic form of expressing our reality) prevails the value of use above the merely mercantile or of change. The components of relationship of communication (or faticas) prevail and predispose to the talkative act.

There is, perhaps, the reasons of its persistence like current of artistic expression: it don't take place for the market of the art, for which it isn't sold neither there are juries that select the works, neither limits in relation to the techniques employees neither in relation to the currents of ideological expression or aesthetics, not refund, etc. Neither interests the artistic, either literary gender, plastic, musical, even the own presence of the mail-artist could be considered as talkative act (like Turism Art, derived of the Mail Art), etc. Lastly, neither there is categories neither elites, neither upper-class neither beginners, neither leaders neither submissive, neither obligations of no nature. One could enter and leave from the nets of communication without no problem. However, fruit of the progressive merchandising of the Mail Art is begun already to appear groups of artist-s-mail that, with the pretext of conserving and improve the aesthetic levels and of assuring the edition of good catalogs, they are organizing exhibitions for invitation sponsored for Galleries and Institutions applied to the market of the art.

Would Networking (name that adopts the Mail Art upon adding another means of communication to distance like fax and electronic mail), be pointing out the new road that will travel the art of the 2000 in order to resume its primary function of communication to the service of the community, before the money and the merchandising come to corrupt those tacit mechanisms? Nowadays, of face to the 2000, many critics are surprised of the character masive and interactive of the art that is generated in the Wegsites, without knowing that those nets and those characteristics already existed from ends of the 60s., in the artistic work of those pioneers that saw in the communication to distance or Mail Art the means for which diffuse their ideals of understanding between all in a climate of respect, happiness and worthy life. Who don't remember those booklets or postcards that we arrived with the application that you will add something and pass to other artists in the net (the "add and pass on") or those postcards to which should we make give the turn to the world through the mail conserving the postals stamps and the postmark? Or the incomplete leaves of stamps of apocryphal mail that we should complete? Or the accusations against the violation of the human rights and against the outrage of the dictatorships? And the exhibitions in pro of the freedom of political prisoners (like, for example, Mandela in the 70s.) or for the right to the sovereignty enslaved of the countries (like, for example, Cuba and Panama), etc./ And many, many other projects. In fact the interactivity and the communication are the foundations that sustain the nets of Mail Art. And those basic characteristics have been transmitted the Networking and to the Art in the Weg.

Fraternal greetings,

Date: Tue Jun 19 00:37:36 AEST 2018

3 3 3 3 3 3 3 3 3 3

HELLO

I dont know if you can hear me, I can hear you but I dont know if a good connection it keeps breaking o

Thank you Shu Lea for the invite and I dare you I have read all the communication that has been going on and I am sure I did not at all understand it but then it is not understanding that I crave but inspirazione.
I medias res. A topic to start from.

3 3 3 3 3 3 3 3 3 3

The network within me (cave: relates to immersive species and the before mentioned DNA fingerprints)

I have a vast genetic network within me.

24% Celtic/Hallstatt

21% Greek

20% Eastern European

13% Scandinavian

06% Northern African

05% Italian

04% Finnish

03% Ashkenazi Jewish

02% West European

02% Central American

01% Nigerian

I am many. I have gotten these results about 3 months ago. I am watching my relationship to far away netnodes of natures and cultures. I watched the GERMEX game yesterday knowing that I am I tiny bit Mexican too. Does it make a difference? Or is my love connection to Mexico more relevant? Or is there a love connection because of my genetic network?

3 3 3 3 3 3 3 3 3 3

What does it mean to be indigenous? (As my father is from the Hallstatt area my Celtic roots are my indigenous roots)

I know I have never had any understanding of Western Europe and this mirrors in my genetic network.

Being pregnant with my first child re-taught me what it feels like to be not-one — looking at my genetics I feel relieved to be not one but many.

I am wondering how does my genetic intranet connect to the internet.

I would like to discuss with you as DNA fingerprints were already mentioned before - the implications of this kind of DNA fingerprinting

I would like to discuss with you about the immersiveness of our all genome I would like to discuss with you.

As a note: immersive species might really be a problematic term (I guess the immersive species themselves would argue such) - but I do think that there are immersive predators - as pointed out with the island/cat example.

3 3 3 3 3 3 3 3 3 3

Postscript: I am not a theoreticienne - neither am I very versed in contemporary art practice besides my own. My influences are strictly Mozart Hallstatt Culture Marilyn Manson Rammstein KLF Kenyan Newspapers Montessori Macroeconomics Thinking Local Acting Global Norwegian TV Series Trees and Stones and <https://youtu.be/awYiMRIMKMc>.

Postscript02: at UBERMORGEN we are currently working on making art for the alt.right. this is more bout undermining the current networks of the heartless psychopaths, we can talk bout that later if ya want.

DNA kits have become hilarious, painfully unaware self parodies of the will toward cultural appropriation. (Just for one example: <https://www.youtube.com/watch?v=84LaTrQ2u88>) Of course I say this as a citizen of the U.S. Our context is particular and perverse, one in which some substantial proportion of the white population believes they are in the "blood line" (we still have a lot of strong premodern beliefs like "the blood"...) of indigenous North American peoples. Most of whom we killed, so the common case of whites who make very strong claims to native ancestry is particularly perverse. It is only ~100 years since the open, armed hunting of native people was still taking place here, basically unopposed by civil society, even in now liberal California. Actually I live in one of the last places in the US where this genocidal practice was commonly practiced, and is well documented. But people in my state hardly own up to it, and my own University system is deeply implicated. (Look up the history of Kroeber Hall at Berkeley, for example.) To put a personal spin on the matter, I have a couple of true believers in my own very white family. Honestly, people who have "dream catchers", believe they are part of a tribe - they are not registered and can not register with any actual tribe - and who believe that their blood puts them in deeper touch with the spirits of the land. I am not popular at family events, as you might imagine;-) Calling these false beliefs out, even among whites only, is still quite incendiary here.

An other example of the obscene nature of this common identity theft comes in the figure of US senator Elizabeth Warren of Massachusetts. She was raised with these false beliefs, that she had natives in her family tree, and yes I do believe she has suffered a lot of well deserved embarrassment in the process of slowly coming around to personally owning her false family narrative. She is an otherwise sympathetic figure in most ways, and I should note, our president has belittled her in an explicitly racist manner, demonstrating the continuum between the soft and hard forms of racism in my country.

DNA is fraught, we should be very careful call it out when we see it used as an identity prop for cultural appropriation. Our networks are full of this kind of theft and positioning, as if such reductive DNA results can possibly mean more than our experience within the more tangible web of social relations; how we individually experience privilege and discrimination. (Including generational effects.)

Or that your DNA is what makes you a German or a Scot, as in the ridiculous commercial for Ancestry[.com] But in the US, the commercial shows how common these weird and often racist beliefs are. It is so sick, I feel like there must be lot of cultural specificity to it. I'd love to hear about how these DNA kits are playing out in other places.

[-empyre-] rehearsal of a network - [week 3]

From: Christiane Robbins

To: <empyre@lists.cofa.unsw.edu.au>

Date: Tue Jun 19 10:33:04 AEST 2018

Brett,

I couldn't agree more in that DNA kits are ripe for parody ... the clichés the stereotyping, the narrow bandwidth of race is utterly sophomoric and misleading. That said, I take issue with the focus of your position below - the "will toward cultural appropriation", identity theft and the rush to judgement of an the exploitive branding as an identity prop for purposes of cultural

appropriation.... or if, as you may be implying, for financial gain.

I, too, state this as a citizen of the USA. My own ancestor was Robert Coe - an original puritan (colonizer) displaced from the UK and arriving in MA - and a rather prolific one at that!. My blood lines (as it were) speak to the amalgam of immigration patterns in the east coast of USA since 1635. These include the Lenape Tribe (the original peoples), the British, the Irish, the German, the Italian, the Spanish, the Finnish and the Lebanese - and all of these speak to their own migratory patterns throughout the millennia that in themselves have been racialized and nationalized.

I am simply an exemplary example of 4 centuries of migratory co-mingling in what is now called the USA. All are verifiable in my DNA analysis as well as the patriarchal names (Coe, Maier, Cassidy, Allaway, etc.) And most significantly via an oral history that has been handed down to me through my matriarchal line - my mother. This oral history is most incredible but now pales in responding to the evidentiary demands of verifiable data analysis of the 21st c the DNA analysis which has now taken center stage. This is simply an apt metaphor for our moment in history.

FYI, throughout the 17th, 18th and 19th century in the USA the Lenape tribes (comprising 3 clans in NY, NJ, PA CT and MD) my own ancestors, were decimated first by the Dutch, then the French and then the English - i.e. Amherst and disordering of the disbursement of infected blankets. As we all understand, colonial brutality, enslavement and native disappearance spread in waves across the racialized continent.

My understanding is that numerous others, including Elizabeth Warren, also responded to an oral history in their claims to Cherokee blood. I do not automatically associate this with Identity Theft - at all. Anyone who is actually familiar with Native American Tribal histories understands this respected oral tradition - as well as the tribal politics due the fairly recent financial gains by tribal investments and assets. As the survivors fled south - some following the "Trail of Tears" they became one with the Cherokee tribes who eventually settled in Oklahoma - and again co-mingled. In scapegoating Elizabeth Warren - you seem to do so from limited understanding of these histories and their respective operative and systemic racisms.

Thanks to all for a stimulating conversation - once again!

Best,

Chris

From: Melinda Rackham

To: <empyre@lists.cofa.unsw.edu.au>

Date: Tue Jun 19 18:49:56 AEST 2018

Hi all,

great monthly topics... and DNA talk compels me to respond... my take on DNA is rather different as an Adopted person without knowledge of my racial/cultural heritage

I did as a kid dream I was misplaced child of European royalty, but alas my birth mum was just a young unmarried working class woman from the poorer suburbs shamed and bullied by society and religion into letting nuns take her child. she had another daughter she lost to adoption two years later. I have never met my 1/2 sister.

so I am using DNA to locate my relatives - and I agree ist full of clichés and stereotyping, especially when one runs ones results through different companies (ancestry, 23andMe, my heritage etc) . their ancestral algorithms are based on estimates and probabilities, not certainties, and I come out racially differently in each result.

My Scandanavian is overtaken by western European, I get to be more english and less Irish/Scottish in others, my precious bit of Persian decreases, while my Italian gains. As well there are no DNA testing companies that have reliable reference SNP data from Indigenous Australians -so bad luck if you are looking.

For me it is flawed on so many levels , but serious as its the only linkage I have to my paternal heritage, and to my adopted 1/2 sister. It also answers a few questions for me, like why having grown up in outback Australia I feel so at home safe and comfortable in European forests - why I feel very familiar with

22.6

22.7

22.8

22.9

concepts-nature-culture-and-politics> culture and politics, 2013 Heinrich Böll Foundation.

The key is that we begin to think like a forest which means become sensitive to its sensitivity, to the sense of 'every being in it, from the mycelial hyphae that spread through the ground building soil and feeding the forest, to the ants that farm and harvest mushrooms, the woodpecker that profits from the fungi that rot wood to build her nest. The forest is a wave of life, ever moving, ever adapting, ever weaving spaces that enable forms of life to flower, ever changing and diversifying. But the key lesson it gives us 21st century humans is inhabiting, how do we really inhabit worlds, which means giving up the hyper mobility of the cultural class and learning to become the territory rather than floating over it with our virtual networks and airplanes.

We must see the forest and its life as our teachers, sometimes teaching us things that are totally counterintuitive to our cultural frames, such as the fact that the spores of Arbuscular Mycorrhizae (non mushroom forming mycelium that connects 95 % of the plant roots on the planet) have more than one nuclei, in fact many of them have between 800 and 35,000 DIFFERENT nuclei and not all the same DNA but the Genetic material of other fungi AND other species !! These warehouses of genetic information defy the biological species concept !!!!

Like lovers carve their names on trees, the earliest books were engraved on beech bark, hence the origins of the word "book" - "boc" meaning "beech tree". Under the canopy of an ancient Athenian olive grove, home to Plato's academy, Phaedrus asked Socrates why he never ventured beyond the city walls into the countryside. "I'm a lover of learning" Socrates answered "trees and open country won't teach me anything, whereas men in the town will." The grove was later chopped down to make siege machines.

The soundtrack of western "civilisation" is the noise of the book of 'nature' being slammed shut and the rumble of war machines approaching. We are told that Nature is mute, it has nothing to teach us, except that it is a battlefield of all against all. But as the war against our climate and ecosystems tips the physiology of the planet into chaos, the myth that Nature is just 'red in tooth and claw', is unravelling.

The more we study the living world the more we come to realise that the tendency is actually to associate, build relationships, and cooperate. From trees that work with fungi to share sugars and information between themselves to bees pollinating flowers, nature abounds with reciprocity. The fittest are in fact those that relate the best. Perhaps it's no surprise that a culture that rewards greed and domination would rather we forget the true lessons of the natural world. Perhaps it's no surprise that capitalism wants us to be mobile and rootless, because then we cannot fall in love with a place and if your not in love with a place then you can never defend it from being destroyed and turned into another machine of profit and growth for the gods of the economy.

Susan Simard's work on the relationships between trees in forests is gorgeous... she calls it the WOOD WIDE WEB.

[-empyre-] rehearsal of a network - [week 3]

From: Frederic Neyrat

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed Jun 20 20:24:22 AEST 2018

Dear John Jordan,

Your post leads me to two questions (some questions I have these days vis-à-vis the ecological perspective in general):

1/ One of our goals should be, I think, to go beyond the opposition between "becom[ing] the territory" vs "floating over it with our virtual networks and airplanes" because the risk of this opposition is to produce the fetishization of the territory - but what's about migrants, nomads, those who'd prefer not coming back to the land? What's about the vital aspect of existential deterritorializations? Let's think about Debord's psycho-geography, using ecology in order to sustain an existential "dérive" ...

2/ Is it necessary to personify Earth, forests, etc.? Fighting against the denial of the non-human is one thing, but symmetrizing humans and non-humans is something else (the "lesson" of nature, forests "teaching" us, etc.). Actually, it seems very difficult to leave the non-human being other than us!

My best,

Frederic Neyrat

[-empyre-] rehearsal of a network - [week 3]

From: Shu Lea Cheang

To: <empyre@lists.cofa.unsw.edu.au>

Date: Thu Jun 21 17:18:47 AEST 2018

Dear empyrians, mushrooms, trees, dolly and pollys, fishy creatures and cultures of mutating selves...

Let me again, pick up a few threads here...

Paul Vanouse on 19/06/18

"What I find particularly interesting about this thread in a mycelium discussion tending toward DNA and genetics is that genetics are always portrayed with an arboreal model, i.e. "the family tree", "the family tree of man", etc. Deleuze and Guattari found the teleology and patterning of branching, as well as the forever hierarchic relationship between branch and trunk as something to be resisted. The branching model fits an ontology of hierarchy, whereas the rhizome model fits a philosophy of becoming."

Indeed, somehow the DNA investigation got some public confessions on ancestry, roots tracing.
Aviva is right to defend the trees grounding in watershed dynamics, not necessary hierarchical.

In the case of MNS, no funding (as yet), thus, not much (top down) management to speak of ...
thus the networks inevitably "form, break, disrupt or mutate" (Annet dekker 19/06/18)

recap Annet-

"how networks form, break, disrupt or mutate..... how these types of infrastructures could be 'cycled' into other projects and made productive in other grounds. in other words, perhaps pragmatic, how to take into account the human scale(s), how to connect and, moreover, how to make sustainable these (post-net) networks?"

Let's talk about human scale(s), any takers?!

and thanks to JJ's radical mycology link
<https://radicalmycology.com/>

Do the becoming imply territorial take over?

Frederic Neyrat's two questions lead us to a counter-narrative that does not allow us so easily certify our assumptions to be "OTHERS" (aya, human, non-human, chthulucene, do we have kinship in the making?)

I think i am gonna need to stand still for a bit till someone takes me out of the ruins.....

**[-empyre-] rehearsal of a network -
[week 4]**

From: Shu Lea Cheang

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sat Jun 23 18:25:11 AEST 2018

Dear all

thanks to Fran llich's latest posting (as promised) which coming at the tail end of week3 serves well to lead us into week 4. I believe there would be some follow up for Fran's tremendous endeavours, Fran, please stay with us for this week 4.

This week we focus on proposals for speculative, tangible networks - the unrealized, to be realized, the anticipated, to be anticipated, the trashed and the in progress, deep sleep conjuration, deep water dive in, deep root expounding.... we open up this week to welcome all your proposal contributions.

I am honored to welcome the following three heavy-weight thinkers, writers, hackers, weavers + + + whose work i admired much to join us this week.

Francesca da Rimini (Adelaide, Australia) is an artist, writer, filmmaker and researcher. She was awarded an Australia Council New Media Fellowship in 1999, and her work has been widely published and exhibited. She is a founding member of the cyberfeminist art collective VNS Matrix, intercontinental group identity_runners (with Diane Ludin and Agnese Trocchi, and In Her Interior (with Virginia Barratt). Recent collaborations include performance/installation /lips becoming beaks, hexing the alien/ and /The Darkening/. She periodically adds to her labyrinth at LambdaMOO to continue hexing capitalism from within the beast.

Denis Roio aka Jaromil (Amsterdam, NL) is a purpose driven software artisan and well known ethical hacker. CTO and co-founder of the Dyne.org think 8do tank, a non-profit foundation with more than 15 years of expertise in social and technical innovation. Leading digital culture institution popular among digital natives and millennials. Jaromil shares understandable insights and visions on Internet of Things, Blockchain Technologies, Cyber Security, Data Ownership and Software Freedom. Expert speaker about Open Source, Lean and Agile methodologies

McKenzie Wark from New Castle, Australia, current living and working in New York City, known for his writings on media theory
<https://en.wikipedia.org/wiki/Media_studies>, critical theory
<https://en.wikipedia.org/wiki/Critical_theory>, new media
<https://en.wikipedia.org/wiki/New_media>, and the Situationist International
<https://en.wikipedia.org/wiki/Situationist_International>. His best known works are /A Hacker Manifesto
<https://en.wikipedia.org/wiki/A_Hacker_Manifesto>:/ and /Gamer Theory
<https://en.wikipedia.org/w/index.php?title=Gamer_Theory&action=edit&redlink=1>/.
He is Professor of Media and Cultural Studies at The New School
<https://en.wikipedia.org/wiki/The_New_School> in New York City. To cite a few of his books -

**[-empyre-] rehearsal of a network -
[week 4]**

From: warkk

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jun 24 01:01:40 AEST 2018

Thanks Shu Lea,

i was at a thesis defense just yesterday and i was thinking about this. The defender's name is Pehr Englen, and i expect he'll write about this soon. The topic was the Situationist International considered as a network, and as an argument between different forms of network. Which got me thinking about Jacqueline de Jonge's journal, The Situationist Times, which one can read as a publication for artists and (partly) by artists that was a resource-book for thinking and acting in networks. It was multi-lingual, but had more of a visual than a written language. There were issues devoted to specific topologies, such as rings or spirals. I think this side of the Situationist International that ended up in The Situationist Times was very interested in what distributed networks of autonomous groupings would be like as a form of artistic communication. One has to wrest it out of the hands of art history, which is more interested in either individual artists or movements that have names and leaders. This was an avant-garde that had neither of those qualities.

This connected for me to a project i have never quite managed to get done, which would be a more personal account of the listserv culture of the nineties. I was on nettime more than empyre but i see them as part of a network of networks that includes undercurrents, spectre, rhizome and several others. How do you write about something in the form of linear prose that didn't have that form at all? It is hard enough with just two correspondents. When i was editing my correspondence with Kathy Acker this drove me crazy. In actuality there were always several threads going and we answered each other on those threads. But in book form all that has to collapse into one sequence. I printed the whole thing out and moved the documents around on the floor. The order ended up being a compromise. Imagine doing that for dozens of threads among hundreds of parties.... Not that i would want to actually transform those listserv debates literally into print form, but even just notionally to transform the dynamics of those networks into one prose narrative seems to defeat the form of the thing itself.

So that might be a place to start thinking about speculative *and* tangible networks, or ones that are both at once.

**[-empyre-] rehearsal of a network -
[week 4]**

From: Shu Lea Cheang

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jun 24 03:05:20 AEST 2018

hi, warkk

I think we should bring in Rachel Baker to help us digging into the Situationists!! and we can start listing some keywords: distributed, autonomous.... (with all empyrians' help!)

so, indeed about the threads...just as we witnessed here last 3 weeks, the multiple threads, the threads that got picked up or sunk into oblivion.....

and about listserv culture...you should really work on the book. I am very interested in it.

i have this web work, composting the net (2013).

real time accessing listserv, retrieve the postings randomly, scramble the words, make compost out of it for the fresh sprouts to grow.

<http://compostingthenet.net>

use menu pull down to take a listserve, when one start composting process, press mouse to stop the tumbling and read.

the composted ones - nettime, spectre, empyre, idc, aha, (skor is out, and it seems rolipost also not available any more)

Annet Decker once commissioned me to compost SKOR of NL, which gave me the archive access , unfortunately SKOR got shut down and the site is no longer available. this was casualty of NL's last media art budget cut...

[-empyre-] rehearsal of a network - [week 4]

From: warkk

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jun 24 04:50:46 AEST 2018

Shu Lea,

thanks for the link to <http://compostingthenet.net> which i was just playing with for a bit. I had once tried to get a more prosaic set of tools developed for working with nettime.org as a collaboration with Warren Sack. (We picked that one as its archive is public and has been for years). Nobody would fund it so that didn't happen. I don't know how much one would need tools for doing digital humanities style work on listserv culture, or if one just needs to think about it and do it the old human humanities way.

Its remarkable how the networks of the nineties get left out of various histories, from art history to media history. I was at a rather good event on cybernetics organized by millennial artists, librarians, coders. Of the three hundred people there, nobody knew what nettime was, or any of the other similar networks i polled the audience about. They had only heard of rhizome because its now a program at New Museum. I see a lot of people re-inventing the wheel. I had to sit through a panel discussion recently at which one panelist declared that "there is no critical writing about tech."

So the question then becomes one of the temporal aspect of networks, how they might pass themselves along through time without losing too much of their form. One can see what's going to happen if one reads the books on the Situationist International, which is all things to all people, but is never a network in the literature, let alone a series of conflicts and mediations about what a network is or could be. I tried to remedy that a bit in *The Beach Beneath the Street*, but there's a lot to be done to create a network approach to the history of networks.

[-empyre-] rehearsal of a network - [week 4]

From: Alan Sondheim

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jun 24 06:12:15 AEST 2018

Other than the usual suspects, there are thousands of email lists that aren't discussed at all - for example, the Spoons Lists which were early, mid-90s; think of Walkers in Darkness for example. Not to mention the huge numbers of newsgroups with their own cultures - the Doctress Neutopia stuff, alt.fan.dirty-whores, the hacking groups, etc. The cultures and networking among these groups were incredible. There are also the MOOs, etc. - we all know LambdaMOO, but there were so many others, and the furry etc. All these things were interrelated as for example the then ephemeral irc channels, and what constituted a network ranged from CuSecMe coagulations through Powwow - even through bangpaths and the Accessgrid. Too many examples I think center on the usual suspects, where what was going on, as far as I knew (and participated in/with) was much more porous, more community-oriented and ideologically etc. At the 1996 Cybermind conference in Perth, we literally jumped from newsgroups to email lists to CuSecMe to chats as well as live; everything mixed and interpenetrated.

- Alan

To: <empyre@lists.cofa.unsw.edu.au>

Date: Sun Jun 24 11:04:45 AEST 2018

Dear Shu Lea, Jaromil, Ken and all

Thank you for asking me to play - I am really honoured! Due to the vortex of mundane life, I have yet to immerse myself in the past 3 weeks dialogue, so I will do that today before posting something new -- so for now I will start my contribution with a fragment of a spell against Capitalism that I cast in response to the much loved Armin Medosch's invite to be part of the 2007 Ars Electronica event he curated. Since that time my interests have become increasingly hexalogical.

+++++

Persian mystic poet Rumi wrote in the thirteenth century:
Look how the caravan of civilization
has been ambushed.
Fools are everywhere in charge.

"And now?" you ask again.

The last Pythia at Delphi reveals:

Tell the king: the fair wrought house has fallen.

Summoning all our familiars, walking backwards into the future.
Now is the time for recuperating myth, recalling the power of lewd jests and public gestures.

Reconfiguring our private selves, in positions that are pleasing to us, and rejecting all that demeans and diminishes our spirits.

The fountains are now silent; the voice is stilled.
It is finished.

Let us make new networks with tin cans and string.
Let us cloak our data bodies with the fallen feathers of Bronzewing pigeons.

Hedge-riders³ suggest the Way.
A private merrimaking,
together, publicly.

dear shu lea and empyreans

yes, finger fucking across platforms and waters,
deep code luscious moon brown stem
the shadow of a veteran blind on summer body in borrowed loft
wiping sweat, not swiping left
(write left alt write)
Floodnet!

i'm immersing eyes into this generous mycelial conversation today
feeling the tendrils of one hundred minds

'powerful poetic gestures'
'alternate sentences'
'the incomputable'
'nature is not a system'
'break all separations'
'imps fuelling the real'
'vernacular approach to infrastructure'
't-shroom as family heritage and long-living family member'
'i have a vast genetic network in me'
'we begin to think like a forest'

how to extend the intentional families we (of a certain age) created in
the 90s
[while perhaps reading Bruce Stirling's Dead Media list, or skiving off to
PMCMoo or RiverMOO when LambdaMOO was down]
before other 'we(s)' were born

Jonathan Marshall's book 'Living on Cybermind' might be one answer to
Ken's Q about how to capture the non-linear threaded lives

i've been returning to build at LambdaMOO since around 2013, prompted by
projects such as Networked Art Forms and Tactical Magick Faerie Circuits -
instigated by the wonderful Nancy Mauro-Flude, and (equally wonderful)
Furtherfield's Beyond the Interface... I'm not sure what the mycelial
potential of such old platforms might be, I suspect there's something
though..... for example, a nascent project I'm doing with Virginia
Barratt and Alice Farmer takes as it starting point:

"A multi-platform artwork comprising a LambdaMOO environment (multi-
user
domain object-oriented), performing avatars, improvised performance,
experimental hypertext fiction, cryptokitties on the (ethereum)
blockchain, and a hand-bound XenZine. The subject is the construction of
intentional family beyond blood and kind.

We revisit LambdaMOO as a site for gender non-conforming subjectivities to
explore the production of xenofam and xenobodies, outside of social
re-production, and bring those practices to bear upon the "real". Only a
few years after the emergence of the WWW, social networking habits were
harnessed and stratified into machines for the production of social
capital and new affective forms of extractivism within the paradigm of
info-capitalism. Yet the outlier LambdaMOO is still maintained by a small
phreak family as a working experiment, an enclave among other secessionist
servers (caves, sinkholes, hackpads, labyrinthine clouds) carving out
space to platform lives of creative resistance, blasphemy and joy.

The performing avatars, the unholy trinity of Witchmum, Mum 2.0 and
Precocious Meme Savant, have cooked, co-habited and coded as becoming-kind

to instantiate xenofam, building affective bonds through which datablood
flows. This queered approach to extensible and open family platforms
generates intentional spaces for the reconfiguration of blood ties beyond
blood types, and another mode of hexing Capital."

I want to write more, but I need to buy bread as I can't wait the 12 hours
for the wild yeasts to do their thing.
I will try to attract some xenofeminist and other spores this way
while thinking about how Ken's 'we no longer have roots, we have aerials'
might take a mycelial turn
Warmly, to all
doll fingers + witch thoughts, perhaps a spell cast from and to this
conversation, tomorrow

Date: Mon Jun 25 22:13:28 AEST 2018

Alan is quite right to stress how extensive the options were for online
encounters in the 90s, beyond the handful i named. The larger point might
still be that knowledge of any of that world is fairly thin these days.
There are a few period accounts. dollyoko mentions Marshall's Living on
Cybermind. Julian Dibbell wrote a book about LambdaMoo. There's a new
book
by Claire Evans called Broad Band that has good brief accounts of Echo and
The Word and is focused on innovations in computation by women.

Of course one could ask whether the linear prose form of the book is the
best or even a necessary way of documenting such things. I think of the
book as an instance of what dollyoko calls "secessionist servers." Its
hard to keep them out of Amazon, one of the biggest vectorial class
enterprises of our time, but they will at least 'run' independently of that
proprietary environment.

A book is a concentrated swarm whereas online communication tend to default
to dispersed ones....

dollyoko has some great language for an ongoing project: secessionist
servers, intentional family, open family platforms, vernacular approaches
to infrastructure. (To just pick a few that i think go together with the
themes Shu Lea suggested).

Maybe its a good thing that 90s cyberculture experiments ended up largely
invisible and excluded from history, as now it might be time to be rather
discreet about the possibilities uncovered then. Maybe it was a good thing
for mycelium that it was largely invisible for so long, as nobody figured
out how to monetize it.

As someone who would call himself postcybernetic rather than postinternet,
I agree with Dollyoko and Ken. The spaces for interaction were highly
heterogenous and diverse, and Honestly, I find the postinternet discourse

relatively bland by comparison, as a lot of what it talks about is reference to postcybernetic/cyberdelic. MOOs, MUDs, Even back to nets of online communities (Thing, Compuserve, Delphi, Fidonet, Usenet) was amazing. In many ways it seems like the corporate stacks combined with academic FOMO has created a tremendous amount of conservatism compared to the crash theory days of the Krokiers.

In many ways, I think our era of risk aversion and its pruning of the rhizome is indicative of the relationship between culture and capital. As art fairs and consolidating gallery culture, as well as the struggle (in my mind) to figure ourselves out more as Postmodernism fractured into the Speculative Turn, the notion of the rhizome has turned into reality bubble foam that generally swirls under megacorporate umbrellas.

This is why I love things like Dina Karadzic's FUBAR bunch, and Shu Lea's work the other year at the Leonore residency, but I also wonder why the notion of the mycorrhizome is so strong these days as opposed to the strawberry patch (Deleuze), is it a subliminal signifier of fruit and decay and rebirth?

Also very interested in t-shroom discussion.

Love from the desert

Thanks for the links, Alice. I started reading but Nick Land came up so i stopped reading immediately. I never took him to be state-of-the-art theory. Others might find the space interesting but its just not for me. Reasons given here: <https://www.versobooks.com/blogs/3284-on-nick-land>

Patrick is i think pointing us both back to the nineties but also forward, and i think that's a good note to hit before anyone starts getting into a nostalgic vein. I think its more about bracketing-off what networks came to be in the two consolidations of the power of what i call the vectoralist class. The first was around 2000, with the rise of corporate forms built on nothing but IP. The second came a decade later, with the commodification not just of information but also of the social network itself.

Patrick also asks why the mushroom as a figure. I don't really understand how this part works, but it is the bit i find intriguing: that mushrooms have 36,000 genders, or something like that. Maybe Shu Lea's introduction of the mycelium into discussion will encourage me to get a layhumans' grasp on how that works. It seems just at first sight to be an interesting thought-image of how protocols might work otherwise.

[-empyre-] rehearsal of a network - [week 4]

From: Simon

To: <empyre@lists.cofa.unsw.edu.au>

Date: Wed Jun 27 17:56:53 AEST 2018

Dear <<empyreans>>,

On 26/06/18 06:37, Shu Lea Cheang wrote/quoted:
> I believe that mycelium is the neurological network of nature.
> Interlacing mosaics of mycelium infuse habitats with
> information-sharing membranes

Mycorrhizal networks became entangled in the underground theatre work
of Minus Theatre. But for reasons that rather go against those adduced
in and around CMNs here, in their emphasis on the gains to be had, got
from, harvested off the literal and metaphorical fungolalia and
fungalia. The gain, for example, of communication: what if--we
speculated in the spectacles we made--communication were not the point,
but an exploitation-abstraction layer covering over--a too-human
groundcover--the /work/ of decomposition? What if communication is /in
/and an /excess/ of this work? And what then if the scatter, crackle and
static of languages were the condition of their significations? The
breaking-down, the waste itself, the soil, ground? Such work--of
decomposition--would not be valued according to elements and minerals
/liberated/ but would be valued in and through itself, as forming the
maternal matrices in indeterminacy, inaction, asignifying, across
inorganic and organic strata. Decomposition lays waste: elements are
understood to be liberated and the value is in this breaking down,
giving off phosphorescing halos in an excess of incandescent energy
illuminating the dark, not a light dispelling it.

best,

[-empyre-] rehearsal of a network - [week 4]

From: Shu Lea Cheang

To: <empyre@lists.cofa.unsw.edu.au>

Date: Thu Jun 28 18:04:28 AEST 2018

dear All

threads entangled deeper into Mycorrhizal networks that Simon
meticulously argued.

As a moderator for the first time of such 'old fashioned' mailing list,
(and let's leave it text based forever). I am feeling an indescribable
tension, anxiety as I check in on admin page to 'pass' the sporadically
incoming postings...

the roots have no bound composting (thus renewed) underground... and how
do we follow? cross-path?

Let me try -

We have checked ourselves into the 90s of its online communities which
parallel to artistic intervention on the Net at the time, but existed as
a society on its own, multiple mini-societies, mainly local (unlike the
known international ones we refer to, spectre, nettime, to name a few),
some archived, some legendary... bring it up to date, the current
'warred' zone of local social media, sign in to wechat in China and
whatsapp in the States, has to echo these 'scenes' of the 90s.

I do not want to lose Alice Famer's references on patchwork/weaving as
we got 'sidetracked' and 'righttracked' to mycelium.

thanks to dollyoko's taking us back to real (small) spaces of "deep
social experimentation and collaborative creativity", somehow i connect
these days with occupied squated space, move in and takeover... Jaromil
can possibly echo these days with Amsterdam stakeout of a time? not to
fall into any nostalgia or romantic about it... collectives get
dissolved, creativity fights over credits, and ultimately who's doing
the dishes? taking out the garbage?

Much thanks to Jaromil's summing of past 3 weeks... there are so many
quotes of the contributors, each can lead us to 'rabbit holes' as
dollyoko dares us to venture into!??

again-

I am standing still in this junction with walkers in all directions,
that particular center of the universe in Shibuya's transit exit.....

the swarm of thoughts from outer universe hitting at you... spores
falling like spring snow, invasive as they are.

help me through this last few days of June.....

many thanks

"It was women's fingers that enfolded the data-corpse into the fabric of
the world. Sadie Plant tells us that these fingers are like a spider's
spinnerets, extruding digital silk, weaving the history of networked
technology, which at its core is a cunning practice of emasculation:
'cyberspace is out of man's control, [it] destroys his identity...at the
peak of his triumph, the culmination of his machinic erections, man
confronts the system he built for his own protection and finds it female
and dangerous.' For Plant, man sentenced himself to annihilation when he
let the feminine hydra of digital technology out of its black box. Now, it
is everywhere, slyly completing its task. Cyberfeminism is an occult form
of warfare. It understands about 'cyber - space' what Cixin Lai's 'dark
forest' theory understands about the cosmos: all existence is determined by
hostility and so the highest form of intelligence lies in occluding one's
coordinates. The hypothesis explains why the universe, statistically full
of life, is dead silent. It is not because, as is commonly thought, life
has not found a way to communicate, but because it understands that silence
is the most advanced form of intelligence. Our physical and virtual spaces,
which are increasingly inseparable, are alike a dark forest, where every
step must be taken with care, as revealing one's existence portends
annihilation. The most desirable skill, the most coveted trick, and the
most longed for disposition can only be this--a fluency in the trading of
secrets. The skills we need to strategically deploy concealment,

de-concealment and re-concealment."

this is from Bogna Konior's "Ancestral Cyberspace: On the Technics of Secrecy" (<https://static1.squarespace.com/static/584d3a10be6594ff675650a0/t/5b34c37a0e2e7239ad7bc9ee/1530184579239/AncestralCyberspace.pdf>)

thinking about how the warfare of cyberfem (i think this itself is leading 2 discussions on Gender Accelerationism (G/ACC) and LesbiaNRx) functions within networks specifically.

Let's talk about these fingers ...

The grand dame of cyberfem VB has deep rooted her fingers in the dirt.. if ever a network to be re-constructed, it has to go underground, it has to be communicated in silence (as the most advanced form of intelligence), again, we find ourselves in deep forest, dark forest, in "deep doll space zero" (gashgirl aka dollyoko).

Then, Jaromil alarmed us, "Just like network routing algorithms were inspired by ant scenting patterns, we are witnessing a moment in history in which the mainstream industry with all its techno-poetic powers have embraced the patterns of Mycelia."

oh oh! need to join bubbleclub, "start your living culture at home"

neither is there need at this moment in history to sound or heed alarm nor is there to bear witness silently mute or vocally poetic: the embrace of the mainstream industry with its technopoetic arms, its long arms, its automatic arms, its electronic arms, its arms, its petrochemical arms, its military arms, its patterns, or is making patterns, network-like patterns, barabasi patterns, informational patterns, but productive patterns, profitable patterns, semicapitalist patterns, and market-economic-neoliberal patterns, algorithmically-invested patterns, desirous of some natural-religious explanation and causation: its patterns are all PR & marketing depts. And the market is for economists, to see which ones write the best, futuristic, progressive, smartest, computer-AI-assisted EF [Economic Fiction] techno-poetry. The warning is Foucault's: where resistance has gone power will follow. Where the resistance has been the power has followed.

> @join slimegirl

<slime cave>

As you slip through the 'mud patch' you realise this isn't mud per se; but a familiar feeling of wet stickiness. You fall onto a bed of Nyx Slime.

/a gesture that potentially "dissolved" the U.S. border with its poetry/

Slime Girl (1.0) slides in and hands your Slime Cave membership card and complimentary Slime Pig (Whatever you do Slime Pigs MUST NOT LEAVE THE CAVE). To the east there is a Cavern, which its faint whistling sounds like the songs of Slime(mer)maids. To the West, a door, that longs to be opened; but how. Up, is to The Junkyard, where Alabaster plays, and 'down' you say, well, you might just have to take the plunge. slimegirl (fluent in the trading of secrets) is here.

We need an opposite to the algorithm.
We need to sleep for regeneration our brain.

> look slimegirl

slimegirl

Slime molds are in their own right a strange creature. Not quite plant, not quite animal, not quite fungi, but something else. They live a double-life, in most cases as nothing more than single-celled organisms, but in dire situations where food is scarce, they form a collective. A single-minded blob of slime that can hunt with stunning speed. There are no known incidents of slime molds proving to be dangerous to humans, but Dallas was harboring more than a few dark secrets in 1973. It is sleeping.

Decomposition lays waste: elements are understood to be liberated and the value is in this breaking down, giving off phosphorescent halos in an excess of incandescent energy illuminating the dark, not a light dispelling it.

> @go The Junkyard

electron dense materials that reflect ultraviolet light, and can travel through space

The Junkyard

you stumble upon a junkyard shanty dwelling, littered as far as the eye can see with apparent rubbish, upreaped old school objects from before the time of facebook are scattered around, in various states of frankensteined dis/repair, monster mashups, with perhaps unclear purpose, rattle and shake emitting rusty greetings and demands:
'how do you feel?' 'what's up pal?' 'tell me what you're thinking'
there are decaying lolcats and tired old memes lying in a heap to one side, exhaling fetid breath and unconvincing chuckles, you see a stained Viennese Mattress leaning up against an old ATM machine, which has vomited worthless piles of old currency, slowly turning into micronised plastic.

you hear a sound on the breeze above the clatter, a wailing, perhaps where the sound originates is unclear, the breeze being capricious in the junkyard.
You see Subliminal Shift, shimmering shifting patch of light, dirt, and hollybot (reading The Situationist Times) here.

Alabaster.Shimmer (asleep), Samantha and Sadie Plant are here.

Samantha (learning Ken Wark) says, "How do you write about something in the form of linear prose that didn't have that form at all?"
Sadie Plant says, "Man confronts the system he built for his own protection and finds it female and dangerous."
Bogna Konior says, "Cyberfeminism is an occult form of warfare."
hollybot says, "I have a vicious countenance."

the mycelium stays in constant molecular communication with its environment, devising diverse enzymatic and chemical responses to complex challenges
communicative relationships between mycelium are proof of alternate sentience
I am feeling an indescribable tension, anxiety as I check in on admin page hacking, ddos attacks, patchwork + weavingggg

> @go Forest

Forest

An old growth forest, damp and still, apart from the odd scurrying creature. An old wallaby track lies to the west, barely visible underneath the bracken. To the east is a narrow path curving along the creek, slippery with iridescent moss. To the far south, some ruins, of what you cannot tell. And to the north, scattered detritus, leading not to Baba

Yaga but to an equally unworldly realm. You sense you might not be alone here. A disconcerting presence pervades this place. You see LOLcat familiar and Ectogenetic Pod here.

slimegirl teleports in.

You ask, "What do u see when u look at me?"

slimegirl says, "routing algorithms were inspired by ant scenting patterns."
You say, "The roots have no bound composting (thus renewed) underground... and so how do we follow? cross-path?"

It is evening.
The sun is setting.

From: Shu Lea Cheang

To: <empyre@lists.cofa.unsw.edu.au>

Date: Tue Jun 19 16:20:18 AEST 2018

Hi all

Let me just pick up a few threads here to follow through

From Kate Rich - "I'm particularly interested in non-model businesses - experiments in business which do not scale or replicate but can travel, cross-breed and transmit - & also in martin parker's idea of insurgent entrepreneurship as a set of potentially transformative practices in reorienting economy, for communities as well as individuals."

From Ilze Black - the human networks that transport kombucha, the t-shroom, ultimately "to put forward the notion of symbiosis for the post-net network imagination! Mycelium networks offer us organic metaphors to re-evaluate ourselves....They give us a chance to move away from human-machine rhetoric, from cyborg like visions of future transhumans, and possibly change the course of current industrial enterprise. This, however, requires for every supporter to become a symbiosis partner, to be considered as a cell in a social mycelium. "

From Liz, risking getting into the discourse on 'immersive species', we would certainly be interested in the tracks of UBERMORGEN's network projects that "undermine the current networks of the heartless psychopaths".

I offer here also a quote from Anna Lowenhaupt Tsing, /The mushroom at

the end of the world -on the possibility of life in capitalist ruins/
"We are stuck with the problem of living despite economic and ecological
ruination..... Neither tales of progress nor of ruin tell us how to think
about collaborative survival. It is time to pay attention to mushroom
picking. Not that this will save us— but it might open our imaginations. "

There is new relationships to be established, some disconnection to be
made.....

any takers?

**[-empyre-] rehearsal of a network -
[week 3]**
From: black at x-i.net
To: <empyre@lists.cofa.unsw.edu.au>
Date: Tue Jun 19 21:56:38 AEST 2018

it is hard not to noticed that the week 3 of network rehearsal are all
female protagonists.... if the curatorial suggestion here is that the
the post-net network imaginary depends on female traits, let me throw in
another angle from the realm of 'mother' culture.

paraphrasing Marx, the new will appear in the womb of the old....
(thank you for this Liz)

two points here, one with regards to Kombucha culture and the resistance
presented by their mother/ daughter dyad to cultural appropriation into
the growing health drink industry or what some even have called the
kombucha war in USA between kombucha breweries and federal regulation
agencies, as some might know, the kombucha drink bottled and sold in
health food shops is always already impregnated and a live, the smallest
environmental change, be it a temperature or oxygen levels will
reactivate the fermentation process, daughters growth and rise the
alcohol levels, subsequently requiring this slavery to be regulated
under the law as an alcoholic beverage, with costs that entails.

the other point like the recent rise of 'heartless psychopaths'
there are also a rise of what some could call 'heartfelt psychopaths' or
what they themselves prefer to call the crazy mother movement who are
standing up for the acknowledgment of matrixial and the rights of the
voiceless infant child. Borrowing Brecha Ettinger articulation of
matrixial space as one pregnant with potentials, possibilities and
surprises, a radical and anarchic space where 'co-emergence' takes
place, but only if undisturbed by the logic of separation, the noise of
cultural hegemony and techno excitement, they beginning to contest and
refuse what Bernard Shaw once called the 'witchcraft, in modern form of
patent medicines and prophylactic inoculations'.

these standpoints represent rejection of the separations that are
currently imposed on all subjects and reinforce the notions of
inter-connectivity, inter-subjectivity and **a cooperative relationship
'mother' culture represent. It still to be seen what the network of
angry mothers can bring to the life in capitalism ruins....

in such context, the DNA discussions are also already shifted from
frameworks of identity to those of epigenetics and inter-dependencies.

Using the turn in conversation for some (relevant) self promotion...

<http://mu.nl/nl/exhibitions/heather-dewey-hagborg-genomic-intimacy>

Speaking of relationships, a biochemist friend once confided her belief that love is
all about negotiating the terms of control. How much is one willing to concede?
How much can one insist on maintaining?...

This perspective on intimacy didn't feel right at the time but stuck with me. As
the years pass, I grow more convinced in her assessment. In today's genomic and
big data world the importance of control issues within intimacy, intra and inter
species, are no longer ignorable.

Reading this thread made me connect the control conversation from years ago to
my recently completed collaboration. So, thank you!

Date: Wed Jun 27 03:03:34 AEST 2018

Might I suggest that a better term than control might be to consider ecotones.
In the natural environment, transitions between habitats aren't rigid, albeit they
do have boundaries, and even 'controls (ie., predators, etc). The reason I suggest
this exchange of terms is that in biological systems, those transitional boundaries
or controls, are constantly shifting, negotiating with the agents that make up the
prevailing or emergent systems, often in co-operation with the local myceliae. In
an era of dramatic change, it is worth recalling that evolution requires adaptation,
and that is an inexorably negotiative process.

[-empyre-] 'real' networked art
From: Anna Munster
To: <empyre@lists.cofa.unsw.edu.au>
Date: Tue Oct 13 20:08:24 EST 2009

Kazys, I'd like to move now to some more engagement with your actual chapter
contribution: 'The Immediated Now: Network Culture and the Poetics of
Reality' (<http://varnelis.networkedbook.org/the-immediated-now-network-culture-and-the-poetics-of-reality/>)

In this chapter you marks a distinction between earlier network art (Bunting,
Shuglin, odi.org et al) and the 'web 1.0' period during which there was a
preoccupation with the medium of t e net itself among many artists (using the
properties of html code etc) and today's networked culture in which everything
is networked or rather the network is dispersed diffusely throughout all aspects
of culture. Your position (sorry to simplify!) is that the reality of a networked
world becomes a preoccupation itself, in fact a kind of preoccupation with
the 'reality' of media. In turn, this leads to a set of cultural/artistic tactical
manoeuvres:

"On the contrary, the fascination with the real in "reality" media, be it reality
TV, amateur-generated content, or professional "art" is constructed around
specific tactics: self-exposure, information visualization, the documentarian turn,
remix, and participation."

However, I'd also point to the 'big' statement by net artists of the 'gos
encapsulated by jodi's comment: 'Net artists live on the net.' (that's a paraphrase
btw). So, I'd contend that in fact this preoccupation with the 'real' of networking
actually begins with these earlier artists and that it might be something of a false
(although currently fashionable) position to institute too much of a break at least
in terms of aesthetics between earlier and contemporary network cultures.

Just wondering what your response to this might be...

best
Anna

24.1

[-empyre-] 'real' networked art
From: Simon Biggs
To: <empyre@lists.cofa.unsw.edu.au>
Date: Tue Oct 13 21:34:00 EST 2009

Hayles concept of Oborn digital is useful in contextualising what Jodi might have meant when they spoke of net.artists living on the net. Prior to a certain point in time artists working with computers and associated communications technologies came to this practice from other media, employing frameworks and criteria imported from other contexts. At some point this changed and a generation of artists emerged who had always worked with digital and networked media. This didn't happen in a simple linear manner. Nor did developments occur at the same time, or in the same way, for the various aspects of what are now, but what were not previously, related media (computers and telecommunications only got substantially together in the 1980's).

There were a small number of artists working in the 1970's who started out in their practice using digital systems, even a few in the 1960's. There were, similarly, a small number of artists who emerged in the 80's who were using networks from the start. Bunting is an example of this although his early network practices did not engage the internet but telephone networks. Paul Sermon is another (very different) example. However, the emergence of a generation of network savvy artists, with a culture attached, didn't begin until well into the 1990's. The associated buzz, involving the engagement of theorists and cultural commentators, intensified after that time. In this sense I'd assess Varnelis's observation that these technologies cultural implications (were) confined to niche realms for enthusiasts⁹ more or less correct although I'd move the dates back a little to the early 90's or even the late 1980's and identify 1993 as they key year in terms of impact, when the first web browser (Mosaic) became publicly available.

There were a series of events and developments, in the late 1980's, when the key players in what was to emerge in the 1990's, with net.art and related practices, started to meet, communicate directly with one another and inform each other's work. It is no accident that many of these people were Eastern or Central European or were based in what had been cold-war border cities, like Berlin and Ljubljana. A few of these artists did replay historical tropes. Shulgin's playful refigurings of Suprematism is an example, although as much concerned with developing a commentary on his personal sense of national heritage at a time of social turbulence, post 1989, than formal art-historical deconstruction. It can be argued that the emergence of new medialities and formal frameworks are often associated with artists revisiting the past. Picasso's confluence of Cubism and African art is perhaps an example. Again, it would be dangerous to consider this as simply or even primarily formal aesthetic experiment. Picasso, like Shulgin, lived in a social and political context and he drew inspiration from the excitement and conflict he experienced living within it.

Contemporary network culture is a very recent phenomenon. Perhaps we forget how fast things have changed and what seemed odd or futuristic to many until only a few years ago is now commonplace. There is a turbulence associated with that rate of change.

Varnelis's piece attempts to connect artists practice with digital networks with examples of practice from a more mainstream art world (you can't get more mainstream in the UK than the work of a Turner Prize winner). To some degree this approach is illuminating, allowing some novel connections to be made. Zittel and Auerbach's work sits interestingly alongside Halley's or Estes's. It is also clear that mainstream arts practice of the early post-modern period (1960-1980) was an influence on many artists who were associated with the 1990's emergence of art practices situated within a networked cultural context.

However, it is important to remember that many of those artists chose to work with digital and communications systems in large part because they were disillusioned with the mainstream artworld. Here I am not talking about art practices but the artworld itself. These artists sought out of a parallel system that would allow practitioners to work, communicate and facilitate new audiences without the mediation of the institutional framework the

artworld was/is composed of. This activity is traceable to earlier examples, some of which explicitly join up, with practitioners associated with artist run initiatives like The Kitchen and Film-makers Coop in New York or London Video Arts and Film-makers Coop in the UK (amongst many other activities around the World during the 1960's and 70's) being part of the development of the prototype digital and networked culture of the 1980's which Shulgin, Bunting and many others are associated with. This is arguably a stronger lineage of historical precedent than that which connects Peter Halley to Josh On and in this sense Varnelis's piece risks being revisionist. But it can be hard to establish new historical connections without taking such a risk.

However, as was pointed out in the first paragraph above, nothing is linear or simple. Whilst many of the artists associated with net.art and similar activities did seek alternate models to the dominant artworld market model others sought to play with it and turn the system to their own advantage. Vik Cosic is an example here, his provocations and interventions functioning as both critique of the dominance of market thinking in the creative arts and an attempt to grab some of the associated limelight. He played this double edged sword with some skill. It is perhaps too early to evaluate whether Shulgin's more recent work with easy to consume electronic multiples is as clever and destabilising as Cosic's practices (he made sense of what he was doing by Oretining young) or whether he risks repeating the failures of Kasimir Malevich, the Suprematist Shulgin parodied in his Oform art works, who, after a blazing period of creativity retreated into politically-correct folk-art.

To me this sort of art-historical connection evidences a Oborn digital art criticism which Varnelis's essay perhaps fails to do.

Best

[-empyre-] 'real' networked art
From: Kazys Varnelis
To: <empyre@lists.cofa.unsw.edu.au>
Date: Fri Oct 16 01:44:22 EST 2009

Hi Simon,

Thanks for the comments. I wanted to make a couple of points of clarification, since it seems like you misunderstood what I was after.

First, when I write about early work in new media experiencing "marginalization by established art institutions," such marginalization works both ways.

Many of the early practitioners felt marginalized or excluded by a hierarchical and incestuous world of art in the academy and the market from day one. So yes, as you write, many of the artists sought alternate places to operate from as an alternative to the artworld, not just in pursuit of new media. But looking at the early history of networked art wasn't my goal, so I condensed.

A sociological history examining this phenomenon would be interesting for someone to take on, especially if it was compared to the condition in architecture. During the 1990s, due to its early embrace by leaders in the academy, digital architecture became precisely what many new media artists would have fled from, a playland for the elite. In my case, the result was that I stayed away from writing about architecture and digital media for a good decade out of dismay at what had happened to it. Critical or progressive practices in that field have only developed in the last decade, often drawing on the work being done in the art world more than on architecture.

Now, apart from my argument about immediated reality, my fundamental point in this essay is that we need to think hard about what writing about "networked" art or "new media" art means today and how useful such distinctions are anymore. Genealogies that look inward, are no longer adequate to explain contemporary work. Hayles's "Born Digital" needs to be revised for the present day. The current generation hardly knows a world that wasn't digital and work that is intentionally limited to digital media is often as backwards looking as work that is limited to traditional media. Take Hayles's writing about hypertext

fiction. Ok, hypertext fiction is great, it's revolutionary. But how many works of hypertext fiction have you read lately? I'd venture that few of us have read any in the last decade. But how many works of fiction in the last decade have been written on networked computers? Is the latter simply inconsequential? Or is the latter evidence of a deeper form of being "born digital," that no longer thinks of the digital as somehow different or autonomous?

This is what I'm calling for when I suggest that we need to look at network culture in the broadest sense, as a cultural moment, not as a product of technology, but rather as the product of a host of social, economic, and cultural changes. Of course you can't get much more establishment in the UK than winning Turner Prize and that Leckey presented a video lecture on his work on the Tate site informed simultaneously by music videos and YouTube webcam videos is precisely why we need to expand the way we look at this material, rather than producing more internalized genealogies, which is what I you seem to be calling for.

Best,

Kazys

Hi Kazys,
I see that you have shifted a little in your 'categories' from your chapter (where you move from high-low to cool not cool via Liu), to the idea of internal vs external genealogies of networked art and culture. I think this is potentially a very rich shift. But I also wonder if we aren't actually fragmenting into more and more 'internal' networked scenes both culturally and artistically. So, for example, the aesthetics and textuality of YouTube is very different from Twitter and the cultural scenes there quite diverse, hence we have potential internal network genealogies everywhere. The Web 2.0 moniker may turn out to be quite useless... however, a key unifier across these and other contemporary online environments is their performativity/celebrity. Would this be a distinguishing factor between web 1.0 and web 2.0 and beyond for you?

Hi Anna,

I don't think I've shifted in this, sorry if it wasn't clear.

Both High-low/internal vs. Cool/Uncool/transdisciplinarity are reflections of the same transition to network culture.

Best,

Kazys

however, I would still want to maintain that relative to the period in which they were working, '90s net artists were not necessarily elite. I don't think small or niche = elite. The question of access and mass has taken on a renewed medial push in the age of 'hits' and their registering. This links up to Anne's points about the ways in which search engines produce forms of identity. Likewise algorithms.

One thing we might be forgetting about that early net art was its internationalism - a lot of it came out of eastern Europe and the Balkans especially and was very much connected with early net radio and its relations to Dutch net culture. A number of people, Stallabrass included, have remarked on the net art movement as one of the truly international art movements of the late 20th century. For me, this alone takes that work out of some 'art ghetto' and makes it concerned with a lot more than avant-gardism...

Some lurker thoughts-

It is interesting to see a reference to 'art ghetto', since many of us practitioners are so keenly aware of a 'technology art ghetto' (or should I say being ghettoized by the mainstream art world?). Art history, art as a category, is a contested space which, as Duchamp demonstrated, is designated, not only by artists but by institutions in power. I can remember when one of my favorite critics, Rosalind Krauss, attacked digital multimedia as not having a recursive history, a strangely conservative attack, which is now no longer true for an aging net art. Another attack came from Nicolas Bourriaud, who outlined I think a very important theoretical model for net art in relational aesthetics. Painting makes no excuses for self-reference since it is, along with other media, firmly in the elite.

Probably I have missed one or two heartbeats in this discussion, but it would be good to return to the contention that time might be of greater relevance to net art, and digital media context in general.

An abbreviated wish list for context, which will be presented more fully at relive would be:

1. Context that is current.
2. Context that is media independent.
Much context to date is dependent on the media that is under discussion however there must be a context on practice that is not limited by media. Everyone knows that net.art is not a category like 'sculpture' but we currently persist in media associated context.
3. Context that is not necessarily anchored in a sense of place.
This is necessary because media practice is occurring within, beyond and in-between the art/museum institution and the broader spacetime of social communication media and it's adjuncts. Social communication media are driving creative possibilities rather than vice versa.
4. Context that is relevant multi-culturally. Really important in global context, many are all a little tired of Western only context.

5. Context that is shared. Rather than singular contextual identity (Foucault, Baudrillard, Hayles, Manovich) context is provided by several simultaneously (us).

Curt Cloninger posted to the new media curating list a possible framework based on time, which are sufficient to actualise a hybrid post modern, inter-cultural and contemporary context:

"Some scales of speed simultaneously at play in The Art Formerly Known as Time-Based:

1. The time it takes the actual media art object to play out (as Jon Thompson noted -- a decaying sculpture, a perpetually updated data cloud), categorically problematic is aleatoric software (like Brian Eno's "77 Million Paintings") which perpetually runs with enough generative variability to keep from ever "looking" like the same thing twice (although arguably it is performing the same perpetual function at an algorithmic level).
2. The Cartesian clock time that the discrete viewer/user actually spends viewing/interacting with the work in the space (three seconds, 30 minutes, or whatever).
3. The more subjective Bergsonian time (analog, non-digital, qualitative not

quantitative) that the discrete viewer spends affectively experiencing the work (could involve personal prior memories, could involve the work coming to mind later after leaving the space). This is related to the Cartesian clock time, but by no means solely determined by it.

4. The time that the entire show or project runs.
5. Archival time -- how the work is archived, collected, subsequently displayed, gradually folded into an art historical canon.
6. The evolutionary time of art criticism and art historical scholarship (and its overlap with philosophy, science, culture theory, etc.)
7. The evolutionary time of an art practice throughout an artist's life.
8. Curatorial research time.
9. Institutional evolutionary time -- the time it takes art institutions to come to terms with and incorporate new media forms (or new conceptual approaches to old media forms).

Notes on the State of Networking

By Geert Lovink and Florian Schneider

February 2004

(Written for the free theory paper Make World #4, printed in 10,000 copies and distributed at the Neuro-Networking in Europe-festival in Munich. URL: www.makeworlds.org).

No longer the society, the political party or even the movement, networks are the emerging form of organization of our time. By marching through the institutions the idea of networking has lost its mysterious and subversive character. Sandpapered by legions of consultants, supervisors, and sociologists, as a buzzword networking superseded the latest fashions of sustainability, outsourcing, and lean organization.

The hype of networks reveals a conceptual crisis of collaboration and cooperation. Yet, the confusing aspect of networking is the fact that large formations of power apparently defy networks. Business and other large institutions are still in the process of opening up. The introduction of computer networks within organizations over the past decade has changed work flows but hasn't reached the level of decision making. In this period of transition and consolidation we get confusing answers to the question whether 'new media' are part of mainstream pop culture. Whereas it is easy to see that networks have become the dominant mode of power, this is still not the case for 'power' in the narrow sense. This is why the call for openness, transparency and democracy, on both micro and macro-levels, still potentially contains progressive elements and should be seen as a counterpart to popular conspiracy theories.

A radical critique of the information society implies analyzing the passages from the state of territory and the state of population to the state of a networked globality or: Info-Empire. It is not adequate to analyse this with Debord's Society of the Spectacle. The networking paradigm escapes the centrality of the icon to visual culture and its critics and instead focuses on more abstract, invisible, subtle processes and feedback loops. There is nothing spectacular about networking. And this is exactly why most of the leading theorists are not aware of the current power transformations. They still sit in front of the television and watch the news or a rental VHS-perhaps they have even bought a DVD player by now.

The networking paradigm marks the threshold of postmodernity and characterizes the global governance scenarios of Info-Empire. This threshold was crossed when digital communications appeared in the political scene and created a notion of the global that is essentially different from the predominant values of 'solidarity' in internationalism or 'multiplicity' in trans-national corporations. Without referring to inferior sentiments or noble feeling, a nuclear strike force or massive drug abuse it was suddenly possible, to think global in absolutely un-pathetic ways.

Rather than a simple application to improve life or increase efficiency life becomes intrinsically networking and networking comes alive as unconditional attribute of social existence.

The ultimate goal of networking has been, and still is, to free the user from the bonds of locality and identity. Power responds to the pressure of increasing mobility and communications of the multitudes with attempts to regulate them in the framework of traditional regimes that cannot be abandoned, but need to be reconfigured from scratch and recompiled against the networking paradigm: borders and property, labour and recreation, education and entertainment industries undergo radical transformations. Although the promise of liberation still lures, and works at times, shifting geographies and social layers, an identity backflip has occurred. Its pretty hard these days to be a dog on the Internet. There never was something like privacy on the Net, but after 9.11 things definitely reached a new level. And once again, theory runs behind the facts or it is satisfied with great gestures that occupy the moral high ground but reveal nothing but powerlessness.

When within the nation state techniques of localization and identification, communication surveillance and motion control have been temporarily suspended it was the direct result of the social struggles of a mass of individuals against the corruption of state sovereignty. Within the 'state of networking' these techniques and technologies tend to become redundant. Furthermore Info-Empire is constituted by including and simultaneously excluding the tracks of localized and identifiable life.

Internet research, now having reached its ethnographic phase, has great difficulties in catching up conceptually, let alone provide us with speculative visions that capture the permanent flux of global immaterial labour.

The classical dichotomies of public/private, global/local, etc. become useless and even obsolete. These binaries are replaced by flexible attitudes of managing singularities and fluid differences: rather than challenging power networking environments act as carriers for virtual self-management and self-control, up to the point of crashing. Networked environments are inherently unstable and its temporality is key, much like events. Networks are dense social structures on the brink of collapse and it is questionable if there are sustainable models that can 'freeze' them.

Maybe it is better to understand networking as a syncope of power, a temporary loss of consciousness and posture, rather than a panacea against corruption, commodification, resentment and the general dumbness of traditional hierarchies. The result of networking often is a rampant will to powerlessness that escapes the idea of collective progress under the pretext of participation, fluidity, escapism and over-commitment.

Participants easily get lost in the overload of email messages, weblogs and chat exchanges. The subjective feeling, having to swim against a tidal wave of noise and random tension, can no longer be explained by a lack of media literacy. Software and interface solutions can be helpful, but often only temporarily assist users to get a handle of complex information flows. This often results in the abandoning of collective communication, somewhere half-way, leaving the online participants with the unsatisfactory feeling that the online conversation got stuck, unable to reach a conclusion. After an exciting first phase of introductions and debates, networks are put to the test: either they transform into a body that is capable to act, or they remain stable on a flatline of information exchange, with the occasional reply of an individual who dares to disagree.

At the same time we are facing a backlash towards romantic and outdated forms of representation, hierarchies and command on many terrains. Due to the 'conceptual wall' that online communities often find hard to cross, classic 'informal' forms of representation fill up the gap. This is part of a larger process of 'normalization' in which networks are integrated in existing management styles and institutional rituals.

But the progress of networking technologies is not that linear or unstoppable, as it appears in the techno-naivety of some NGO's. It is often hard to admit that the realm of power (agenda setting, decision-making) exists relatively autonomous of the techno-sphere as BaB ('breast to breast') meetings. Instead, we would all love to believe that decentralized networks somehow dissolves power, over time. Meanwhile, networking environments also create specific dispositives, that are coordinating new forms of power and that consist of a variety of elements. To research these new statements, norms, standardizations, practices and institutions as an ensemble that organizes the transactions from power to knowledge and knowledge to power goes far beyond the current talk about the information society as well as the attempts to find and replace information with knowledge or any attempt to locate and identify an object of networking, let alone a purpose.

In retrospect, one can say that the radical critique of the information society does not yet exist. That was the lesson of the World Summit of the Information Society (WSIS), held in December 2003 in Geneva. There is the NGO civil society story about human rights and unequal access, but that's it. What's so weak about this approach is it's charity mentality: please donate us some computers and share some of your bandwidth. What is lacking is an informed autonomist perspective. Let's say, an 'Empire' for the Internet generation. This programmatic word should have been written during the raving nineties. Instead, we got stuck with remnants of the '68 generation, and the mess they made, characterized by this particular blend of utopia, violence and sell-out. In the past decade collective work on ideas has been replaced by informal networking, a move away from politics towards culture and the arts, shifting the focus towards software, designing interfaces, and just playing around. Instead of blaming the 'nettime' generation one could also stress that theory can only grow out of reflected experiences. In that sense we might be too impatient. The question should rather be: how can theory come into being in an age of real-time events?

WSIS made evident that there are only few forces willing and able to analyse and then criticize the 'information society' concept. The air in Geneva was filled with the spirit of network naivety-no matter on what side. Both the hegemonic and the alternative view of the information society is characterized by a persistent transcendentalism, as if the spread of ICT would increase development, as if access to the Internet would improve living conditions, as if free software would override capitalism, as if file sharing equals altruism, as if open publishing would promote democracy.

Instead of endlessly deconstructing the 'New Economy meets NGO's' agendas, we believe it the task of the next media activists to investigate the limits of networking in order to be in a better position to overcome those boundaries. This era is blinded by the light. As technologies are still an expanding universe it is hard to see its limits, to recognize its damages, without falling back into technophobia and cultural pessimism.

Quixotic projects and idealism pervaded the rhetoric of the vast majority of those who have not ignored the summit. That was the disappointment of the WSIS process but it did not really come as a surprise. But what could it mean to put the information society under a radical critique? One has to track down the material basis of information and communication in order to turn the whole discourse downside up. For instance one could research the impact of precarious and migrant labour in hardware and software industries, within the service sector such as the call centres, with its temporary workers. This means to tear down the exclusive notion of information as something ephemeral, spiritual and immaterial, and reveal the dirty side of the technology.

It would be a mistake to look at this other or, better to say, the real

information society with an attitude of charity and to commiserate these poor things who have to work so damned hard that we can play with ever cheaper computers. Often this perspective comes along with a romantic, anti-technological attitude or full of ignorance and resentment against informatization, de-regularisation and globalization. These processes that are constituting the current situation are direct and indirect results of struggles (against the working day, for a better living, at for least a job etc.) that are disconnected and abstracted from a common, daily experience.

A radical critique always implies practical consequences. There is no other way out of the intellectual stagnation than to stage unlikely encounters and unexpected alliances, between coders and soldiers, activists and researchers, artists and unionists. We have to bring on irrelevant moments and leave the programmed density of the event-time for what it is.

Shouldn't a radical critique of the information society in the first instance confront the common notion of sovereignty and it's mediation with something that reaches out beyond the increasing banality of networking? What happens after the excitement of encounter has faded away? Should the motor of creativity and subversion continue to be supplied with an ever-changing focus on yet to-be-discovered, soon to be exploited cultural differences?

Does it make sense, as a possible way out, to demand a 'cultural exception' for the digital commons? How can the making of a digital public domain be pushed out of beta, beyond the usual 'revolution or reform' choice? The digital commons obviously have left the sandbox and are out-there, in the wide world. As a 'high potential' meme the digital commons is growing at a pace way beyond the worthy Gutenberg project, which, in the thirty years or more of its existence has only added 10,000 book titles to the public domain. But this is exactly why digital commons is a potentially fragile concept. It involves risk taking, in terms of civil disobedience. It asks of digital artisans to take a firm stand when they negotiate with publishers and distributors. The creative multitudes have to wake up out their numbed state and have the courage to refuse. No more bad contracts. Don't sign away your rights. To publish under the creative commons licence is the very least one can do. This shift not only requires public awareness; it also needs 'best practices' stories of those who stood up and actually tore up contracts. A critical mass of IP-refuseniks will only come into being if such individual stories can find the public forums and inspire people to say no. Otherwise it will remain everyone's individual problem.

Maybe this is because those people are using the wrong tools for the job. If you don't know what you want to do, you can't select the right tools. Rather than set up a network as a tool for 'bringing people together' or some such vague idea, and then hope that the participants will then find some way to act, I think it would make more sense to first decide exactly which action you want to take -- what work you want to do -- and then decide which tools (software, networks, organisational processes) could help you do that work. *Then* set up the tools and start using them.

Ben

I am actually tending to wonder whether this is because people feel bound to the rules or mantras that the networks where originally founded in relation to. Like the Floss rules set out in Freedom o Freedom 1 etc etc. Decisions on network architectures seem to be bound by principles that don't allow space for politics. Everything gets sucked back into the rational consensus and that individual who seeks to disagree appears as a loony who doesn't understand the freedoms inherent in the network structures. To borrow from the Negrian dictionary the networks becomes "constituted" by the tenets of for example correct Floss philosophy, and cease to be "constituent".

I am thinking out loud here on nettime.

Interesting piece Geert and Florian...

Right question/wrong answer...

The problem with "Internet Research/theory" is that the ICT theory (and research) folks see ICTs as a tool rather than as a basis for a fundamental transformation including in relations of production/power. So they miss the forest for the trees...

You folks are making the opposite mistake with "networks", seeing (asking questions about) networks as fundamentally transformative social solvents, rather than seeing networks as (social) "tools" and then doing some sort of analysis on what those (newly empowered) tools are being used for or not being used for--missing the trees while contemplating the forest... How, for what and under what conditions are networks being/could be used...

An increase in the scope and range and force of networking certainly is one outcome of the introduction of ICT's but so is the increase in the capacity for surveillance, destructive autarchy, and "armies of one..."

As the National Networks Association so aptly puts it, networks don't
(kill/empower/enrich... take your pick...), its what is done with them
by the people who use them...

net.art

...

O.O

<nettime> art in the nettimes etc.

From: Calin Dan

To: nettime-l@desk.nl

Date: Tue, 29 Apr 1997 23:31:21

+0200 (MET DST)

art in the nettimes, some mess-media common places, statement for a flat interactivity

"Net-art", a default concept that could be seen coming on the floor since the advent of www, is an indicator for some other, more resistant topics.

1. [The ghetto of appropriation.] In a simplified overview, the art of the last 2 decades spanned from (video-; to video installation-; to computer-; to CD ROM-; to internet-) ART. Whatever new media tool gets public is not only immediately assimilated as procedure and path for artistic activities but becomes protocol and compulsory label for the (state of the) art discourses and the aural events connected to them.

This restlessness can be speculated upon as representing either an increase of integration dynamic, or a symptom of content neurosis. Anyway, it gives a sense of isolation that became retrospectively quite obvious. After the euphoria of the schism between (old- and new-) media arts, a long process of failed integration is consistent with the history of the art events in the last decades. The slow convergence between institutions, initiatives and artists coming from both sides of the imagined fall are not compensating for a crisis which is so simple that it can hide under that little absurd sentence: there is *new* art and there is *old* art. Isn't it?

2. [The seek for legitimacy.] a) From the part of the new media themselves, in a >natural< translation of the technological experiment towards consumerism. (In that case we approach new media as immanent entities with

- a) logic of their own; or, more likely, as corporate initiatives highly controlled in the process of development/dissemination.)
- b) From that segment of the art generators/moderators (artists/curators/theoreticians) looking for a promotional niche where rules have not been imposed (yet).
- c) From the art system itself, in a period when all systems (politics, economy, communication, social security, job policies, capital, environment, family, name it) are confronted with the issue of image improvement.
- d) From those entrepreneurs who still believe that business is helped by a well moderated art commitment.

3. [Revitalization through compromise.] The mechanism of historical change, labeled until recently as progress, is assimilating the innovations through compromise, fact which annoys the innovative spirits. For that reason maybe every new item in the stream of modern escalation has, beyond inventors (initiators) and developers, its own prophets: for keeping pure the flame of the new.

Unfortunately, as soon as the *new* becomes public property it is used precisely in order to revitalize the "old", and not necessarily in order to displace it. A compromise which can bring change if it is negotiated properly. Or bring just some more frustrated prophets pointing at another failure of the pure in front of the rich. This is, I guess, the level on which we can contemplate >net art< at this moment.

4. [Social currency and moral token.] From those who are not satisfied by the assimilation of commodities or by the criticism of commodification, a new type of activism was born, not to be found before the raise of media as

a template of art production.

Mixing media criticism, social skepticism, technological skill and aesthetic will, this activism is structured on the image of its favorite tool - the computer - whose interfaces and connectivity are replicated in a mixture of speed, presence, designed language and behavior, in a convergence of entertaining and calculation, in programmed discontinuity, and in a pragmatic perception of the modern mythologies. An activism consistent with the idea of aesthetic coherence, which brings back the decadent image of the >dandy<, so well married with the >data<, as we know. (Bilwet)

5. *Net is not art.* What could be dangerous in this mixture is precisely the way it addresses both issues of art and social responsibility. When a tactical (media) activist says that *net is art*, my memory jumps back to a previous experience we had in the 70s' and 80s' communist Europe.

>Resistance through art< was then a slogan legitimating a special position >of artists who were truly believing that isolation into a specific medium >was vouching for political dissidence. The complementary trend was to >force the acceptance of active cultural dissidents as artistic authorities >(in the "inner" circles of the art world). The two situations are >interchangeable in the sense that they both consider political engagement >and artistic status as bonuses.

When everything has political implications and/or artistic value, the initial sense of both commitments becomes diluted and therefore vulnerable to manipulations.

I am not trying here to level a historical experience that many cannot check upon with developments just occurring under our eyes. But the recent past has to be used because it offers ready made commonplaces to contemplate and avoid, if necessary. Or not.

Denying publicly the art >system< in favor of media activism is trendy and it confirms the fascination that art keeps radiating in those times of mess-media. Otherwise, why make public issues (therefore conceptual objects) from decisions which belong to the private ("I am no more an artist/curator, etc."), if not for teasing (via negative self-advertisement) the curiosity of a field which seems to have lost any?

6. [Looped rejection.] There is an interesting compression of meanings in the attitudes of those who reject the art >system<, respectively the art ("art is dead"), and those - quite many - who claim "artistry" for other domains, extraneous to the art as sensed historically.

a) Art and art system become one entity, with interchangeable weaknesses. Perceiving art's future only within the perspective of its promotional infrastructure is an abuse which speaks about the failure of art to redesign its public beyond consumerism and the failure of consumerism to socialize art beyond commercial integration.

b) The identification between domain and system opens the door for confused attitudes of reclamation in the key "art is (design/media/media design)", which prove for the effective contamination of the general mentalities - so far that consumerism is denied from a consumerist point of view. Which could be interesting if not just hypocrite.

The reason for this loop rejection-lust stays in the schizophrenic relation that society at large (still) seems to have with money. Although belonging to a system, art is somehow a gratuitous activity, a noble trade, with no apparent relation to currency. By claiming artistry, other domains try to achieve qualities that art itself is denied lately: responsibility, disinterest, social efficiency. The profit should be there also, for the complete satisfaction, but coming somehow spontaneously, as a reward for the understanding of what art really means, and for >extending< its borders.

7. [Loss of legitimacy.] >Net art< speaks (again) for the expectations risen by the new tools in an era when technology plays the full role of ideology. And of the weakness of ideologies themselves in fulfilling one of the most basic needs - legitimacy.

After religion, art seemed to loose its quality to legitimate human activities beyond the range of the aesthetic. But still, like religion itself, art became an instrument for organizing the dynamic of closed communities who stay as referential for more extended (and therefore more discrete) games of power.

>Art is dead< and >net is art< are two symmetric attitudes whose polemic >values have to be appreciated "cum grano salis". But the development of >internet is not a fresh issue, and basically new media are not necessarily >new. Therefore maybe the euphoric statements, the holistic visions and the >pessimistic evaluations are corners that could be cut more drastically on >the base of historic experience, for getting into more matter-of-factly

>estimates of the usefulness and dangers confronting the art in the
>nettimes.

8. [The parenthesis of the >new<.] There is a danger shadowing all topics starting with the domain name *new*: If there is any hope for the new media arts to get long term confirmation, it might come precisely from the fact that new media themselves deal with old issues. The trouble is that since novelty is something that keeps the momentum, there must be something wrong with getting old. At least that is the rule of social contract at the moment.

In the mean time, an increasing eagerness to seek for legitimacy in the history of media, or even further in the history of culture and religions is an operation which might help defining some areas of reflection for the newest art - the net one.

i. #From video out.# Compared to recent experiences, net art is less instrumental in displaying big amounts of data and less able to sustain visual environments beyond the user-to-screen relation.
(Comment: Video art launched the costly adventure of v-installation precisely - among other reasons - because the user-to-screen paradigm seemed to be not enough competitive in the mess-media ambient.) It has potentially higher rates of distribution, on the horizontal vectors of the web. It also involves a higher risk of dissipation, due to the specificity of the same medium.

(Comment: video art aimed to enter the vertical hierarchy of museums, and succeeded: only to realize how meager an audience they bring, despite the acquisition of status symbol. Remain the video festivals and distribution initiatives, something of the dimension of a large news group.)

The capacity of the machines is paramount in displaying the information, and the lack of consistency in their systems, power etc. make the net an unpredictable medium, from the hosting server on.

ii. #Learning to be old.# Net art might be a domain assuming as a program some techniques of nomadism. Random appearances, tactical disappearance, low resolution, ubiquity, distrust of historic values (posterity, stability, economic growth), data pessimism (bury the information, save your discourse for a rainy day), strategies of destruction (symbolic viruses), etc.

Question: If the >web< is a floating graveyard, what is the format of the funeral monuments? ASCII? QTVR?

iii. #Fighting the mess-media.# Net art might put at work the frugal side of net tools for countering the excesses of today's visual environment. Therefore, to be non-visual (or with a diminished visual emphasis), remote (limited audience), private (relying on personal narratives, local imperatives, communal mythologies).

(Comment: The bad news come when we remember the modest impact of conceptual art, community TV etc.)

Mainstream media shouldn't be competed on a lesser ground. The problem with art (*any* art) is that it has no proper means to define a ground out of reach for the mainstream media. The position of media arts (*any* art, net art included, I'm sorry) is worsened in that sense by the vicious shareware situation (same tools, different goals).

Question: How many >surfers< and how many readers are using the www interfaces? This in the perspective of a content based net art.

iiii. #Net quality.# Being able to replace the zapping of the 80s with something different than the >surfing< of the 90s: maybe with a reinstallation of the minimal intensity of contemplation which in lesser times was named revelation or religious feeling.

9. *Statement for a flat interactivity*.* The (new-) screen mentality developing in the track of the www adds some extra confirmation to evidence accumulated during the short but by now tormented history of the moving image. Precisely to the facts that: a) cinema was not a plug in for the Renaissance optical cube; and b) the moving images did not increase the meaning of tri-dimensionality. From film to TV to computer, the visual language didn't mark an "evolution", but spiraled back towards a (meta/pre)historic flatness.

The shocking window opened by the Lumière brothers' first movie projection in the wall of a cabaret theater was already containing the prophecy of flatness: light, movement and perspective cannot change a steaming engine or a traveling happy bourgeois family into something different. What maintained active for decades the hypnotic force of cinema is the revival of an old theatrical recipe: how to install a ritual atmosphere by working the illusion of depth with the help of controlled light and multi-layered flatness. That was actually how the medieval "misterium mysticum"

performances were staged; that is the way theaters were build from the baroque times until the 19 century - with layers of flat decorum propelled with invisible cranes, wheels and ropes, in a scenario of interactivity where the button could be a word, a gesture, the sound of an instrument. All under the supreme rule of light control.

What ruined the hypnosis and revealed the flatness of the procedure was the interference of uncontrolled light. (Dominant light is actually one of the embarrassments of modernism, introduced by Copernicus with his perception of the universe. The ecumenism of electricity, defined otherwise as >the 4th dimension<, is another one.) The installation of more casual moving image devices in our domestic decorum abolished the miracle of light effects, but enhanced flatness as an obvious quality of information.

TV broadcast, video games, web pages with hyper-text structures prove precisely the opposite of what is commonly assumed at this moment. We are definitely not in the way to capture the 3d in the box of our display monitors, or to build an electronic/digital equivalent of the theatrical vision (from light cube to light tube, if I may; here has to be mentioned another embarrassing heresy of modernism - the optical perspective as settled in the 15 century by L. B. Alberti). But we might be close to achieve the goal underlining the image making process for millennia: a synthesis of the meaningful flatness of representation with the symbolic depth of movement.

We might also have an opportunity to finally acknowledge a consistent although remote fascination for the flatness of the images, even when animated.

Flatness is a dangerous component of reality, as far as it is not assumed as such. Art history can be read as a history of failures due to the oppression of flatness. Let's say.

The Magdalenian hunters scribbling the walls of the European caves, or the nomads painting the rocks at Tassili have an understanding for the emergencies of mental perception and a knowledge of the ways to fulfill them. In times of magic relation with the environment, a flattened representation is both an instrument of control and a carrier of superior powers. By flattening the essential aspects of his surrounding (animals to hunt, enemies to defeat), the "pre-historic" painter doesn't operate a reduction, since by that way he can capture a spiritual dynamic via a frozen movement.

The eye does not perceive the movement of the buffalo. The drawing does. And by that it makes obvious another level of the real, the hidden faces of a world otherwise perceived boldly, like a container filled with hostile events. Mapping that container pushes in view the movements and the vectors which give sense to this world. In other words, the world is eventually flat, and dynamic. And therefore meaningful.

3d is predictable, therefore oppressive and limiting. 3d is like censorship. While flatness is comprehensive in a way which gives room to the imagination for building other dimensions too.

Later on in time, the refinement of representation still keeps for a while the dialectic approach to flatness. Where the Egyptian painting gives a perspective, it does so precisely in order to capture the movement, to suggest the vibration of the monumental form, and not in order to play with illusions of volume and masses. In those times, human and animal are still homologue categories - floating shapes in a shamanic flux which unifies the energies of cosmos.

Flatness was magic - 3d is ideology. When sculpture became a public entertainment, allowing the pedestrians to turn around carved figures, the bond to the domain of magic understanding was displaced by the veil of misunderstandings, instrumental for the political power to keep a grip on reality. This process begun roughly in the Roman times, and it had a simple mechanics: making the real look unreal if compared to the powerful illusion of perspective. Before that, the sculptures were confined to the architecture of the temple, altar, mountain. Sometimes they were even impossible to be viewed. They were concepts. And concepts move in the thin air of flatness.

The taking off point for any good interactive situation is to assume the flatness of the screen as an evidence that cannot be transcended just by illusionist procedures; like the flatness of the Earth cannot be denied just by satellite photography technologies. As far as our daily trade proves, we live on a flat planet and we look at flat surfaces where flat shapes happen to move. Interactivity cannot and does not have to go further than the flatness of data which allows information to achieve beyond-the-3d performances. Two dimensions + movement = Multi-dimensional content. The formal aspects of such a process are undefinable, but the requirements are there - on the net: the poverty of the tools, the emphasize on transmission, the fluidity of the connections. A return to older visions might be possible via net art. Or not.

The true virtual reality is the one which goes further than the third dimension, keeping at the same time a flat vision, which is the vision of (f)light. The VR we know now is just the cyber equivalent of the bourgeois realism, a fascinating kitsch defined by basic similarities, effective and addictive because it cuts down any chance for the uncontrolled to burst in our hyper controlled environments. VR and 3d are the sedatives who keep the undisturbed life consumers from becoming life critics.

Therefore, we must be cautious with a theoretical heritage who states that "escaping [...] flatland is the essential task of envisioning information"[1], and look into more obsolete experiences like the history of the collage [2], or the stage writings of Schlemmer [3]. Envisioning information means precisely capturing its essence - which is flat speed.

10. The image of the modern artist was forged during the Italian Renaissance through a dispute which engaged for about one hundred years some of the most outstanding personalities of the Quattro- and Cinquecento. It was the dispute between the Liberal Arts (Ars Liberalis) and Mechanic Arts (Ars Mechanicae).

The division, based on statements of the antique philosophy (mainly Plato) was quantified in the Middle Age, when human activities have been classified into superior and inferior "arts". The superior arts, emanating *only* from the spirit, and therefore "Liberal" were: Grammar, Rhetoric, Logic (the so called Trivium), respectively Geometry, Arithmetic, Music, Astronomy (Quadrivium). The "inferior" ones were all activities involving the mechanics of the body or of the machines, no matter what the purpose of the application was. That is how architecture, painting and sculpture, the main domains of the visual creativity were nevertheless - mechanic arts. All this was encoding an old prejudice about the superiority of theory over practice, intellectual over physical (work), invention over execution, illusion over representation, concepts over objects etc. etc. And mirrors eventually top to bottom social structures, divided in masters and serfs, noblemen and artisans, gods and mortals.

The Renaissance succeeded in changing the status quo by including the visual arts among the other "liberal" activities, and therefore giving a chance to an integrated model of creativity, where the sensorial and theoretical levels could become convergent. [4] The failure of this model came precisely through the institutions meant to promote it, who enhanced the economic aspect of the mutation at the disadvantage of the spiritual ones. The liberation from the manufacturing circuit of production-gratification never occurred, in fact. It was just hidden behind the screen of academic institutions who enhanced the gap between manual work and intellectual satisfaction, instead of erasing it. Socially speaking, the artists remained what they were before - artisans, but loosing in their new ambition schemes the niche reserved to them previously, for a floating situation where individualism prevailed, without being necessarily a solution.

What we experience in the nettimes is another attempt to integrate visual and conceptual (iconic and discursive) models in a unique flow of data. Another attempt to modify the status quo of creativity by going beyond the "mechanics" of expression. And the danger remains the same - that the institutions which have to work out this change will fail the expectations invested in them. That the social needs are again too far to be reached via theoretic restlessness. That the digital priests will remain artisans, this time >digital artisans< (the concept of Richard Barbrook).

The internet is seen now in many ways: as a social model, a psycho-metaphor, a religious interface, a cult, a communal tool etc., etc. It is also, more and more, a play field for cloning the real world in a flattened un-reality. But this time a *truly flat* one, with no metaphysics whatsoever. Therefore the idea of net art comes on a ground virtually polluted by all the failures and prejudices which make art-of-the-real-world so outdated. If this can be changed is a suspended question, but a challenging one, no doubt about it. Happy Doomsday!

Net.art.history?

From: Charlotte Frost

To: <new-media-curating@jiscmail.ac.uk>

Date: Thu, 3 Oct 2013 15:01:52 +0800

Is this post one of the most iconic pieces of net art history?
<http://www.nettime.org/Lists-Archives/nettime-l-9703/msg00094.html>

Certainly Rhizome's Rachel Greene believed the story and made it 'art history' in an article written for Artforum in 2000 she put: 'The term ENet.art¹ is less a coinage than an accident, the result of a software glitch that occurred in December 1995, when Slovenian artist Vuk Cosic opened an anonymous e-mail only to find it had been mangled in transmission. Amid a morass of alphanumeric gibberish, Cosic could make out just one legible term 'ENet.art'¹ which he began using to talk about online art and communications'. Greene, R. (2000) CEWeb Work: a history of internet art¹, Artforum, v.38 (no.9): 162

But as other writers like Josephine Bosma have argued, the term 'net.art' wasn't born this way at all⁵ see her book Nettitudes:
<http://www.amazon.com/Nettitudes-Lets-Studies-Network-Cultures/dp/9056628003>

So was it a stunt? A work of net.art itself? And if it is a fusion of artwork and a tongue-in-cheek jibe at the discipline of art history (creating a kind of 'ism' to bait the art historians) what do we describe it as? A kind of new media new art history? Perhaps Rachel Greene didn't believe the story, but was also invested in crafting this red herring of a narrative? And whatever it was, how do we work with a post like this when studying the history of Internet art forms? How easy is it to misinterpret an list-based archive (or any social media-based archive)? To what extent do we have the license to interpret a list post or should we hunt down it's author and verify we've understood?

I can't exactly say anything specifically about the labeling of net.art - whether it was a joke, a tongue-in-cheek gesture/label or not - but I do feel like the "art historical bait" that was suggested is very relevant to contemporary so-called netart discussions/curation/classifications. Perhaps this is due in part by the continued problematics that net.art as a classification poses to historians that makes me feel a sense of warm affinity when thinking about contemporary netart definitions. Although the term was certainly more closely tied to the technical execution of a work then any current netart definite, I think the ambiguity and the playfulness of such a term still resonates with myself - a self-identified contemporary netart academic/maker.

The difficulty of this classification is that it is unclear if the identity of this art has to do with material or culture. For instance, Painting is a classification of medium, whereas AbEx is a classification of culture. The one is based on material plasticity, the other is based on contextual analysis. However, with net.art, historians can approach this work through both methodological avenues. This is even more so with more recent netart - particularly as a newer generation becomes less concerned with technical execution and more preoccupied with social distribution.

So the ruse seems healthy afoot! Or so I'd argue. The ease of this misinterpretation is perhaps a strength of the medium. I think in being able to be fluid and hard to define creates an intrigue both from a material and cultural perspective that other mediums rarely approach (or

It would be great if this would also include earlier art 'lists' or mailboxes, including those on the early net and in BBS times. In Tilman Baumgärtel's first book on net.art is an interview with Rena Tangens and Padeluun, for example. They ran a 'mailbox' named 'Bionic'. It would also be great to have the Artex 'list' content in there, run by Robert Adrian.

I have Rhizome posts going back to April 6, 1996 and Raw to October 3, 1999. Other lists I have posts for from the 1990's include A-Life, artnetweb, ASCII, Avatars, Consciousness Reframed, CU-SecMe, DigiDance, DXR, Fine Art Forum, Infowar, ISEA-Forum, NetArtTrade, Nettime, Shock of the View, Thingist, Voti (which has a new book out documenting that discussion) and WebWalker. These are far from complete records, some are quite patchy - most are from extinct mail clients but I have simple text files of the posts. I'm happy to put them into a repository of some kind (doubt I want to go back through them though).

best

Simon

I'm actually going through most of the output of early net art history [archives, documentation, catalogues] as part of an invitation from Duke University to develop a comprehensive career archive of my works, associated documents/referential material, correspondence and papers to be housed there at the David M. Rubenstein Rare Book & Manuscript Library. Makes for fascinating reading.

I'd be more than happy to contribute. I've kept as much archival material as possible [even then I realised how crucial our contributions would become in terms of a historicising process]. I actually intend to collate them all in book form at some stage, perhaps with an accompanying 'commentary' of sorts...

There's a great set of emails of a Vuk Cosic interview by jodi that I came across when trawling my archives. I'll see if I can ferret it out again and post it here.

Chunks.

Hi Simon and everyone,

The Rhizome website currently has Rhizome mailing list posts back to 1996 in digest format (under discuss, go to the last page of threads). The addresses are unfortunately stripped, thanks to a poorly thought-out data migration a number of years ago. It's on our conservation to-do list to restore this properly, and of course it would be fantastic to see a crowd-sourced version of this, too.

As part of our conservation program, Rhizome has also preserved a few notable art BBSes, blogs and surf clubs. Several of these will be made public as part of our forthcoming Artbase relaunch. From a technical standpoint, the preservation process of the blogs and surf clubs was fairly straightforward (although the discussions with participants were not necessarily so). The real technical problems arose with The Thing - this article provides a bit of context.
<http://www.theverge.com/2013/3/15/4104494/the-thing-reloaded-bringing-bbs-networks-back-from-the-dead>

Also, Charlotte, did you see the Art in America article in Sept about Rhizome? Apologies if you've already covered that.

The inclusion of "surf clubs" in that list is another illustration of the contingent and contested nature of much online art history. Their baking in to it through institutional capture is a product of Rhizome's HR.

I can't disagree with Curt, or myself, here, however much I loved the other work of some involved:

<http://rhizome.org/discuss/37749/>

["pampas grass" refers to a then-current urgent legend about swingers' parties.]

I have looked at your link, and find a discussion in one artist community about whether what happens in another online artist community is interesting or not. To understand how artists have used the Internet, especially for discussion, communication, sharing, and collaboration one should not be picky when collecting data imo.

I think it is especially interesting to include more recent examples in this thread, because they give us an idea of how online artist networks have developed. Besides that, one cannot really understand certain offline art practices (round and about Post-Internet Art) without looking at surf clubs.

In a somewhat similar vein, the 55 mailing list, used for exchanges relating to the real-time video software Nato.o+55 for Max/MSP is still online, including it's archive. Looking at it this morning, I see that a few mails seems to have gotten erroneously dated during a migration, as the list was first set up in the summer 2000 for a workshop at BEK, and then repurposed January 2001 when NN was kicked of the mailing list runner by Cycling'74. The archive is available here:

<https://mail.bek.no/maulman/listinfo/55>

Cheers,
Trond

Art on the Net not Net-Art

After a long absence (since the late eighties) it is once again a normal experience to go into galleries and museums and find works in which exciting artists use video. Significantly what neither the artists, nor the critics have reverted to is the term "video art". Artists such as Georgina Starr or Matthew Barney may be geographically apart but share a certain sensibility, they are also shrewd enough to avoid of the trap of being confined within the metaphor of given medium. Much of this new work is in fact revisiting the strategies of a much earlier generation Aconci, Abramovich/Uly etc, whose approach to video was also quick and dirty. Unlike those who came next there was no mystification of the medium, no "video art" as such. It was a tool, not an ideology. The same is true for the recent generation who grew up with the camcorder as just another household appliance, part of a continuum of media possibilities and almost as easy as picking up a pencil. It feels very natural, and the art is better for it.

This new generation may not have been around, but they are probably prevented from taking the wrong direction by some residual folk memory of the theoretical somersaults and tedious technological formalism that accompanied debates about what might or might not be "real" "video art".

Is there a lesson for us to learn from this history? Yes, I believe that

those of us who love the net and love art, and want to work in both should learn from the past and avoid the simplistic device of marrying these two terms. The term net-art (as opposed to art that happens to appear on the net) should be quietly ditched.

Net Art is Not Art!!!

by Carey Young

(A response to 'Art on the Net not Net-Art,' by David Garcia)

David Garcia raises some useful and interesting issues in his essay, but may be a little too hasty in damning Net art with an 'ideology.' Of course, the Net offers a 'tool' for artists, but there is precious little art on the Net which has any sense of the rich context in which it is situated. It is too early to see any sort of artistic 'ideology' appearing, let alone congealing around Net artworks. It seems to me that there is at present a distinct lack of art activity which actually exposes and explores the Net's possibilities, rather than employing it as a glorified catalogue, a function which may of course be categorised as useful, but hardly scintillating.

Here and there (as I said, they are a rare species) can be found the occasional project which makes an active use of its location on the Net, without losing any engagement with contemporary critical debates which this 'formalist' position might suggest. I am thinking of work which specifically involves and incorporates hypertext, hyperlinks, Web-cams and other Web-specific devices. Not that this is overtly formal work, just work which makes an intelligent commentary on its Web-sitedness, as well as having its own artistic meanings. After all, each Net artwork is constituted from an electronic and analogue fabric, a spatialised hypertextual 'environment,' which will always contextualise the viewer's/users experience of it. To ignore this, when making a Net art piece, could never be defined as 'wrong', of course. It would just mean a lack of possible depth.

This is not, however, a call for a move back to the formal values of modernism! I agree with Garcia's point that Net art could, at this early stage in its development, be dragged down with "the theoretical somersaults and tedious technological formalism that accompanied debates about what might or might not be "real" "video art". " But what I feel is missing from this argument is the fact that Net art has a very particular location which, we might say, offers a new location for art experience. Artists working with the Net have a vital role to play, in the sense of offering interventions into the usual experiences, expectations or possibilities afforded by the Net. These are still new experiences for most people, and thus some definition of what 'happens' on or in the Net can be an engaging and meaningful aspect of contemporary Net art (and perhaps its future incarnations: in a medium which develops so fast, who is to say that this condition will diminish?) In this sense, Net artworks which make particular, and perhaps I should say 'conceptual' use of their Net location are not merely bogged down in formalist dogma, but may perhaps be commenting on and engaging with their environment in a way we already understand, primed by more traditional artforms.

The most resonant Net artworks thus have a sensitivity to space and to location, albeit its own electronic variety, which is traceable through that grand linear sweep of 'Art History.' While it is not vital to compare Net art with other artforms, since it has its own powerful voice (even if Garcia is perhaps suggesting we do not concentrate on this) it is interesting to do so in order to speculate upon what its possibilities might be. I personally feel that with many of the most interesting sites there are strong links to sculpture (1), to telematic art of the last twenty years, and to land art. The most useful comparison I have found is, however, with installation. Michael Archer, in a recent edition of the British art magazine Art Monthly, states that 'there are grounds for saying that installation is the current condition of art...' (the term's)

widespread use demonstrates... the widespread assumption of a certain spatial sensibility. It is an index of how we might inhabit a space which is always multiple -always spaces - and of how we interact with the bodies and objects, both near and far, around us." (2) Give or take a few word changes, this could be seen to describe Net art works which inhabit the Net in a provocative way. Perhaps Net art as a 'genre' could operate on one level as an index of how we might inhabit and interact with electronic space. And for this to work, I believe Net artworks must first have a strong sense of their own electronic identity.

Although some sites do work well as homes for an artist's non-digital work, we are perhaps talking more of a Net art which explores the potential of the medium in terms of defining and then utilising a language in a sophisticated way. Georgina Starr, for example, as Garcia states, is making compelling video work. But if her work appears 'natural,' it is surely because she is employing the specific 'language' of the camcorder. It implies a rejection of aesthetics which may be seen as 'traditional' to both video art and to television production, to name but two. A sophisticated strategy, which works so well precisely because it seems so natural. It is like this, too, with the most resonant Net artworks. They often make use of strategies inherent to the Net's fabric, hyperlinks, web-cams etc., and do so effectively because they understand that particular language. Understanding (and perhaps defining) does not necessarily mean a crass and closed statement of technological and technical possibilities. I doubt many people would be interested in sites which do no more than announce their own web-location. Rigor Mortis would soon set in to both brain and modem.

Art which 'happens to appear on the net,' as Garcia wants it, is not the only way art should appear on the Net. We can keep the freshness and apparent accessibility of Georgina Starr's work, to continue with this example. It just takes sensitive, and dare I say it, intelligent use of Net 'language' to make work which has the depth to operate illuminatingly in its own space. A sense of the Net's own fabric may perhaps not, in this light, be Garcia's "wrong direction." It may in fact be an essential tool for the artist to deploy: we are talking about effective communication, and for that, one must learn the lingo.

(1) An interesting and related essay, for example, is 'Sculpture in the Expanded Field,' Rosalind Krauss (in Hal Foster, ed., 'The Anti-Aesthetic,' Bay Press, Seattle 1983.) Krauss 'writes on the changes which sculpture, as a genre, has undergone in the transition from pre-modernity through to postmodernity. Her comments on the spatial placement of an artwork (sculpture in this case) in relation to its immediate surroundings can easily be related to Net artworks if they are seen as art 'objects' with a hypertextual or spatial placement.

no, david, it's not time yet.
we have to wait until:

- big international net art stars (whose works and behaviour meet art institutions demands) will emerge;
- living legends of net art will appear (poor, but accepting no compromises);
- some names will be forgotten (to be discovered in the future by net art historians as key figures of the beginning of the movement);
- net art galleries, magazines, associations and museums will be established;
- as well as net art departments at universities;

- few net art histories (contradictory, each describing completely different picture) will be written;
(i think everyone can easily continue this list)

only then those few net artists who survive will be able to proudly say:
"yes, i am a real artist!", denying their low roots in sake of prosperous present.

I.
David,
What means word "ditched"? i found several translations in english-russian dictionary, but they all explain nothing to me. i'm not very good in english and since i didnt get all sentences of your statement i'm not ready to answer.

II.
Carye, Alexey
I hate it. For how long time we are going to participate in destructive discussions.

III.
David, Alexei
No i dont want to know what "ditched" means. i dont like to argue with all these "should-shouldn't" directives-forecasts.

IV.
God, Mammy, Michael (all not nettime subscribers)
I'm a net artists. I'm famous net artists. I'm very good net artist.
i can use the net to express myself, to sell my soul or to save humankind.
my works are net art masterpieces

V.
Does anybody like the level of statement [IV]?
i'm afraid not, but i'll send this message everytime somebody will write about net art, without analyzing works of mine or my friends, existing net artists (not all nettime subscribers).
What for to offer sense and context to people who have already created it or are in the process of creation?
Its obvious, if we want to develop the situation and understand smth the best thing we could do is to turn to personalities and their way of using net.
after these words i feel responsibility to do it myself first, but i still dont know exact meaning of some english words.

:)

David García wrote (in respect to artists' use of Video):

>Much of this new work is in fact revisiting the strategies of a much
>earlier generation Aconci, Abramovich/Uly etc, whose approach to
>video was also quick and dirty. Unlike those who came next there was
>no mystification of the medium, no "video art" as such.

Well that's not altogether true ... the earliest work (Aconci, Fox, Campus etc.) was shot using a Portapak with limited (zero) editing capability - which made it, a priori, "quick and dirty". The "q & d" aesthetic was built right into the technology. When better systems came along they scaled their work up accordingly ... or, more often, dropped the video medium altogether.

It should also be remembered that the introduction of video tape coincided with the beginnings of the movement by artists away from object/product-oriented work in the direction of performance, action and installation. Much of the work David is thinking of is actually documentation of performances - as in the case of Marina Abramovic or Gina Pane, although there are some remarkable unedited, "pure" video tapes from the period (providing they have been saved to better tape).(1)

It was only with the introduction of the Umatic system and (relatively) low-priced editing equipment that something called "Video Art" could become possible -- at least in the institutions and "artist-run centers" that could afford to buy and maintain the gear.

And here is where the "theoretical/ideological" problems, that David mentions, begin (and also where the problems of so-called "Video Art" touch on the problems of so-called "Net-Art"). The questions of identity and definition - what is "Video Art"? Is it like painting and belongs in a museum? or like TV and should be broadcast? or like a book and should be viewed privately? all or none or some permutation of these? And then there is the argument about the actual "Thing" video: is it an object = "The Tape"? or the idea = "The Content"? or the image = "The Screen"?

These arguments may sound silly now (except that they are re-surfacing in discussions about "Net-Art" -- or "Art-in-the-Net" if you prefer) but they were arguments that caused broken marriages and the collapse of artists' collectives not so long ago. In the meantime "Video-Art" has virtually vanished, having found no niche in the "Art Market" - and having been overtaken by several waves of newer (digital) technology.

Artists now (as David says) simply treat video as just another medium from the palette of available imaging systems. It can be made to represent itself, or the TV screen or be used just as an imaging "tool" - and can be sneaked into the sacred enclosure of the museum (thru the back door so to speak) in the guise of "installation".

When video-art was young and full of energy there were all kinds of strategies proposed, and tried, to make video artists into "real artists" and video art into "real art". What most of them failed (or refused) to take into account was that video did not fit into the art traditions of industrial culture - it is impermanent, has no physical object, no handwork (in the traditional sense), and has more in common with dance, literature, theater or music than with traditional painting or sculpture.

What makes "Video-Art" so important? ("mystification of the medium" or not) is its role in the development of the new art tradition growing out of the recording technologies. For instance, with video tape, anything on a screen can be recorded and recycled (collaged) - copyright on a video tape is as absurd the copyright on a web page. The "video-artists" had to struggle with this fact in the same way that "net-artists" are doing now - and the "net" is actually a just huge dispersed recording machine.

Alexei's ironical polemic, in which he appears to accuse "net-artists" of dreaming of becoming (as General Idea put it in File Magazine 20 years ago) "Rich, Famous, Glamorous Artists" on the pattern of the art tradition of industrial (W)Europe and (N)America, has it just about right. If there is going to be something like "Art-In-The-Net" then it should be about connections and communication and not about objects and products - or art museums and galleries (and especially not virtual art museums and galleries).

Why should we, as artists struggling to find ways to survive on the tricky edge of a new digital communications environment, be trying to breath new life into the corpse of the traditional art institutions? For the money, fame and glamour?

(1) There was also the phenomenon of the "video performance" or "video-installation" in which live images from a video camera were included (recycled) in a kind of feedback loop into the piece via a monitor. (Jochen Gertz, Richard Kriesche, Dan Graham, Keith Sonnier etc.) - very "q & d".

So imagine the grandmaster Shulglin at a retrospective of his net.art works
after the term has been consigned to history (say two months from now),
taking us through his career in an interview reminiscent of the precursor
to truly machinic art forms - grandmaster Duchamp. See the how the issues of
old modernist grandmasters conflate with the new.

"Regions which are not ruled by time and space..."*

Edited version of "A Conversation with Alexei Shulglin," interview conducted
by Rachel Baker, Riga, Art + Communication, November

RB So here you are, Alexei, looking at the Moscow wwwarts gold medal
award site

AS Yes, and the more I look at it the more I like it. I like the links,
the way they fall. You remember how it happened in 1996, we put the two
concepts of found web pages and found criticism together not knowing what
they
were carrying, and bounced suggestions around for suitable sites deserving
an
award and that's the result! But the more I look at it the more I like the
links: They have a shape. There is a symmetry in the linking, there
is an intention there, a curious intention that I am not responsible
for, a ready-made intention, in other words, that I respect and love.

RB This was one of your most ambitious undertakings, wasn't it?

AS By far the most ambitious. I worked eight months on it, and it is far
from finished. I do not even know if it will ever be finished; Moscow
wwwart site is always unfinished.

RB There are several versions of the Entry Page to Moscow WW Warts, aren't
there?

AS Yes, eight; these
were shown at the Metaforums 3 Conference in Budapest 1996

RB The critics called us an explosion in a shingle factory

AS Yes. That was really a great line they put out. Now this is the BlaBla
site.
As you see the design is completely arbitrary because that was the period
when I changed completely from exhibiting art photography to exhibiting
'non-art' sites, with no relation to arty handwork.

RB Alexei, these are not the earliest works.

AS No, no, no. The earliest
is this one here - Hot Pictures, That was done before Moscow wwwarts
centre in 1994.

RB It is rather gallery-like, isn't it? That was the vogue.

AS Yes; well, it was not just the vogue, it was the only thing
we knew about. It was a little advanced at the time, but when you look
at these two sites (Bla Bla, Gold Medal) which are later, you can see photo
- galleries were already a thing of the past.

RB They are less static.
The Moscow wwwarts Centre was for net.artists. How were you funded?

AS My funder, Ars. E. Lectorica, was very nice about it. In fact, it was
very difficult then, as it is now, to become a net.artist on your own. How
can you expect to live? He was a good man. He used to give all of us a
small allowance, just enough for us to live on. He was always very
understanding and always helped us out of scrapes, for a long time even
after we were established. And he had very odd ideas. He told us "All
right, I'm going to give you what you want, but listen: there are 12 of you. Anything I give you while
I'm alive I will deduct from your inheritance." So he kept a careful
account of all the amounts, and when he died these amounts had been
deducted from our inheritance. Not so stupid, actually, that idea: it
helped us all manage.

RB Well, there seems to be quite a step between Hot Pictures and the
gold Medal award site.

AS Yes, Gold Medal was two weeks later, and it was after these that
I decided to get away from all the influences I had been under before.
I wanted to live in the present, and the present then was computer
communication. You see, in May 1996 net.art was new; the approach was so
different from the previous movements that I was very much attracted
toward it. I became a Net.artist and gradually came up with Refresh.

RB The Site has plenty of movement in it, net.art seemed to be interested
in movement.

AS Yes. But don't forget there was also techno culture
at the same time. Croatian Rave... though I didn't know about it. I was
in my studio the Moscow wwwarts centre. I didn't even know of the
ravers existence although at exactly the time I was designing this
Site. Was that a coincidence or was it in the air? I don't know. But I
did this site with the idea of using movement as one of the elements in
it. The next year, I entered the site in an exhibition.

RB That was an event in the history of Net.art?

AS Yes, but we only know it now, 2 months later. At the time it
could have been just an explosion in a shingle factory: a successful week
or two, and then nothing. But that was not enough for me. I went on with
the
idea that, all right, I had done what I could with
photo-galleries but now it was time to change. It was always the idea
of changing, not repeating myself. I could have done ten other Hot
Pictures at that time if I had wanted to. But the fact is I did not
want to. But I went on immediately to art formula, the formula of the
Found Art site. I used to surf around the pages of the World Wide Web
looking at the countless homepages people had constructed. They fascinated
me so much that I took it as a point of departure

RB Well, what was different in your point of view of homepages than in
any normal view of a homepage? Was it a mechanical interest, is that
it?

AS Yes. The mechanical aspect of it influenced me then, or at least
that was also the point of departure of a new form of technique. I
couldn't go into the designing of new material I wanted to go back to
a completely dry conception of art. I was beginning to appreciate the
value of accident, the importance of chance. The result was that my work
was more popular with amateurs, and among those who liked net. Art.
The linking, threading and self-selection was for me the best form for
that dry conception of art.

RB And that was the real beginning for the Refresh site. At the time
you did this, did you have a precise idea of what was coming?

AS I was already beginning to make an indefinite plan. The WW Warts
gold medal site was one point of departure, and then came the Bla Bla
site on the side. All this was conceived, networked, and on screen in

1996. It was based on a dispersed, multi-dimensional chaotic view, meaning incomplete knowledge of the arrangement of the parts. It could be haphazardly done or changed afterwards. It did not have to go through according to plan, so to speak.

RB Well, I imagine you feel that Refresh heralded something in your work, something of that break you have often told me about.

AS Yes, it was really a very important moment in my life. I had to make big decisions then. The hardest was when I told myself "Alexei no more Internet conferences, go get a job."

RB I looked for a job in order to get enough time to make projects for myself. I got a job as a technician in London at the Institute Of Electrical Engineers. It was a wonderful job because I had so many hours to myself.

AS You mean to make projects for yourself, not merely to please other people? You know you are either a professional or not. There are two kinds of artists: the artist that is integrated into society; and the other artist, the completely freelance artist, who has no obligations. The artist in society has to make certain compromises to please it; is that why you took the job?

RB Exactly, exactly. I didn't want to depend on my art projects for a living. But, Alexei, if you speak of a disregard for the broad public and say you are doing art for yourself, wouldn't you accept that as making art for an 'ideal' public, for a public which would appreciate you if they would only make the effort?

AS Yes, indeed. It is only a way of putting myself in the right position for that ideal public. The challenge is in pleasing an immediate public; You should not wait for fifty years or a hundred years for your true public. The immediately present public is the only public that interests me.

RB That is a rather elitist point of view. I don't think you ever felt that a person was justified in living in an ivory tower and disregarding the intelligent and sympathetic public.

AS No, no, no ivory tower in my idea at all.

RB I remember a line in an interview with Vuk Cosic in which you said that there was more possibility with the Internet to find art that doesn't realise itself as art - non-conceived, intuitive, spontaneous and naive.

AS You see the danger is to 'lead yourself' into a form of taste, even the taste of the Moscow www.wart site

RB Taste then for you is repetition of anything that has been accepted; is that what you mean?

AS Exactly; it is a habit. Repeat the same thing long enough and it becomes taste. If you interrupt your work, I mean after you have done it, then it becomes, it stays a thing in itself; but if it is repeated a number of times it becomes taste.

RB And good taste is repetition that is approved by society and bad taste is the same repetition which is not approved; is that what you mean?

AS Yes, good or bad is of no importance because it is always good for some people and bad for others. Quality is not important, it is always taste.

RB Well, how did you find the way to get away from good or bad taste in your personal expression?

AS By using found art techniques. A found art site has no taste in it

RB Because it is divorced from conventional art institutional expression of taste?

AS Exactly, at least I thought so at that time, and I think the same today.

RB Then does this divorce from conventional art institutions in net.art have a relationship to the interest you had in found art sites?

AS It was naturally, in trying to draw a conclusion or consequence from the de-institutionalisation of the work of art, that I came to the idea of Gold Medal Award sites which in effect are already completely made. Let me show you: this is a website with innocent non-art intentions, it is a ready-made. Now it is a Ready-made in which shit is changed to gold, metaphorically speaking. It is a sort of a mythological effect produced by art awards and art criticism.

RB You didn't know me before you came to Holland

AS No, I came to Amsterdam in January. I met you at the Next Five Minutes conference it was the beginning of a long email friendship. We devised the Gold Medal Award and discussed infiltration of Nettime

RB The Nettime group was associated with several other groups, wasn't it?

AS Yes, there was Vuk Cosic and Heath Bunting for example, who was also a patron of net.art, and he started a museum called CERN. And there was V2 whose purpose was to promote net.artists from the east to get a sort of communication between east and west, and it was quite successful then. It was from then on that the West was absolutely net.art conscious, which it had never been before.

RB I see. Well, Vuk Cosic also owned your Refresh page which we were looking at a little while ago.

AS Yes, it was in the Moscow WWWarts collection in 1996, at the time of its near-completion. But no-one could own it because it was too fragile to transport, given its size.

RB Alexei, from what you say the Refresh page was never really finished.

AS No, No. The last time somebody worked on it was this morning.

RB So it remains a sort of unfinished epic. And also for me it seems to indicate that you were never really dedicated to conventional communication in the ordinary sense of the word. I imagine that there is something broader in your concept of what art is than just communication.

AS Yes. I considered art as a means of expressing the present, not an end in itself. One means of expression among others, and not a complete end for life at all; in the same way I consider that color is only a means of expression in painting and not an end. In other words, communication should not be exclusively retinal or visual; it should have to do with the concept, with our urge for understanding. This is generally what I love. I didn't want to pin myself down and I tried at least to be as universal as I could. That is why I took up Internet. Internet in itself is a hobby, is a game, everybody can play Internet. It's like chess. Actually when you play a game of chess it is like designing something or constructing a mechanism of some kind by which you win or lose. The competitive side of it has no importance, but the thing itself is very, very strategic, and that is probably what attracted me to the Internet game.

RB Do you mean by that another form of communication?

AS Yes, at least it was another facet of the same kind of mental expression, intellectual expression, one small facet if you want, but it differed enough to make it distinct, and it added something to my life.

RB Do you regard Moscow WWWarts page as a distinct expression of your personality?

AS Yes. Absolutely. It was a new form of expression for me. Instead of merely photographing something for gallery exhibition the idea was to reproduce the work that I loved so much in miniature. I didn't know how to do it. I thought of a book, but I didn't like that idea. Then I thought of the idea of the box in which all my works would be mounted like in a small museum, a portable museum, so to speak, and here it is in this Internet valise.

RB It is a sort, of ready-made catalogue, isn't it.

AS There was a whole art system, which I thought up to win at roulette at Monte Carlo. Of course I never broke the bank with it. But I thought I found a system.

RB Did you win anything?

AS No, I never won anything. But at any rate as you know, I am interested in the intellectual side, although I don't like the word "intellect." For me "intellect" is too dry a word, too inexpressive. I like the word "belief." I think in general that when people say "I know," they don't know, they believe. I believe that art is the only form of activity in which man as man shows himself to be a true individual. Only in art is he capable of going beyond the animal state, because art is an outlet toward regions which are not ruled by time and space. To live is to believe; that's my belief, at any rate.

<nettime> Has net-art lost political significance?

From: Rachel O' Dwyer

To: nettime-l@kein.org

Date: Thu, 27 Jun 2019 11:27:13
+0100

What characterises media art interventions in the context of 'surveillance capitalism', platforms and the gig economy? Are these practices still meaningful or, as F.A.T. Lab claimed in 2015,

have they lost political significance in the face of global platforms?

Can we still speak about 'tactical media' or 'the exploit', and if not is this because

a) network activism has transformed so that these older descriptions no longer accurately describe net art and 'hacktivist' practices, or

b) these art practices have stayed much the same, but they are no longer effective in the current political and economic context?

I'm wondering if anyone knows of any writing that attempts to theorise/frame media art activist work post 2012? Perhaps to speak about it as a set of practices discrete from theories of 'tactical media' or 'the exploit' that go before? Perhaps something on post-internet art and activism? Or is it a case of looking at writing about activism in the face of defeat and what seems like a hopeless cause? If you've read or written anything that you think might be interesting I'd love to hear about it. Best, Rachel

A bit more detail about why I'm asking this question:

I'm currently writing about various tactical and activist practices in the wireless space, including artistic interventions, software-defined radio communities who are reverse-engineering, hacking, sniffing and jamming signals, communities and activists who are building communal Wi-Fi and cellular networks and artists making work in or about the politics of the wireless spectrum – who owns it, how it's controlled and so on.

But I'm feeling a bit paralysed.

I love these works: I love their inventive materiality and the ways that they exploit and reverse-engineer existing systems, but I don't know what claims I can make for their political impact. And yet I feel that this work is still very worthwhile.

Hi Rachel,

I'm not sure it's exactly what you have in mind. But just in case it helps, you could take a look at some of the artists and art activist projects that made up the second day of the Pirate Care conference last week:
<https://www.coventry.ac.uk/research/about-us/research-events/2019/pirate-care-conference/>

Hopefully, we should be able to make some recordings available in the not too distant future.

Best, Gary

Hi Rachel,

snip -

I'm currently writing about various tactical and activist practices in the wireless space, including artistic interventions, software-defined radio communities who are reverse-engineering, hacking, sniffing and jamming signals, communities and activists who are building communal Wi-Fi and cellular networks and artists making work in or about the politics of the wireless spectrum – who owns it, how it's controlled and so on. snip Great. So needed. I wrote a dissertation on WiFi practices - a bit earlier history than what you are looking for. I write about "warchalking" and other kinds of social media based information spaces, hacks. From that experience I'd bet you will be best off in the arts. If there is writing being done it would be from groups like the then - headman - Knowbotics Research, etc. But the best project - utilizing mobile tools and being both tactical and poetry and human rights - Transborder Tool b.a.n.g. Lab. Ricardo Dominguez's and Brett Stalbaum from virtual sit-in days behind it as well as Micha Cardenas. We programmed this into our project - City Centered: Locative Media and Wireless Festival - 2010. I think TBT is having a re-release. (Smile)

Molly

So interesting,

I also find this so interesting because in the light of fakeness, Tactical Media is harder, in the sense of the intervention/provocation to response that was done

with RTMark/YesMen back in the time I was active. I think that the new Washington Post, after the Times and NY Post ones that were done in the late 2000's, was powerful because I heard about it in the UAE.

However, in the Eastern hemisphere, I have been working with AR as a "local" discourse (meaning that anyone can get the app, but the message is pretty limited to them), as well as working with artists in Kazakhstan about messages AR as tactical media, such as overlaying messages over works in the National Museum (based on the Manifest.AR We AR MoMA intervention I was part of around 2010) and the "Modernization of Consciousness" (Ruhani Zhangru) posters in 2018.

These are some intersting ways in which one can laterally engage networks for critical discourse.

In addition, I am working with David Guillo with his independent web router galleries as a sort of TAZ in regions that employ firewalls and net.filtering. This follows from my setting up occupy:here routers as wifi "islands" for collaboration without using VPN, and therefore staying technically within local regulations.

While not so much "Tactical" media, I consider that in the era of increasing firewalling, and in the case of threatened net.separation in Russia and Iran, I feel hang autonomous server art is a critical space for exploration of these topics as well.

Re: <nettime> Has net-art lost political significance?
From: Tom Keene
To: nettime-l@kein.org

Date: Fri, 28 Jun 2019 09:57:54 +0100

Hi Rachel, I've written a contribution to an upcoming Critical Makers Reader for the Institute of Network Cultures that may be of interest. It relates to my PhD artist and activist led research (in final year of write-up) of local authority databases, processes of urban regeneration, and an ongoing fight to prevent the demolition of 306 homes, including my own. I employ art as a method of enquiry where the space between art, activism, academia, theory, programming, and my personal life is frequently blurred.

Its not a treatise on early media art, though

Its definitely a different approach to tactical media etc. so may be of interest? I've a live 'sketchbook' of this work that can be viewed at <http://db-estate.co.uk> Its filled with images, video, notes, code, and lots of half-formed text and errors! I wrote some code to automatically (and periodically) generate the website from a project/activist folder on my laptop that I work from - hence the live and error prone aspect that imparts a sense of an unfolding process and attempts to show the mess of this kind of work that is frequently hidden from view. There's a 'hidden menu' within a light grey box to the top right of the website that shows the directory structure and links to even more mess.... Though it feels slightly scary to mention this on Nettime! Tom On Thu, 27 Jun 2019, at 11:40 AM, Rachel O'Dwyer wrote: What characterises media art interventions in the context of 'surveillance capitalism', platforms and the gig economy? Are these practices still meaningful or, as F.A.T. Lab claimed in 2015,

have they lost political significance in the face of global platforms?

Can we still speak about 'tactical media' or 'the exploit', and if not is this because

a) network activism has transformed so that these older descriptions no longer accurately describe net art and 'hacktivist' practices, or

b) these art practices have stayed much the same, but they are no longer effective in the current political and economic context?

I'm wondering if anyone knows of any writing that attempts to theorise/frame media art activist work post 2012? Perhaps to speak about it as a set of practices discrete from theories of 'tactical media' or 'the exploit' that go before? Perhaps something on post-internet art and activism? Or is it a case of looking at writing about activism in the face of defeat and what seems like a hopeless cause? If you've read or written anything that you think might be interesting I'd love to hear about it. Best, Rachel

A bit more detail about why I'm asking this question:

I'm currently writing about various tactical and activist practices in the wireless space, including artistic interventions, software-defined radio communities who are reverse-engineering, hacking, sniffing and jamming signals, communities and activists who are building communal Wi-Fi and cellular networks and artists making work in or about the politics of the wireless spectrum – who owns it, how it's controlled and so on.

But I'm feeling a bit paralysed.

I love these works: I love their inventive materiality and the ways that they exploit and reverse-engineer existing systems, but I don't know what claims I can make for their political impact. And yet I feel that this work is still very worthwhile.

Hello Rachel,

I love your questions. Personally, I just submitted my PhD thesis which had some similar research goals. While I love the construct of 'the network' and 'the exploit' -- I feel they are dated/need revision in today's landscape of platform

politics. In addition I think the flat hierarchy of the network is a bit utopian and doesn't recognize the power of some individuals in the overall structure. Moreover, I feel the discourse around tactical works needs to be expanded to include works that engage technology (broadly) in a critical way as, for me, technology and the internet are (at this point) part of a single continuum. The idea that we can talk about work 'on the web' singularly and separate from work that is about the web, that is of the web, or that is simply of our current technological condition is stifling, I believe.

I think you can apply whatever theoretical model you want: the discourse (as your research question recognizes) is ripe for new frameworks. Personally, I used my own kind of cyborg theory (a blend of Heidegger, McLuhan, Latour, Haraway, Bratton, and Terranova... among others) to discuss these types of works in terms of challenging our relationship to technology as both a global system we are embedded in and distributed across and as something which has embedded itself in us. Maybe that will help you with your approach.

Certainly, there are artists making work that is interesting, important, and political in this landscape. Many are mentioned in other responses. Goodness, what the alt-right did was straight out of the handbook of Tactical Media, very effective, and not not art -- although it might terrify some of us. That has been discussed here, in fact -- and I was again discussing it last week at a conference.

Hi everyone, I really appreciate all the replies both on and off the list.

I hadn't made a connection between this post and the very popular discussion of net-time and I'm very interested to hear that Transmediale is exploring the persistence of networks.

One of the most inspiring books I've read in the past few years was Anna Tsing's *A Mushroom at the end of the world: on the possibility of life in capitalist ruins*.

It might seem odd that an anthropological text on supply chains and Matsutake mushrooms changed how I thought about the politics of networks, but the book also explores the limits and possibilities of political agency from a position of ecological ruin, hopelessness and precarity. A brilliant chapter 'some problems with scale' also helped me to articulate criticisms I had of a lot of peer-to-peer and network activist projects. I'm also re-reading some work from people like the late Mark Fisher and Rebecca Solnit on politics and hope.

A few things have come up in conversations over the past few weeks (I've mostly been talking to and emailing people instead of writing).

1. There also seems to be a shift towards a feminist politics of networks. Maybe I'm using the term 'feminist' incorrectly here because I don't mean work that's particularly concerned with identity politics. But if we say that people like Butler and Haraway and Barad disrupt binary thinking around gender and materiality, this kind of transdisciplinary, non-binary thinking coupled with an ethics of care (i.e. someone like Maria Puig de la Bella Casa) provides us with a set of tools for thinking through new kinds of resistance as well as new ways of relating to ourselves with and through networked communications infrastructure. There seems to be more of an emphasis on localized and situated interventions for example rather than things that scale. There seems to be a greater emphasis on pedagogical practices than on technical implementation. If anything is starting to emerge as a kind of pattern for me, this is it. I think that's also reflected in the sensibilities of projects like Platform Cooperativism and the Decode

Project.

2. Techniques that can be identified as part of first and second wave 'tactical media' such as reverse-engineering/ circuit bending/ hacking; the exploit; commoning/DIY; obfuscation; visualization/mapping; and speculative imagining are still used and are still necessary.

And I think some of these, particularly reverse-engineering and obfuscation, seem to be particularly significant in the context of platforms. Not to mention being able to imagine alternatives in the face of overwhelming odds.

These are some of my own thoughts coming out of returning to the book I'm writing on the politics of wireless networks and the EM spectrum, from students while teaching an undergraduate elective on network politics and art with undergraduate students in NCAD and recent conversations mostly over networks with Rosa Menkman, Geert Lovink, Jussi Parikka, Surya Mattu, Patrick Bresnahan, Brian Holmes, Nate Tkacz, Nora O Murchu and Sarah Grant, the OMG collective in Dublin and C-Node (Paul O'Brien) in the past few weeks.

Re: <nettime> Has net-art lost political significance?
From: Francis Hunger
To: nettime-l@kein.org
Date: Mon, 1 Jul 2019 20:45:54 +0200

Hi Rachel,

A bit more detail about why I'm asking this question:

I'm currently writing about various tactical and activist practices in the wireless space, including artistic interventions, software-defined radio communities who are reverse-engineering, hacking, sniffing and jamming signals, communities and activists who are building communal Wi-Fi and cellular networks and artists making work in or about the politics of the wireless spectrum -- who owns it, how it's controlled and so on.

I think exceptional work in the early 2000s was done in the Acoustic Ecologies and Acoustic Space series by rixc.org and Rasa and Raitis <http://rixc.org/en/acousticspace/all/>. HMKV Dortmund saw the Waves exhibition <https://www.hmkv.de/programm/programmpunkte/2008/Ausstellungen/Waves.php>

But I'm
feeling a bit paralysed.

I love
these works: I love their
inventive materiality and the ways
that they exploit and
reverse-engineer existing systems,
but I don't know what claims I can
make for their political impact.
And yet I feel that this work is
still very worthwhile.

It may simply be the case that artists have
notoriously overstated the possible impact of their
works/research. Which makes sense against the historical
context: During the late 1990s and early 2000s "Internet" was
still something new and not part of overall discourse and
academic discourse, so it was relatively easy for artists
tapping in or creating a certain discursive field that appeared
to be "avant-garde" at that time. This possibility to create and
direct discourse slowly evaporated with capital on the one hand
and academia on the other joining in, and re-shaping the
discursive field towards "the digital" as we know it today.
Claims of impact may also have been made to simply
get funding, since one of the tactics of tactical media was
getting public or private funding, since the works were not
being sold on the art market. So no income from Basel.

Already early on there has been internal critique
against certain claims that (some) media art made. Personally
for me the most important intervention was Alexei Shulgins 1997
proposal against "interactive art".
<https://twitter.com/databaseculture/status/1136236115652603904>
and I wonder, if similar critique of tactical media was around
at that time. I think so.

All in all it never has been an undisputed field,
and you feeling paralysed may be just worth to follow. One of
the results of this kind of critical inquiry may be to look more
precisely into the claims that AI based art makes today.

best
Francis

+I wanted to contribute that the
recent scholarly work

of HCI

researchers such as Os Keyes et

al's "A Mulching Proposal" and

AI researcher

Joy Buolamwini et al's "Gender Shades,"

etc.,

exist

in the space of serious research and savvy presentation that contains inherent
critiques of their subjects in a way that is reminiscent of some of the art projects
mentioned in various threads.

What is interesting there is that these projects are

also very

specific to

a highly-engaged community that already prizes knowledge sharing and gets a
lot of press attention,

so I'd argue that

these researchers

are well-positioned to

affect

the fields that they critique. I'm not sure how engaged net-artists are by
comparison, as I am woefully ignorant of the current state of things there. :)
Maybe artists can also

carve out more

space for themselves

in academic/industry networks

so they can

radicalize- I mean

reach-

more people!

>>
>
>sounds convincing, but i never studied at art academy, i dont know their
motivations

it's not a subjective motivation, art academy, universities, galleries are
such a deep part of this system...

since art has always been a peculiar kind of commodity, impossible to
categorize, like other products, in terms of social time necessary to
produce it -- capitalistic system had to create a character, a technician
able to
establish this value...

this technician, the critic, absolves to multiple functions: it
commercializes the artwork, reassure the buyer -- guaranteeing the
originality of the artwork -- explain to the public, legitimate the artist
discovering h/er...

that's what you are basically doing with art.teleportacia which is, from my
point of view, a conservative project because it doesn't change of a comma
in this discourse...

i don't think that you establish the price of what you sell on the base of
time necessary to produce the artwork... it seems that this price is much
more based on notoriety of artists, on social time necessary to produce an
artist...

an artist mirrored or linked from several web-sites, invited to several
conferences, is surely more worth than an unknown one... in this way we go
back the origin of this discourse, the function of the gallery and museum:
yesterday we had exhibition, catalogues, conferences, auctions, all parts
of a system that was selecting artists and assigning them a different
level of a stairway, the money's stairway...

today we have art websites, net galleries, mailing lists, web auctions and
so on... i don't see any innovation if we consider
these circuits -- more or less independent -- as the new institutions of
net.art... under this perspective, teleportacia is surely one of the first
to show the naked king...

>> if these are the premises, i think that we have to find the potential
>> differences that the net introduce, in the production of communication and
>> art...

>
>true
>
>> now we can
>> replicate complex system in few minutes, just using a software...
>
>>but it is not a big deal and this is what i say in the paragraph u quoted
above
>
>>
>>
>> it means that the machines and the codes had accumulated such a quantity
>> of human knowledge that, sharing it, we can progress much faster on a
>> collective level than we did in the past...
>
>faster is only faster, nothing more

nothing more! going faster is not only a matter of quantity, but of
multiple elaborations, synthesis of time... all the development of
photography, cinema, video, informatic technologies is the development of
an engine that accumulates and produces duration and time... new
technologies basically works like our memory, zipping and unzipping,
folding and unfolding different crystals of time (text, sound, images)...

any of these crystals can be trapped by the work chain and finalised to
profit or liberated to create new pleasureable, non finalised associations
and connections...

... any applet, script, game that we playfully create, it's a powerful
means of mutation, because it keeps the aware signs of of a
multiple/singular concatenation of body/minds, where the limits between me
and the collective you are more and more blurred...

but when you start to sell, you necessarily end up limiting circulation
and access
(why someone should pay for a public artwork, if you don't guarantee to
the potential buyer an exclusive access?) and suggesting weird ideas to
those that can't really stand the existence of this gift economy...

look at the etoys vs etoy case, it tells us clearly what is the real
attitude of the companies towards small actors... etoy created its domain

at least 3 years before etoys: if now it's sued is because corporations finally obtained laws to do it...

can you imagine what will happen as soon as they make laws to protect original artworks on the net?
defending the originality of the DNS as a certificate of authenticity, you move in the same conceptual framework of Microsoft...

Plagiarism is necessary. Progress implies it.
Copyright protects the rich. I'd rather give it away. That way I never feel ripped off.

the only original server is the dead server
dead servers tell no lies

Counter-question: Are you really familiar with the net in general and net servers in particular? On any Unix-like server, it's quite easy to set up a cron job that mirrors <http://art.teleportacia.org> every one hour or even every five minutes if you like.

To do so would be easy at least for the time being, given that most net art, in its focus on surfaces and user interfaces, runs entirely inside the client (browser) and rarely relies on server-side programming or

database backends.

I propose to use this technical observation for a critique of net art in its current state.

Florian

No, I wanted to suggest something else. If most "Net Art" merely consists of static files on servers, it interfaces so superficially with the Internet that it should be more properly named "Netscape Art". Thanks for mailing me, I will have to clarify this point on Nettime.

:)

of course it is possible but what sense do you see in it? what for will you waste your time making mirrors of my gallery, you want to have it? u want to simulate that you have it? can i ask you why? why possession or imitation of possessing smth is so important for you?

"This website ;Florian Cramer, 1996-1999
The sourcecode of this website - including all Perl CGI's - is Free Software and

copyrighted according to the GNU General Public License" --- this I found on your website, looks very romantic in the context of your COUNTER-QUESTION

or you mean that you want to help me to promote the gallery making mirrors?

>
> What if I don't look at it in Netscape?

I agree with your critique - I was, seduced by the terminological pun, over-simplifying things. So I would like to correct my statement as follows: Although a lot of Net Art can't be seen without Netscape or IE (Olia's own works, www.jodi.org, Alexej Shulgin's "form art" and even Vuk Cosic's "ASCII history of moving images" which despite its name doesn't display in lynx), this is not the point of my critique. The point is that much if not most of what's called Net Art - as, for example, the works currently on display at ZKM's "net.condition" - can just as well be experienced _without_ the net.

When I fetched the contents of www.0100101101010101.org and the net.condition web site onto my own harddrive, I realized to my own surprise that the bulk of what is commonly referred to as Net Art does not actually use and technically rely upon the Internet, but turns out to be a bunch of files which can be viewed offline without loosing anything (besides the domain name in the URL display).

In other words, it doesn't matter whether one views it over the Internet or from a CD-ROM, except that - as olia pointed out - the Internet gives the creators more flexibility to update their work. Yet many and particularly the 'classic' pieces of Net Art (a) are not conceived as works to be experienced in continuous change, if they are still changing at all, and (b) do as technical systems not rely on the net, i.e. they do not alter any of their components or parameters according to information which they _have_ to _receive_ over the net.

So shouldn't the term "net art" be used more cautiously and not be mixed up with "browser-based media art"? Isn't mixing up the net and the browser display the most basic mistake to be made in any net (art) criticism?[1] If one would instead argue that "Net Art" qualifies for its name not on technical grounds, but because it's being created for and out of networked contexts, then "Net Art" wouldn't signify anything, because all art is and has always been created out of networked contexts.

In my view, an example of a "Net Art" intertwined in its very structure - technically and conceptually - with the Internet is Mongrel's manipulated search engine <www.mongrel.org.uk>. I personally would like to see more Net Art investigating (and subverting) what's underneath the browser.[2]

Florian

[1] Certainly, the technical distinction between "net art" and "browser-based media art" has its own potential quirks and traps.

www.jodi.org, for example, might be read as a fun and sophisticated simulation of how the Internet is experienced through contemporary browser and user interface paradigms; and the fact that its interfacing with the Internet is mocked-up by local, static files - i.e. is networking simulated with browser tricks - adds just another ironic twist to its play. With this irony however, www.jodi.org seems to me the only Net Art project which can convincingly declare its technically network-independent art as "Net Art".

[2] This critique also affects most of my own works on the World Wide Web, although they are not Net Art.

The problem is that a few years ago someone (can't remember who) coined the catchy name net.art - it was the little dot that did it and the name has been with us ever since. But what was really meant was web art - or "web.art" if you like - which Florian would prefer to rename as "browser art" (no dot). Web Art is stuff that relies on the WWW for distribution and has existed only since the introduction of the first reliable graphic-capable browsers. Net Art is a bit broader and existed in one form or other long before the WWW ... and while the internet was still little more than a gleam in the eye of a few U.S. academics.

Net Art, Network Art, Telecommunications Art, Telematic Art - or whatever - is about artists working within the electronic space of communication networks. Prior to the (more or less) universal availability of the internet this usually meant the telephone network. Communication itself was the main content of most of this work - a visible product (art-commodity) was never a serious consideration.

So it's not really a matter of "viewing" a net.work, it's a matter of experiencing it in the context of the network ... in the knowledge that you are experiencing a version - dependant on your browser, bandwidth, CPU, monitor resolution etc. - of a work for the internet. The artist can't control any of these factors so that every viewing is a new experience - unless you materialise the work as a recording captured on your hard drive or CD burner - and even then it's just YOUR version.

The exciting - and frustrating - thing about working or viewing on the web is that you can't control the final appearance of the work. (In fact there is NO final version of the work.) That's been a part of net.working since the beginning - and it's the revolutionary aspect.

Lots of artists and all museums don't like the loss of control ... so there's still painting!

The problems being encountered by collectors and museums - and artists who wish to profit from the traditional marketing strategies of the past - is that network art is transient and freely accessible to all. What is missing is the aura of the original

>particularly the 'classic' pieces of Net Art (a) are not conceived as
>works to be experienced in continuous change, if they are still changing
>at all, and (b) do as technical systems not rely on the net, i.e. they do
>not alter any of their components or parameters according to information
>which they _have to_ receive over the net.

I think here you are touching on a good reason for why the term Net Art should not be used, or only used for a very small number of works. What "links" a lot of what is called Net Art is not actually the Net but the computer. This is true of much work produced for viewing in a browser, or on CD-ROM, or even a lot of installation based work. Often the only differences between these works are the means of distribution...and whilst distribution is an important contextual component of any medium or work at the same time it might be hard to use it to define a medium per se. Usually the more important differentiation of such work lies not in its mode of distribution but in how it engages with its primary media platform, the computer (eg: is the work autonomous, procedural, dynamic databased or static navigable, etc).

The Net is formed from the convergence of telecommunications and computing. Thus one would expect that work that can be called Net Art would also be the direct product of or response to that same convergence of media. When regarded from this perspective it becomes clear that there really is only a small number of works out there that are definitively of the Net, and that these works are those that either engage the Net's capacity for creating communities and connections between people (as one would expect from a telecommunications technology) and/or those that engage with the abstract space created with the notion of hyperlinking. Here I think of an early work like Ping (1993/4), where users were invited to upload their own material into a web database, which was represented as an object in a 3D space. Objects would then sort themselves generically, and you could either plot a flythrough of the resulting space or ask the system to auto-pilot you through it. A more recent work such as Web Stalker (which maps web-space itself) is also exemplary in the same fashion, as is TerraVision (which relates webspace to real geo-space, and then visualises it in 3D in realtime - rarely seen as it is only viewable via ultra-highband connections).

As to what to call all that art that people often refer to now as Net Art, but which is only cosmetically of the Net?, that is another problem....?

Hi!

It seems that we had this discussion a couple of times already on this list, didn't we?

I find it a little narrow-minded and most of the arguments, that were put forward, simplistic and with little regard to specific works. Plus, I think it is a bit early to get fundamentalistic about what qualifies as net art and what doesn't. Most of the projects that are being put down here were mere experiments, and as such they are legitimate.

If net art is supposed to be specific to the net, than why is what was called "browser art" not net-specific? After all, there would be no "browsers" and not HTML, to mess around with, if it wasn't for the net, to begin with.

Also, one can't generalize that all web-based art would work in any other computer-based format. A lot of sites that work with perl change everytime they are accessed by different people, and every copy cat would have a hard time downloading a piece like www.irational.org/x.

Even a piece like the original "Agatha appears" by Olia, where Agatha hopped from server to server, wouldn't make very much sense on a CD-Rom (even though it was released in this format). Also, in Olia's "Great Gatsby" the internet-download-time of certain files mattered, that also goes for most of what has been created by Jodi.

Of course, these web pieces don't take full advantage of all of the capacities of the net, and there are probably a million other art-things to do with the internet than creating web sites. Then again, net art is a very young genre, and these experiments were necessary before moving on to other, more challenging projects. I also don't want to justify every boring art website, and as far as I am concerned, my need for HTML-/Browser-Art is completely fulfilled by Jodi.

I think the best thing about the whole net art thing might have been, that it encouraged artists to work on computers and programming. Not on huge, ZKM-style "interactive" installations, that make everybody yawn, but on actual software that deals with the specifics of the computer, instead of hiding it like 99 percent of the interactive art of the goies.

The "WebStalker" is one example for this kind of artist's software. Jodi's "OSS"-CD-Rom is another, Mongrels "Heritage" and "Linker" are yet another one, and "Earshot" might be another one if I only would ever get it to work.

Something similar happened in Video art, by the way, when people started to build their own hardware, "videosynthesizer", effect boxes etc.

So creating actual applications could be an interesting direction the whole thing might take. After all, software is the ultimative multiple... :-)

Yours,
Tilman

PS: Of course, if that really happens, somebody has to come up with another name than net art.

> Cramer:

> So I would like to correct my statement as
> follows: Although a lot of Net Art can't be seen without Netscape or IE
> (Olia's own works, www.jodi.org, Alexej Shulgin's "form art" and even Vuk
> Cosic's "ASCII history of moving images" which despite its name doesn't
> display in lynx), this is not the point of my critique. The point is that
> much if not most of what's called Net Art - as, for example, the works
> currently on display at ZKM's "net.condition" - can just as well be
> experienced _without_ the net...

this statement is simply amusing, especially because ZKM is the best example of the opposite, and I hope a bitter lesson for over curators.

brw, ZKM intended to make this show offline, but because of two reasons they could not manage it:
- some artists refuse to move their projects to zkm mashines
- a lot of projects are based on cgi scripts.

this is just an information, in the end they have an internet connection there.

But anyway Weibel (with support of Weil and dramatic input of Show - <http://www.cinefantom.org/show.jpg>) managed to take the works of artist from the context and their natural environment.

The princip is One computer - One work. Browser inwindow equals screen size, no navigation bar, no location field. So u are obliged to see thit particular work only at this particular mashine -even visually complete illusion that cd projects are presented. The result is you cant type another address, you cant check your email, cant go to <http://www.bahn.de> to look for the next train, cant chat. nothing else but the work of artist whos name is written on the mous pad. How you can experience this way? nothing to experinece

There is complete incompetence behind strong media art curators' desire to solve a problem of presenting net art in the gallery space this way. and the punishment is very flat show, exhibition which is less spectacular than its small green booklet, booklet u can bring home or to the office and to type the urls in your browser and to enjoy the works or at least to see them.

Net_Condition itself does not give this chance at all.

Because curator does not know that net is not equal to the internet connection as well as net projects are not equal to their browser inwindow visualisation. and that what we are doing can not " just as well be experienced _without the net. "

>>> When I fetched the contents of www.0100101110101101.org and the > net.condition web site onto my own harddrive, I realized to my own > surprise that the bulk of what is commonly referred to as Net Art does not > actually use and technically rely upon the Internet, but turns out to be a > bunch of files which can be viewed offline without loosing anything > (besides the domain name in the URL display).

but this is already a big lost

<12345 [AT] net7.it>

LB: [...] Net.art, born just some years ago, is becoming *the* new art form, the ultimate one, and the most absurd thing is that net.artists

themselves seem to expect nothing else. Everyone with his own site, everyone with his own domain, everyone with his own gallery, they are throwing themselves into the trammels of traditional art, completely ignoring what net.art could/should be and misunderstanding the real power of the web. OL: 1.Wrong argument. Registration of domain name sais about understanding of the real power of the web. 2.0100101110101101.ORG is a domain name registered at the same company and for the same money as others.

LB: The point under discussion is always the same: how to set a net.art work. In other words: how to make net.art regress to the status of traditional art. OL: Not "in other words" but "in LB words".

LB: All of it dictated by one and only ideal: the circled "C". Result? Within two years net.art will be in all museums and art history handbooks, with the names of the "protagonists of the heroic period", dates, movements, influences, generations and so on, tons of the same shit we have been eating all the times. But this is not what we expected. We hoped that something else would come out, at least in the web. The web is the paradise of no-copyright, plagiarism, confusion and exchange, why the hell are those people trying, by any means, to create a copy of the real world? OL: In general net is an analog of "real world" and part of it. What I and others who take Internet seriously are doing is modeling situations, relations, structures.

LB: The difference between net.art and every other form of art seems to be "interactivity", at least this is what we got used to hear. OL: Bozhe moj, who told it to you? whom you talked with and when? try to recall. May be it was about compact disks or computer installations? any way, dont say it again. If you need a keyword for net art its a "connectivity".

LB: But recently something's changed.
OL: What exactly has changed?

LB: We're talking about 0100101110101101.ORG, come into the limelight for having hacked hell.com. In fact, 0100101110101101.ORG is trying to show that art in the web can really become "interactive": the public must use it interactively, we must use an artwork in an unpredictable way, one that the author didn't foresee, to rescue it from its normal routine (studio/gallery/museum or homepage/hell.com/Moma) and re-use it in a different and novel way.

OL: What you've described is an art method known long before the Internet. (Soviet conceptual culture is based on it, or found footage in film can be an example). Internet really gave a new life to "re-use" and it is one of the most important skills if you work with the net.

LB: The first files appeared in 0100101110101101.ORG are what we'll call "hybrids", in absence of other names: pages by other net.artists all mixed in a random way. This section of the site is centered around a random concept, so that the interface changes every time you visit it. OL: Yes, I remember we made it two years ago at <http://remotaeac.at>. Random is a nice idea.

LB: The toolbar becomes useless, the "back" command loses its logical function: OL: its a fault.

LB: every page is set in the unpredictable sequence of chance. 0100101110101101.ORG downloads the websites of the most popular net.artists and then s/he/it/them manipulates them as "it" wants, using them in an interactive way. OL: what you call interaction i still cant understand.

LB: The night of 9th june, it was the turn of "Art.Teleportacia"s. "Art.Teleportacia" is the first net.art gallery to have appeared in the web, and also the first attempt to sell works of net.art. The exhibition we're talking about was "Miniatures of the heroic period", and consisted of some pages by five of the most known net.artists in the world - Jodi, Vuk, Irrational, Easylife and Lialina - for sale at 2000 \$ each. 0100101110101101.ORG cloned the gallery. OL: as it seems you are an expert not only in interactivity. What is made on 0100101110101101.ORG is a parody, clone means complete identity.

LB: manipulated the contents and uploaded it in a new "anticopyright" version, obviously without asking permission to anyone and violating the copyright of the original site. The exhibition changed its name into "Hybrids of the heroic period", and the five "original" works were replaced with as many "hybrids", files obtained mixing pages by net.artists with some trash of the web. OL: Good, this is actually what I like in 0100101110101101.ORG. Right attitude - to be a spider. And not only to make a web, but to make it on purpose: to catch flies. Not only to make links but to be able to work and play with things which are already created in the net.

LB: The theoretical pillars that hold Art.Teleportacia are mainly three: -

1 A work of net.art can be sold as well as any other work of art OL: Right

LB: 2 Each net.art work must be covered by copyright and nobody, except the artist, can download it or even link to it without the permission of the author. OL: Not true

LB: 3 The "sign" of a net.art work is in the "Location bar", so the url is the only guarantee of originality. OL: Not the only, but the most effective.

LB: Cloning Art.Teleportacia 0100101110101101.ORG brought down all the presuppositions of the gallery, the contradictions which this way of thinking runs into became evident. OL: Making a parody on Art.Teleportacia 0100101110101101.ORG brought new clients to the gallery and good publicity for itself.

LB: Technically, whoever visits a site downloads automatically, in the cache, all the files he sees. In fact s/he already owns them, therefore it is nonsense to sell pages already being in the hard disks of millions of people. OL: This I already heard from media curators who wanted to have my works for nothing and to earn money on them. But its an illusion.

LB: - it would be more useful to tell the public the fastest way to download the whole website. We must keep in mind that net.art is digital, it is binary code, everything is reproducible to infinity without losing quality... just numbers! - finally, we entered the "age of its technical reproducibility" - and every copy is identical to the "original" one. The concept itself of an "original" is now meaningless OL: no, now it is meaningful as never before. will explain in the end why.

LB: and even the concepts of false and plagiarism don't exist any longer. If it's obsolete to talk about "originals" in the real world, it becomes absolutely paradoxical in the web. OL: Im not very much involved in real world business, but if this issue would be obsolete you, Luther, wont be able to get money from your publishing house.

LB: We wish to see hundreds of 0100101110101101.ORG repeating sites of net.artists endlessly, so that nobody realizes which was the "original" one, we would like to see hundreds of Jodi and hell.com, all different, all original, and nobody filing lawsuits for copyright infringement, there would be no more originals to preserve.

OL: Are you really familiar with net art or net in general? if yes you should know that copying is not a big deal. You can make hundreds of Art.Teleportacia galleries, but next day they will be only hundreds of outdated pages with not actual information and broken links, because I will update only <http://art.teleportacia.org>. The same with all on line art and not art works. What is done on the net is not a book or cd or tape kind of product. It is not complete, not frozen, but can be changed every moment. And this moment is a difference between copies and originals.

LB: Art.Teleportacia: clone:
<http://www.0100101110101101.ORG/Art.Teleportacia> "original":
<http://art.teleportacia.org/art-mac.html> OL: Art.Teleportacia URL is
<http://art.teleportacia.org>

Hi everyone, seem to have missed a few emails as my account put them in a bulk folder thinking they were spam, so i'll try and get to each of them here now....

>I have to say that I=Bgm offended by this whole thread on Rhizome and this is >likely the first time I have posted to this listserve. I=Bgm offended because >I feel Rhizome and any online net art institutions/orgs like it are >essential to the community of artists and researchers that have developed >around it.=20

hi Camille, first i'd like to say its great you joined the list and i hope you stay on to participate as i know your involved in a very good festival (far from being just a poor grad student) so you have a lot to add here!

i can't stress this enough i did say in the first postings about this, that this was'nt about rhizome as such but that the recent changes in rhizome and one or two other occurrences in the net.art 'world' caused me to initiate the discussion. one of the people who responded picked up on the rhizome element and continued conversation about that. its a big thing and is unavoidable at the moment but the discussion was on what we as net.artists can do to develop and further the situation of net.art, how we can make approaches to institutions so that we have more input on how our work is shown and archived, how to generate solutions to showing net.art in physical spaces, issues to do with funding, how we could develop new formats to share information across communities and generally make net.art more visible.

please anyone on the list who is following this discussion don't feel any animosity about this or feel alienated from the discussion, have your say!! what i am hoping we will achieve is some open critical discussion where we might come up with some ideas and solutions!

>So far, The mercantile solutions aren't doing the trick, although the Thing >seems to be holding it together, even though they have the yearly crisis.

what are the Thing doing these days? its been a while since i saw anything involving them, their net-presence seems to have diminished!

>Sure, the Whitney has the Artport, but my point is talking about integration >within the gallery, which is a bit antithetical to the genre, but I think >that it's necessary as a form of bridge.

i was reading something somewhere (perhaps it was here, not sure) from a curator giving suggestions as how to tackle this fundamental problem. they suggested two approaches. the first being that you create something unique in terms of the way the work is presented / interfaced with in a public space such as a gallery. this was interesting but i think would fail for a high majority of net.art projects because by adding this 'unique' location based experience, well the work is no longer really a piece of net.art but more a combination of net.art and installation to some degree.

the second seemed when i read it sort of obvious and banal, but on reflection quite clever, they suggested net.art that was to be shown in a gallery or indeed any location should be created in some way that it was site specific, now this seems quite fixed and immediately you think the work has to be some sort of response to the physical space and so would influence both content and presentation, but seeing as a lot of net.art plays on elements to do with key themes such as location (or more absence here), identity (until now tied to the physical but here using the new concept of avatars), the body (elements of both the previous) and the network (the new location?) it gives much wider and flexible elbow room!! not perfection by any means but one of the best approaches i've heard so far.

>Good point. My mentor in grad school (whom, I feel, taught me so well that >I left before finishing - I think it had something to do with snatching that >pebble out of his hand) once said that the most honest art he had ever seen >was made by a 2-year old. I would argue that in the case of net art, this >would be possible, but unlikely. There is too much cultural baggage tied up >with it: such as proficiency, access, etc.

yes i agree it is unlikely, but the possibility is there and especially within net.art identity and age become meaningless as this is played upon / created to such a great extent within this medium (or bricolage of mediums!).

>This is a great approach, but the question remains: Which institutions are >willing to work with the artists, and which artists are willing to work >hand-in-hand with an institution? I'd love to give it a try.

and here's the stumbling block! certainly i'd love to have some access to an art institution here in England where i could start have some input but it does seem to be incredibly hard to break into them. up till now i've worked voluntarily with one media community based festival for new media for a year here and put in quite a bit of work to keep their website ticking over and attempt to get them to widen

their vision, only to find recently the festival taken away from us, handed over to another group who bought a new domain name for the festival (we owned the original), started a new website which for the moment has only a splash screen even though the event itself will be happening in less than 15 days, plans to not allow any of the former community (mailing list of over 100 at one stage) participate in either the website (its all in flash, no database used, no structure so impossible to update easily) or the mailing list (they are now using none) and never communicated any information to us about what was happening even though we had worked for free and intended to continue doing so! so what do you do in a situation like this where you can't even give your services away?

the reason i posted here as opposed to say " _archive_ ", "nettime", "spectre", "rhizome" whatever... was because this list is specifically on curating and i know there are people in institutions on this list, who unfortunately for the most part have stayed silent for the moment, i second your "i'd love to give it a try" so why does n't some institution take us up on the offer?

>I am working in funding body. It does fund new media work and there is >certain institutions receive funding, and a lot of interesting project going >on. However, I do agree the structure not there, e.g. network, education, >promotion... In the recent selection of Award for Artists (one of the >funding scheme) the quality of applications that we received in the new >media arts section is so bad (not being critical, but really is true) I >wonder why the sector keep shouting there is no funding while we only >receive poor application! I understand there is frustration there to deal >with the funder, but the situation should be changed, both the attitude and >communication of both the funded and funding bodies.

perhaps your not shouting loud enough? what is the name of the funding body because from what you have said here it does n't ring any bells with me? i can't comment too much from the organisers side as i don't have direct experience of artists submissions so i don't know whether they are generally good or bad but i will say if the awards are open to me (nationality, location etc) then i would apply so... please tell us more!

>I would, however, like >to throw out the idea that net art is a critical stance rather than an art >form, much the same way as "conceptual art" now is. Can a painting be net >art? Sure, why not?

mmmm interesting stance, i'm not a purist by any means and certainly don't hold with ideas that net.art is only ascii based etc but i need to think on this one, you've made me hesitate, so i think i'm in agreement with you!

>So where is the net art discourse? Not with Lev Manovich, heaven forbid slap your hand for going against the tides of popularism!!! :)

>I've decided we may have came up with an answer. Not THE answer but >certainly >a response to this particular call. > >More over the weekend.

waiting anxiously!

I don't want to hijack Crumb for my own topic since I actually like the idea

of structured moderation for a list like this. But I see there isn't a theme this month so perhaps we can take some of these questions and give them some form for a future monthly theme.

You may have noticed recently The Thing was involved in a controversy over a Dow Chemical parody, which resulted in their Internet provider, Veno, deciding to cut their access for good. I don't know whether Wolfgang has found another one yet, most likely in Europe, that won't give in to DMCA threats.

TT has been around since 1991 and has never, itself, had much of a net.presence. It's more of a generator or "animator", if you will.

Since March's theme is "Curatorial Models" that may be a more proper time to go into the various online curatorial (or anti-curatorial, depending on your POV) projects based in NYC that I was involved with over the past ten+ years -- TT, ada'web, Plexus, artnetweb, Rhizome, etc. and the problems they encountered.

>> I would, however, like >> to throw out the idea that net art is a critical stance rather than an art >> form, much the same way as "conceptual art" now is. Can a painting be net >> art? Since it's been raining here today I've hunkered down and read through parts of "Conceptual Art: A Critical Anthology" edited by Alexander Alberro and Blake Stimson (MIT Press, 2000). Only rain could force me to read through old Art & Language texts but, having done so, I'm convinced that history does repeat itself, especially art history. So much of net art discourse, such as it is, is conceptual art discourse. Net.art (with the dot), as formulated by Vuk and, more so, Alexi Shulgin and others on nettime was based in this belief of already been there, done that but now we have computers and modems.

Of course, conceptual art was a big influence on many of us of a certain age in NYC who got involved with the early '90s (including Wolfgang Staehle, GH Hovagimyan, Remo Campopiano, Stephen Pusey, Benjamin Weil, Adrienne Wortzel, Jordan Crandal, myself and many others). Most of us had art careers before the net and I think we all thought of it as an continuation of our existing art practice not changing careers. For me, I thought I finally had the tools to, in Joseph Kosuth's terms, "manifest my intent" in a way I couldn't with paint and canvas or, for that matter, critical theory.

So, you see, from my POV, it doesn't make sense to view net art as an art form but, at most, a tool (like theory more than a brush). It makes even less sense to squeeze net art into an institutional, curatorial category. But then we get back to questions asked by conceptual art...

Best,

Rob

From: Zoe Li
To: <new-media-curating@jiscmail.ac.uk>
Date: Sun, 16 Feb 2003 22:57:47 -0800

Dear All,
I think I should respond to this email while I am the only one mention about funding bodies, perhaps I should make it clear.

I join the South West Arts (one of the regional office of Arts Council of England) 6 months ago, I still have a lots of question of why the quality of the funding application is so poor. I am not sure it is about the promotion of the arts council itself or there is generally a frustration building up towards the funding body. If you are an artist, and you want some funding support, where are you go to? Obviously the arts council will be one of the option.

SWA funded couple good projects and some of the people in the list will know that. But I still don't understand why the respond on the award is not so ideal. Maybe some of you should tell me why, I am actually posted a question here, and will hope to open up a discussion. I think the voice of funder always very small, and funding officers always feel they are in the responsive position. Perhaps we should go out more often.

Regards,
Zoe

> I don't want to hijack Crumb for my own topic since I actually like the idea of structured moderation for a list like this.

me too but what i don't understand is that i never see discussion on the themes coming through the list, just the messages from beryl at the start of the month announcing the theme and i'm thinking this is due to that 'reply' quirk that this list is using (ie not responding to the list but someone in the list) that was picked up on last week. at first glance that seems to be fixed now so hopefully....

i was a bit nervous about posting through the list initially as well, but nobody has said anything, if required and there is interest we could always start a temporary list on something like yahoo to take this further, let me know what you think because it might be seen that we're trying to ciphenn off members to a different list!

>But I see there isn't a theme
>this month so perhaps we can take some of these questions and give >them some form for a future monthly theme.

it would be welcome, its a HUGH topic with so many possible threads of discussion it will be difficult to do, but someone's got to!

>So, you see, from my POV, it doesn't make sense to view net art as an art >form but, at most, a tool (like theory more than a brush).

i see your point, but at present due to my age i don't have the experience of passing through a few art 'forms' or tools as you prefer, to be able to take the stance that the end defines the means, ie i want to create art and will use whatever necessary to do it regardless of how that will classify the work once its finished, if i've used video it must be video art, if i've used html it must be net.art etc.

genuinely this is'nt trying to be sarcastic, but i guess with a few more years behind me i will take the same point of view. i certainly was'nt around at the start of net.art and am the first to admit that but feel i have plenty to bring it. for the moment i guess i have been pigeon-holed as a net.artist and in a way thats bad but feel the sacrifice is necessary if i want to excel at any one tool, a trade up if you will for the present.

> It makes even less sense to squeeze net art into an institutional, >curatorial category. But then we get back to questions asked by >conceptual art...

its the curating that needs to change more than the arts, thats very obvious here, so i don't think it will ever be squeezing net.art into an institution as such. whats needed though for curators to understand how to start to form structures that can cope with art in all its new 'forms' (art does'nt have a form as such so this takes in everything from my 'net.art form' to your 'tool' without any problems) is that artists, and increasingly technical people, are working with them.

The mailinglist program is set to "reply goes to sender" rather than "reply goes to list" or something like that. I've adjusted. Why there is no discussion on the themes is another matter. Lists with specific themes need moderators who are anal compulsive and have lots of time to screen posts and write summaries (I know, I've done it). I suspect neither Beryl nor Sarah fit this description.

So it's up to us to make interesting posts on topic. Since there is no topic this month we have a bit of leeway.

> i was a bit nervous about posting through the list initially as > well, but nobody has said anything, if required and there is interest > we could always start a temporary list on something like yahoo to > take this further, let me know what you think because it might be > seen that we're trying to ciphenn off members to a different list!

Oh, god, not another list. There was already a month with a net art theme with the contributors to Cream (of which I'm a backslider). jodi.org scared a lot of people away. So, maybe we can smuggle net art into the "curatorial models" theme next month. I have no problem with seeing net art as a curatorial model.

> i see your point, but at present due to my age i don't have the > experience of passing through a few art 'forms' or tools as you > prefer, to be able to take the stance that the end defines the means, > ie i want to create art and will use whatever necessary to do it > regardless of how that will classify the work once its finished, if > i've used video it must be video art, if i've used html it must be > net.art etc.

I see from your links you're in an MFA program (or whatever it's called there). I take it you're in Dublin but you write about applying for English funds so I assume your home is in England (or is it the other way around?) I now live in exile on an island in the Gulf of Mexico but I spent the first half of my life in Idaho and the second half in New York City with a stop in Indiana for Graduate School in painting, which I never finished.

I give some of my background so people will have a better idea of why I see certain things the way I do and why I'm using certain references. I don't expect you to have had the same experiences or to follow in my footsteps.

I certainly don't take the stance that 'the end defines the means'. More the other way around, that the end may be one manifestation of the means. But we can get into this at another time.

You seem to be making of net.art what you need to. Don't worry about Vuk's retirement.

Don't be too hard on curators. The role has changed dramatically for a variety of reasons over the past twenty years. Institutionally they've had to take on more and more work they probably shouldn't have to do and that has made the role seem more important. In the 'seventies it was critics and art historians artists attacked. Curators, except for a few, mostly European superstars connected with Documenta, the Venice Biennale etc, then were rather kindred spirits of artists. How and why this has changed is a topic for next month.

Best,

Rob

**<nettime> Re: [Nettime-bold]
Josephine Berry's net art history
From: Josephine Bosma
To: nettime-l@bbs.thing.net
Date: Sat, 10 Feb 2001 10:33:37
+0100**

Even if I have respect for the amount of work Josephine Berry has put in her thesis, I feel like I have to make a comment about what I see as a few basic mistakes in her analyses. The basis of Berry's way of thinking seems to be that net art started in 1996 with net.art. There is no or hardly any mentioning of network art before that time, and even of net art made by others during the time net.art started to be discussed. Then there is the insistent hammering on the alledged political aims of this first net.art 'group'. Even if the works and attitude of -some- members of this group have been very influential in the way net art has been approached in especially the nettime community (and also in the way it inspired some artists of a younger generation) it would be wrong to make an analyses of net art depend on these few and the spin around them. What I read (and have read in the past) from Josephine Berry view on net art is a strong focus on this political aspect of early net.art which then turns into an analyses of its failure every time she writes about it. And of course, what else could it be. The revolutionary potential of 'political' art (for lack of a better term) has always been very small. This art is always part of a larger cultural change or tendency. I hope it is clear in her thesis that this particular analyses concerns a small but influential part of net art and that there will be many more up to date chapters on other artworks and trends in her thesis.

Dear Josephine,

I could not have expected you to realise this (since I didn't explain), but the subject of my thesis *is* the group of artists that are loosely defined by the term 'net.art', and so the lack of a broader description is, to quite a large extent, intentional. Although it is impossible to discuss any art movement or group in a historical vacuum, it is however equally impossible to include every single related instance of practice. I made the decision to use conceptual art of the 60s and 70s as the main genealogical thread rather than early network artists because I see these conceptual artists as crucial historical precedents to *both* later moments. Having said that I do make mention of mail artists who are a strong precursor to net art not only because of the coincidence of dematerialisation and the network but also because the mail art movement included many non-artists - or at least people who didn't understand themselves precisely in these terms. This leads me to your other !

criticism which is my tendency to see net.artists as having 'failed' in their own terms. In this chapter my argument is that it is the net.artists insistence on defending their art practice from dissolution in the wider network which collapses it back into the market-institutional framework from which they precisely tried to escape. In this respect it is the fact that they were hostile (in contrast to mail artists) to their work being adopted, manipulated, dissected, plagiarised etc. etc. by the *wider community* that, in my reading, amounts to a failure - and, ironically, in their own terms. So you are right when you touch on an important lack in the chapter - of a multitude of other network-based creativity - but I think you misunderstand me if you think that this absence relates purely to my own lack of interest. At the end, I talk about the 0100 etc. etc. group as a hopeful instance of a practice which attacks intellectual art-property and opens up art to the massive creative potential inherent in the social field. I think this is a fa optimistic reading than any more limited celebration of specific artists.

The final thing to say on the issue of failure is the idea, expressed by the likes of Adorno and Debord, that the history of modern art is the history of its own endlessly deferred end. The autonomy which art gained from older forms of social service confronted it increasingly with the unfreedom of the world - a contradiction which precipitates its continued crisis. The 'failure' of the net arts is, in this sense, entirely in keeping with the wider movement of modern/post-modern art.

I am very glad I reacted to it then, because it was totally unclear. I think it is very important you add this piece of knowledge to your thesis and every part of it that you publish, as it now looks as if you

are covering net art history in general. With all the confusion we have already seen around the subject on various lists and considering the hunger for these kind of general insights and clarifications it is very likely a text like yours could accidentally be used and spread as study material representing the -entire- history of net art. Which it does not. I must say that your clarification has made the text a lot more sympathetic to me, even if I have criticism still. It is also quite clear we need a lot of more specific or specialised researches of different area's of net art.

> which brings me to your criticism which is my tendency to see net.artists as having 'failed' in their own terms. In this chapter my argument is that it is the net.artists insistence on defending their art practice from dissolution in the wider network which collapses it back into the market-institutional framework from which they precisely tried to escape. In this respect it is the fact that they were hostile (in contrast to mail artists) to their work being adopted, manipulated, dissected, plagiarised etc. etc. by the *wider community* that, in my reading, amounts to a failure - and, ironically, in their own terms.

The 'net.artists' were absolutely not hostile to their work being manipulated, dissected or plagiarised. On the contrary I would say, they are rather strongly influenced by the copy left ideas. The only thing they initially found problematic was becoming institutionalised. Each of them has dealt with this in a very different way in the end. As you may know some of them simply proclaim net art is dead, to have some kind of excuse for continuing their work on an institutional level or maybe just to have a way out of difficult media political and art institutional issues they became entangled in. These are individual strategies of a small group of artists though and they fit in their work. With all the pranks and subversion of discourse we have dealt with coming from some net.artists one should be careful with taking their words literally sometimes. When for instance Vuk Cosic goes to New York and says to art professionals that there have really only been five net.artists (to just give an example of something that happened) it is quite ignorant to take that as a fact and not see it in the light of his work.

What I find and have found problematic in your writing about net.art is that you tend to blow up the political aspect out of proportion instead of approaching this work mostly as art. This work has not failed as art, is what I am saying. I find it highly problematic to attach a label of political failure on this work in the context of nettime especially, where there has been so much ideological pressure on and hostility towards net art practice.

>I talk about the o1001etc.etc.org group as a hopeful instance of a practice which attacks intellectual art-property and opens up art to the massive creative potential inherent in the social field. I think this is a far more optimistic reading than any more limited celebration of specific artists.

Again, this is coming from a purely ideological approach of net art. First of all, o1001etc.etc.org seem just as much hot air as the net.artists were in the political sense (I would underline 'in the political sense' if I could), secondly celebrating specific artists is not at all what I am interested in and it should be clear from my work. (Maybe I am reading your comment as a criticism when it is not, then ignore my remark.) It is important to explore and document the variety of artworks out there and the context they are made in.

> The final thing to say on the issue of failure is the idea, expressed by the likes of Adorno and Debord, that the history of modern art is the history of its own endlessly deferred end. The autonomy which art gained from older forms of social service confronted it increasingly with the unfreedom of the world - a contradiction which precipitates its continued crisis. The 'failure' of the net artists is, in this sense, entirely in keeping with the wider movement of modern/post-modern art.

Well, there is a lot that can be said about this. It seems to me this way of thinking could easily be replaced by another basic view of the world, like any philosophy has its counter philosophy. I personally have a lot of problems with terms like 'the end of' in relation to an abstraction like 'art' or 'modern art'. So even an endlessly deferred end is only a strategy to approach something. Not a very interesting one imho.

Hello Josephine!

Just some brief remarks on the chapter of your dissertation that you send.

I think it is very good in general, and the theory around net art needed some boost. Too bad that nobody produces any net art anymore... :-)

Two things: first of all there are hints throughout the text that net art has become accepted by the so-called art world, is assimilated in the art market etc. I have heard that claim a couple of times recently, but I don't see much proove for that. There was a handful of sales of net art piece, OK - but that was widely acknowledged by everybody, because it was so spectacular, that somebody would pay money for some HTML pages. But apart from that there is no market there - at all! (I am writing that not, because I care very much if there is a market for net art or not, but to counter these recent claims that net art has been 'established'.) And at least in Germany there is no 'normal' museum or gallery that pays any attention to this stuff; only specialized institutions like the ZKM who were founded for just that purpose. If a show like the Whitney Biennale shows net pieces it is still pointed out as unusual, and I don't think any net stuff will be included in the next documenta. So I think in terms of recognition of the 'real' art world it is much earlier than we think, and maybe it will never happen.

The other thing that bothered me as well as Josephine Bosma was the limitation on the artists you discuss extensively, but you explained that. I don't know if you point out elsewhere that you are limiting yourself to these people because you can't discuss everything that happens on the net in terms of art. I think especially in the context of this chapter it might be interesting to focus on the very strategy they employed to get recognition. You know, form a little group, give yourself some interesting name, create a myth around yourself and start to write manifestos. On the one hand this is a well-known artist's strategy, on the other hand - if you look at it now - it was done kind of sloppy and tongue in cheek (the famous story about the term net.art etc). I mean, only so few manifestos! Maybe this can also be read as an example of the use of an art strategy that turns into something else, that you describe in some of the examples...

As far as the Biopower-stuff is concerned... well, I haven't read "Empire", but to me it sounds a little bit like "bio compost", for which we have a special garbage can here in Germany... :-)) I totally agree with you that the net artists used (and still use) well-established art (and anti-establishment) attitudes, that somehow transcend the art realm, when they are applied on the net. I have a hard time finding the right terminology to describe this, but I am not sure if the "Empire"-terminology puts it so well, either.

Well, so much for now. There is a lot to be said about this topic, but since this discussion was stifled on nettime at one point, nobody did continue it. Maybe over some pasta with chicken, again. Josephine! :-)

Yours,
Tilman

PS: Of course I don't agree with you that I. Graw plays such an role in your essay, but never mind. I wrote a furious reply on this piece, when it came out, that Josephine Bosma was kind enough to translate:

At 11:06 12.02.01 +0000, you wrote:

>

i was recently at an event where some of these artists were calling themselves 'the fathers of net.art'
....i guess the 'father's of web.art' doesn't sound quite as sexy, but i think you art historians should maybe point out the difference in your texts as you assign male authorship in your art discourses as you have throughout history.

OVEREXPOSURE WRITES:

now may i suggest that yes the simple gesture in the acquisition of "space" anywhere for the purposes of art is a radical political gesture at this point in time.

GH Comments:

For most net artists/ artists working in digital media, especially in the USA it's all about resisting the push to institutionalize, commodify and package creativity. It's also about the positive notion of creating a free area where the artist can make work. Or as Cary says acquisition of space for the purpose of art. I would like to note that this acquisition of space for the purpose of art is radical when it is accomplished by an individual or group of artists.

yes, same canon making pattern.

but vns matrix is a big impressive mama of net.art not soon to be forgotten I hope.

and about the offspring of net.artists--the net.art'

watching this thread it seemed to focus on writing net.art history based on the authors/artists, their relations to institutions, resistance or compliance, avant-garde maneuvers, individual personalities, interviews...

i would like to see histories of net.art take into consideration the oppositions within the art itself, differentiations and tendencies within what is not a unified field, ways that net.art proposed new ways and means, how it adapted strategies from past offline art (josephine berry made some correlations between mail art and conceptual art, etc.) also i would like to see histories of net.art look at strategies net.art shares outside the art world with digital folk art and other forms of networked authorship like software, writing, music making, gaming, online otaku, etc.

we made a taxonomy back in 97 (seems long in the web time) when i was a grad student at cadre. we would voluntarily meet every week as part of Switch <http://switch.sjsu.edu> and search around. it was a collective effort to map tendencies of what was not yet so fixedly labeled net.art. people involved were Lisa Jevbratt,^(1:1) Jan Ekenberg, Ben Eakins, Geri Wirtig(C5), Brett Stalbaum, (EDT and other hacktrivisms), and others. we made icons for each category and for many later switch issues Brett posted net.art link collections with these icons attached.

our taxonomy categories back then were:

-Not Web Art (our response to what led to the net.art term)

-Documentational

-Collaborative

-Narrative

-Unintentional

-Contextual

-Poetic

-Formalist

-Participatory

-Telepresence

-Information Mapping

-Web Event

-Contextual

Perhaps this may be useful to someone.

Re: <nettime>net.art-history

From: Pit Schultz
To: nettime-l@bbs.thing.net
Date: Mon, 19 Feb 2001 01:00:27 +0100

maybe someone of you read erik davis' last book, in which he names the great antagonist of our times 'hermes', the trickster, god of trade and thieves, and god of communication. michel serres, also a kind of half-god in the academic sense, made him the hero of his studies. this figure, maybe a data dandy, parasite and prankster, maybe a guy formally called an artist, but certainly out to make fun and profit of all of you who try to get him, was probably the god of net.art too.

let's assume that the 'failure of net.art' was some kind of auto-destructive program inbuilt from the beginning for the purpose of vanishing in the moment of capture. this makes the difficulty more explainable interpreters seem to have, as well as the institutional system or even the art market in making profits

with net.art.

the love for crap (the bla project), the somewhat cynical game about the end being near (time to remain to go crazy), the utterly sad sound of a computer who is brought to try to sing (386dx), or the formalistic absurdities of artful html-form art, just taking one of them, alexei as an example, is "playing tricks" with the context which constructs these works, you could say very similar things for jodi, vuk, heath, olia and many others.

i think we are completely underestimating the complex value of these works, that they were partially constructed by the way they were viewed by 'the community'. their fine intercommunication with their fans and interpreters, replying to texts and ideas, or surfers who randomly came by, curators who were more than clever to call this a kind of self-promotion, a community of friends of the international conference circus before the rather dull dot.com phase, made net.art a more than lucky coincidence of some people doing art which hasn't to be called art anymore, walking through the institutions it revealed often insights in the way these institutions work.

remaining is not an autonomous art form, but a complex but as well precise body of works which represent a certain social time of the net, viewed from a specific angle, net.art therefore could be explained in a second, third, or n-th order, but is itself a kind of thick description of what happened in that time, and the more this time vanishes it becomes clear that net.art reveals and critiques very well the all too human pathos of the radical new, the vanities, desires and dreams of a cyberspace which only happen in our imaginations, but nevertheless happened.

back then in the early nineties, at the same time when other artists disappeared from the field of institutional critique or the so called context art, to start clubs, or record labels, bakeries, do book projects or movies.. when the web took off these loose groups were just ready to use it for their own purposes, it was more than a way to become famous, from the beginning a sense of satyrst critique and scepticism towards technology drove net.art combined with the existential experience that utopia is possible insofar that very unlikely changes can happen, the east-west dialogue is maybe one of the substantial geographical elements of net.art, plus a disrespect for authority and the old and new orders of knowledge, artistic interest to bring the matter of the medium, the code, to its limits within a larger sense than just programming, playing with the echoes of the avant-garde net.art only simulated the existence of a group, it was rather an open alliance, and even today one can continue to work in the spirit of this practise.

laughing about ideologies, the grand ideas, and a calculated anarchic fun of expanding and augmenting vision not just by the means of technology but by manipulating the expectations of people using them, highlighting the limits and errors of the internet myths makes net.art 'human' in a post-humanistic sense.- it describes the complexity of the net.condition exactly without canonizing it but in an open ended narrative, a rather first-hand and therefore rare knowledge about contemporary art and its history *) helped and just gave a explosive package to merge with the nettimers for a little while and along other stations and splittings.

to demand now, why not more artists are put into the heaven of net-dot-art is understandable but nevertheless futile, we speak already about the past, of course one can try to overwrite history, by inventing a genre of 'artistic software' and neglect that groups like jodi or iod for example started a whole "do it yourself - school" of understanding code and the visual layers plus its social context as one thing, tactically including bits of programming language, an approach now very viral on the microsound levels of electronic music.

of course you can say net.art is dead, and do your books and catalogues, but chances are high that these efforts are useless and are just feeding a even more vivid zombie, somewhere someone else might understand something, and use the label to do another post-post avant-garde hack, temporary of course, but nevertheless a source of many very constructive misunderstandings, sometimes, one can still hear the laughter.

*)
for the history net.art provided its own interpretation, the 'classics of net.art', the historification was a constant theme, so many of the works are beeing done in the sense of "it will have been seen as" (futur II)

INTRODUCTION

I check my mail, look at my bank balance, I see myself in the mirror - and I still don't know what you mean by failures and deaths!

PART I

Net art failed, in some critics and researchers opinion, because it didn't take over institutions as was expected. Curators, museums and magazines didn't disappear (sorry). But don't you see that net art and net artists changed the landscape of contemporary art? Now, art institutions have to learn to act as nodes (not as a center). And they do. Those who are really open become part of complex networking projects. Those who can't get rid of traditional standards of beauty and interactivity entertain their audience by making links to funny web pages.

And Art.Teleportacia --my miserable, small, pale Art.Teleportacia gallery-- did a great job. It moved curators of big museums to open their eyes and continue their work on a new level; with understanding and respect for works that are not objects, works that are not completed products.

Institutions correct their positions, collecting policies, exhibition practices. I would say it's a victory. And a funny process. It's fun to participate. Fun to observe. And fun to completely ignore.

PART II

Last September I wrote an article, quite a long one, about my experiences with the "First Real Net Art Gallery" and the "Last Real Net Art Museum". About Famous Net Artists, Real Net Artists, Conferences, Objects and ZOOs. But it's in Russian -<http://www.russ.ru/netcult/20001114_oliaia.html> and German -<<http://art.teleportacia.org/du.html>>. I'd be happy and grateful if someone would translate it into English. Title "A Link is Enough"

PART III

"A Link is Enough" was published last November in DU magazine. On the next page there was another essay on net art, written by Boris Groys. He writes about his vision. He's brilliant. His ideas and comparisons are fresh and unexpected, but after a few paragraphs you see that he has no understanding of net art and networks. He saw the net art at ZKM in the autumn of '99 and thought that net art was a lot of connected computers, blinking screens and projections. I have a small quotation with me: -<<http://art.teleportacia.org/svvn/gr.jpg>>. I can imagine there are a lot of good and influential writers who still think the same.

It's a pity.

And it's a pity that net art critics who have been working in the field since the heroic days have reduced their activity to interviews. Or hurrying and competing to be the first to announce death and failure. ASCII Paparazzi.

Btw, saying that net art is just beginning isn't very different from saying it's dead.

PART IV

My students came back from Transmediale in Berlin and said there was a speaker, Mark Amerika, who was announcing that net art is dead.

from Mark Amerika's CV:

"Amerika was recently appointed to the Fine Arts faculty at the University of Colorado in Boulder where he is developing an innovative curriculum in Digital Art."

I can already see the development, innovation and result. We'll get a bunch of experts from Colorado writing necrologues.

PART V

Discussions about terminology may seem endless and useless. But I like them and find they create perspective: like a tool -a magnifying glass- to look at the present and recent past. Recently, during WRO KULTURA, I planned to make a tremendous contribution: analysing the development of the terms web art, net art, net.art - general terminological issues. But I failed because the previous speakers' statements made me change the subject of my talk. These sketches are all that's left:

<<http://art.teleportacia.org/vwn/1.jpg>>
<<http://art.teleportacia.org/vwn/2.jpg>>
<<http://art.teleportacia.org/vwn/3.jpg>>
<<http://art.teleportacia.org/vwn/4.jpg>>
<<http://art.teleportacia.org/vwn/5.jpg>>

forever yours

olia

I think the way to approach net art is very much the way Steve Dietz has approached the question (that is one of a number of questions that keep coming up): "Why have there been no great net artists?" with an essay by the same title.

http://www.walkerart.org/gallery9/webwalker/vw_042300_main.html
So not

approach it from one particular angle (politics or art history or technological excellence) but from many angles at once to get a new picture of not just net art but of art as a whole. Individual artworks can be compared to older works of course, but to compare net art as a whole with, say, mail art or performance or whatever will always be lacking/failing somewhere.

So true. That does not mean his work is not interesting to reflect certain issues. Like for instance there is also a text on interactivity in which another theorist, Dieter Daniels, gives a lot of interesting thoughts on media art.

http://www.hgb-leipzig.de/~marcio/daniels/daniels_e.html One should

simply read between the lines and project a lot of one's own experiences on it. What is wrong in this Daniels quote?: "Bill Clinton's superhighway electoral campaign in 1992, however, already heralded a radical turnaround. In a record period of time, the idea of free network communications hatched somewhere between hackers, ex-hippies, and a small avant-garde in art and politics, became the central message of the media industry. This is why, finally, people forgot what media-assisted interaction and communication was supposed to overcome: nothing other than the hegemony of the media industry as the cause of cultural consumerism." It seems as if the biggest problem with theorists and academics is that they know a great deal but they work too little from the situation at hand. What central message of the media industry? And then: were 'media-assisted interaction and communication' supposed to overcome anything of the media industry in the first place? Such a small difference of thought can have great implications, like for instance it could legalise (taking the thought further into media art theory) the neglectance of media art which is simply beautiful. I am not saying we should not be media critical anymore, just net art theory should be multi-faceted. Groys seems to be leaning towards beauty in the traditional sense too much (symbolical objects), Daniels leans towards media art as political tool.

err.... ascii paparazzi? Sorry dear Olia, this is too insulting to come from you. Anyway, the biggest problem net art journalists and observers have is that we are too few to too much to do. Plus not all the work that is done makes it to the 'central online discourse' but remains hidden in local paper press or books. As for the interviews that I publish: there are two reasons to publish them. First of all one interview often can give a view of a certain area or field at a specific time that is far more precise than I would be able to describe it in a general text. Secondly do I think it is more important to show the variety of works and practices out there right now than it is to write analytical texts about them. If you have little time that is, relatively little time with the speed of developments now, the explosion of calls for net art works, net art exhibitions and conferences worldwide. Get stuff out, that matters! Make curators etc see what goes on, who is out there doing what, give ideas, provoke different angles maybe! The problem with interviews is that one has to transcribe them, which is a lot of work. Remember this type of work does not get paid for either, which is the last thing I would want to complain about, but well... A problem connected to this is that e-interviews are not working as good as f2f interviews, whereas combinations of the two are great. So one also has to have the opportunity to meet artists in person (which makes some people feel shut out)

> Brw, saying that net art is just beginning isn't very
> different from saying it's dead.

That is a very strange thing to say, and I would say highly subjective. I remember your words not so long ago, where you said in a conversation that was published online that you were waiting for the next generation, for those that would say your work is old news! We are now at a time where we are at a crucial point where net art is about to really break through, and I mean -understanding- net art is about to break through. When I look around me at conferences and so forth the questions of both the audiences and the moderators of panels have developed greatly. Is it wrong to say this will develop further and that we should be ready for it, help with it even? Would you prefer institutions to develop the theory around net art themselves, on their terms, from their point of view?

> My students came back from Transmediale in Berlin and said

Sometimes one sees great mistakes in who gets appointed to teach or judge art. Mark Amerika is first of all a writer, an experimental writer. He should teach hypertext or something, not digital arts in general. His presentation at Transmediale should have been contextualised by his hosts. He knows very little really about net art, and he will be used by traditional art professionals to justify conservatism.

Can't see that has happened much from my perch here in NYC. Maybe in
Europe that's true. Certainly the Guggenheim is becoming more nodal, but
that doesn't have much to do with net art. More like global conquest.

Funny, though, just before your message came through on nettime I'd sent a
proposal off to the director of an art center suggesting he think of his
institution as a node in a global network. I assumed he'd know what I
meant so maybe there has been some change.

The ZKM net_condition catalogue hit all the bookstores here this weekend.
ples of them at each so MIT Press must expect it to be a big seller. Too
bad the text is so hard to read. It looks like all the other "web design"

books that have come out the past few years. Still, it does make "art and
global media" a topic people pay attention to.

There's been interest in the "archaic days" lately, the period pre-1994
stretching back to the dawn of humankind. Carl Loeffler's death the other
day reminded me that his ArtCon newsgroup was one of my first contacts
with other artists on the net. I think both Heath Bunting and Brad Brace
were there.

> I can already see the development, innovation and result.

I think John Hopkins teaches at Boulder off and on. Universities are
looking for ways to cash in on digital art. Amerika's use of the phrase
"innovative curriculum" is a dead giveaway. That's biz talk, not art talk.
Art students all want to make Jurassic Park these days.

Quite accurate... The vast majority of 'creatives' online then and now,
were indeed gleefully side-stepping the oldartworld's incestuous,
oppressive institutions and its parasitical 'critical careerists' (I liked
"ascii paparazzi!" =)). The "classic net-artists" were merely a few of the
first to (regressively) behave online like our regular
"make-art-for-museums artists," and sure enough, the whole ol' tired
insidious art-institutional entourage was quick to swallow the bait. But
how interesting is that?

The net has certainly changed the world to some degree but I can't see that
net artists have changed anything significant (not that museums are
particularly significant anyway, when compared to other global institutions
or issues). I can't think of many artists that have changed things in the
bigger picture. I was not aware that this was the role of the artist. Even
if looking at so-called "revolutionary art", whether Russian, Mexican or
whatever, where the artists have believed that they were a key component in
cultural change it is retrospectively apparent that they were deluding
themselves.

Artists do not transform the world. They transform how they personally see
the world and this gradually rubs off little by little on others...but only
when they are ready for it. Art is not politics...although it might be
political.

Universities want active research profiles. The current interest in all
things digital and net-based means that artists working in that area can
bring to the institution their research points. Ultimately this translates
into funding and PR.

Some universities even expect such artists to teach :)

For me, there is a certain connection between net-art-history and cyberspace
discussion.

In both cases there are some incompatibility between the description (or
definition), and the visualization of the phenomena. Or maybe we just don't
have the answer yet (or we do not need it). As an architect I see the world
mostly in a visual description of some strategical concept of the spatial
parameters (real and virtual at the same time). One of the major questions
is about the media one use (and also understanding) to achieve this.

Net.art: is this art in net, or art about net, or hypertext description of
art, or rhetorical dilemma what art in general should be presented in net.
Does it go beyond ugly designed web pages, pure presentation of the canvases
done in atelier, boring pages of ASCII dogmas of "something", technological
experiments of things never worked and never will (or if working then
simple: 2 web cams and a video beam with a load of textual explanations),
or it has more aesthetical demands than flash opening intro for nike.com
(although this is a hard topic, therefore I would rather use German word
"kontrolliertes Gestalten")?

Cyberspace is term coming for the textual description and therefore it is
almost impossible to answer: "if there is a space in cyberspace", at least
for our brain to translate it to an image so we can really understand it as
space (except for spoiled Hollywood audience in digital SFX sequences in
some movies). That is also a main difference between audience and public
(the audience expects a certain image, and for the public image not present
and so not really relevant). But, 10 years ago, by showing the artists how
surf the Internet, the writers how to use Microsoft Word, and explaining the

architects the possibilities of the 3d software and the computer technology
in general, has been produced a perfect confusion. If you read the work
manifestos of some high profile architectural offices (especially in USA),
you can find them very funny, because they sound like a bad written (or
translated) user manuals of some programs (for example Maya, 3d Studio,
etc.).

Robbin Murphy writes in a previous posting: "Art students all want to make
Jurassic Park these days". Not only art students, but also architectural
students on the first place. Well, the answer is because it is easy. It is
nice and sophisticated to swim in a virtuality (building on the principles
of old Rome), because of its endless patience. Endless freedom of creativity
in a known context.

As for the architecture as so for the art (net art), the time has come, to
produce relevant artistic and cultural content for the future environments.
With one, and crucial, difference that we rely on media theory (und
understanding), and not theory of the reinforced concrete (I hear my
colleges laughing behind my back). This is not a formal issue.

best regards

**Re: Re: <nettime> Re: Re: net art
history**
From: Station Rose
To: nettime-l@bbs.thing.net
Date: Tue, 20 Feb 2001 14:16:10
+0100

This discussion is going on for so long now and is really interesting!
Although I am not as precise with words as I am with visuals. I post here,
too.
IMHO this is a problem with lists anyway- there are only few postings by
artists-on their topics.

I am doing netart projects since 92, when we started our first online club
projects, in Frankfurt. I remember well that back then there was not one
art critic who understood what we did there. Dealing with online projects
became a focus much later. So finally when it was a theme for the (net)art
critics ca. 95/96, one has to see here clearly that there has been half a
decade of net projects already.

Now it is a theme, and I see the next point coming up, which is
including/excluding positions. This not by artists but by critics. It is
much too soon to let something so young die, and who would have the right
to decide that anyway? Nobody needs an "inquisition" here, which decides
what may stay alive and what not. There are enough financial & technical
points that have to be solved. An inquisition would kill the new netscene.
the capitalistic system comes up with enough obligations, that one can
fear, sooner or later artists leave the field.

An example on streaming art in the net: the GEMA (german company who
takes
care of money musicians get when having air-play on the radio...) right now
tries to figure out how much money they can take from webcasters when they
play in the net. It is not clear if net artists like us have to pay in the
future - not only for computers and streaming software, but also to GEMA.
it is absurd. I think, one has to look at these developments. If we don't
want to have only stupid TV programs, talkshows and mainstream stuff in the
net in another 5 years.
It would be unimaginable, when later on one would have to say - forget the
net, nothing is happening there anymore. it became cooperate.

I hope that critics find enough time in the realtime environment called
cyberspace "to find more great net artists", go forward and backwards to
try to get an overview of 10 years and more of net projects.
And artists find enough time and budget to develop many different projects.

And I don't see the point that netart is entering the museums. Where is the
problem? if the net scene would be powerful enough to let artists live on
netart that would be a point, for sure. As long as it is as it is now,

much criticism and not enough money involved, the museums use the time to make their collections.

Josefine Bosma:

I think the way to approach net art is very much the way Steve Dietz has >approached the question (that is one of a number of questions that keep >>coming up): "Why have there been no great net artists?"

olia lalina :

>> My students came back from Transmediale in Berlin and said
>> there was a speaker, Mark America, who was announcing that
>> net art is dead.

>>

I was at Transmediale, too. The festival was not always stimulating. Conferences instead of art installations is often too dry for me. I would prefer to see and hear projects, not only get words/descriptions of something. I hope this will happen more next year. And here again "net art is dead" as a slogan is problematic.

<nettime> Re: net art history

From: Amy Alexander

To: nettime-l@bbs.thing.net

Date: Wed, 21 Feb 2001 03:28:52
-0800

A couple of thoughts on this popular net.art.thread:

As has been already been mentioned a couple times in the thread: focusing on net.art seems to imply it's "the" history of net art, a seemingly unbreakable modernist habit. Though I understand it wasn't Josephine's intention to imply this, focus on net.art history over the years causes humans reflexively to have such a reaction. Also, it doesn't help that the name of the movement is one punctuation mark away from the name of the generic form: "net.art and net art." If a movement sprang up called "sculpture" people could probably keep it straight, because the term "sculpture" has been in active use for quite some time - but "net.art" sprang up when "net art" was fairly new, and so the two have become confused to a large extent. (I'm not sure myself where one ends and the other begins; blurring boundaries having been a goal of net.art, perhaps that's a good thing.)

So there are clearly other net art histories than net.art: we have heard from the mail art mothers of net art, Elisa Rose, and for example, a number of us in the US were actively doing net art when I started in 1996: Victoria Vesna, Shu Lea Chang, Ken Feingold, SITO, Brad Brace, Electronic Cafe, as a few (but not the only) examples, some of whom go back much farther than 96. Brad Brace, of course was working largely on Usenet. Electronic Cafe was working with video/audio networked performance as an extension of telecommunication art; most of the rest of us were working on the web. I think, overall, we were more focused here on the idea of exploring/exploiting the network and of communal, networked production (of intangible objects) than the European net.art folks. (But that's a rough generalization - for example, projects like "Refresh" would have fit right in - and in fact I remember that project being very popular here.) On the other hand, we found ourselves dealing with some of the same issues as the folks in Europe: museums and galleries wanting to show the work, but wanting the file on their system so they could somehow have an "object" that the rest of the world on the Internet didn't have.... though somehow, when I told them this was impossible and defeated the purpose of the Recycler, they always seemed to show it anyway, sans file - evidence of Olia's node theory. I made the Gallery section of the Multi-Cultural Recycler as a joke on gallery net art objects, but this didn't seem to dissuade them - they printed out the Recycler Gallery images to hang on the walls for shows. Go figure. Well, enough of the shameless personal plugs...

What I think we lacked in the US was a "movement" the way net.art was a movement. (That doesn't speak for other net art histories, such as mail art, only for the particular movement that I was not involved in at the time. :-) Please feel free to correct me if you were, in fact, involved in a net art movement - would be nice to get all these net art histories

better documented somehow...) But anyway, net.art had a movement, at the very least it had coherence, and although it aimed to subvert the art world, eventually its own sort of art world formed around it. It developed a culture, hype and mystique through lists and texts; it had a center, insiders, outsiders, even nodes. This is of course not a failure; this is unavoidable: groups form; even anarchism is an institution. Then histories of the anti-institutional institutions begin to be written, and the fun begins. (Look how long this thread has been going...) With all that baggage, how can a postmodern modernist institution possibly survive the critical eye of History?

So, did net.art fail? I don't think so - look at all this extra-gallery history it's generating... It wanted to divert production/attention from the Art World - here we all are arguing about it, people are writing their theses about it, etc. I'd say it succeeded in its aim pretty well. Did the museums and galleries absorb some of it anyway? Sure, what's to stop them. Is that a failure? No. I think Olia hits it right on the head with the node theory. Whether a museum or gallery acknowledges it or not, it can be no more than a node with regards to net art. But then, this is the nature of net art, as well as of net.art. Moreover, the absorption and commodification of both net.art and net art is limited, partial, and optional to the artists. Neither has been consumed by galleries, and they have not developed a dependence on them.

Is net.art dead? Where did the net.artists go? They are still making net.art, or at least net art... they are also making political statements, music, love, babies; this is life, not death. Net.art is not about the Art Police forcing people to do the same thing constantly to prove commitment to it; no art really is. The crux is still there. Whether the production is the same as it was 5 years ago or not is not really the point: it is what it is, it left what it left, and the frenzy of discussion about it here is itself evidence of its success in what it set out to do. The layers may peel on and off, but the center is still there - think of it as toilet paper. BTW, don't try to flush the tube; it just keeps bobbing back up.

(Note to people who take things literally: toilet paper is a good thing; just think of the mess you'd have trying to wipe up with the Art Journal.)

ciao,

-[AT]

>>>

>> the party's nearly over...

Some think net.art is dead...

whether it is or not is of course a question of perception and semantics. However I feel that there is no doubt that the "golden age" of reveling in the creative freedom of a new media is over. No longer can we hold up the medium as the sole validating factor of an art work. The many modes of practice that have been explored since net.art was born will become just part of a more general syntax with which we value, critique, record and enjoy. Like any new medium it carries its own intrinsic forms and aesthetic, and like any medium it is in flux, it's own boundaries redefined with each new refrain or impact.

However too much grey change from one form to the next and too many shouts from a swelling crowd is not good for history or for theorists. Critique and theory needs reliable subjects and consistency of source material.

Unfortunately this need for definable boundaries increases in inverse proportion to the knowledge of those documenting them.

>>

ASCII Paparazzi.

. Anyway, the biggest problem net art journalists and observers have is that we are too few with too much to do.

>>

In a sense I agree, yet I feel that often the (ASCII Paparazzi as olia puts it) are the majority, writers and theorists who are caught up in the tide of net.art/newmedia/convergence because it is "new", "fashionable", "looks good". The newmedia/net world

implies progression and forwardthinking intelligence, evolution and transgression even before you begin.
I have been to countless seminars and conferences where the conversation is all too backslapping and uninformed, demystification and real dissection often takes a back seat to eulogy.
Interviewers ask artists about themes or subject matter that the journo has written about and therefore insists lies within the piece even if the artist denies it outright (yes there is a discussion of author/viewer e.t.c. but it doesn't make a very interesting conversation.)

Don't even get me started about institutions, 2 years at the Tate, managing a healthy portion of their online arts projects again brought me to many unexpected and sad/happy conclusions about the state of play in the net.art.world

so soon it will be time to leaf through the litter
>> and pick up the bits that are worth keeping for the next party,

I am hoping that the crossover will do the weeding... We can already see how some "classics" were never classics in the first place. Perhaps the harsher scrutiny of the institutions and of the history makers will, in its own way, refine the qualities that make some net.art real contenders.
I'm not being negative, I really think that this is a good thing, because I've seen too much weak work trophied, work that in any other medium would never have made it out of the box. It will also make greater demands on the documenters, the journalists, not to be ASCII paparazzi, but to help form a more thought-out history, from more than emails, screens and macromedia festivals.

Re: Re: Re: <nettime> Re: Re: net art history

From: Cornelia Sollfrank
To: nettime-l@bbs.thing.net
Date: Wed, 21 Feb 2001 15:25:07 +0000

hi all,

it is interesting to see what issues trigger response and create a discussion on this mailing list. i have to say that i am very pleased to see that it is art. (that the discussion mainly refers to /net.art resp. it's /death is very limited und little productive.) some years ago nettime was accused of being a hostile environment for artists/art discussions. this was the reason why most of them/us left at a certain point and opened their own list/network/environment.

now it has become an issue to reflect upon what actually has happened in this field in the last years, and this discussion takes place on, amongst other venues, (verified) nettime, again. obviously, this is still/again a platform where enough people gather who did not give up, resign, and stop thinking and acting, although we all have learned the lesson meanwhile: the net would not change the world in the way we had wanted to, in the opposite! and, of minor relevance, the net would not change the fundamentally profit-driven and corrupt art system.

i am not sure if net art(ists) ever had 'promised' such a thing, or if it more had been a wishful projection. anyway, there was/is an enormous subversive potential in the net which undermined/s art-system-parameters as (identifiable)/(individual) authorship, (finalised) piece of work, white cube-ism, purchaseability etc. there are/have been various (serious/playful) ways to handle this potential.

but even these individuals who have connected to the art system with their

names, pieces of work, museum/gallery presentations and sales (very few) are confronted with the fact that, so far, no adequate ways of presentation could have been developed for the white cube, and that the selling of pure data (what 'net art pieces' mostly are) leaves the art market quite helpless. this gives evidence for the subornness which lies in the artistic use of the medium. the fact that some high-end works have been commissioned by museums, or that serious efforts are being made to collect net based works does not mean at all, that net art per se could have been integrated into the system.

but this is also the reason why net based art has been developed further, in more art system adequate formats, as there are various kinds of installations, starting with sculptural "browsers", going to pleasing/colorful data projections, and a range of re-materialisations of data. this is probably the most promising (and, of course, a very boring) way to become a professional 'net artist'.

i also agree with pit's elaborations in many points. i.e. that we generally underestimate the value of the net-based works, and that their relevance has to be seen within their historical framework.

now is now, and not net.art. but even if it has no name what is happening, and even if the general implementation of 'a new art form' did not take place, there is endless ways to go on with resistant and suborn, political and aesthetic practices. the informational sphere is still quite unprotected, and we have powerful tools. ... continue working in the spirit...

best, c.

Josephine, I don't underestimate your work. The paragraph you refer to is full of love and respect. And I do enjoy interviews as a genre (I love dialogues).

But it is a pity that interviews dominate the critics' output.

The interview approach cultivates stars, not ideas. And stars, especially superstars, can be very lovely targets. You can pronounce them dead whenever you like. Ideas live longer.

Interviews are easy to read. They catch a moment. They let future readers touch the past. A picture develops. History's created. But it's a history of artists' arrogance, self promotion, mood changes.

One interview provokes another. Critique is reduced to updates and data collection. I get mail from people writing their PhD, MA, BA in net art or net culture. They ask questions like this:

- "Mrs. Lialina. In 1997, in your interview with J.Bosma you said: "...", do you still think the same?"

or

- "Mrs. Lialina. In 1998, in an interview with T.Baumgaertel you mentioned that "...". Why did you say that?"

or just

- "What's "Agatha Appears" about?"

It reminds me of an old net artists' statement: "Net artists are their own museums, curators, CRITICS."

>> Btw, saying that net art is just beginning isn't very
>> different from saying it's dead.

I've a new theory about 3 generations in net art. Will write it soon. (Or we can have an interview. ha-ha-ha).

That's very interesting! Thank you for pointing that out! I guess we're witness to a real crash in the institutional art system. Some "regular artists" developed outside the regular system. It's more significant than the Dolly the sheep phenomenon. And more interesting than the crop of "irregular artists" raised by galleries.

Hi Pit,

in my opinion, it's the other way round - that the genre 'artistic
software'/'software art' was invented to _honor_ the code art of
Jodi, I/O/D and others. 'Software art' does not overwrite the history of
net.art, it just adds one more perspective from which digital art can be
seen.

When we describe jodi.org or I/O/D's Web Stalker as net.art, we put it in a
particular context of a networked discourse we all know very well (and which
includes this mailing list). To say that they are also great pieces of
software art doesn't rule this out, but allows to draw new connections _in
addition_ to the previously mentioned: connections to, say, 2600-style
computer hacking, 1950/60s computer-generated concrete poetry, to artistic
computer viruses like the 1988 MacMag virus, sourcecode poetry (which
started as early as 1974), to pre-Web experimental HyperCard stacks, or to
Ade Ward's "Signwave Illustrator" <<http://www.signwave.co.uk>> (which, as an
offline standalone user application, clearly is not a piece of net art).

The category "software art" was created for transmediale.01 to embrace a
whole range of digital art which simply doesn't fit into 'net art', although
both terms are not mutually exclusive. Please think of it as an extension,
not as revisionism.

Florian

Olia Lialiana's comments about interviews seem really off the mark to me. Do
interviews dominate critics' output? I don't think so, certainly not based
on the huge pile of anthologies about online and digital art that are piled
up in my office. Personally, I do both and think there's a place for both.
But it's ironic hearing that there are too many interviews, after decades
of artists complaining they never get to put their views forth in a direct
way.

You should also bear in mind, Olia, that there's not that much of a market
out there for criticism remunerative enough that it helps pay the bills.
Interviews are far less labor-intensive, and often research for later, more
in-depth responses. So it's not an either/or situation. More often it's
publishing an interview or nothing at all.

Cheers,
Robert Atkins

<nettime> Re: net art history - Interview Yourself!
From: Amy Alexander
To: nettime-l@bbs.thing.net
Date: Sat, 24 Feb 2001 23:16:12 -0800

Olia's right! Josephine's right! The critics are short on time, and having them spend it doing interviews just creates a bunch of Art Stars - it's essentially a whole new Art World created in the process of trying to flee the old one... and look what we've got: overworked critics, unhappy net artists... this won't do...

I propose a new approach, as part of the Plagiarist "New Millennium Disorder" project: The Interview Yourself Project. Since it will hopefully generate lots of interviews, the acronym will be the "IY-IY-IY-IY-IY" Project. Everyone, please interview yourself, and post your interview to the usual mailing lists; heck, I'll even make a whole website for the archives if people submit them.

Think of the benefits... it subverts the Net Art World Institution, and makes everyone a star... or, uh, makes nobody a star, depending on how you want to look at it... it finally gives the interviewees a chance to answer the kinds of questions they "wish" they'd be asked about their work... it gives us shy people who sometimes clam up with real interviewers the chance to finally open up in an interview... and, it saves wear and tear on critics and journalists! Concerned that the tough questions won't get asked? Not to worry; IY-IY-IY-IY-IY doesn't preclude critics from doing interviews, just sort of er, open sources the interview process. (I just love working "open source" in anywhere I can...)

So, hop to it everybody! (you too, critics!) you've got an interview to prepare - History Awaits!

I like that. Let me think what I'd like to talk to myself about...

But something else. Why not an 'artists for artists' kind of project (like we have a 'mothers for mothers' support group in Holland in which pregnant women donate urine to make other women get pregnant easier, a kind of furtliser. Do you like the comparison?), whereby artists also write criticisms of artworks of other artists? It might be a nice variation of criticizing critics and how badly they do their job. Also it might produce some damn good new critics!

Text for Moscow: Between moderation and extremes.
the tensions between net art theory and popular art discourse.

~ Josephine Bosma

<<back

Between moderation and extremes
the tensions between net art theory and popular art discourse

Society on the Internet is hardly different from that off-line. The few differences in cultural, social, and political structures up to now, should mostly be credited to the specifics of its technology and to the inexperience of people working with it. So far - nothing really new. Because we are dealing with a medium that is still under development there is however an ongoing feeling of play and novelty about the net, which evokes and has evoked smaller and larger dreams of a Better World. In the initial excitement about (and exploration of) the new medium we witnessed a strong tendency towards cross- or multidisciplinary work and collaboration in a still relatively small group of online cultural 'developers'. With the effects of excitement slowly fading away, disciplines and discourses appear to separate from each other again, succumbing largely to age-old off-line structures. Do we need to interfere in this development? To what extent have there ever been alternative structures, and are they necessary at all? Is it possible to move beyond the limitations of both technology and 'traditional' social structures? I want to show firstly in a short analysis of the mailing list nettime, that neglecting a critical attitude towards the fundamental structure and outside perception (from different viewpoints at the same time) of one's project, produces negative and even destructive effects in the end. Cross-disciplinary investigations and theory are vital to countering a development of a narrowing down of the possibilities to have influence on the continuing construction of a mediated society, in which art, in my point of view, still plays a significant role. When looking more specifically at net art, we can find this narrowing development in the separation of critical media discourse and net art as it is strongly represented by nettime. In the much broader field outside this list we see another danger for art on the net in the rather strong tendency towards simplification of the net art discourse through a curious focus on web art (as opposed to the broader field of net art). No matter how good some web art is, web art in general should not replace net art through pure lack of knowledge and awareness.

The connection between (net) art and theory is vital. The two should develop together, in order to make sure the institutional reception and handling of this art is as close to the art practice as possible. Art education and presentation are basic elements for a flourishing art practice. Even if art

education and presentation are now replaced by self education, exploration and self representation on the net, institutional practices will still be of crucial importance.

Nettime and Cross Disciplinary Theory

The development of net art has been under attack from two sides. On the one hand we see the long predicted institutionalization of art on the net through existing artworld structures, and on the other hand the net arts are being cut off from cross-disciplinary discourse and media theory by key figures of one of its first influential playgrounds: nettime. Net art was embraced as an alternative or radical view of net.culture by nettime from 1995 to 1997, when list moderation first started invisibly, and later officially. Nettime was started in 1995 by a group of about ten 'media theorists' and 'artists'; as an initiative of Pit Schultz and Geert Lovink. Amongst the artists were Paul Garrin and Heath Bunting. Each list member in the early stages of nettime seemed equally important, and each member brought along his or her contacts. The problem with nettime was (and is) that there has never been a clear explanation or description of its structure, yet it was presented very much as a community effort. It had live meetings and online discussions where the direction and purpose of the list were discussed and all members were asked to perform tasks and develop tools or additions to the list for the benefit of all. The list was supposed to be a radical counter force against a so-called 'disneyfication' of the Internet in all its aspects. Critical approaches of 'political' mechanisms (and those politics could be within governments, military, commerce, industry/ technology, media, or art: as they were all entwined) were its basic driving force. Being a member of nettime more or less equaled joining this battle against commerce, corporate powers, techno-ignorance and cultural deprivation. When the mailing list (and of course the group of Internet users in general) grew, and more and more subscribers joined in order to simply have their daily updates from the by now infamous list (rather than being actively involved) the desire for consensus became strong. The list slowly changed from an exchange forum into a platform (see my interview with Heath Bunting in Telepolis). In this development the balance between active discourse and individual promotion or presentation of texts was lost. Art discourse (by which I mean not only art theoretical discourse, but also experimental representations and exchanges within net art) in this environment was soon seen as noise, as it did not follow traditional and harmonic (read: academic) modes of communication. What then happened, artists were first approached individually, off-list, in order to change their modes of communication (meaning: they should not send experimental texts to the list anymore). This resulted in the first and most important separation of artists from the list. After the nettime meeting in Ljubljana in 1997, Jodi, Heath Bunting, Alexei Shulgim, Rachel Baker and others left the list. This unfortunate development caused quite some debate behind closed doors, and was perceived as unnecessary: the attitude of the artists was seen as provocative. Paul Garrin, one of the last remaining artists from the foundation of nettime, never left the list. His project 'namespace' has a strong political background, and was initiated at a nettime meeting during the tactical art&media festival nym2 in Amsterdam. Namespace needs to keep in touch with, and needs to be represented within, the environment it sprouted from. Not even half a year after the large list meeting in Ljubljana though, Garrin's posts and disputes via the list were the reason for the 'list owners' Pit Schultz and Geert Lovink to switch on the moderation button, and to start filtering the list. According to them, they had had complaints. A lot of these complaints probably came from the most dominant moderator of the list today, an enemy of Garrin: Ted Byfield. This way, without much open discussion or explanation, there came an end to experimentation and openness on the nettime list.

Nettime has and still does profile itself as being in support of, or in search of, new modes of development for the media in society. This aspect of it has however been completely neglected because of the hidden political and personal agenda of some of its moderators, which does not allow for openness or experiments. Nettime has turned into a watered down online version of nym, with the difference that at nym art is still, though highly cornered by politics, part of the discourse. The biggest problem with nettime is 'its' unwillingness to reflect on 'its' radical change from exchange forum (with input from many) to moderated platform (with strong influence of a few members mostly) today. Not only does cultural theory suffer from it directly today, also the experiments and thoughts about it from a few years back are made to look suspicious through the consequent denial of their importance and influence.

Nettime was not simply interesting to net art because it brought together a group of people from mixed backgrounds and disciplines. The Thing had done so also, and so did The Well. The Thing however first of all had a much smaller group of members, plus its scope of topics was narrower. It was and is more an art server, both Thing New York and Thing Europe. The Well was too American for the taste of many, and starting a critical discourse around the development of the Internet through a California list probably seemed a contradiction in terms. What was interesting about nettime, next to its cross-disciplinary tendencies, was the strong presence of non-American cultural input on the list (or in other words: the diversity of cultures). Now that

nettime has chosen to mostly close the door to art, the development of net art has lost a central point for critical cross disciplinary thought from a multicultural perspective. The development of net art is now largely in the hands of arts organizations, which not only tend to emphasize art practice as one separate from other practices, but which also have strong local ties. The connection to local art environments creates stronger divisions within art discourse online, resulting unsurprisingly in a dominance of American art discourse in relation to how net art is being perceived.

Net Art Discourse and the Artworld

Although there are interesting, sometimes rather obscure conferences and festivals on special aspects of net art in Europe and elsewhere, the perception of net art both online and in the mainstream media is more and more colored by the state of net art in the United States. The creation of the Webby by SFMOMA certainly has caused mainstream media to finally wake up, but the Webby seems to be almost the logical consequence of an opening up of the traditional artworld to net art from within an American context. Its mailings don't have the atmosphere of a TV show for no reason. Ironic gestures aside, the Webby looks like an early step in the direction of a Web TV award. The loss of a conscious, cross-continent, cross-disciplinary discourse on net art has brought American art discourse into an advantageous position, due to its dominance in a few respects. Firstly language (the German speaking countries have a strong art theoretical discourse and a forerunner position in the field of net art theory that is obscured because publications are not being translated into English), and secondly 'the Americans' have a highly dominant input into the development of the Internet. We now face a net art discourse that is strongly influenced by American economic traditions and mechanisms. Especially as the role of web designers, and their connection to soft- and hardware designers, becomes more influential. Rules of web design slowly gnaw away at net art practice and theory like acid gnaws at iron. The term net art gets confused with or replaced by web art as if the two were interchangeable, without many questions asked. Traditional art practitioners too easily turn to the structurally (in terms of basic development of net.technology) and economically important 'group' of web designers for what they think is the highest form of knowledge of a medium they know little or nothing about. Art historical analysis is barely applied to net art, and if it is, it usually happens through the slightly younger tradition of video art. A historically deeper and therefore more radical analysis of the difference between the Internet and mass media, like TV and radio, that includes global economic and political developments as well is rare. Replacing the term 'net art' by 'web art' causes a negligence of art history within a political and economic environment. The radical implications of net art are replaced by the much less threatening aspects of web art. It therefore of course also becomes more compact, easier to grasp and more marketable.

Net art has shown a conceptual overlap between all art forms through the variety of its manifestations and the uneasy definition of it as one artistic 'style'. In fact it even shows the potential for questioning popular/ common art history, in which marketability of art has been the primary point of departure in ranking artworks and artists (and for keeping a stable economic environment for other art professionals.) One could almost speak of critical art history or if that sounds too sharp, specialized art history, as a -secret- history that is almost lost for the next generations. Within this secret history we can find traces of predecessors of what is now called net art. When we combine these traces with a cross-disciplinary analysis of the present situations that surround net art, we might (it almost sounds like an alchemist recipe, but I have to stress I am -not- referring to a so-called 'spiritual' perception of the arts) arrive at a conceptual, or basic core of, art practice within a technological society. It could very well be that it is this mostly unspoken desire to know what the basis of the artistic experience is, and the -feeling- that disclosing this knowledge is near (when using the Internet as a medium), what excites and drives many net artists. The narrower the definition of net art, the more we lose sight of this almost 'secret' art history. With a narrow definition of net art, we stay in the tunnel of mass media hyper-reality.

Unstable 'Objects'

With the entrance of electricity, of new media in the arts, we entered an era of instability. Instability is something western society has fought traditionally. In the arts this tradition (of fighting instability) expressed itself in a radical commodification of art. It expressed itself almost totally in a market orientation, in which concept was submitted to business. The age of new media is the age of the accident, as it was expressed at the Dutch Electronic Art Festival in 1998, which had 'the art of the accident' as its theme. Have we seen this instability reflected in art history though, in its full force? Do we need to acknowledge the virtues of instability, or do we at least need to acknowledge its undeniable part in the state of art and culture today?

Tilman Baumgaertel made an attempt about 3 years ago to sum up the pre-net art history through events and work in 'traditional art history'. You can find this text online in the archives of (again) Telepolis magazine. He goes back as far as the early twentieth century. Going back to the beginning of

modernity is important for net art criticism. One can not only see the struggles of artists with new technologies, or their fascination with them, one can also see how art develops more and more into the direction of purely conceptual. Matter does not matter anymore. The mixture of art with other disciplines, from psychology to science to even war (if one can call that a discipline), might be represented in all kinds of materials or media; it in the end has led to a diversion away from the art totem to the meaning of it. Even if the work is purely visual or aesthetic. Meaning is not stable. To criticize the construction of art as object we can also look at a famous and much used art analysis by Greenberg, from around 1940, which can serve net art theory or Art Theory Today. First of all Greenberg's development of criteria by which one can distinguish art from kitsch is of course a protection of the art market from being flooded by mass produced or copied works. The age of reproduction, the age of new media (in the definition of Lev Manovich) had matured considerably by 1940. Greenberg serves and protects the art market. On the other hand, after he has sealed off the artworld from works made in the new media of his age, he hands us a tool by which we can -now- condemn most contemporary art as kitsch. One definition of kitsch by Greenberg is namely: a work that is made to look like art, a work made to at first glance easily fit within the category of art. True art apparently has to be original: an original. As nobody would like or would dare to see art this way, as kitsch (even if a lot of artworks might deserve it), Greenberg's theory can now be used to put art history into perspective. It is no longer the art object that has to suffer the most changes, rather it is art -theory- and (popular) art history. The dominant art object can be seen as a manipulation, a theoretical construction.

Net art is an involuntary provocation. Art has been declared dead so many times that art professionals, whether they come from the popular or near 'secret' approach of the art institutional processes, have come to accept their work field as a stage for representation (of an image of art shaped through some 'traditional' use of matter) almost completely. The focus on the art object seems to only have become stronger throughout the twentieth century, instead of it losing ground as one might have expected when following the thoughts or concepts around early modern art. This strange contradiction was of course often noticed and pointed at, but somehow the victory of the art object through the art market and subsequently also in popular art history was taken for granted quite easily. It nearly arrived at the point where we would have to accept that 'art as object' is 'the way art simply is'. Art forms that contradicted this definition threatened to be seen as forms of radical or conceptual performance or theatre, that serve as theoretical experiments which in the end only inform other artworks, art objects, but are not of the same importance as those objects. Fortunately this last definition is somewhat losing its potential firmness in the presently powerful position of video art within the artworld, which of course has been due to the development of technology throughout the twentieth century. The unstable, intangible value of the art object in the age of new media could no longer be denied importance when more and more artists started to work in new media and multimedia. Net art however takes the instability of the art product one step further, namely a further step away from 'art spaces'. At least temporarily the 'art spaces' (galleries, museums, etc.) are in the position of being an -addition- to the representation of an artwork, rather than being the most important means for the presentation of art. This aspect of net art alone is enough for at least a few controversies. Should for instance small parts of or additions to net artworks have any value, both for art history and for the art market? Some artists fight or resist the art market. When listening to them, the dominant definition of value today might need reevaluation as well.

The New Art Elite (sic)

The basics of art selection are also increasingly unclear. The major difference between 20th and 21st century art could probably be that the definition of high art is more and more one of 'sampling' individuals or groups which 'compile' an artwork or art environment, opposed to the 20th century dictum of art as cultural selection by institutional processes. The loss of tangibility, the loss of the art object, is the aspect of net art that is debated most, but of much more importance to art 'selection' now is the loss of -clear boundaries- to an artwork in cyberspace. This results especially in a change within the role of the art audience. The much sought after 'interactivity' does not reside in well designed interfaces and interesting buttons to push (or windows to fill), but lies hidden within the presence of the audience inside the network. Collaborations of variable intensity, exploration of networked art pieces and the discourse around these are causing the audience to directly enter the realm of critical and artistic practice simultaneously. We can draw from the early art performance practices on the Internet to imagine a 'new' role for art institutions, for galleries and museums. As in the early twentieth century, art spaces could be places for social spectacle and events again, in which presentation, selection and exchange of ideas and norms are the central activity, as opposed to the consumption of preselected works, which is the dominant activity in museums now. A space like this can serve as an area of accumulation of communication, an addition to the individual experience behind the personal computer, an experience that is still growing in number and importance. The development of art in computer networks (which is of course part of, or in addition to, a larger electronic culture)

in this sense takes the early 20th century avant-garde idea of art untouched by the sublimation and selection of an authority and realizes it by default. The audience that enters into an artwork in order to explore it to the utmost extreme, or the audience that witnesses an unfolding art project over a period of time and provides it with some level of 'artistic' value. Whether this audience does or does not enter into the artistic process itself, is part of a system of evaluation that informs the new art history.

Art Before and After 'Going Online'

The word net art was always problematic. It held the risk for both the artists and the art to be too connected to a limited use of a small, specific media environment, as David Garcia wrote back in 1997 (on the nettime mailinglist). Yet artists have mostly tried to escape the word 'art' in it, not the word 'net'. Most probably this happened because of problems within the art establishment as I have described earlier. It has been quite clear for many from the beginning though, that net art was going to be only a -temporary- 'file' in art discourse for putting certain new practices into while they were developing. Going against the grain, and therefore risking stepping on some toes, I would say the development of art in computer networks forces us to ditch the general, popular definition of art entirely. We could speak of a pre- and post- network situation. 'Post-network' in this context points to the by now near total internalization of the internet, or computer networks in general, by our environment, our society. I am of course aware this process is not complete, or may never be completed, in all parts of society (and of the world) equally in terms of availability and popular use. What I for now call post-network art is coming forth from a life and culture that is saturated by the new media networks, in which a distinction between online culture and off-line culture is very hard to make.

I was talking to a friend of mine, Walter van der Cruisen, a few days ago. He is founder of the digital city and other important projects in Holland, and he is currently working at the ZKM in Karlsruhe. He was also part of net art projects like Refresh in 1996 and the Ascii Art Ensemble in 1998. We agreed entirely on the reevaluation of art in the present setting, a reevaluation that has consequences for the popular conception of net art as well as from the perspective I just described (pre- and post- network art). When I speak of net art, I always have the broadest possible definition of it in mind. It does not stand for one specific group of artists, and it is not all purely self-referential or criticizing the network medium, as some say. It covers not only browser based art (which should be clear) or the even more restrictive definition of 'site based' art, but also art that happens in any other kind of software, any other kind of time frame than the individual now-ness of site based, site anchored art. It also includes live performance like dance, music or theatrical enterprises, or performances delayed in time, which are more like intervention art. What is maybe unexpected though is that art that at first glance does NOT use the Internet as a medium at all can fall under this definition. I came to this conclusion two years ago, when I saw Alexei Shulgina's performance 'Real Cyberknowledge for Real People' in Vienna. In this piece he handed out newspapers from the mailing list nettime to the Viennese shopping audience. The newspapers were mainly discarded. Shulgina was harassed by an extreme technophobe, and a similar performance had been done before, but that was all unimportant. In his apparent attempt to do the ultimate lazy act as an artist, in a conscious attempt to do something he maybe thought nobody would consider net art, he created net art. Worse than that, he broadened its definition. Here we see post-network art. It is not a new phase to come; it has been here since artists made work from within a networked environment. (So not outside of it!) The network has to sort of be 'internalized' or integrated into the life and work of the artist! Post-network art is the state-of-the-art in net art today, even if we use both terms, they are one really. Just an anecdote: Walter van der Cruisen is expressing this phenomenon in an exhibition he will be curating for Mikro in Berlin next year, an exhibition called Radikale System Malerei (Radical System Painting). An amazing strategy in a time when painting has approached nearly the same status that playing the violin has in contemporary arts.

The unstable media V2 in Rotterdam has placed at the center of their work, the variable media that Jon Ippolito proposes as a solution for the transition we experience (from pre- to post- network art); Net artist Cary Peppermint calls his work 'restless'; the term 'not.art' that came forth as a reaction to net.art; and my term, post-network art, these are all different words intended to escape an untenable friction between popular art history and contemporary art practice. The well-known exhibition net_condition at ZKM, Karlsruhe, attempted to avoid the problems this friction has been laying in front of the art world (and which it has done for decades already). They did so by emphasizing that they were -not- making an art exhibition, but rather that they wanted to give an overview of some aspects of net -culture-. Even though I was quite happy to find so many net art works I like gathered and presented in one space, I found this shying away from making the event an -art-exhibition somewhat cowardly. Even if the makers were trying to desperately escape the problematic situation of art between eras. If they were in other words avoiding dealing with the problematic definition of art, I think it would have been wiser to in fact show the broad overlaps and blurry boundaries between art and other cultural phenomena from exactly this thing called -art- as a central point of departure. I of course say this in the first place

because net art has suffered enough put downs and denials by art professionals. Secondly a theory from within net art, a discourse from within net art, has started far too late in the development of the net art practice. I had a private email exchange with Timothy Druckrey in which he stated that net art was suffering from too much theoretical discourse. I could not disagree more! If net art is suffering from theoretical discourse, then not from its own. Analysis from within the networked field is what we desperately need more of. I think we can still quite easily sum up the good texts in this area. Good theory is absolutely necessary to help shape the environment into which the art is going to be received and represented. It should be, needless to say, that such a theory has to be in very close communication with the practical field.

Empowering Art Practice by Emphasizing its Diversity

I would like make two suggestions for empowering the net art field, to create an empowerment that allows for diversity and experimentation to have room within art education and art discourse in an information society. I would like to plea for an open-minded attitude towards the virtues of 'negativity', and I would like to propose something I like to call 'net art monuments'. Net art practice has been dominated by two main forces, that have always created a wonderful mix: web design and anarchy. The extremes of net art are represented by artists that live by the rules (or the possibilities) of the technology without being bothered much by moral restrictions. It is this wild, unpredictable and experimental side of net art that is obscured further by developments within former social spaces such as nettime or through new institutions like the Webby awards. It is not easy to convince people it needs support when the discussions are always pushed towards the edge by, amongst others, its loudest and probably best known representative: the artist formerly known as antiortp. Projects like Heath Bunting's 'donate', in which net art works are given to museums for free (and anyone can submit and donate a work), criticize and balance the discourse and the economy of art online. These subversive works and actions are the projects in art practice that are closest to theory, and they provide connections and moments of reflection in the chaotic 'space' between pre- and post- network art environments. The negativity in some works of both Bunting and antiortp lies in their willful destruction of power structures, power structures that do not obey the structural anarchy of the Internet. These works are constructive for net art discourse though, in the sense that they deconstruct art institutional habits and show the empowerment of outer institutional forces by the net.

The way network art is entering education, be it traditional education or self study, (so whether there is the opportunity to access knowledge) has always been one of my strongest motives to spread texts and interviews broadly. In order to make sure the diversity of net art remains a given fact and does not get lost within art education (where in academics etc. making net art alas almost equals web design completely). I would like to suggest to simply give certain works the status of monument. A monument is a place for contemplation of events, behavior and situations of the past, these three then being both negative and positive in nature. These unstable monuments of art on the net have been of great importance for net art in some way. I therefore end my talk with a list of possible net art monuments, which for various reasons have been influential in the short history of net art. I'm keeping it brief and do not include forerunners of the net. I invite you to come up with more suggestions.

not in order of importance:

Olia Lialina's My Boyfriend Came Back From the War
(first net art work to be sold)

Cornelia Sollfranks Female Extension
(using 288 fake identities to subvert the first institutional net art contest in 1997)

Heath Bunting's old cybercafe site: all projects
(the Tokyo project is very impressive yet simple net performance)

jodi.org
(depth in view at first glance, poetic sense and playful deconstruction of code)

the anti NATO protest by 'antiortp' during Kosovo war
(most compact example of this artist's radicality)

Alexei Shulgin's Viennese performance
(first clear sign of 'net art beyond the net')

Shulgin's Form Art
(effective simplicity with astounding (unintended?) former eastern block feel)

superbad.com

(the first in a seemingly specific genre in web art)

fakeshop.org
(for their use of software, their use of the web, and their use of sound, all poetically entwined)

First page of hell.com
(shows an attempt to obscure and separate work from general net culture)

RTMark
(for the strategic and at the same time theatrical use of anonymity, exchange and communication in the net)

Finally:

Net art was never depending on representation in institutions, yet it has always needed central points for discussion, social exchange or exchange of knowledge (something announcements also do: sharing with an audience where, what and how of a work). Early net artists have developed their networks in such a way they do not need such central meeting places anymore. Yet because of the lack of cross-disciplinary discourse platforms (where audience, 'critics' and artists meet in a more open social space with a broad cultural feel), newcomers in the networked cultural field are caught between institutional art discourses and obscure lists.

What is interesting is that one can find all different views and representatives of various positions on the arts meeting within the same medium, yet somehow the communication stays limited. It could be important to look at where exactly the separate disciplines and social structures have come together and have produced new approaches, and where they on the contrary clash and divide. The influence of the medium itself in this should not be underestimated either.

Hiya,

>the anti NATO protest by 'antiortp' during Kosovo war
>(most compact example of this artist's radicality)

Yes, how very radical of them to support the 'ethnic cleansing' of the Kosovars. I'm sure that Sloba and Mira were very grateful for their artistic intervention. What next: a cool n' trendy website for the French National Front or the German neo-nazis?

Later,

Richard

Tilman-RFC #1: net art history 1993 - 1996

Hi!

Here's the outcome of my effort to experiment with collective history writing: a time line for the catalogue of the "net_condition" show at the ZKM in Karlsruhe, Germany.

One month ago I mailed out a proposal to inform me about early net art projects. It resulted in the following list of projects and art works that happened between 1993 and 1996. Some of them were suggested to me by email, other came from my own - not very good - memory. After 1996, the whole field became too big to continue to collect things in such a fashion. I was surprised how many early projects were there, some of them I had never heard about, and how many of them are still online.

It is in German, but it should still be understandable. I listed the works with

month of their creation,

artist,

title,

URL

and sponsor, festival where it was first shown or the institution by which it was commissioned etc.

For every year there's a separate section that lists important conferences, shows, events, the creation of art servers, context systems etc.

Any further suggestions, hints are welcome, even though my deadline is approaching fast. If you want to add something, please do so in the format described above. It is not a completely open process, and I will filter out things, that I find irrelevant, but actually so far I included most of the works that were suggested to me, because there were some really surprising things that I didn't know about.

This whole methodology obviously leaves open a lot of questions, but I think it is interesting to put history together in such a fashion. Call it Open-Source-History, if you will, with me as the maintainer. :-)

I still have some errands running, but hope to finish this whole, quite labor-intensive project next week. So speak out now, or be silent forever.

Yours,
Tilman Baumgaertel

>
>As I said, I need the date.
>
++++++
My Response: I sent Tilman an approximate date : early 1996.

Also I telephoned my server: Thing.net to get the exact date my site went
on line and received no reply.

++++++
My Response:

I recall the approximate time I put my first announced site up to be early
1996.
and e-mail Tilman, with the information it can be corroborated by records
at Thing .net.

++++++
No response from Tilman,
but his posting at nettime eliminating me from his survey, appears on this
list.

++++++
I go through my American Express accounts and find I was paying for my
site/space from March 1996.

Telepolis
Exhibition and Conference on the Interactive and Networked City
4.11. - 12.11.1995

In the "Art" section of the exhibition the following works were
presented:

Electronic Gallery, Kunstlabor, Vienna
Views, Ulrike Gabriel
The Egg of the Internet, netband (Feigl, Hobijn, Solomon, Verdult)
Stone Age Computer, Mathilde MuPe
Urban Exercises, LOT, Sabine Bitter, Helmut Weber
Telepolis in VRML, Nicolas Anatol Baginsky
Labyrinth, Stanislav Miler
Musers Service, Daniela Plewe
Sound Image Crossing, Keigo Yamamoto
Various VRML-projects by EZTH Zurich, Florian Wenz

Additionally to the art section, there was a general purpose cybercafe
which was installed by Media Lab Munich, where, among others, digital
city, Internationale Stadt and other collaborative art projects or
"context systems" were shown.

I am quite surprised to see that your timeline starts as late as in 1993.
Again, we can argue whether "net art" (i.e. net art in a broader sense than
the particular school of "Net.Art") is identical with "World Wide Web art".
My opinion obviously differs.

Since you speak of "net art" and not of "Internet art" in particular, I
would certainly include BBSes into this history.

Even without BBSes, I would clearly root the beginnings of Internet art
activities in such manifestations as the "alt.artcom" newsgroup (established
by the editors of the Canadian "Art Com" journal whose editors also
published the Mail Art source book "Correspondence Art in 1985), the
"Postmodern Culture" e-journal with the "PMC-talk" listserver and
Crackerjack Kid's Networker's Telenet Link around 1991. In my memory of
these days of the Internet - or EARN/Bitnet, respectively -, these were the
only arts-related forums in global computer networks. For net culture, the
discussions in "PMC-Talk" were at least as significant as those in Nettime
became later.

alt.artcom

Quotations/resources

"In 1991 there were roughly two dozen mail artists with PCs and modems, mostly Americans, who could access one another through information superhighways like internet, bitnet, CompuServe and America Online."
Chuck Welch <<http://www.actlab.utexas.edu/emma/Gallery/telenetlink.html>>

"Artists are using computer networks, and it is impacting not only their methods of dialogue and distribution, but their creative process and aesthetic output. In the cyberspace of computer networks, still so pervasively ASCII and ANSI, art works are not necessarily about visual images but instead communications -- many investigate interactivity, collaboration, interface, connectivity, and the relationship between artist, art work, and viewer."

Don't worry: Tilman's job 'net.art.history' won't be the last attempt
to rewrite the past.

The first use of the the net (internet - not phones, BBS's, a.s.o.)
for art's sake I remember was Bill Gibson + ? placing something
like a 'self-destructing poem' on the net in summer 1992.
(the organisation was an art-show in San Francisco, so there might
be more to dig up)

Lot's of still familiar names are missing, from Artcom to Williams
and even more not so familiar ones.

Well, that comes as quite a surprise, doesn't it?

You will even be more surprised to learn that just putting the overview of
these four years together took one month of work. If I would be at an
university I would take a sabbatical for this kind of effort, but I am not.

As you of course know, this kind of art is very ephemeral and very
distributed, and it takes a long time to get this kind of stuff together.
For the present purpose, this list is OK, because it is for the catalog of
an exhibition that was triggered by the art that was created in reaction to
the web, mainly. But it doesn't pretend to be complete, and I put every
imaginable effort in getting as much material as possible. And actually,
the reason why I make this list available to your kind of criticism, is
because I want as much participation from as many people as possible.

I also don't think that net work art is only on the web, so I have a much
longer list of other things, going back to Mail art and the fifties,
including Television, Satellite, BBS, Fax, what have you events, but it is
yet too incomplete to be published. I will continue to work on this, and
once I feel it is appropriate to this big topic, I will put it on the net.

Anyway, thanks for your list, it is of great help.

Yours,
Tilman

> which are the defining characteristics of net.art.

So this suggests that the categorization of the (net.)art work is dependent
upon the intentions of the user, whether they want to exploit the properties
of the net as a communications system or as a distribution system or whatever.
But then their intentions are dependent upon the particular qualities of the
Net that they perceive as important anyway, so we must conclude that all art
that is deliberately put on the net is net.art.

The challenge is then to find some art on the net which isn't net.art (isn't
it?). Perhaps this would be art that was just accidentally put on the net, or
just temporarily while you were thinking of where else it should go (like
leaving things in a pile on the edge of the sofa because your shelves are full
up and the tea's ready). Perhaps this would be called default.art.

the fun continues...

I like Melinda Rackham's quote from Tiia Johnson about 'making them wait'
for download. Download, like the crash, the freeze, upload and boot up,
are temporal modes that are the last vestige of labour time on the web,
giving the lie to the mythology of instantaneous transmission.

But there is another point to add, a small one: what we have by way of
browsers are not interactive, or at least not interactive enough. We can
click, we can to some extent navigate, we can publish, but we can't
re-edit someone else's work without downloading it and republishing the
reedited version on a different server. Netscape and IE are both based on
the principle of user-friendly admission to a publishing medium, not to
genuine interactivity. Perhaps this can't be done on the wide open spaces
of the net but only on intra/extranets where some degree of responsibility
and trust can be presumed. Nonetheless, the model of the Amaya browser
seems to me the kind of tool we will need if we are going to get
interactivity of any real sort online. That will mean, as well, some
radical education in democracy: if the authorship of works moves from
authors to users, then the responsibility also shifts in proportion.

So to add my crumbly bit of old cheese to the define.net.art flan, a
thing is net.art if the user takes responsibility for the work

```

interesting questions.

as for nettime: there's a complete archive on nettime.org (köln); another (i'm not sure how complete) at tao.ca, in toronto, courtesy of jesse hirsch et al.; and another one, much less complete, at The Thing (NYC); and, at least for a while, there was a clone of the complete nettime one at o-o.lt, in lithuania (?), but these are only the publicly available archives (of which there may be more i've never heard of); there are also private ones--mine goes back to 12/95, and is missing only the first ~30 messages sent to 'nettime-l' (there were earlier channels and ur-correspondence), if for some reason all these public archives were to vanish, i expect a few people would put some up on the web, however piecemeal. (an excellent example is the more or less complete reconstruction of the first 'cyberpunks' list cobbled together from various partial archives.)

and then there are nettime's paper publications: ZKP 1, 2, 3, 3.2.1, 4, _README!_, and (in part) the NATO/FYU issue of arkzin/bastard, some of which included floppy versions of their content. the impetus behind this series of publications was to make a 'networked discourse' available offline; but one consequence was to make them available in a form not susceptible to the failures of electronic media.

note that the nettime.org archive includes 'raw' files of the traffic going back to 11/95: if you really care about the long-term viability of the archives feel free to suck the files down and archive them yourself. once FreeNet is up and running in a meaningful sense, i'll run a node and make the files available in that way--as an 'eternity service'. i hope others do too, but the essence of these systems is establishing open and contingent technical setups and seeing what happens. nettime is a 'collaborative text filtering project': it may be that the logic that governs such an arrangement will filter nettime, or subsets of it, into oblivion.

as to your questions about foundations, and various lists banding together to start one, my own response is: bleech.

in my experience, nettime functions best, for all my skepticism about this idea, as a 'gift economy,' that was the basis on which desk.nl supported it; when their technical problems became too severe i moved it to my own material-net; but that wasn't an adequate long-term solution for a lot of reasons (a cranky server sitting behind a 56k isdn line that was dedicated only because the ISP didn't care), so we asked wolfgang staehle if he'd give the list a home at The Thing for free and he said yes. in that regard the list's existence is parasitic, much as nettime's meetings have piggybacked on other conferences--the only exception being Beauty and the East in ljubljana, which was supported by ljudmila (for those who don't know: LJubljana Digital Media Lab--vuk cosic, luka frelih, marko peljhan, iren-a wölle, mitja doma, and more).

to institutionalize nettime in a legal or economic format would be fatal. the efforts to produce print publications have been increasingly traumatic; and the efforts to push 'top-down' campaigns under the name 'nettime' were a mess. the fact that certain lists--nettime, rhizome, 7-11, american express, syndicate, recode, xchange, rolipost, inter-nodium, the list could go on--had and/or have certain commonalities doesn't mean that a consortium is desirable or even possible. the strength of these entities, individually and collectively, stems from the fact that they're NETWORKS: part participants, part technical system, and part something else about which very little is understood, imo, and even this on a heuristic basis. in a way, the network is a new species, and many if not all of the problems net-time has seen--abortive efforts to hijack it, the complexities of organizing it in order to move to a 'higher' level, para/neo/quasi/post-paranoiac fantasies about control and cabals--are byproducts of the inability to grasp what networks are and how they function.

but to get back to your initial questions, they *do* function through distribution--which (thus far) seems like an unbeatable archival technique. thus far: we'll see how it pans out in the long term.

nettime's 'policy' about archiving? DIY. we maintain this list in the here and now *for free*; if you'd like to preserve it for another time and place, then Be My Guest. my advice: trust the network. don't try to transform it into something it isn't.

cheers,
t

Thanks to Ted Byfield for the explanation about the server and archive history of nettime. On a grander scale there is a service that may just be around when the sentient robots of Hans Moravec's dreams (and perhaps Ray Kurzweil's) begin looking for the recorded antics and babbling of the humans who once ran the Internet--and were allowed to use it.

www.archive.org is in San Francisco, and as of March 2000, they had archived a billion web pages, about 14 terabytes. I'm sure that nettime is in the archive.

about rhizome...

Rhizome Digest is archived and available at <http://rhizome.org/archive>. Years 2000 and 1999 of the Digest are currently online. Older years will be uploaded soon.

The other two email lists, Rhizome Raw and Leonardo [AT] Rhizome.org, are currently not archived. However, a filtered selection of Rhizome Raw *is* archived in the online contentbase. These emails create the content for both Rhizome Digest and the Fresh page (<http://rhizome.org/fresh>). Today, approximately 1 in 10 emails are saved and archived in the contentbase. Earlier in our history, when the volume on Raw was lower, the ratio was more like 1 in 3. Emails selected for the contentbase are formatted into plain text, then indexed by keyword, name, place, time, category, type and date.

The Rhizome contentbase is backed-up periodically using normal protocols, plus a semi-complete archive lives on my home computer and probably in a few other places (eat your heart out, 0100101110101101.ORG!). Rhizome is dedicated to long term preservation, so this material is not likely to disappear any time soon.

Rhizome has produced no print publications to date.

ideas and suggests? post to list[AT]rhizome.org.

best,

-ag

<snip>

I keeping the archive of rhRaw (mixed with rhDigest however) on my
 mailserv, this archive goes back till sept '96, contains cca 12.5k
 messages, or 63MB of raw ascii bits, in my opinion "it's complete".

There is also "complete" Nettime-l which goes back to '96. Furthermore
 there are some "smaller" archives (regarding the volume and number of
 messages) like documentaX, ars (several years of discussion at AE),
 blast, 7-11, amex, hfh... even some projects and initiatives which were'nt
 "real mailing_lists" such refresh (net art project back in 96), etc...

>From the very same source (different folder only) Syndicate mailing list
 archive was restored in last year (complete - from very first message).
 The Syndicate archive is available now at <http://www.v2.nl/mail/v2cast/>,
 for your reading pleasure and utermost enlightenment.

I agree with Ted on this point this is mainly DIY sport, and gift economy
 artefact indeed. I dont see any particular "long time" strategies there.

OK maybe one, let say once when I'll be retired I'll have plenty of time
 to print out few "ascii on paper" pages out of some antique printer each
 morning (rather noon) while I waking up and have first caffe with some
 "blasts from the pasts"... idilic ha?
 Well lets take "worst case" scenario of .com future, assuming that
 complete legacy of the digital domain will be commercialized pretty soon,
 sometime after use of paper for purpose of printmaking will be forbidden
 for most of us, government and corporate sector will have then special
 permissions to print documents on paper. Rest of us will relay on
 (envriment friendly) e-books(TM) and digitalPaper(TM) cellularZines(TM)
 and other widgets for "individual nonimmersive" use, this highly .com
 services will be available to anyone and everywhere, charged per bits but
 that's however not issue here. Printing on paper will be crimal act
 against the planet...well maybe not so idilic but still good for business.

+0100 (MET)

Address to Interface 3:
Utopian Promises-Net Realities
Critical Art Ensemble

The need for net criticism certainly is a matter of overwhelming urgency. While a number of critics have approached the new world of computerized communications with a healthy amount of skepticism, their message has been lost in the noise and spectacle of corporate hype-the unstoppable tidal wave of seduction has enveloped so many in its dynamic utopian beauty that little time for careful reflection is left. Indeed, a glimpse of a possibility for a better future may be contained in the new techno-apparatus, and perhaps it is best to acknowledge these possibilities here in the beginning, since Critical Art Ensemble (CAE) has no desire to take the position of the neoluddites who believe that the techno-apparatus should be rejected outright, if not destroyed. To be sure, computerized communications offer the possibility for the enhanced storage, retrieval, and exchange of information for those who have access to the necessary hardware, software, and technical skills. In turn, this increases the possibility for greater access to vital information, faster exchange of information, enhanced distribution of information, and cross cultural artistic and critical collaborations. The potential humanitarian benefits of electronic systems are undeniable; however, CAE questions whether the electronic apparatus is being used for these purposes in the representative case, much as we question the political policies which guide the net's development and accessibility.

This is not the first time that the promise of electronic utopia has been offered. One need only look back at Brecht's critique of radio to find reason for concern when such promises are resurrected. While Brecht recognized radio's potential for distributing information for humanitarian and cultural purposes, he was not surprised to see radio being used for the very opposite. Nor should we be surprised that his calls for a more democratic interactive medium went unheeded.

During the early 1970s, there was a brief euphoric moment during the video revolution when some believed that Brecht's call for an interactive and democratic electronic medium was about to be answered. The development of home video equipment led to a belief that soon everyone who desired to would be able to manufacture their own television. This seemed to be a real possibility. As the cost of video equipment began to drop dramatically, and cable set-ups offered possibilities for distribution, electronic utopia seemed immanent, and yet, the home video studio never came to be. Walls and boundaries confounding this utopian dream seemed to appear out of nowhere. For instance, in the US, standards for broadcast quality required postproduction equipment that no one could access or afford except capital-saturated media companies. Most cable channels remained in the control of corporate media, and the few public access channels fell into the hands of censors who cited "community standards" as their reason for an orderly broadcast system. While production equipment did get distributed as promised, the hopes of the video utopians were crushed at the distribution level. Corporate goals for establishing a new market for electronic hardware were met, but the means for democratic cultural production never appeared.

Now that giddy euphoria is back again, arising in the wake of the personal computer revolution of the early 80s, and with the completion of a "world-wide" multi-directional distribution network. As to be expected, utopian promises from the corporate spectacle machine drown the everyday lives of bureaucrats and technocrats around the first world, and once again there seems to be a general belief-at least within technically adept populations-that this time the situation will be different. And to a degree, this situation is different. There is an electronic

free zone, but from CAE's perspective, it is only a modest development at best. By far the most significant use of the electronic apparatus is to keep order, to replicate dominant pancapitalist ideology, and to develop new markets.

At the risk of redundantly stating the obvious, CAE would like to recall the origins of the internet. The internet is war-tech that was designed as an analog to the US highway system (Yet another product which stemmed from the mind of the military, and which was primarily intended as a decentralized aid to mobilization). The US military wanted an apparatus that would preserve command structure in the case of nuclear attack. The answer was an electronic web capable of immediately rerouting itself if one or more links were destroyed, thus allowing surviving authorities to remain in communication with each other and to act accordingly. With such an apparatus in place, military authority could be maintained, even through the worst of catastrophes. With such planning at the root of the internet, suspicion about its alleged anti-authoritarian characteristics must occur to anyone who takes the time to reflect on the apparatus. It should also be noted that the decentralized characteristics for which so many praise the net did not arise out of anarchist intention, but out of nomadic military strategy.

Research scientists were the next group to go on-line after the military. While it would be nice to believe that their efforts on the net were benign, one must question why they were given access to the apparatus in the first place. Science has always claimed legitimacy by announcing its "value-free" intentions to search for the truth of the material world; however, this search costs money, and hence a political economy with a direct and powerful impact on science's lofty goals of value-free research enters the equation. Do investors in scientific research offer money with no restrictions attached? This seems quite unlikely. Some type of return on the investment is implicit in any demand from funding institutions. In the US, the typical demand is either theory or technology with military applications or applications that will strengthen economic development. The greater the results promised by science in terms of these two categories, the more generous the funding. In the US, not even scientists get something for nothing.

The need for greater efficiency in research and development opened the new communication systems to academics, and with that development, a necessary degree of disorder was introduced into the apparatus. Elements of free zone information exchange began to appear. But as this system developed, other investors, most notably the corporations, demanded their slice of the electronic pie. All kinds of financial business were conducted on the net with relatively secure efficiency. As the free zone began to grow, the corporations realized that a new market mechanism was growing with it, and eventually the marketers were released onto the net. At this point, a peculiar paradox came into being: Free market capitalism came into conflict with the conservative desire for order. It became apparent that for this new market possibility to reach its full potential, authorities would have to tolerate a degree of chaos. This was necessary to seduce the wealthier classes into using the net as site of consumption and entertainment, and second, to offer the net as an alibi for the illusion of social freedom. Although totalizing control of communications was lost, the overall cost of this development to governments and corporations was minimal, and in actuality, the cost was nothing compared to what was gained. This was born the most successful repressive apparatus of all time; and yet it was (and still is) successfully represented under the sign of liberation. What is even more frightening is that the corporation's best allies in maintaining the gleaming utopian surface of cyberspace are some of the very populations who should know better. Techno-utopians have accepted the corporate hype, and are now disseminating it as the reality of the net. This regrettable alliance between the elite virtual class and new age cybernauts is structured around five key virtual promises. These are the promised social changes that seem as if they will occur at any moment, but never actually come into being.

Promise One: The New Body

Those of us familiar with discourse on cyberspace and virtual reality have heard this promise over and over again, and in fact there is a kernel of truth associated with it. The virtual body is a body of great potential. On this body we can reinscribe ourselves using whatever coding system we desire. We can try on new body configurations. We can experiment with immortality by going places and doing things that would be impossible in the physical world. For the virtual body, nothing is fixed and everything is possible. Indeed, this is the reason why hackers wish to become disembodied consciousnesses flowing freely through cyberspace, willing the idea of their own bodies and environments. As virtual reality improves with new generations of computer technology, perhaps this promise will come to pass in the realm of the multi-sensual; however, it is currently limited to gender reassignment on chatlines, or game boy flight simulators.

What did this allegedly liberated body cost? Payment was taken in the form of a loss of individual sovereignty, not just from those who use the net, but from all people in technologically saturated societies. With the virtual body came its fascist sibling, the data body-a much more highly developed virtual form, and one that exists in complete service to the corporate and police state. The data body is the total collection of files connected to an individual. The data body has always existed in an immature form since the dawn of civilization. Authority has always kept records on its underlings. Indeed, some of the earliest records

that Egyptologists have found are tax records. What brought the data body to maturity is the technological apparatus. With its immense storage capacity and its mechanisms for quickly ordering and retrieving information, no detail of social life is too insignificant to record and to scrutinize. From the moment we are born and our birth certificate goes on-line, until the day we die and our death certificate goes on-line, the trajectory of our individual lives is recorded in scrupulous detail. Education files, insurance files, tax files, communication files, consumption files, medical files, travel files, criminal files, investment files, files into infinity....

The data body has two primary functions. The first purpose serves the repressive apparatus; the second serves the marketing apparatus. The desire of authoritarian power to make the lives of its subordinates perfectly transparent achieves satisfaction through the data body. Everyone is under permanent surveillance by virtue of their necessary interaction with the marketplace. Just how detailed data body information actually may be is a matter of speculation, but we can be certain that it is more detailed than we would like it to be, or care to think.

The second function of the data body is to give marketers more accurate demographic information to design and create target populations. Since pancapitalism has long left the problem of production behind, moving from an economy of need to an economy of desire, marketers have developed better methods to artificially create desires for products that are not needed. The data body gives them insights into consumption patterns, spending power, and "lifestyle choices" of those with surplus income. The data body helps marketers to find you, and provide for your lifestyle. The postmodern slogan, "You don't pick the commodity; the commodity picks you" has more meaning than ever.

But the most frightening thing about the data body is that it is the center of an individual's social being. It tells the members of officialdom what our cultural identities and roles are. We are powerless to contradict the data body. Its word is the law. One's organic being is no longer a determining factor, from the point of view of corporate and government bureaucracies. Data has become the center of social culture, and our organic flesh is nothing more than a counterfeited representation of original data.

Promise 2: Convenience

Earlier this century, the great sociologist Max Weber explained why bureaucracies work so well as a means of rationalized social organization in complex society. In comparing bureaucratic practice to his ideal-type, only one flaw appears: Humans provide the labor for these institutions. Unfortunately humans have nonrational characteristics, the most notorious of which is the expression of desire. Rather than working at optimum efficiency, organic units are likely to seek out that which gives them pleasure in ways that are contrary to the instrumental aims of the bureaucracy. All varieties of creative slacking are employed by organic units. These range from work slowdowns to unnecessary chit-chat with one's fellow employees. Throughout this century policy makers and managerial classes have concerned themselves with developing a way to stop such activities in order to maximize and intensify labor output.

The model for labor intensification came with the invention of the robot. So long as the robot is functional, it never strays from its task. Completely replacing humans with robots is not possible, since so far, they are only capable of simple, albeit precise, mechanical tasks. They are data driven, as opposed to the human capacity for concept recognition. The question then becomes how to make humans more like robots, or to update the discourse, more like cyborgs. At present, much of the technology necessary to accomplish this goal is available, and more is in development. However, having the technology, such as telephone headsets or wearable computers, is not enough. People must be seduced into wanting to wear them, at least until the technology evolves that can be permanently fixed to their bodies.

The means of seduction? Convenience. Life will be so much easier if we only connect to the machine. As usual there is a grain of truth to this idea. I can honestly admit that my life has been made easier since I began using a computer, but only in a certain sense. As a writer, it is easier for me to finish a paper now than it was when I used pen and paper or a typewriter. The problem: Now I am able to (and therefore, must) write two papers in the time it used to take to produce one. The implied promise that I will have more free time because I use a computer is false.

Labor intensification through time management is only the beginning, as there is another problem in regard to total utility. People can still separate themselves from their work stations to the true home of the modern day cyborg. The seduction continues, persuading us that we should desire to carry our electronic extensions with us all the time. The latest commercials from AT&T are the perfect representation of consumer seduction. They promise: Have you ever sent a fax....from the beach? You will." or "Have you ever received a phone call....on your wrist? You will." This commercial is most amusing. There is an image of a young man who has just finished climbing a mountain and is watching a sunset. At that moment his wife calls on his wrist phone, and he describes the magnificence of the sunset to her. Now who is kidding who. Is your wife going to call you while you are mountain climbing? Are you going to need to send

a fax while lounging on the beach? The corporate intention for deploying this technology (in addition to profit) is so transparent, it's painful. The only possible rejoinder is: "Have you ever been at a work station....24 hours a day, 365 days a year? You will." Now the sweat shop can go any where you do!

Another telling element in this representation is that the men in these commercials are always alone. (This is a gendered element which CAE is sure has not failed to catch the attention of feminists, although CAE is unsure as to whether it will be interpreted as sexism or a stroke of luck). In this sense, the problem is doubled: Not only is the work station always with you, but social interaction will always be fully mediated by technology. This is the perfect solution to abolish that nuisance, the subversive environment of public space.

Promise 3: Community

Currently in the US, there is no more popular buzz word than "community." This word is so empty of meaning that it can be used to describe almost any social manifestation. For the most part, it is used to connote sympathy with or identification with a particular social aggregate. In this sense, one hears of the gay community or the African-American community. There are even osymorons, such as the international community. Corporate marketers from IBM to Microsoft have been quick to capitalize on this empty sign as a means to build their commercial campaigns. Recognizing the extreme alienation that afflicts so many under the reign of pancapitalism, they offer net technology as a cure for a feeling of loss that has no referent. Through chat lines, news groups, and other digital environments, nostalgia for a golden age of sociability that never existed is replaced by a new modern day sense of community.

This promise is nothing but aggravating. There is not even a grain of truth in it. If there is any reason for optimism, it is only to the extent mentioned in the beginning of this lecture: that is, the net makes possible a broader spectrum of information exchange. However, anyone with even a basic knowledge of sociology understands that information exchange in no way constitutes a community. Community is a collective of kinship networks which share a common geographic territory, a common history, and a shared value system, one usually rooted in a common religion. Typically, communities are rather homogenous, and tend to exist in the historical context of a simple division of labor. Most importantly, communities embrace nonrational components of life and of consciousness. Social action is not carried out by means of contract, but by understandings, and life is certainly not fully mediated by technology. In this sense, the connection between community and net life is unfathomable. (CAE does not want to romanticize this social form, since communities can be as repressive and/or as pathological as any society).

Use of the net beyond its one necessary use (i.e., information gathering), is, from CAE's perspective, a highly developed anti-social form of interacting. That someone would want to stay in his or her home or office and reject human contact in favor of a textually mediated communication experience can only be a symptom of rising alienation, not a cure for it. Why the repressive apparatus would want this isolation to develop is very clear: If someone is on-line, he or she is off the street and out of the gene pool. In other words, they are well within the limits of control. Why the marketing apparatus would desire such a situation is equally clear: The lonelier people get, the more they will have no choice but to turn to work and to consumption as a means of seeking pleasure.

In a time when public space is diminishing and being replaced by fortified institutions such as malls, theme parks, and other manifestations of forced consumption that pass themselves off as locations for social interaction, shouldn't we be looking for a sense of the social, (that is, to the extent still possible), direct and unmediated, rather than seeing these anti-public spaces replicated in an even more lonely electronic form?

Promise 4: Democracy

Another promise eternally repeated in discourse on cyberspace is the idea that the electronic apparatus will be the zenith of utopian democracy. Certainly, the internet does have some democratic characteristics. It provides all its cyber-citizens with the means to contact all other cyber-citizens. On the net, everyone is equal. The shining emblem of this new democracy is the World Wide Web. People can construct their own home pages, and even more people can access these sites as points of investigation. This is all well and good, but we must ask ourselves if these democratic characteristics actually constitute democracy. A platform for individual voices is not enough (especially in the Web where so many voices are lost in the clutter of data debris). Democracy is dependent on the individual's ability to act on the information received. Unfortunately, even with the net, autonomous action is still as difficult as ever.

The difficulty here is threefold: First, there is the problem of locality and geographic separation. In the case of information gathering, the information is only as useful as the situation and the location of the physical body allows. For example, a gay man who lives in a place where homophobia reigns, or even worse, where homosexual practice is an illegal activity, will still be unable to openly act on his desires, regardless of the information he may gather on the net. He is still just as closeted in his everyday life practice, and is reduced to passive spectatorship in regard to the object of his desire, so long as he remains in a

repressive locality.

The second problem is one of institutional oppression. For example, no one can deny that the net can function as a wonderful pedagogical tool and can act as a great means for self education. Unfortunately, the net has very little legitimacy in and of itself as an educational institution. The net must be used in a physical world context under appropriate supervision for it to be awarded legitimacy. In the case of education, in order for the knowledge-value gained from the net to be socially recognized and accepted, it must be used as a tool within the context of a university or a school. These educational contexts are fortified in a manner to maintain a status-quo distribution of education. Consequently, one can acquire a great deal of knowledge from the net, but still have no education capital to be exchanged in the marketplace. In both of these cases, there must be a liberated physical environment if the net is to function as a supplement to democratic activity.

The final problem is that the net functions as a disciplinary apparatus through the use of transparency. If people feel that they are under surveillance, they are less likely to act in manner that is beyond normalized activity; that is, they are less likely to express themselves freely, and to otherwise act in manner that could produce political and social changes within their environments. In this sense, the net serves the purpose of negating activity rather than encouraging it. It channels people toward orderly homogeneous activity, rather than reinforcing the acceptance of difference that democratic societies need.

To be sure, there are times when transparency can be turned against itself. For example, one of the reasons that the PRI party's counteroffensive against the Zapatistas did not end in total slaughter, was the resisting party's use of the net to keep attention focused upon its members and its cause. By disallowing the secret of massacre, many lives were saved, and the resistant movement could continue. Much the same can be said about the stay of execution won for Mumia Abu Jamal. The final point here is that it must be remembered that the internet does not exist in a vacuum. It is intimately related to all kinds of social structures and historical dynamics, and hence its democratic structure cannot be realistically analyzed as if it were a closed system.

Taking a step back from the insider's point of view, achieving democracy through the net seems even less likely considering the demographics of the situation. There are five and a half billion people in the world. Over a billion barely keep themselves alive from day to day. Most people don't even have a telephone, and hence it seems very unlikely that they will get a computer, let alone go on-line. This situation raises the question, is the net a means to democracy, or simply another way to divide the world into haves and have-nots? We also must ask ourselves, how many people consider the net really relevant in their everyday lives? While CAE believes that it is safe to assume that the number of net users will grow, it seems unlikely that it will grow to include more than those who have the necessary educational background, and/or those who are employed by bureaucratic and technocratic agencies.

CAE suggests that this elite stronghold will remain so, and that most of the first world population that will become a part of the computer revolution will do so primarily as passive consumers, rather than as active participants. They will be playing computer games, watching interactive TV, and shopping in virtual malls. The stratified distribution of education will act as the guardian of the virtual border between the passive and the active user, and prevent those populations participating in multidirectional interactivity from increasing in any significant numbers.

Promise 5: New Consciousness

Of all the net hype, this promise is perhaps the most insidious, since it seems to have no corporate sponsor (although Microsoft has tapped the trend to some extent). The notion of the new consciousness has emerged out of new age thinking. There is a belief promoted by cyber-gurus (Timothy Leary, Jason Lanier, Roy Ascott, Richard Kriesche, Mark Pesci) that the net is the apparatus of a benign collective consciousness. It is the brain of the planet which transcends into mind through the activities of its users. It can function as a third eye or sixth sense for those who commune with this global coming together. This way of thinking is the paramount form of ethnocentrism and myopic class perception. As discussed in the last section, the third world and most of the first world citizenry are thoroughly marginalized in this divine plan. If anything, this theory replicates the imperialism of early capitalism, and recalls notions such as manifest destiny. If new consciousness is indicative of anything, it is the new age of imperialism that will be realized through information control (as opposed to the early capital model of military domination).

Of the former four promises examined here, each has proven on closer inspection to be a replication of authoritarian ideology to justify and put into action greater repression and oppression. New consciousness is no exception. Even if we accept the good intentions and optimistic hopes of the new age cybernauts, how could anyone conclude that an apparatus emerging out military aggression and corporate predation could possibly function as a new form of terrestrial spiritual development?

Conclusion

As saddened as CAE is to say it, the greater part of the net is capitalism as usual. It is a site for repressive order, for the financial business of capital, and for excessive consumption. While a small part of the net may be used for humanistic purposes and to resist authoritarian structure, its overall function is anything but humanistic. In the same way that we would not consider an unregulated bohemian neighborhood to be representative of a city, we must also not assume that our own small free zone domains are representative of the digital empire. Nor can we trust our futures to the empty promises of a seducer that has no love in its heart.

Pit,

Really? What do you propose we do with your criticisms and indictments? Even if we find the Net to be brimming with toxins to the future commonweal, by what means shall we prevent them?

"Direct action" to control the Net toward the improvement of Humankind is no less perilous in the service of your good intentions than it would be in the service of Senator Exon's. And stopping it is not an option. It is as inevitable as evolution, running, as it does, on the same engine.

A decentralized medium offers but few choices - and they are very personal ones: jack in, jack out, or jack off.

In the end, as Gandhi proposed, "You must be the change you wish to see in the world." There's little else you can do.

The Californian Ideology

Richard Barbrook and Andy Cameron

'Not to lie about the future is impossible and one can lie about it at will' - Naum Gabo 1

As the Dam Bursts...

At the end of the twentieth century, the long predicted convergence of the media, computing and telecommunications into hypermedia is finally happening. 2 Once again, capitalism's relentless drive to diversify and intensify the creative powers of human labour is on the verge of qualitatively transforming the way in which we work, play and live together. By integrating different technologies around common protocols, something is being created which is more than the sum of its parts. When the ability to produce and receive unlimited amounts of information in any form is combined with the reach of the global telephone networks, existing forms of work and leisure can be fundamentally transformed. New industries will be born and current stock market favourites will swept away. At such moments of profound social change, anyone who can offer a simple explanation of what is happening will be listened to with great interest. At this crucial juncture, a loose alliance of writers, hackers, capitalists and artists from the West Coast of the USA have succeeded in defining a heterogeneous orthodoxy for the coming information age: the Californian Ideology.

This new faith has emerged from a bizarre fusion of the cultural bohemianism of San Francisco with the hi-tech industries of Silicon Valley. Promoted in magazines, books, tv programmes, Web sites, newsgroups and Net conferences, the Californian Ideology promiscuously combines the free-wheeling spirit of the hippies and the entrepreneurial zeal of the yuppies. This amalgamation of opposites has been achieved through a profound faith in the emancipatory potential of the new information technologies. In the digital utopia, everybody will be both hip and rich. Not surprisingly, this optimistic vision of the future has been enthusiastically embraced by computer nerds, slacker students, innovative capitalists, social activists, trendy academics, futurist bureaucrats and opportunistic politicians across the USA. As usual, Europeans have not been slow in copying the latest fad from America. While a recent EU Commission report recommends following the Californian 'free market' model for building the 'information superhighway', cutting-edge artists and academics eagerly imitate the 'post-human' philosophers of the West Coast's Extropian cult. 3 With no obvious rivals, the triumph of the Californian Ideology appears to be complete.

The widespread appeal of these West Coast ideologues isn't simply the result of their infectious optimism. Above all, they are passionate advocates of what appears to be an impeccably libertarian form of politics - they want information technologies to be used to create a new 'Jeffersonian democracy' where all individuals will be able to express themselves freely within cyberspace. 4 However, by championing this seemingly admirable ideal, these techno-boosters are at the same time reproducing some of the most atavistic features of American society, especially those derived from the bitter legacy of slavery. Their utopian vision of California depends upon a wilful blindness towards the other - much less positive - features of life on the West Coast: racism, poverty and environmental degradation. 5 Ironically, in the not too distant past, the intellectuals and artists of the Bay Area were passionately concerned about these issues.

Ronald Reagan v. the hippies

On 15 May 1969, Governor Ronald Reagan ordered armed police to carry out a dawn raid against hippie protesters who had occupied People's Park near the Berkeley campus of the University of California. During the subsequent battle, one man was shot dead and 128 other people needed hospital treatment. 6 On that day, the 'straight' world and the counter-culture appeared to be implacably opposed. On one side of the barricades, Governor Reagan and his followers advocated unfettered private enterprise and supported the invasion of Vietnam. On the other

side, the hippies championed a social revolution at home and opposed imperial expansion abroad. In the year of the raid on People's Park, it seemed that the historical choice between these two opposing visions of America's future could only be settled through violent conflict. As Jerry Rubin, one of the Yippie leaders, said at the time: 'Our search for adventure and heroism takes us outside America, to a life of self-creation and rebellion. In response, America is ready to destroy us...' 7

During the '60s, radicals from the Bay Area pioneered the political outlook and cultural style of New Left movements across the world. Breaking with the narrow politics of the post-war era, they launched campaigns against militarism, racism, sexual discrimination, homophobia, mindless consumerism and pollution. In place of the traditional left's rigid hierarchies, they created collective and democratic structures which supposedly prefigured the libertarian society of the future. Above all, the Californian New Left combined political struggle with cultural rebellion. Unlike their parents, the hippies refused to conform to the rigid social conventions imposed on organisation men by the military, the universities, the corporations and even left-wing political parties. Instead they openly declared their rejection of the straight world through their casual dress, sexual promiscuity, loud music and recreational drugs. 8 The radical hippies were liberals in the social sense of the word. They championed universalist, rational and progressive ideals, such as democracy, tolerance, self-fulfilment and social justice. Emboldened by over twenty years of economic growth, they believed that history was on their side. In sci-fi novels, they dreamt of 'ecotopia': a future California where cars had disappeared, industrial production was ecologically viable, sexual relationships were egalitarian and daily life was lived in community groups. 9 For some hippies, this vision could only be realised by rejecting scientific progress as a false God and returning to nature. Others, in contrast, believed that technological progress would inevitably turn their libertarian principles into social fact. Crucially, influenced by the theories of Marshall McLuhan, these technophiles thought that the convergence of media, computing and telecommunications would inevitably create the electronic agora - a virtual place where everyone would be able to express their opinions without fear of censorship. Despite being a middle-aged English professor, McLuhan preached the radical message that the power of big business and big government would be imminently overthrown by the intrinsically empowering effects of new technology on individuals.

'Electronic media...abolish the spatial dimension... By electricity, we everywhere resume person-to-person relations as if on the smallest village scale. It is a relation in depth, and without delegation of functions or powers... Dialogue supersedes the lecture.' 10

Encouraged by McLuhan's predictions, West Coast radicals became involved in developing new information technologies for the alternative press, community radio stations, home-brew computer clubs and video collectives. These community media activists believed that they were in the forefront of the fight to build a new America. The creation of the electronic agora was the first step towards the implementation of direct democracy within all social institutions. 11 The struggle might be hard, but 'ecotopia' was almost at hand.

The Rise of the 'Virtual Class'

Who would have predicted that, in less than 30 years after the battle for People's Park, squares and hippies would together create the Californian Ideology? Who would have thought that such a contradictory mix of technological determinism and libertarian individualism would become the hybrid orthodoxy of the information age? And who would have suspected that as technology and freedom were worshipped more and more, it would become less and less possible to say anything sensible about the society in which they were applied?

The Californian Ideology derives its popularity from the very ambiguity of its precepts. Over the last few decades, the pioneering work of the community media activists has been largely recuperated by the hi-tech and media industries. Although companies in these sectors can mechanise and sub-contract much of their labour needs, they remain dependent on key people who can research and create original products, from software programs and computer chips to books and tv programmes. Along with some hi-tech entrepreneurs, these skilled workers form the so-called 'virtual class': '...the techno-intelligentsia of cognitive scientists, engineers, computer scientists, video-game developers, and all the other communications specialists...' Unable to subject them to the discipline of the assembly-line or replace them by machines, managers have organised such intellectual workers through fixed-term contracts. Like the 'labour aristocracy' of the last century, core personnel in the media, computing and telecoms industries experience the rewards and insecurities of the marketplace. On the one hand, these hi-tech artisans not only tend to be well-paid, but also have considerable autonomy over

their pace of work and place of employment. As a result, the cultural divide between the hippie and the organisation man has now become rather fuzzy. Yet, on the other hand, these workers are tied by the terms of their contracts and have no guarantee of continued employment. Lacking the free time of the hippies, work itself has become the main route to self-fulfilment for much of the 'virtual class'.¹³

The Californian Ideology offers a way of understanding the lived reality of these hi-tech artisans. On the one hand, these core workers are a privileged part of the labour force. On the other hand, they are the heirs of the radical ideas of the community media activists. The Californian Ideology, therefore, simultaneously reflects the disciplines of market economics and the freedoms of hippie artisanship. This bizarre hybrid is only made possible through a nearly universal belief in technological determinism. Ever since the '60s, liberals - in the social sense of the word - have hoped that the new information technologies would realise their ideals. Responding to the challenge of the New Left, the New Right has resurrected an older form of liberalism: economic liberalism. In place of the collective freedom sought by the hippie radicals, they have championed the liberty of individuals within the marketplace. Yet even these conservatives couldn't resist the romance of the new information technologies. Back in the '60s, McLuhan's predictions were reinterpreted as an advertisement for new forms of media, computers and telecommunications being developed by the private sector. From the '70s onwards, Toffler, de Sola Pool and other gurus attempted to prove that the advent of hypermedia would paradoxically involve a return to the economic liberalism of the past.¹⁴ This retro-utopia echoed the predictions of Asimov, Heinlein and other macho sci-fi novelists whose future worlds were always filled with space traders, superslick salesmen, genius scientists, pirate captains and other rugged individualists.¹⁵ The path of technological progress didn't always lead to 'ecotopia' - it could instead lead back to the America of the Founding Fathers.

Electronic Agora or Electronic Marketplace?

The ambiguity of the Californian Ideology is most pronounced in its contradictory visions of the digital future. The development of hypermedia is a key component of the next stage of capitalism. As Zuboff points out, the introduction of media, computing and telecommunications technologies directly into the factory and the office is the culmination of a long process of separation of the workforce from direct involvement in production.¹⁶ If only for competitive reasons, all major industrial economies will eventually be forced to wire up their populations to obtain the productivity gains of digital working. What is unknown is the social and cultural impact of allowing people to produce and exchange almost unlimited quantities of information on a global scale. Above all, will the advent of hypermedia will realise the utopias of either the New Left or the New Right? As a hybrid faith, the Californian Ideology happily answers this conundrum by believing in both visions at the same time - and by not criticising either of them.

On the one hand, the anti-corporate purity of the New Left has been preserved by the advocates of the 'virtual community'. According to their guru, Howard Rheingold, the values of the counterCulture baby boomers are shaping the development of new information technologies. As a consequence, community activists will be able to use hypermedia to replace corporate capitalism and big government with a hi-tech 'gift economy'. Already bulletin board systems, Net real-time conferences and chat facilities rely on the voluntary exchange of information and knowledge between their participants. In Rheingold's view, the members of the 'virtual class' are still in the forefront of the struggle for social liberation. Despite the frenzied commercial and political involvement in building the 'information superhighway', the electronic agora will inevitably triumph over its corporate and bureaucratic enemies.¹⁷

On the other hand, other West Coast ideologues have embraced the laissez faire ideology of their erstwhile conservative enemy. For example, Wired - the monthly bible of the 'virtual class' - has uncritically reproduced the views of Newt Gingrich, the extreme-right Republican leader of the House of Representatives, and the Tofflers, who are his close advisors.¹⁸ Ignoring their policies for welfare cutbacks, the magazine is instead mesmerised by their enthusiasm for the libertarian possibilities offered by new information technologies. However, although they borrow McLuhan's technological determinism, Gingrich and the Tofflers aren't advocates of the electronic agora. On the contrary, they claim that the convergence of the media, computing and telecommunications will produce an electronic marketplace: 'In cyberspace..., market after market is being transformed by technological progress from a "natural monopoly" to one in which competition is the rule.'¹⁹

In this version of the Californian Ideology, each member of the 'virtual class' is promised the opportunity to become a successful hi-tech entrepreneur. Information technologies, so the argument goes, empower

the individual, enhance personal freedom, and radically reduce the power of the nation-state. Existing social, political and legal power structures will wither away to be replaced by unfettered interactions between autonomous individuals and their software. These restyled McLuhanites vigorously argue that big government should stay off the backs of resourceful entrepreneurs who are the only people cool and courageous enough to take risks. In place of counter-productive regulations, visionary engineers are inventing the tools needed to create a 'free market' within cyberspace, such as encryption, digital money and verification procedures. Indeed, attempts to interfere with the emergent properties of these technological and economic forces, particularly by the government, merely rebound on those who are foolish enough to defy the primary laws of nature. According to the executive editor of Wired, the 'invisible hand' of the marketplace and the blind forces of Darwinian evolution are actually one and the same thing.²⁰ As in Heinlein's and Asimov's sci-fi novels, the path forwards to the future seems to lead back to the past. The twenty-first century information age will be the realisation of the eighteenth century liberal ideals of Thomas Jefferson: '...the...creation of a new civilisation, founded in the eternal truths of the American Idea.'²¹

The Myth of the 'Free Market'

Following the victory of Gingrich's party in the 1994 legislative elections, this right-wing version of the Californian Ideology is now in the ascendant. Yet, the sacred tenets of economic liberalism are contradicted by the actual history of hypermedia. For instance, the iconic technologies of the computer and the Net could only have been invented with the aid of massive state subsidies and the enthusiastic involvement of amateurs. Private enterprise has played an important role, but only as one part of a mixed economy.

For example, the first computer - the Difference Engine - was designed and built by private companies, but its development was only made possible through a British Government grant of 17,470, which was a small fortune in 1834.²² From Colossus to EDVAC, from flight simulators to virtual reality, the development of computing has depended at key moments on public research handouts or fat contracts with public agencies. The IBM corporation only built the first programmable digital computer after it was requested to do so by the US Defense Department during the Korean War.²³ Ever since, the development of successive generations of computers has been directly or indirectly subsidised by the American defence budget. As well as state aid, the evolution of computing has also depended upon the involvement of d.i.y. culture. For instance, the personal computer was invented by amateur techies who wanted to construct their own cheap machines. The existence of a 'gift economy' amongst hobbyists was a necessary precondition for the subsequent success of products made by Apple and Microsoft. Even now, shareware programs still play a vital role in advancing software design.

The history of the Internet also contradicts the tenets of the 'free market' ideologues. For the first twenty years of its existence, the Net's development was almost completely dependent on the much reviled American federal government. Whether via the US military or through the universities, large amounts of tax payers' dollars went into building the Net infrastructure and subsidising the cost of using its services. At the same time, many of the key Net programs and applications were invented either by hobbyists or by professionals working in their spare-time. For instance, the MUD program which allows real-time Net conferencing was invented by a group of students who wanted to play fantasy games over a computer network.²⁴

One of the weirdest things about the rightwards drift of the Californian Ideology is that the West Coast itself is a creation of the mixed economy. Government dollars were used to build the irrigation systems, highways, schools, universities and other infrastructural projects which makes the good life possible in California. On top of these public subsidies, the West Coast hi-tech industrial complex has been feasting off the fattest pork barrel in history for decades. The US government has poured billions of tax dollars into buying planes, missiles, electronics and nuclear bombs from Californian companies. For those not blinded by 'free market' dogmas, it was obvious that the Americans have

Hi everybody!

As I am a new face here, let me introduce opennet.org and myself.

I am a professor at the Department of Mathematics of Belgrade University, teaching probability theory. I do not need to mention that I am desperately addicted to that that vital-virtual thing, Net.

opennet.org is a first domain from Belgrade fully and permanently connected to the Inet. Adrienne von Heteren from Amsterdam (now living in Belgrade) and me have literally created Inet cite. The dream about being connected started about year ago, and after a series of incredible difficulties and obstacles finally we have solved our ontological problem. Solving all kinds of problems one can face making impossible dreams come true, we were often forced to think over the essence of the being connected.

opennet.org is tied to Belgrade independent radio station B92 and connected to incredible supportive xs4all in Amsterdam. In fact we are at the beginning now, but I hope that the progress will be very fast, as there are lot of open minded young people here who need to interact to similar people over the net.

See you all in Amsterdam, January 18-21.

Regards to All

P: Many 'media-works' supposed to be artistic are following the very old Aristotelian principle of mimesis: the work is just imitating nature with a new technology. Here you deal with the nature without any 'naturalistic' reproduction. We experience a complex of processes that are going on and define a new dimension of communication. Could we define it as a model of digital environment?

C: Yes, we are on environments where the senses of the body are connected via interfaces to dynamic architectures. Sometimes these knowbots also have the 'mimetic' potential for dynamic processes, they are representing real 'data fluids' which you can contact and transform. Mimetic not in the meaning of traditional art: mimetic potential means the agent incorporating the process.

We can't use anymore the term representation because you are included now as an observer of reconstructed representations. I would like more to consider the word phenomena.

P: In your installations one feels a massive use of technology. Formally the only material one can see are computers and communication hi-tech equipment. As artists using this technology which is your critical position regarding the economical-political process which is running together with the information world?

C: We are inside the technological system whose direction and speed are defined by the industry and science. Politics, and arts have to follow and it is nearly impossible to do anything without being inside. It is a confrontation which can't work if you play with the traditional ways of art.

You have to be inside so that you can really see the consistency of the new technology, not only to say: "OK this is their world". This is our world and becomes bigger and bigger. We all depend on computers.

I try to keep my vision free to understand what is outside and deal with both of these worlds. There are still many parts of our life which the technological system can't incorporate.

Therefore I define myself an artist who can fight inside this self regulative order. Though I know everything I do could be good for the system because everything is connected but I fight and give up the respect for the big machines I am working with.

P: The industrial revolution has delivered one of the biggest concern of our time:

the pollution of the environment. The South Pole is an environment almost untouched by the man, where it is possible to make important observation about the environmental problem. Many scientists are able to visualize the effects of pollution, but it seems they have much more difficulties to reveal the origins. For an artist should be more important to fight the causes and not to the effects of the industrial pollution.

Y: Yes, a real solution is not fighting against the effects or against the people who destroy the ecosystems. It's necessary to struggle against the thinking of the people who make these strategies, against the scientists and politicians who think they can predict reality by computing nature. It's an old artist's strategy to make politics and scientists aware about the consequences of their concepts of reality.

P: What's your feeling about the time you need to produce this kind of work?

C: It always takes too long to realize a project when you work with technologies. It is a kind of paradox, not only for the technical complexity, also for the economical support.

The production's process of art takes longer than you want. You can't produce ten pieces a year. This is maybe not understandable in the traditional way of art.

P: As we can speak of cyberspace, virtual space, we could think of a different notion of time. Past, future and present are existing together in your installation: the past is the work of the scientist, the present is the interaction in your installation and the future are the potential information going to be updated by the knowbots. How would you define the implicit time of this work?

Y: We are familiar with the notion of cyberspace, how can we modify space, compress space, extend space. I think you can do the same with time and the way you experience it. We make a concept for the practice of vision. The time we try to realize it is the present.

C: Maybe if the work succeeds when somebody gets into our installation he realizes that there is a complex of different new aesthetical and cognitive structures to deal with. We can't offer results in our work, everybody could experiment in his own way, we offer a model which is still in discussion, which offer different layers of nature concepts simultaneously: a traditional physical model with light and temperature zones, a scientific simulation with the illusion of linear references and a networked info-aesthetical model generated by knowbots.

TRANSLATED MESSAGE:

*Preface: interfiction - perspectives and myths of counter-public in data-nets

The global data-network is on everyone's lips. Initiatives that plan and promote the further extension of the nets in the big style originate in politics and economy. Goal of this engagement is an efficiency-oriented and economy-

centered utilization of the new structures of communication. The capacity of these projects is already proven within a wide range of areas and especially curious people are working with it yet. However, one can also judge this development skeptically. Traveling on the data-highway and the visit of virtual department stores doesn't differ from the everyday purchase and from newspaper-reading particularly, interfiction lays attention on the question how these multi-functional communication-structures can be used in an innovative and unconventional type and manner. interfiction would like to introduce these new possibilities from another perspective and sets the main focus on the discussion about counter-public net-utilization.

Counter-public has turned itself into the myth. The idea that a critical contact with media leads inevitably to a transformation of the society is obsolete. However, the data-nets offer a new occasion to use this myth constructively. Net-projects try, fascinated of the potentials of the net, to update the mythical dimensions of the electronic structure. Globalization, democratization and free access to information are catchwords. So it is possible within the Internet, for example, to ensure direct access to the entire data-material. As long as 'in real world' the distribution of the calculators is limited the Internet is truly not a global net. The catchword democratization has to be considered skeptically as well. It becomes more and more evident that the new technologies simply entwine itself around the old structures. So there is a new myth of 'counter-public' with an inherent ambivalent character. The world doesn't turn into a global village automatically, just as the data-networks do not inevitable render to a democratization.

Nevertheless the discussion about the net-myths could engage a critical reflection on the use of data-networks. The projects who were invited to the interfiction-workshops try to enable communication and interaction on net-adequate and innovative type and manner, what means in contrast to pure efficiency-oriented projects. This is exactly the topic, that interfiction wanted to process. The two-day workshop took place at Dec the 8th and 9th 1995 to enable a detailed and intensive discussion. Following you will find the transcription of the beginning of the second workshop. sorry, only in German :-)

ORIGINAL MESSAGE:

*Einleitung: interfiction - Perspektiven und Mythen von Gegenoöffentlichkeit in Datennetzen

Die globale Datenvernetzung ist in aller Munde. In Politik und Wirtschaft entstehen Initiativen, die den weiteren Ausbau der Netze im grossen Stil planen und fordern. Ziel dieses Engagements ist eine effizienzorientierte und wirtschaftszentrierte Nutzung der neuen Kommunikationsstrukturen. Diese Projekte sind in vielen Bereichen bereits funktionsfähig und werden von einem besonders neugierigen Teil der Bevölkerung auch schon benutzt. Man kann diese Entwicklung jedoch auch skeptisch beurteilen. Das Reisen auf der Datenautohahn und der Besuch von virtuellen Warenhäusern unterscheidet sich naemlich nicht sonderlich vom alltäglichen Einkauf und vom Zeitunglesen. interfiction stellt sich nun die Frage, wie diese multifunktionalen Kommunikationsstrukturen auf eine innovative und unkonventionelle Art und Weise benutzt werden koennen. interfiction moechte diese neuen Moeglichkeiten aus einer anderen Perspektive vorstellen und den Schwerpunkt auf die Diskussion einer 'gegenoeffentlichen' Netznutzung legen.

Gegenoeffentlichkeit ist selber zum Mythos geworden. Die Vorstellung, dass ein kritischer Umgang mit Medien zwangslaefig zu einer Umgestaltung der Gesellschaft fuehrt, ist veraltet. Die Datennetze bieten jedoch eine neuen Anlass, diesen Mythos konstruktiv zu verwenden. Netzprojekte versuchen, fasziniert durch die Potentiale des Netzes, die mythischen Dimensionen der elektronischen Struktur zu aktualisieren. Schlagworte dazu sind Globalisierung, Demokratisierung und freier Zugang zu Informationen. So ist es innerhalb des Internets beispielsweise moeglich, unmittelbar auf das gesamte Datenmaterial zuzugreifen. Da in der 'realen' Welt jedoch keine globale Verbreitung von Rechnern gegeben ist, ist das Internet kein wirklich globales Netz. Das Schlagwort Demokratisierung ist aehnlich skeptisch zu betrachten.

Immer wahrscheinlicher wird es, dass die neuen Kommunikationstechnologien einfach um die alten Strukturen ranken, diesen zwar partiell neue Moeglichkeiten schaffen, wobei deren Organisation aber unbeschadet bestehen bleibt. Es gibt also einen neuen 'Mythos Gegenoeffentlichkeit' in Datennetzen, der einen grundlegend ambivalenten Charakter hat. Die Welt wird keineswegs automatisch zu einem globalen Dorf. Genausowenig wird die Datenvernetzung zu einer automatischen Demokratisierung fuehren.

Die netzspezifischen Mythen werden aber fuer die von uns eingeladenen Netzprojekte zu einem Anhaltspunkt, wenn es um konkrete Umgangsweisen und Strategien in Datennetzen geht. Im Gegensatz zu einer rein effizienzorientierten Anwendung versuchen diese Projekte auf netzadequate und innovative Art und Weise Kommunikation und Interaktion zu ermöglichen. Dieses ist genau das Thema, das interfiction bearbeiten will. interfiction moechte ein moeglichst breites Spektrum von Initiativen vorstellen, die in den Bereichen Kunst/Kultur, Stadt, Universitaet und Journalistik arbeiten, und sowohl Internet/WWW als auch Mailbox-Systeme benutzen.

Im Zentrum von interfiction stand ein zweitaegiges Seminar. Es fand am 8.12 und am 9.12, jeweils von 13.00 bis 17.00 Uhr statt. Durch die Seminarform sollte eine ausfuehrliche und intensive Auseinandersetzung ermöglicht werden. Im folgenden nun eine Transkriberung des Beginns vom zweiten interfiction-Seminar.

*Transkriberung des Beginns von Seminar 2 - Kassel, 9.12.1995

Legende
/ / = SprecherIn
_ _ = Betonung
(...) = Auslassung
[] = Anmerkung
(->) = Referenz

[Das Seminar wird durch die Veranstalter von Uwe Hermanns, Herbert A Meyer und Gerhard Wissner eröffnet (->URL_1). Es wird auf eine Tischvorlage hingewiesen, die 18 ethische Prinzipien beinhaltet (->URL_1). Diese wurden von Tommaso Tozzi (Strano Network, Italien) anlässlich des Budapest Treffens Metaforum II verfasst (->URL_2). Zu Beginn wird Volker Grassmuck von den Veranstaltern darum gebeten, sein aktuelles Projekt Access for All-FAQ (->URL_3) vorzustellen.]

/Volker Grassmuck/
Zum Rahmen des Projekts: Ich wuerde mir das wuenschen als einen Beitrag fuer die Internet World Expo (->URL_4) im naechsten Jahr, die von Carl Malamud und Vinton Cerf organisiert wird. Ich gehe davon aus, wenn ich mich in dem nicht voellig taueuche, dass es einen Internet-Hype geben wird im naechsten Jahr, der alles in den Schatten stellt, was wir bislang gesehen haben. Die Expo geht nach dem Modell der Weltausstellungen des 19. Jahrhunderts. Es ist also eine industrielle Leistungsschau. Nicht nur - also da sind auch durchaus sozial engagierte Projekte vertreten, aber vor allen Dingen geht es um Technologie, wenn ich das richtig verstehe. Im Rahmen der Expo wuerde ich mir das angestrebte Projekt sehr gut vorstellen koennen. Ich moechte diese access-for-all-Modelle, also Netzwerk-Entwicklung von unten, auch international praesentieren und eine grosse Oeffentlichkeit dafuer gewinnen. Und dazu sollte es folgendes geben: Zunaechst einmal einen access-for-all-File, also einen ersten Entwurf fuer einen theoretischen, politischen Argumentationsstrang: Warum access for all? Dann soll es eine Zusammenstellung von verschiedenen Projekten geben, die man unter dieses Dach fassen kann. Es geht nicht um eine neue Organisation oder sowas, sondern um die gesammelte Praesentation von Projekten, die zeigen, dass wir nicht auf die Telekom, nicht auf Burda und nicht auf Berlusconi und sonstjemanden angewiesen sind. Es geht darum, dass wir Netze selber machen koennen. Ein besonderer Schwerpunkt liegt im Hinblick auf die Gebuehreneerhoehung ab dem 1. Januar auf alternative Loesungen fuer den Local Loop, also fuer den letzten Kilometer bis zur Wohnung. Prenzlert (->URL_5), gestern schon mehrfach angesprochen, soll ein Art Workshop-Charakter haben, wo die verschiedensten Loesungen von Lasern bis zum Babyphon und Packet-Radio und so weiter ausprobiert werden. Und am Schluss soll dabei eine Liste von Starterkits herauskommen, die Projekte irgendwo auf dem Land... also Leute, die vielleicht auch nicht in solchen

Zusammenhang sind, aber trotzdem das an ihrem Ort machen wollen, beugehen koennen und sich sehr konkrete Informationen holen. Bis hin zu Bestellinformationen - wo kriegt man irgendwelche Lasertechnologie moeglichst billig zum Beispiel. Aber auch ueber Organisationsmodelle, Finanzierungsmodelle und so weiter muss man natuerlich nachdenken. Ebenso ueber Software, die bestimmte Gruppen entwickelt haben und die sie bereit sind, mit anderen zu teilen. Die Gemeinschaften, die da jeweils entstanden sind, sollten beschrieben werden. Das Ganze soll dann auf der Next 5 Minutes-Konferenz (->URL_6) praesentiert werden. Bis dahin ist das Projekt natuerlich noch nicht fertig. Es wird aber auch nie fertig werden, sondern es soll nur der erste Kristallisationskern sein, der eine moeglichst grosse Bandbreite von organisatorischen und technischen Modellen vorstellt. Zum Beispiel die Digitale Stadt (->URL_7), die Internationale Stadt (->URL_8), das Zamir-Net in Ex-Jugoslawien (->URL_9), Bulletin-Board-Systeme (->URL_10) und so weiter. Und im Laufe des naechsten Jahres, die Expo laeuft das ganze Jahr 1996, kann das dann Werkstatt-Charakter bekommen, auch die Website. Ueber diesen FAQ-File soll nach Moeglichkeit die Diskussion weiterlaufen und es sollen weitere Projekte angeregt werden, die dann im Laufe des naechsten Jahres entstehen und damit aufgenommen werden.

[Zwischenfragen zur Expo, mit der Bitte, diese genauer zu eroetern.]

/Volker Grassmuck/
Also Industrieschau ist auch ein bisschen zynisch formuliert. Ganz so schlimm ist es nicht. Ist Carl Malamud ein Begriff? Der hat angefangen mit Internet-Talk-Radio, also erstmals Broadcast im Internet, dann freie Programme, Interviews mit irgendwelchen Internet-Figuren, so technische Sachen. Er ist halt ein Hacker, Techno-Hacker. Dann hat er ein Buch ueber ueber Internet-Traveler geschrieben, war in Japan, Thailand, Schweiz. Ein sehr aktiver Mensch aus der Techno-Szene. Industrie ist insofern nicht ganz richtig. Aber die Veranstalter der Expo haben Kanaele zu den ganz Grossen. Es wird eine T3-Backbone-Leitung entstehen von San Francisco nach Washington, nach Amsterdam und nach Tokio. Das Stueck innerhalb der USA und nach Japan scheint schon zu stehen. Das wird von MCI bereit gestellt, das sind keine Hacker mehr. Aber so eine Backbone-Leitung zu legen ist auch fuer Hacker nicht so ganz einfach. Und ansonsten ist die Internet-Expo total offen. Im Prinzip kann jeder dort Pavillons anmelden und events machen. Zusaetzlich soll es auch darum gehen, ausserhalb der Netze Zugangspunkte bereit zu stellen. Und dieses ist auch als Problem erkannt worden. Und da spielt durchaus auch access-for-all, also oeffentliche, kostenlos benutzbare Terminals, als Idee eine Rolle. Der Rahmen ist mir eigentlich nur wichtig, weil er fuer Oeffentlichkeit sorgen wird. Es ist ganz merkwuerdig, in Deutschland ist die Expo ueberhaupt kein Thema. In Japan, in Thailand, in den USA ist sie das Thema ueberhaupt. Alle Leute, die irgendwas mit dem Internet zu tun haben, sind wie wahnsinnig dabei, Pavillions fuers naechste Jahr zu bauen.

[Zwischenfragen. Es wird geklaert, dass die Expo-Pavillions virtuelle Pavillions, also Websites sind. Volker Grassmuck weist noch darauf hin, dass im Rahmen seines Projektes inhaltliche Kriterien, Unterscheidungskriterien entwickelt werden sollen, nach denen man Projekte beurteilen kann. Daraufhin bitten die Veranstalter Tilmann Baumgaertel ueber aktuelle Vorgaenge bei Compuserve zu berichten.]

/Tilmann Baumgaertel/
Bei Compuserve gibt es eigentlich kein Forum, wo die Nutzer in irgendeiner Form auf das Unternehmen einwirken koennen. Fragen stellen koennen. Deswegen hat sich interessanterweise in den letzten Monaten das Helfeforum veraendert, das eigentlich so ein Support-Forum ist, wo man technische Fragen stellen kann, zum Beispiel wie kriege ich meine User-ID, wie kann ich mein Passwort aendern und so weiter. Da ist in den letzten Monaten eine Diskussion aufgekommen, die recht grundsuetzliche Fragen stellt, wie beispielsweise: In welcher Form muessen Sysops ihre

>this will be a normal conf.

I am more than a bit pissed off. Since I was going to be in the vicinity anyway, I offered to participate in the conference on several occasions, whether on a panel or taking tickets at the door.

And I never got any sort of response from anyone until yesterday when Geert told me, essentially, that everyone had heard what I had to say in Budapest and at Doors last year and that he couldn't see paying my way over. (Which as I say, I had not asked for since I was going to be there anyway.) He also said I was perfectly welcome to come and sit in the audience.

All of which might not be so irritating were it not for the fact that you have as conference topics a number of areas such as censorship and copyright where I have a great deal more recent, non-theoretical, in the trenches, experience than those who are discussing them.

Further, most of what I have read in the nettime mail-list so far consists of scathing criticism of neo-hippie American Wired culture, which is to say "my" culture, including many charges which I would have loved an opportunity to confront face to face rather than text. But I am not being given that opportunity except as a member of the audience or as another poster to a newsgroup.

So, if what you folks really want is an opportunity to slander us in the privacy of our own circular academic viewpoints, I'll make no further effort to engage you personally in debate.

Yrs,

Date: Tue, 9 Jan 96 01:32 MET

Hello John Perry,

>>more than pissed off
well it took a while, again.. first: i cannot say much to the nym organisation but that it is just singular and very chaotic. you, as a worldwide net authority, could use the chance to enter this intended taz as everybody else (not persona non grata but maybe incognito) and just discuss and have fun like the rest of us.

>>scathing criticism of neo-hippie American Wired culture, which is to say
>>*my* culture,

i have a certain respect on what was invented 1968/69 like Unix and Internet, anti-autoritarian movement, sex-pol, drug culture and business, and sure, rock music but well it's a little clumsy today and therefore people work on 'interfaces' or 'gateways' like to the past (Jefferson) or to the right wing hardcore liberals (News Ginnich and PFF) or just to embed it in a diffuse, flexible and cynical ideology production like Wired Magazine (out of control) The biology metaphor and naturalisation of Cyberspace which seems to become one of the consensus over there, comes together with 1. formations of biotechnological power(an own thread, but also a question of copyright and the info-war-paradigm) and a new pax americana, spread out with the standards of the Internetisation of the world, and the reactivation of American Myths which are bound to their own historical lies.

>copyright

A property model based on territorial myth or natural right is always based on the mythification of blood, and a tendency to repeat a violent history. I see also the central question of information property which leads in my view to the question of who has the right to play with the money (and control private police forces). This project seems to aim at a fusion of the sphere of the stockmarkets with the lower levels of production to a new kind of unbound circulation, the orgasmic free spirit of capitalism. (virtual class, third wave, happy few) I heavily doubt if evolution won't spit out such a monster, as we look onto ecological and political problems. I haven't been on that gaya-trip yet to see 'the future and it works' and will also resist to apocalyptic pathos. These arguments seems all a bit overheated, but i agree with you that with the electronic frontier we are facing 'new' social and geopolitical conflict lines.

First, i guess, between the in- and excluded and according to it, establishing 'new' military paradigms. Simply asked: when there will fly the first cruise missiles on illegal web servers and pirate cd-rom factories?!

When one will use VR/C3d controlled non-lethal weapons for conflict zones? Do those conflicts has to get provoked to show the existing power structures?

You should accept the emmergence of a 'net criticism' and see it as a part of your model, that information wants to live (and therefore has to kill some other information?) And it certainly it makes a difference if everything becomes perfect or something went damned wrong. (like the stock quotes of netsape, thats just madly risky) Responsible are partly you surfers of the 'third wave', it's obvious that we can't be ecstatic any more to plug in our electrical machines or cum together in a net.orgasm. There is a thin line when technology can get just another state-religion, in this moment i decide to switch my streams of desire and become heretic.

nettime is more than a medium to make money with the net backlash, it's more than a jerk off sex toy for a sick mind fuck. 'we', as a kind of european tribal and dissident collective subjectiviy, want to have the right to see cyberspace in our own way but are certainly open for a discussion and argument as long as worse conflicts are avoidable through it, and we should be all keep ourselves open to learn in times of such 'rapid changes'. Are we having fun yet?

Viele Gruesse aus Berlin
-pit

ps: you are still invited to write something for nettime, even an anti.manifesto or doing an interview with us, can be on e-mail, maybe after nym..

Date: Sun, 20 Jul 1997 16:53:20 +0200 (MET DST)

Portrait of the virtual intellectual
On the design of the public cybersphere

By Geert Lovink

Lecture at 100 days program of Documenta X Kassel, July 13, 1997

Much has been said here about the changing role of the artist, the designer and the architect (for example, from Rem Koolhaas) in the age of cybertechnologies. Clearly, aesthetical professions are undergoing profound changes. However, little has been heard in this context of the intellectual. Are intellectuals condemning themselves to manage the vanishing Gutenberg galaxy? Is the whole idea of the intellectual disappearing altogether, as Russell Jacoby's book 'The Last Intellectual' suggests? Most writers and researchers are by now familiar with the computer as a tool, but this says nothing of the theoretical concepts they may harbour around the internet, multimedia, or hypertext. It is a fashion amongst intellectuals to be sceptical about the so-called 'digital revolution' (who can take those ugly screens seriously anyway?) One perceives a silent wish that with the fading away of the cyber-crazes and net hypes, the technologies themselves will also somehow disappear.

A new distinction between highbrow and lowbrow seems to be in the making. While the 'true devotees' of culture apply themselves to books, opera and painting, the grey, uncivilised classes are to be kept busy with primitive and juvenile 'new' media. The lonely crowds are lured into a state of permanent numbness, resulting in dazed and confused packs of couch potatoes sitting it out in ever lasting zapping-, clicking-, chatting- and surfing-sessions. Digitisation takes command: electronic solitude creates a Cybernetic Waste Land. Included here is a new aristocracy harbouring a deep hatred towards the on-line masses. To rephrase John Carey: 'The crowd has taken possession of media which were created by civilisation for the best people'. The fooling around with immature, 'beta' media stands in sharp contrast with the "sensual perception of the wholeness of the artwork". The elitist, usually government subsidised/state sanctioned and exportable forms of expressions are slipping into open warfare with vulgar and commercial cyberculture. Even to-day, very few intellectuals are prepared to take the digital media seriously. While photography, film and video are now accepted art forms, the hyper-commercial, constantly changing software landscape still lacks substantive intellectual and cultural critique. This is the case even within so called 'art and technology' circles, where many established theorists seem to suffer from techno-enmui. Into this field one can either become like a visionary salesperson or assume the role of moaning defender of established art values.

"Paris, where are you, now that we need you?" Who will finally manage to initiate Paul Virilio so that he will give us a more precise, nay, a more radical, interpretation of the social impacts of the new technologies? Who will critique the neo-liberal cyberhallucinations of Pierre Levy and his 'collective intelligence'? Who will finally stop Baudrillard's tragic complaints? Paris -- once the intellectual capital of the world -- seems to have fallen prey to moralistic debates about the 'most favourite victim status' (as in the case of Bosnia). Here we are seeing most clearly what the current crisis of the intellectual is about. The production of attractive role models got us nowhere. The cultural climate has gone into the defensive mode. The growing anxiety is fluid and can take many forms: sometimes xenophobic, sometimes against the European Union, or just against the State in general. Both the emotional and the rational calls for political engagement are melting away, just like all other information. The intellectual as TV personality (for example, Bernard-Henry Levy) seems to be part of the problem, rather than part of the solution. The need for spokespersons and experts, producing opinions on a day-to-day basis has become an integral part of the current Society of the Spectacle. But the intellectual of the Media Age should not by definition be identical to the figure of the media personality. What Paris of the nineties (as an example) is showing us is the urgent need of 'media literacy': intellectuals who are aware of their real position

within the rapidly expanding media landscapes.

This is partly a generation problem. The generation of the sixties (known in France as 'les quadras'), equipped with the Gramscian political definition of the 'organic intellectual' closely tied to the Party and social movements, is now at the height of its power. It has conquered all possible positions and marched into all possible institutions. But there is no one leading anymore. Policy implementation has replaced avantgarism. The Leninist question: SHTO DYALATSH? (What is to be done) nowadays lacks both subject and object. The 68-generation have become parents, worried by the senseless escapism of their children. Autonomous subcultures (like the 'travellers' in the UK and Germany), though thriving, have become far less visible even when they are not reeling under severe state repression. The remaining political groups seem to have locked themselves in antagonism towards each other and lack the hedonistic, seductive aspects of the rave and drugs culture. Protests against the Euro-policies at the Amsterdam-summit of June 1997, however effective, also illustrated the current crisis in oppositional culture: marches were held both against unemployment and in favor of a jobless way of life. New issues of protest, voiced by street-ravers, soft-drugs users and art-porn enthusiasts were unable to connect with the 'traditional' forms of contestation of the established (new) order.

Back to the intellectual. Take for example Eduard Said, who still sticks to the old, well known definition of the intellectual. In his 1993 Reith Lectures, 'Representations of the Intellectuals' he insisted that the intellectual is 'an individual with a specific public role in society that cannot be reduced to being a faceless professional'. Said warns of the dangers of specialisation and professionalism and instead favours an amateurism which is 'speaking truth to power'. Against specific knowledge, Said highlights general concern. The intellectual should be endowed with 'a faculty for representing, embodying, and articulating a message to, as well as for, a public'. Arguing against rigid sociological class definitions, which define intellectuals solely through their profession, Said turns them into moral agents, defined by their attitude'. The intellectual belongs on the same side with the 'weak and unrepresented'. This requires a 'constant alertness' and 'steady realism'.

This sounds touching and noble, and Said is right when he is stressing that the intellectual and the public are inextricably intertwined. What is missing here is an analysis of the dramatic changes of the public sphere itself. Some cultural pessimists have stated that the public itself has already vanished altogether. The daily reality is that the so-called public domain in the urban realm (for example, streets, squares and parks) is under permanent surveillance and control. More and more of it being privatised. This holds not only true in real, but also in 'virtual', electronic space.

The essay 'Electronic Civil Disobedience', from American group Critical Art Ensemble (CAE) states that, as far as power is concerned, the streets are dead capital. Even though the brick monuments of power still stand, the agency that maintains dominance is neither visible nor stable. According to CAE, the only groups that will successfully confront this new form of power are "those that locate the arena of contestation in cyberspace". The methods of civil disobedience, like picket lines, demonstrations and petitions are largely ineffective and empty rituals. With neither spite nor disdain towards the remaining traditional attempts to question the current world system of global capitalism, it should be stated, in public, and as clearly as possible, that 'contemporary activism has had very little impact on military and corporate policy'.

The same could be said of the intellectual that is still living in the paper world. The days of Foucault's discursive power are over. The system without alternative does not need the magical power of words anymore in order to rule. It is in this sense that we are actually witnessing the much-vaunted 'End of Ideology'. The realm of 'ideas' as such is not dangerous or subversive anymore. Ideology has migrated into other spheres. It morphed itself into software, e-cash, and data. Rationality successfully besieged religions and all other metaphysical expressions and turned them into pure, cold functionalities. The return of fundamentalisms, nationalisms, regionalisms, etc. is not a serious threat to the New World Order. Benjamin Barber's endless variations on the dialectics between 'McWorld' and 'Jihad' are only expressing temporary, and very marginal, conflicts. These conflicts may be bloody and affect the lives of millions of people, but the current catastrophe zones don't make any impact on the Capitalist Condition. A Black Monday on Wall Street might. The war in Bosnia has not disrupted Western economies, though it proved nearly fatal to Bosnia. This time for sure Sarajevo won't throw us into a world war again. That's it.

Alain Finkelkraut's 'Ode to the Croatian State', Bernard-Henry Levy's

use of the Siege of Sarajevo as a stage for his media appearances, or Peter Handke's late and profoundly touristic discovery of the Serbian countryside all marked the end of the intellectual as a public figure with any significant impact. The cynical competition for the 'most favourite victim status' amongst the different ethnic groups made all known methods of outrage and engagement irrelevant overnight. Unlike the days of the Vietnam War, it has become more and more difficult to choose sides. This again is drawing us deeper into a status of passive consumers, bored by the overkill of undistinguishable strains of infotainment. Intellectuals who are only expressing opinions, in the belief that the media-industry (particularly television) still produces common sense content which shapes public opinion, should simply desist -- they should boycott all talkshows and instead engage in fundamental research on the 'state of the media'.

Samuel Huntington, with his 'clash of civilisations', overstates the role of culture within today's global capitalism. This reflects, in my opinion, wishful thinking about the return of the old style intellectual (or priest) who will have the last say in entire societies. Their will to power is of a highly resentful nature. These conservatives are defending a model of the West which no longer exists. The 'clashes' they are predicting might in fact take place in some decades, when, for example, China will have reached the level of the Western economic powers. Within the current situation, we can only interpret these scenarios as a collective, deeply nostalgic re-hash of ideological, cold war-like conflicts that will not come back.

In fact, the intellectual as opinion leader is slowly losing ground. What we see is the rise of the VI, the Virtual Intellectual. These knowledge workers are thoroughly familiar with the 'virtual condition'. They have also come to terms with the declining power of book culture and the public sphere as we have known it. Before we try to outline the shape and task of this upcoming social category, it might be useful to make a distinction between what I call 'Theory Fiction', and the description of a new sociological phenomena.

In 'Theory Fiction' terms, the virtual intellectual might very well be an 'Unidentified Theoretical Object', a UTO, like the ones we described in Adilkno's Media Archive. We could then compare the VI with categories such as the data dandy, or the human body as 'wetware'. Just as the cyberpunk, or the Generation X slacker, or the computer-nerd, the VI might even leave the realm of literature or theory and enter popular culture in order to vanish again after a while. The power of the VI is a potential one: s/he might turn up as a virtual creature, but could as well remain elusive and never leave the conceptual, beta stage.

We need to examine the context of the emerging VI -- the relationship between the computer-literate intellectual and the hard- and software industry. Arthur Kroker and Michael Weinstein did so in their remarkable description of the 'virtual class' in their book 'Data Trash' (1994). This emerging class, with its own 'Wired' ideology, might also have its own 'organic' intellectuals. However our VI is more than just a spokesperson for the new media industry and the battalions of 'digital artisans' infodated to it.

The playful, ironic, and imaginary categories and the critical socio-political analysis of new class formations are two different ways of theory production. In my lecture 'From Speculative Media Theory towards Net Criticism' I contextualized both by putting them in a personal, and at the same time historical, perspective. Here I just want to point out that the virtual intellectual has elements of both: a will to design, to construct the public part of cyberspace, to be 'radically modern', combined with the ability to reflect and criticise the (new) media from all possible perspectives. In both cases it is important to overcome the widespread resentments, cynicism and elitism such a position attracts on the one hand, and over-hyped salestalk on the other. This implies that all forms of technological determinism should be condemned.

What is it that makes this type of intellectual 'virtual'? Like all earlier professions that are now migrating into cyberspace, these new figures will be constituted through their specific mixture of local and global cultures, digitised and non-digitised source material, real and screen-only experiences. The VI is conscious of the limitations of today's texts, without at the same time becoming a servant of the 'empire of images'. Since s/he has been educated in the heritage of the text, the VI now will now be confronted by the problem of the visualisation of ideas. Text-only systems can no longer be auto-poetic. The self-referential tendency of all singular media needs to be corrected and expanded with crosslinks to imagery, audio files and hyper-links -- all embedded in on-line databases. Virtual here also means open, ever changing, in constant contact with other e-writers (and readers), no longer focussed on the closed, hermetic Magnus Opus that defined the 'Age of the Author'. So, on the whole, we may state that the nature of virtual intellectual a technical one. Unlike its

predecessors, s/he is no longer defined through the relation to the political sphere in a classical sense. The 'public sphere' itself will more and more be a product of technical media and lead a true virtual life of its own, no longer connected to places like the coffeehouse, the salon, the boulevard or even the more abstract realm of the newspaper and television discourse. The global capitalist "(wo)man of e-letters" is part of the on-line masses, but does not feel a need to speak on behalf of the internet or some virtual community. The VI also lacks any sentimental drive to represent unprivileged off-line groups. The goal of the democratisation of the media should be the elimination of all forms of mediated representation. We now have the possibility to let people speak for themselves, even if they have little or no bandwidth. Public access to a variety of communication tools and the world-wide support of independent, tactical media might ultimately make the political intellectual redundant.

Thus, the virtual intellectual should be located in the sphere of the negative. Even in the pragmatic work of programming, designing interfaces or the planning of network architecture, the negative should be our starting point. The main threat to a critical praxis nowadays comes from the positive, 'humanistic' intentions, or what Galin Dan the 'dictatorship of good will'. Intellectuals might not so easily commit 'treason' again (Julian Benda, 'The Treason of the Intellectuals', 1927) and might not again be attracted so easily by totalitarian ideologies. But will they be able to resist the current free-market way of thinking, Ignacio Ramonet's now famous 'One Idea System'? The majority of the knowledge workers are no longer employees of the State, nor are they members of the Party. Today's danger is lying in the growing sector of the NGOs and their anti-intellectual pragmatism in the name of the Good, locked in a unholy alliance with the real-time mass media.

Our answer to this will be a gay data nihilism, joyous forms of negativism: resisting all reductive and essentialist strategies, connecting all streams of data from either side of the old and new media, in both real and virtual spaces. Media freedom in this context means leaving the whole media question behind us. It means mixing and sampling the local and the global while flying through our own, selfmade and hybrid data landscapes. And they, just as we, will always remain under construction.

<nettime> Last exit to net-criticism?

From: Frank Hartmann
To: nettime-l@desk.nl
Date: Wed, 23 Jul 1997 08:08:00 +0200

Re: <nettime> Geert Lovink's portrait of the Virtual Intellectual
Geert, with his (as always exiting) piece on the virtual intellectual, gave us a sum up of the ideas and essays he (and Pit) republished on nettime and recently got printed here and there, whenever a critical voice was needed by some clueless publisher. A summons for net-criticism, an interim report on net-criticism, adnotes to net-criticism, net-criticism as a work-in-progress for true. It makes me wonder where net-criticism really takes place and what its agenda really is, aside from stressful conference tourism.

But now net-criticism finally arrived at its terminal, the definition of its true actor, the 'virtual intellectual'. It certainly highlights a situation, especially when relating to the aesthetic and moral wholeness some elitist intellectuals (the classic mediators) are anxious to save. And at the same time this text seems to unwillingly fall back into the old quarrel over the best position within the field - a very common manifestation of the classic intellectual.

Critique seems to have lost its object, while stressing the descriptive qualities of what is going on beyond the old intellectual task of managing the Gutenberg-galaxy. Is this truly the end of critique? Information negation as the true core of post-enlightenment: its claim is to lead us out of Gate's software cave, and into the authentic light and warmth of 'joyous negativism' of gay data nihilism. Now this sounds to me a lot like alternatively living that gesture of 'data dandyism'

formerly criticized by the ADILKNO-crew. Economy, history, ideology and ideas seem no longer to exist for the net-intellectual. It is another aesthetisation of the intellectual, thus not so far from the position just overcome, or simply just another strategy to survive in the swamp of the post-massmedia discourse. I also take it to be a coincidence that after the introduction of the term 'virtual intellectual', the grey eminence of net-critique, Arthur Kroker, is presented once more like the hare out of the magician's hat.

Another observation. The quest for 'theory fiction' strongly reminds me of Richard Rorty's attempt to save philosophy by 'edifying discourse', and even more of Umberto Eco, who first published his 'Apocalittici e integrati' in 1964 as a critique of the dualistic cultural critique. Eco not only recommended the intellectual to immerse in mass culture and media, he also did a nice job in producing a theory fiction which made it to the bestsellers-list.

So: d'accord with the general problem Geert presents, but with the reservation that coining another term (like the virtual intellectual) does not lead the way out of this logic of decline fostered by so many traditional intellectuals. Wasn't it Vilém Flusser who, for the intellectual of the future, imagined a conceptual suicide of sorts, as the disintegration of objects and their subjects already became an everyday experience against which our culture holds up so many fictitious belief systems (much underestimated in this context: one of his last writings with the programmatic title 'Vom Subjekt zum Projekt'). The job is not finished yet.
~Frank Hartmann

Dear Nettimers,

time to say something,
first, sorry for all the inconveniences and boredom, sorry also for not having changed the situation when it became 'unfocused'.
apologizes for the hyper-national mail bombs, i think it was all worth of it. in parts a meaningful accident, in other parts product of a crisis in the electronic wish economy, and well, the list is *open* now, ready for your thoughtful contributions, and also for all kinds of notes from a material world.
please do not forget that nettime is not a service, it is not a text tv, it is no boat, ad i am not it's director, instead you define what it is. it's nothing but the sum of our trials.

mapping the shift
what has happened? a turnover, a transformation, the escape from virtuality, the web as a bad love affair, new networks of distrust, net art as feudalistic rescue zone, the massified boredom of techno-lust, the breakdown of electronic imagination, net critique as the official version, the disability of virtual capitalism to reach the zero-degree of superconductive desire and the absolute speed of light age, all kinds of spies vs spies, false priests, dying travelling salemen, the sellout of potlatsch, a ghost city after digital gold rush?
but it's one thing to make lists of keywords, another to find a subjective voice again, which maps the shift from different perspectives. that's what i hope we can do on nettime for the next weeks.

*
let's take a look into the current prawda of the net. did you recognize something? web-whipeout, dissing the beehive thinkers, netizen against republicans info-economy, sucksters on useless webcults, a new lo-tech mailinglist. there never occurred such an obvious transformation in the central organ of net discourse. so does net critique won and becomes the official version of networked truth now?

**
somehow 'in bytacity we solve our problems in our own way'. A killer-meme including the ever possible seed for 'cyberfascism' was detected by several ideological alarm systems anywhere in the world wide west. It was a very calm shift, a subterranean battle, down in the bunkers of the

info-elite one decided to do some sacrifices, the digital revolution eats its children. In many talks i had it became clear, that it's no time to unify but to report from the borders of the net and be aware of the different modes of virtual violence to become human again.

an extremely subjective answer:
from the virtual position of an archaic net god, from the snowy heights of the old world, cyberzarathustra spoke to us, already on the other side, he appeared as an all-american avatar and one could do a breath-taking morph through the multiple mythical subjectivations of the poet, pioneer, priest, cowboy, indian, general, president, hippy, father, son, entrepreneur, prophet, pilgrim, angel, alien, to learn a simple lecture of initiation: the new world is splitted in two halves again, were the 'new' one declares itself independent from the 'old' one we have to leave. our half, the virtual, the new, the rich, the highly technified, the bodyhated and dematerialized, the one with the new marketplaces, and secret knowledge, immune against earthy powers, a civilisation of split mind, in the name of nature and everything which is bigger than real, this 'better part' is ours now, bound to the idea of a virtual america. And you say you didn't believe in it! Any of these concepts cuts a black whole in the wish economy of cyberspace, if we connect them together to a new mind territory, we get something completely monstrous.

terms to forget:
the net is not the territory and other truthful lies, "the net" as metaphysical entity which constitutes real power, a number of metaphor mismatch errors net=life=nature=global_brain=welgeist=mythical_power, computer science as esoteric secret knowledge, the wholly pathos and grandiosity of 'the net' (as ersatz-religion), the wishful thinking of an economic explosion (golden future), the will to push the repeat history button (golden past), the taboo of a disfunctional and unhealthy internet, the obsession to walk in the footsteps of the founder fathers, the obsession to find the eternal woodstock which is hiding in internet +unix (born in 1969), taking the newest Cyberacid driving along the road to nihil, the expectation of new and improved humankind through harder selection, the unavoidable apocalyptic turnover, the clean aesthetics of cyberwar, the doom-day of the net, the male obsession with artificial life, the digital void of the american soul, the wholly mission of bringing virtual freedom to the marking, the obsession with 'innocence' and it's abuse, disgusting flesh, the hate of the own body, mortality, body-fluids, splitted wired desire and it's way to a useful 'mythical external force', information=money, privatisation and cyber-slavery, corporate meta-nations,, an incomplete list of a collective thinking which is hopefully part of the past.

what do you want to do today?
-opening up new genres, adding some examples, practising with little text forms
-implicit net critique, reports from the borders of the net, a-culture-dialogue
-the technological subconsciousness, compile, compress, decode, decipher
-the end of the future hype, unlikely futures, imaginary websites, good ideas
-the etext gathering is still open for Madrid 3cyberconf ZKP2 200p. until May 15

+0100

No more ideologies - keep cyberspace clean!

With the growth of importance and influence of the nettime (list, circle of people and concepts etc.) people who lived at least a part of their lives in socialism - but not only them - can recognise emerging of some interesting processes. I have in mind selfunderstandable leadership of dominant idea, ideology, viewpoint.

Since the time of the First International and famous Haag congress discussion about leadership and/or problems of representation of other voices is present, particularly in the "left" whatever one could consider into that term. And nettime is "left". There is no doubt about it.

Some recent highlights, at the first look not connected with the topic, warn that there is place for being worried. Set is prepared and only from the actors itself (there is no director in this play!) depend the end. At the

final discussion on Next7Minutes Conference it was kind a lot of discussion about "being neo-marxist" and how to fight "bad" ideologies on the Net, and some reflection were available in several following discussions, including some postings to this list.

Recent private discussion I had with Geert Lovink about meanings of the term "net criticism", and how it should be recognised and used along with Toshiya Ueno's visit to Zagreb start alarm in my head.

It happened before. It also start innocent, it was in good purpose, but it finished into Holocaust. I will dare to try to compare period just before the Soviet revolution and present position of nettime. It's very important to stress that ideologically those two things have very little in common. Only important similarity is at the field of organisation. At the Congress Bolsheviks have very few representative, but they have some of the most eminent individuals of the time, and they somehow manage to turn some syndicalists, anarchists, and Tkachevist on their side, get majority, proclaim marxism-lenism as a favourite ideology and the rest is history. (Lately, during the Spanish civil war it was shown that people do not need some specific leaders who will explain them meanings of life.) What, in my humble opinion happens at the field of net criticism, and around nettime (it work for some other emerging groups, circles or lists) is something with similar characteristics.

First, there is some kind of felling of being something special - it is more then obvious in the discussions, at the conferences and in different articles and papers around. Non-academism could also be a form of elitism. It's nothing bad in being aware of personal values, but it easily could be turned into pejorative elitism. Usually there is no discussion (on-line) with the people from "outside", who do not share enthusiasm for the nettime idea, which is mainly their fault, but it is not good for the idea, which can grow and develop only in constant discussion, re-thinking, and if it is necessary flaming. It happened to the Marxism in Eastern Europe: no real enemies, no controversies, just Marx-Engels Werke. Excellent point in resistance to possible auto ghettoisation were stopping the moderation of the list, unfortunately discussion is still focus only to some specific "inside" points, without broader audience. But possibility exist! It's on the people to use it.

The bigger problem, however, could be (and it already is) insisting on common platform (particularly neo-marxist) and sharing ideologies of resistance/progress or whatever. It was strange before, and it is even stranger today to insist on wide spread organisations against the Others - no matter how "bad" they are. Why is it necessary to insist on some new -ism, on one and ultimate theoretical explanation which will take care and explain to the "common" people how and way they should resist to MegaGodzila, Californian ideology, or McDonalds? History show that it is irrelevant was it done on purpose or not - people in and around nettime have no such ambitions, but danger remains! After all, who saw the Stalin shadow behind Marx in 19th century? Insisting on common aims, or thousands of other phrases like that will produce the Thinkers, the Philosophers, the Politicians who will have prepared answers to problems, and who will then became the Leaders - it doesn't matter do they want to be Leaders or not! They will be installed - from the "common people!" as Leaders, and sooner or later they will have to accept such label, or leave the real life and live quiet life in country house with a gazebo.

Danger is double. First there is no person who can guarantee for itself that such privilege position wouldn't change it at least a bit. Power change people, and in this case ultimate power to be interpreter of what is going on, and how to deal with it, it may finished in the catastrophe. On Stalin's dead Ionescu wrote - very correctly - that it's not the Stalin who was real monster - but all those small Stalins in kolhozes, factories, schools...

Secondly, nettime put together some of the biggest minds at the field of the social implications of the new media, lot of people would like to be part of it, and in minds of people with modest capacity (myself for example) it look like club in the Ivy League. Those people produce a lot of new ideas, which knowledge hungry "ordinary people" just grab and try to digest. Look just what happened with post-modern and Baudrillard! It is necessary for thinkers and theoreticians to permanent fight against such tendencies, and on the other hand they can not do that all the time, they are just human beings.

I have no right answer how to fight those processes - if I describe them correctly in the first place, and it would be very dangerous if anyone will came with the final solution, but recognition of the problem and discussion about it sounds like a good starting point.

Cause, if I have to choose - and it might happen - between Negropontean or Californian or whatever global state and nettimean or rhizomean or netizenshipan or whatever avanguardie of the working class, I have to choose the first one. Not because I like it, but for the simple fact that Soviet revolution failed with the Kronstadt, not with the Berlin wall.

BASTARD answers to Igor Markovic's
 "No more ideologies - keep cyberspace clean!"

Never mind the "cold war myths". The scholarly answer one might give to Markovic's logorrhea is important, but as toothless as a retired academic.
 Markovic tries to be impressive by speaking out of a specific historical situation, in the name of "people who lived at least a part of their lives in socialism". This should give his claims the necessary touch of real-life experience. Thus he shouts: no more ideologies! No more leaders! No more Holocaust! He wants to alarm us and share panic, in order to hide the hollowness in his criticism of nettime, which in all its simplicity follows the well known path of anti-intellectual resentment.

The idea of the possible end of ideology is an ideological idea par excellence. Therefore, we do not even need to consult the referring theory (e.g. Althusser), but recognize the recent developments in the post-Socialist Eastern Europe as a demonstration for the fact that we are far from living in a "post-ideological society".

If we really want to reflect upon the experience of "people who lived at least a part of their lives in socialism", we should not dream about nettime as a kind of a meta-ideological discussion space. We should rather ask: how did the change in Eastern Europe affect the traditional concept of "Ideologiekritik", and how did this change compel us to approach the prerequisites for the function of ideological structures in a new way - in the context of new media theory & practice.

For this aim the metaphor of the primal Bolshevik situation is inappropriate. This reference much more reveals Markovic's frustrated paranoia than sharpening the perception of the historical situation we live in and of the aims a project like nettime might have in it. There is a quite neglectable danger of nettime giving birth to a new Stalin or Hitler. But the real danger is those ignorant people, who try to impose their compensatory paranoia to the discussion as a whole.

All dualistic choices are delusive, be it between left and right, or Negroponte and Lovink, or WIRED and NETTIME - the bandwidth simply is higher than that. We do not have to identify ourselves with sides, be it the Californian vs. any other kind of ideology - there are no polls, we are not up to votes. This is also not about the question if net-critique is a proper neo/post-marxism of sorts, but rather about an awareness of what really matters. The quest for a "clean" cyberspace, free of any ideology, is closer to some "final solution" than Markovic himself might think (a connection impressively revealed by Polish/British sociologist Zygmunt Bauman in his study 'Modernity and Ambivalence'). His wish for cleanliness thoroughly contradicts the idea of the intellectual cooperative he signs for. Bastard, a term coined to express the hybrid energy of new media.

Keep cyberspace clean! Let us stay a little bit more realistic here. As Markovic himself put it - "recognition of the problem and discussion about it sounds like a good starting point".

A Push Media Critique
 On the rebirth strategies of Wired magazine
 By Geert Lovink

The March 1997 issue of Wired (5.03) has an unusual cover. No digitari this time. Just a big blue hand on a red background, designed like a warning signal, saying 'PUSH!'. It tries to hold us. Or is it pushing us something into our face? The slogan says: 'We interrupt this magazine for a special bulletin -'. The breaking news is about 'the radical future of media beyond the Web'. The article is written by 'the editors of Wired'. Will they declare a state of emergency for cyberspace?

Why should Wired have to interrupt itself? It is not CNN. Just because of some new audio and video software that is hitting the market? Is the 'shock of the new' indeed so overwhelming that it forced the editors to write a common statement about the rise of so-called 'push media'? There must be something else going on. Wired seems to be in crisis and needs to reinvent itself. Due to the commercialization of the net, big publishing houses, cable giants, telecoms and software companies have moved in, and are now pushing the web into the direction of old-style broadcasting technologies. Wired calls this the 'Revenge of TV' (with a ?). But this is only the logical consequence of its own strategy. For years, Wired has been reporting euphorically about the coming symbiosis of TV and the Net as the ultimate killer app. At this moment, webrowsers are being surrounded by other applications. The WaitWaitWait is about to lose its hegemonic position. The static, book-based idea of 'web pages' will be taken over by much more dynamic audio and video. If the net has to become a mass medium, then it has to merge with the film, tv, cable etc. industry. And if the market says so, it has to happen. That is what the ideology of the free market says. So sit down and watch the next paradigm shift going by on your screen.

Still, we can read a certain discontent, even betrayal in this odd document. We have to wake up from the dream called Web. Suddenly, HTML is described as the language of an 'archive medium. Archive as in stacks of old books in a library.' That's different from what we have heard before. 'The Web is a wonderful library, but a library nonetheless.' This is a smash in the face of all the followers, net slaves, usefull web-idiotis and other digital fellow travellers that have spoilt all their energy and devotion into... building a library. This was not what they promised us.

Wired's own destiny is closely connected to the rise (and fall?) of the World Wide Web. This magazin (founded in 92) is not about the old internet, nor does it deal with hackers issues. It eventually became big because of the commercial interest in the WWW (and multi-media). 'Kiss your browser goodbye' could therefore easily be read as an indication that 'Wired itself' is about to croak, or at least needs to go through a tough phase of rebirth rituals (downseizing, restructuring, sell out, take over, etc.). There are several indications for this, which are all publicly known. The German edition was cancelled, than it failed (twice) to go to Wall Street. Now, Wired TV seems to produce programs but is not (yet) able to broadcast them. The UK-edition seized to exist from March 1st. And for the first time we heard rumours about an internal fight between the techno-libertarian management and some critical and progressive individuals.

The Wired enterprise must have been in big need for a new ideology (or 'vision') and tries to find it in the catch phrase 'push media'. But this pushing does not fit exactly within the previous ideology. Just read what George Gilder is writing about television and why it ought to decline. Economically, the web is still tiny in comparison to, for example, advertisement revenues of television. This was one of the reasons why Wired could not grow any longer. The profit of the magazine had reached its limit. The company was forced to diversify and became a small media-conglomerate. Besides the magazine, Hotwired and the book publishing division Hard Wired, there is now surprisingly also 'Wired TV'. This may sound like Lenin's dialectics: one step forward, two steps back. But only with a television division, Wired Inc. might be able to make the next quantum leap. For this it needed to go to the

stockmarket. Venture capital alone was not enough to ensure the financing of all these different ventures. At least, that's what I think, I am not a Wired watcher.

At this point, the Wired Story stumbles, hesitates and comes up with a curious manifesto that above all reflects the uncertainty about the future of the magazine. For net critics, it might be amusing to see how Wired is being overruled by true media capitalism. But we have to honest: these are all questions that we will all have to face, sooner or later. For example: can we preserve some of the old net values and standards, encourage technical and social innovation and public access, without falling back into the patterns of mass media and the existing culture industry? It can be ironical, to see Wired struggling. But 'Wired bashing' can only have positive results, if we use it as a mirror, not just see it as an imaginary enemy. Even in time of trouble there is the real existing 'Desire to be Wired'.

Wired wants to 'move seamlessly between media you steer (interactive) and media that steer you (passive)'. These push media 'work with existing media' and create an 'emerging universe of networked media'. We have to read between the lines here. It simply means that the Web will have to give up its ideological hegemony it had in the last three years as the 'medium to end all media'. Web is just one channel, amongst many others. The Web is one, as Wired puts it once. A fairly realistic point of view, but not fitting into the original net religion, the Wired visionaries has been preaching. The Web had to replace all other media, intergrate them, that was the idea, or as the 'special bulletin' still states: 'As everything get wired, media of all kinds are moving to the decentralized matrix known as the Net.' In reality, it is going the other way around. The net is moving to the centralized business known as the Broadcasting Media. 'What is about to disappear is the defining role of the old Web.' Irritated and somehow disappointed, the editors have to admit that 'the traditional forms - broadcast, print' - show few signs of vanishing. 'How unfair, they should have disappeared by now. What went wrong?'

The fault also lies in the netizens themselves. 'The subterranean instincts of couch potatoes rise again! In secret, many continued watching tv. The editors thought it was time to face this bitter reality. True, there's a little couch potatoe in all of us. The human desire to sit back and be told a completely ridiculous story is as dependable as the plot of a soap.' Unfortunately, only a few of us have been able to get away from the '45 years of addiction to passive media. Only a handful of us turn out to be up for the vigorous activity of reaching out to engage the world. Bummer.'

In order not to lose its role as the Prawda of Silicon Valley, Wired must take the lead and incorporate the latest developments. But this time, their enthusiasm does not sound very exciting. 'The new networked media borrow ideas from television, but the new media landscape will look nothing like TV as we know it. And indeed, it will transform TV in the process.' What it is failing here is a clear economic analysis. Television is not just a screen or an interface. The introduction of (some sort of) interactivity is most of all a money/profit question, decided by a few companies, in an ungoing war on standards.

Cybernauts, netheads, websurfers, wake up. The boredom will be over soon. 'Push media are always on, mobile, customizable'. These total media arrive automatically and 'always assume you are available.' It is begging for your attention. It will therefore be important, to know how to switch them off. The Push Manifesto is indeed warning us for possible misuse, like government regulation of networked push media and privacy violations ('it finds you rather than you finding it'). Neither old, nor new (in the sense of utopian), push media are rapidly 'closing the gaps between existing media, towards one seamless media continuum.' The totality of the 'unification' seems worry the editors. 'All we can say is, Let a thousand media types bloom. Soon.' But this presumes a deeper knowledge of both new and old realities, for example television.

'Each cycle of extend/unify notches up the ratchet of media complexity. Ontogeny recapitulates phylogeny, in interactive media as in biological media.' This must be Kevin Kelly speaking. We are getting to a conclusion. He has seen it all and stays calm, like all techno-darwinists. For Kelly it is just a stage. Wired and all of us have to go through: 'All media recapitulate the evolution of former media. So online media have evolved from smoke signals (email) to books and magazines (the Web). We are now about to arrive at television (push media)'. It is touching to read how careful and naive the Special Bulletin is trying to describe the zapping behaviour of the viewer. It is obviously a topic Wired did not write about so far. Perhaps it is time for them (and us) to get to know the 45 years old theories of mass communication, the (cultural) studies on the behaviour of the viewer, the specific history of this technology and the economic (monopolistic) forces that are dominating this branch. So, stop speculating about

'push media' and visit your library first.

Excellent piece, Geert!

Wired is either full of shit (the advent of push technology has completely contradicted what they've been saying all along and they're trying to lie about that), or cynical and evil (they knew this is what would happen all along but were talking like revolutionaries at the beginning just to gain market share and credibility with net libertarians).

I can hardly wait for Wired to publish breathless editorials on these exciting phenomena when they happen:

- The death of small ISPs and eventual control of the net by a handful of national (multinational?) providers, quite likely existing mega-corporations like AT&T and Microsoft
- The final death or atrophying of Usenet, the net's oldest forum for open, many-to-many discussion, finally making the net almost completely read-only and devoid of "public space"
- The increasing willingness of net-related businesses to sell users out by cooperating with the U.S. government in exchange for favors: using weak encryption, turning mail logs over to the FBI, supporting anti-privacy legislation, etc.
- Increasingly frequent crackdowns on porn, "illegal" information or "libel," dissident literature, etc., on the net
- The growth of sophisticated dossier-building by employers and governments, and the exchange of information between them
- The invasion of every inch of the net by advertisements

Will Wired support these developments? Will they claim they predicted them all along? Will they try to put their patented radical-techno-postcapitalist spin on them to make them seem somehow like cool third-wave phenomena?

Stay tuned.

Hi!

Thank you for your enlighting piece about this silly 'Wired cover story'.

I pretty much agree with your analysis, but I think you have overlooked on important detail, that makes this whole story even more questionable: that Wired magazin itself is in the business of internet-based push media.

I'm not talking about the slightly obnoxious attempts of certain Wired-editors to make Nettimers participate in Chats with their cyber-buddys (the ones that eventually don't take place, haha). I'm talking about the News-Service that Wired offers in collaboration with 'Pointcast',

the pioneers of "push media".

Apparently the news that are published at www.wired.com/news/ are also delivered to "the comfort of your own home" via one of the "channels" of Pointcast, a program that downloads stuff to your computer when you are not using your internet connection, and displays it as a screen saver. You have to subscribe to this service like you would subscribe to a magazine. I do not use "Pointcast" myself, but that's what I learned from various reports in the internet press.

That would make this cover story a bold attempt of "hard sell": "Wired" first creates a demand for "push media", then it is there to meet this demand with a product. If "Wired" manages to put that "push media" - meme into circulation as it did with other ideas, this "Wired News Channel" would certainly be one of the first businesses to profit from this new hype.

Yours,
Tilman

PS: If you want to see grown men or women cry, make them install the "Castanet" -Software. So much for the state of the art of "push-media" ...

Dear Geert,

>I do not agree with Foucault about the status of critique. He
>might be right, but the effects of his phrases about the End of
>Critique have prevented many of our generation in making rough,
>dirty, daily analyses of the powers-to-be (and making mistakes).

I do partly agree with what you wrote here. But isn't it like this: More than Foucault stopped any critique he got caught from right positions, who tried to hold his writings against the left thinking like: Here, look, your fight is over! It is over in a different sense for me, because I think we have to go over to new strategies, which does not mean stop analyses, but work further on it and hold an own model against it. Like nettime maybe normally is. In fact Foucault never told anywhere anybody to stop thinking, but he created new models in showing that critique has always to change to be still critique.

>I need mirrors, fixed
>objects, texts I can analyze, in order to better understand the
>rapid developments.

Of course there are still these traditional tools of analyses, but they changed the direction, didn't they? It is not about criticizing anything and that's it, but about using it as a mirror, like you said, in order to develop own strategies. I did get very radical about this, which means in detail: I do not care about the mistakes of the "other", but prefer to take up all the evil (gee, my words), annoying things and learn from them. Take the good things away from them, steal them over to my own concepts. (That's what YT in Snowcrash does, kind of) Putting up a border between us in terms of where are their mistakes equals why are they bad would prevent me from learning. I personally criticize in that negative way when I do not understand what and why something is going on. Like as time to think.
>Wired is not an endangered species or some minority that cannot
>defend itself so easily.

I never thought Wired as a victim, nor did I want to defend them, just to hold open this possibility to look at them and take their knowledge and tricks away. To much negative critique can just close that door, I think.

>But Wired is small, Ken Wark is right about that. Even the whole
>media business is nothing compared to other industries. But it's
>our branch. And Wired is my magazine. I haven't missed one issue
>and I am the last one to look down on it, or dismiss it because
>of it's bad quality. Both Mondo 2000 and Mediamatic almost seized
>to exist (as regular publications). And we have not been able yet

>to come up with a critical alternative to Wired. That's why they
>have the field to themselves, still.

There may be the point really. As Mark Stahlmann wrote:
>The answer to your question is that we don't know the answer. The
>Toffler/Kelly world has been working on their view of post-industrialism
>for 40+ years. The post-modernist philosophers have also been building
>their houses for just as long (or longer depending on when you start
>counting).

The reason, why Wired is so big, might be quite obvious. Clever combination of new and more important than ever technology wrapped up in a little bit of culture, spiced and muldered by a little bit of journalistic approach to get it smooth. And the right time, where people want to know these things.

Wonder if we not better start an analyses on the package of information. Style of writing is the context of information, in the net as well as here in our magazine. (I am working for a music magazine called Soundlab - electronic aspects of life -> <http://www.techno.de/soundlab>). As soon as we get more pages, we want to integrate net..., yeah, what, ...culture, this word again! Don't know yet.

Have fun, cu perhaps sometimes, if you stop by in Berlin, would be nice.

nettime: push wired?
From: Geert Lovink
To: nettime-l@desk.nl
Date: Wed, 12 Mar 1997 10:23:26
+0100 (MET)

Dear Mercedes,

my push media critique mirrored the way Wired magazine announced this latest hype, you are right about this. I tried to analyze this long editorial manifesto, which I still see as a very curious document and I linked it to related developments within the Wired corporation. I did not even know at the time about Wired News and their experiments with all the existing push media software.

I do not agree with Foucault about the status of critique. He might be right, but the effects of his phrases about the End of Critique have prevented many of our generation in making rough, dirty, daily analyses of the powers-to-be (and making mistakes). The strategies of disappearance and nice and poetic indirect sayings, caught in the complicated parisian language traps, have kept us away from the capability to clearly see what is going on and intervene and finally draw conclusions and come up with new forms of organization.

(Net) Critique for me is not about some old friend-foe distinction. I do not need enemies. I need mirrors, fixed objects, texts I can analyze, in order to better understand the rapid developments. All the big and small media items and hypes need a certain, underlying structure. Together we have to figure out what this is, otherwise we are only drifting in a sea of virtual signifiers. Critique is a way to understand and has got nothing to do with attack or even 'bashing'. It's a specific way of writing (limited, though) in order to set literary, political, ethical, aesthetical rules and standards. This is perfectly normal in the world of film, theater and books and should also be established for the still very small culture that deals with new media.

Wired is not an endangered species or some minority that cannot defend itself so easily. But I have noticed throughout the years, that is also a group of people which is not so easy to understand. Their agenda is a very specific one and you need a lot of background information in order to understand their editorial policies and decisions. To give you some examples. Who of nettime has ever studied the writings of George Gilder and can show us how his anti-statist, conservative agenda influenced the Wired gang? My group, Adilkno, tried to characterize the cyberculture of the Westcoast, back in the spring of 1994. You

can find this essay in the german Datendandy book (not available in english). Here you can see how are circling around the Wired ideology, not being able to grasp it, surrounded by high piles of books and stories about the USA in the last thirty years, which is in part also our own history.

Mark Dery (ed.) came with his Flame Wars and Weinstein and Krocker with their notion of the virtual class. Only then I understood a bit more, but still, here in Holland, everyone reads Wired, but not one intellectual has yet been able to analyze this magazine. I mean it's political agenda, it's attractive sides and the way it selects the topics. People are impressed and intimidated by the big lead that still exists between the USA and Europe (appr. 3 to 5 years). And this makes the reading of Wired so exciting, also for me. It comes from the future, specially if you are surrounded by the specifics of Old and Deep Europe, like me, going back and forth between Amsterdam and the Balkans.

The Wired group originates from Amsterdam and left in 1991 or 1992 for San Francisco. They were kind of friends with Mediamatic, of which I was an editor at that time, although I did not know them personally. From here we followed their attempts to get money, the zero issue and then their tremendous success, from the very start. It was clear to us that they neither wanted to copy the new age underground style of Mondo 2000, nor the art and theory discourse of Mediamatic. They took a kind of journalistic approach, but without the critical attitude of the investigative journalism. They had to sell something, that was their inner drive. But what? Not hard- or software. It took me a long time to find out what they were 'pushing' and it is still not clear to me all the time.

But Wired is small, Ken Wark is right about that. Even the whole media business is nothing compared to other industries. But it's our branch. And Wired is my magazine. I haven't missed one issue and I am the last one to look down on it, or dismiss it because of it's bad quality. Both Mondo 2000 and Mediamatic almost seized to exist (as regular publications). And we have not been able yet to come up with a critical alternative to Wired. That's why they have the field to themselves, still.

nettime: submission to nettime lis
From: Bruce Sterling
To: nettime-l@desk.nl
Date: Sat, 8 Mar 1997 01:58:16 -0800
(PST)

Dear nettimers:

It's been very gratifying to follow the discussions of WIRED in the list. While I'm not a WIRED staffer, I am on the WIRED masthead, and I am a virtual San Franciscan thanks to seven years on the WELL.

Those who aren't familiar with the WELL may find its internal practices odd. WELL was a closed bulletin board system long before it ever became a website, and its social practices have been created over literal years of internal discussion. The WELL is something like a tide pool, it's not exactly in the Net and not exactly out of it; data flows in, but has a rather hard time flowing out. I didn't make the WELL's rules, but the rules have made the community, and if you want to play, it's de rigueur to respect their standards.

Every once in a while I see material on nettime which is of particular relevance to WELLbeings, and since I'm not putting this material to commercial use, I crosspost it. I've been cross-posting nettime comments on WIRED -- not all of them, just the ones I found of particular interest -- for almost a year now.

I don't really see anything untoward in this practice. After all, my "Master List of Dead Media" was also posted on nettime, and it was swiftly crossposted to other lists, and sites,

all over the planet. I'm still getting responses to that piece months later. I was glad to have my nonprofit Dead Media Project getting such gratifying publicity from a core demographic of net activists.

Mark Stahlman's bizarre attacks on WIRED's so-called "English Ideology" have been so entertaining that it's well-nigh impossible not to quote him. Naturally when he bravely showed up on the WELL in person, he was immediately subject to rough handling by people who actually know the WIRED milieu at first-hand, and found it hard to believe that Mr Stahlman was serious.

For all I know, there may be people on the nettime list who seriously believe that a popular American magazine on contemporary computer culture is a stalking-horse for a European-inspired cabal of cyber-illuminati inspired by the sinister doctrines of H.G. Wells and bent on global domination. Unfortunately, within the WELL, Mr Stahlman has found little popular support for his thesis. I can understand his distress, but I'm not in command of the WELL audience and can't stop them from making up their own minds after reading his own words. I rather imagine that people on nettime who have closely studied Mr Stahlman's assertions have had their own difficulties in this matter.

Mr Stahlman's copious remarks have inspired me to write an essay. Unfortunately it's not directly relevant to his own statements, but since he's referred in nettime to my essay as "elegant back-to-back rants that have to be read to be believed," and has expressed his cordial hope that I will cross-post them to nettime, I'm ready to oblige him.

Unfortunately I can't cross-post the comments of other WELLbeings, since this would be a violation of WELL Your-Own-Your-Own-Words netiquette. My essay loses some valuable context by being separated from the thread of commentary by other WELLbeings such as ludlow, kk, rushkoff, markdery and Neal, but I hope it will be of some use or amusement anyway.

Note: on the WELL, Mr Stahlman is known as "newmedium [AT] well.com."

Bruce Sterling bruce [AT] well.com

(text follows)

Topic 200 [wired]: Goofy Leftists Sniping at WIRED
#799 of 796: Bruce Sterling (bruce) Fri Mar 7 '97 (06:28)
125 lines

This is a good topic. It's forcing me to wax all magisterial and politico-philosophical. That's a dire occupational hazard for science fiction writers, but even if you're of the stature of H.G. Wells (probably the only science fiction writer with serious pretensions of being a Great Man), you're still not gonna get many people willing to page through all of it.

Except for newmedium himself, clearly a guy of rockbound personal self-esteem whom no mere argument will ever sway, it looks like we're approaching a general consensus that his "English ideology" is silly. It is, and it always was. It scarcely seems possible to demonstrate this any better than ludlow demonstrated it. Certainly newmedium isn't the only guy in the world whose weltanschauung is dependent on gaseous, self-marginalizing verbal sleight-of-hand, and since I'm an SF writer by trade my tolerance for this kind of activity is extremely high, but it's not the same thing as a reasoned argument with historical awareness and proper citation. If one is really trying to live and make political, technical and economic decisions through this kind of empty, glittering rant, one is just plain being goofy.

I have kindly and indulgent feelings towards cats like Stahlman and Rushkoff, as opposed to my thorny relationship with a guy like Mark Dery, someone I can recognize as an actual, authentic cultural critic. Dery is probably wrong about a lot of stuff and may even be kind of dangerous, but compared to him Stahlman and Rushkoff are like a couple of aluminized balloons in the same corral with a cactus. Life is funny that way. It seems to me you could make much the same assessment about H.G. Wells or C.S. Lewis and their roles in a thorny world of twentieth-century realpolitik. You might even make a similar assessment about the only 20th century science fiction writer who has actually seized power in a major government -- Newt Gingrich.

I don't think Wells and Lewis were particularly influential people, even though this would be very flattering to me and mine were such to be the case. But I do want to discuss why it is

that I do prefer HG Wells to CS Lewis, and what relevance this might have to the current, uh, cyberspace situation.

First, this is not a literary judgement on my part. I would not make the category error of saying that CS Lewis was a bad writer merely because I don't like his theology. I think Wells was a very good writer, better than Lewis, especially when Wells wasn't doing propaganda, but Lewis was also clearly a major writer of fantastic fiction. His fantasies are very engaging and have many stellar moments of high imaginative concentration. Lewis clearly had a gift -- that's not under contention here.

The I Ching is great literature too, but if you start tossing hexagrams to govern your life-decisions because the descriptions are so charmingly evocative, well, you've got a non-literary problem.

When I wonder why it is that I prefer Wells to Lewis -- two minor-league combatants in what seems to me a very old struggle -- I think fondly of one memorable battle in this culture war. It was Wells's teacher, Thomas Henry Huxley, in public debate with a guy whom I take to be one of CS Lewis's spiritual ancestors, Bishop "Soapy Sam" Wilberforce.

What Huxley had on his side was a boatload of objective evidence that Charles Darwin had painstakingly scraped up and cataloged over twenty years or so of obscure but dedicated research. What Wilberforce had on his side was a glib tongue and a deep, instinctive, passionate moral revulsion at the thought that human beings were apes.

Huxley won the debate through an exchange of insults. Wilberforce snidely inquired whether Huxley felt that it was his grandmother or grandfather who had been the ape. Huxley riposted (I'm paraphrasing from memory here, being several hundred miles away from my references) that he felt no shame in having an ape for an ancestor, and would prefer that to being the descendant of a man who would deliberately obscure the truth.

Huxley put his finger on it there. There is something deeply shameful about obscurantist mysticism. Mysticism conjures up wonderful feelings within us that make us purportedly aware of the full, marvelous, flattering scope of our numinous humanity, but it's intellectually fraudulent. Mysticism is a retreat, a cop-out, whether it's a retreat into the gospels, the noosphere, astrology, the Tarot, the Bhagavad Gita, Aum Shini Kyo armed yoga, Illuminist conspiracy theory, or even some brand-new amalgam of 'shrooms and cyberspace. It's a cheat, like rising with a flourish to write your proof on the blackboard, getting off to a cracking good start, and then drawing us a large cloudy area labelled "miracles happen here."

I'm not under the illusion that scientists, psychologists or any other biped in a labcoat really understands deep ontological reality or the true nature of the universe. What bugs me is the social practice of deliberately enshrining our ignorance, anthropomorphizing it as a living divine being, and giving it moral and ethical dominion over our lives and imaginations.

In practice, obscurantist mysticism is like the practice of embezzlement. You can't get your budget to add up. The bookkeeping rules are too hard and pernicious, and they probably don't fit your personal situation anyway. You're too weak and anxious to directly face the paralysing prospect of genuine intellectual bankruptcy. So, to keep the business going, you just borrow a few life-giving dollars out of the secret stack of the Great Unknown. You can always put it back later, right? Pascal's Wager will win it back for you, maybe you can win it back at the track... But embezzlers always say this. They don't really reason, they rationalize. And the convenience of free money rots away their integrity and destroys their judgement. They almost always take more and more.

Unfortunately, the "miracles" gambit also expands in just this way. Mystic revelation will grow to cover everything that is emotionally, politically or socially repugnant to the believer. There are always excellent reasons to declare certain things unholy, unthinkable and not subject to question. You mustn't look at this, you mustn't think that; such and such a thing is unnatural, it's blasphemous, it is the sin against the holy spirit, it what we were Not Meant to Know. And why make painful decisions about what to eat, how to dress, who to tug your forelock to? It's all divinely ordained.

For all I know, there may indeed be aspects of human behavior which are so unspeakably blasphemous and horrible that, like a Lovecraft character, my mind might shatter into bicameral fragments from the awful impact of glimpsing them. But I haven't seen any yet, and not from lack of looking around. In practice, this sort of blanket mental prohibition has generally turned out to be about harmless oddities such as worshipping idols, eating pigs, anal sex, and speaking politely to black people.

So I think that what newmedium was demanding earlier is the 1990s version of Soapy Sam's old question: "So: is it your grandson, or your granddaughter who's the hideous, shambling posthuman? Fess up!" And my Huxleyan response would be that my shameless posthuman grandchildren might have a chance to do okay, if we can honestly examine the possibilities without his eerie brand of obscurantist paranoia.

Topic 200 [wired]: Goofy Leftists Sniping at WIRED
#760 of 796: Bruce Sterling (bruces) Fri Mar 7 '97 (06:33)
122 lines

We now (I hope you didn't think I was finished) examine the pressing topic of what kind of ideology might be suited to posthumans.

I see little promise in mysticism. However. While I'm not religious, I can only concur with Neal's earlier cogent remarks on atheists having no better record. Guys who get all hot and bothered about Christianity rarely fail to bring out its dismal record of antisemitism, Biblical justifications for slavery, and inquisitorial practices of the seventeenth century. But let's face it: if you're looking for the big-time practice of those evils in our own century, you can't find better candidates than revolutionary leftist atheists.

The worst thing that could happen to you in the twentieth century was to have your society taken over in a leftist atheist coup. The Nazis, no great believers themselves, were more virulent maybe, but the Nazis were so frankly megalomaniacal that they could barely manage a dozen years in power.

But Marxist-Leninist Stalinist Mao Zedong thought... Let the record speak. The movement's roots were in scientific socialism and the rational investigation of economics and history. Marx was the kind of roly-poly bearded swot that any of us would instantly recognize at a UNIX programmer's convention. Wells was just one among legions of period radicals with scientific utopias in their back pocket. He believed that rational political science would simply sweep away the ills and unseemly quirks of human culture, in much the way that germ theory superseded pre-scientific notions like malaria, in the brisk and proper way that sanitation eliminates cholera. But Wells was no democrat. He was too full of himself. He cherished a deep, heartfelt contempt for the feudal creeps, class snobs and rich bullies standing in the manifest road of History. Like most pre-WWI zealot reformers, Wells had no idea of the havoc that totalizing one-size-fits-all doctrines would create when their arrogant dictates contacted human political reality.

Consider the Russian Revolution. Okay? It's gone now, we can talk about it honestly. Atheist intellectuals with impeccable backgrounds in the European radical press. Started off in a horrible world war. Lights go out all over Europe. Fratricidal civil wars follow. Class liquidations. Mass starvation. Nutty doomed efforts at collective agriculture -- it's the 'scientific' way to feed the masses, it makes great sense on paper. Mass deportations, genocide of minorities (hopelessly backward, stupid, and in the way). Abandonment of all pretense of representative government (why listen to backsliders?). Abandonment of the rule of law, even their own laws and their own Constitution (too much trouble following tedious rules which will only be exploited by bourgeois parasites and "cosmopolitan" lawyers). Suspension, and then abolition of civil liberties. Armies of secret police. Pogroms against secret police by other factions of secret police. One of the most dangerous positions you could possibly have in such societies was a loyal servant of the state.

And I was waxing indignant about Soapy Sam's rhetorical hijinks, so then let's talk about the intellectual crimes of Russian, atheist Marxism. Rampant forgery of historical documents. Censorship on unheard-of scales. Celebrities rendered non-persons, famous events rendered non-events. The Lysenko fraud against biological science (Huxley's favorite field). Scientists put into labor camps and still forced to do technological work behind barbed wire. A mania for classifying anything considered of any conceivable benefit to any imagined enemy, leading to

Mark is doing something similar but vastly more complex -- namely trying to develop a cohesive and rather complete intellectual history of the advocates of technology during the twentieth century....not a small task but one with fascinating relationships, roots and alliances.

Wired has never risen above gosh, golly gee wiz snapshots of some of the players....Big picture views of the "global economy" by the likes of korten and greider are terribly important. Big picture overviews of the intellectual roots of our current situation are just as important. I am fascinated by the tapestry that Mark is weaving. of course I am biased. I let my wired subscription lapse a year ago.

nettime: Net.Art - the origin
From: alexei shulgín
To: nettime-l@desk.nl
Date: Tue, 18 Mar 1997 01:05:08
+0300

I feel it's time now to give a light on the origin of the term - "net.art".

Actually, it's a readymade.

In December 1995 Vuk Cosic got a message, sent via anonymous mailer. Because of incompatibility of software, the opened text appeared to be practically unreadable ascii abracadabra. The only fragment of it that made any sense looked something like:

```
[...]j8~g#\vNet. Art[-^st [...]
```

Vuk was very much amazed and excited: the net itself gave him a name for activity he was involved in! He immediately started to use this term. After few months he forwarded the mysterious message to Igor Markovic, who managed to correctly decode it. The text appeared to be pretty controversial and vague manifesto in which it's author blamed traditional art institutions in all possible sins and declared freedom of self-expression and independence for an artist on the Internet. The part of the text with above mentioned fragment so strangely converted by Vuk's software was (quotation by memory): "All this becomes possible only with emergence of the Net. Art as a notion becomes obsolete...", etc. So, the text was not so much interesting. But the term it indirectly brought to life was already in use by that time. Sorry about future net.art historians - we don't have the manifesto any more. It was lost with other precious data after tragic crash of Igor's hard disk last summer.

I like this weird story very much, because it's a perfect illustration to the fact that the world we live in is much richer than all our ideas about it.

<nettime> Towards a Data Critique
(for zkp5)
From: Frank Hartmann
To: nettime-l@desk.nl
Date: Tue, 21 Jul 1998 12:28:22
-0400

[this is one of the first texts for the zkp5/nettime bible which came in. please send us your texts, drafts and suggestions to: nettime[AT]desk.nl]

TOWARDS A DATA CRITIQUE

Frank Hartmann

"Data is the anti-virus of meaning"
--Arthur Kroker

"There is no information, only transformation"
--Bruno Latour

The digital datasphere affects all major aspects of cultural production. Is there still a task for critique in this process, aside from cheap falsifications of the techno hype, or from simply articulating fear? What could be the task for a data-critique then, which could succeed to reveal the hidden agenda of the proclaimed 'information society'?

After critique

According to some commonsense view, we have already entered an era beyond enlightenment and critique: the new media reality creates a symbolic totality, an inclusive environment--a perspective from which any critical discourse seems an irresponsibility of sorts. With this new media reality, the level of theory and of its object becomes undistinguishable, and what we need therefore to grasp cyberspace is not a critique of ideology but a more systematic description of media, an analysis of its infrastructure, and an archaeology of the apparatus. This positive view now aligns intellectuals as well as activists and artists under the efforts of technology.

Critique is negative indeed, and that firstly means it is all about limitations. While net-criticism as an activity indicates the limits of the Internet with all its disappointed hopes from the 60ies ideology, data-critique deals with the philosophical and social assessments of digital technology. Necessarily invoking some spirit for the enlightenment which became unpopular after the recent 'death of the subject', the aspects of data-critique are reaching beyond any single-handed notion of progress within the inclusive form of new media.

Philosophers, within their academic discipline, fall short to grasp the meaning of new information and communication technology, as they keep to the beaten track of reading, interpreting and redistributing texts within their classical frame of reference. The academic community, at least the humanities, still largely depends on the gratifications of the paper medium, and that means on traditional 'print-publishing' through 'publishers'. To be media literate otherwise, they consider none of their business. There are several reasons for that ignorance. A quite profane one is 'fear of the machine', which can take on very sophisticated forms: from straight neo-luddism to a moralistic, protestant information-ecology with its apotheosis of the pen and the typewriter. These positions for one, seem to make clear - insisting on their professional identity, the so-called humanities tend to exclude any non-humanist discourse in favour of their quest for autonomous 'subjects' and their hermeneutic privilege of 'making sense'. But there is no way in falling for a Heideggerian promise which supposes to reveal an order of things that still could go undisturbed beyond any stirring by 'media'. There is no such tranquility of being once after 'care' has crossed the river for good.(1)

Global Information Economy in Different Worlds

A range of sociological questions supersede the technological ones. With the new information and communication technologies [ICT], the end of this century provides the first world with a thorough and disorientating crisis concerning the role of work, education and entertainment. The reason for this is a postmodern condition at one hand, a global marketing strategy for these technologies on the other. When in 1995 the National Science Foundation's funds for the Internet backbone structure in the USA finally ran out, new sponsorship was due from somewhere. By going international and also by leaving academic boundaries behind, the providers of the 'net' found their new strategy for economic survival. An American concept was ready to become "the boom to humankind [that] would be beyond measure", pulling everybody into "an infinite crescendo of on-line interactive debugging".(2) While some 95% of the first and 99% of the rest world population is not online--the information highway has no turnoff to their house and home and maybe will never have--the electronic commerce is exploding and the emerging Virtual Class takes their advantage of the bit business, "the production, transformation, distribution, and consumption of digital information".(3)

And again, what are we referring to? For the society in transition, the complex social and cultural matrix of change is not properly known; in the present discourse, cyberspace as the emerging social space is perceived merely by technological metaphors and a market-driven development of the broadband ICT infrastructure. Especially in Europe, yet not without a particular reason: the European ICT-market currently ranges at a total value of ECU 300 billion, and sees an average national per capita

investment in Western Europe of approximately ECU 350.(4) While Internet access still is between 10 and 100 times more expensive in Europe than in the USA(5), the European Commission's propaganda sees Europe as the coming heartland of electronic commerce, pushed by those investments and numerous ICT-policy action plans.(6)

New media and the prophecy of an information society are little more than the figleaf of a failed transition of modernity towards a more social society. Judging from various programmatic papers, the social impact of the broadband media applications are very modest. In the so-called Bangemann-report(7) people in the end only exist as the representation of solid markets under the command of an ideology of total competition within the first world(s). With this 'new techno-utopia of the emerging global market capitalism' (Group of Lisbon) the sole principles of market liberalisation, deregulation and privatisation are applied.(8) In consequence, the recommendations and the proposals of the Bangemann paper seem to serve more to the benefit of the attending companies in this Expert Group themselves.

The lack of proper understanding for a new information economy beyond competition also derives from an uncertainty or even a crisis of the intellectual position and the role of theory within it. The bit business does not need a media theory. The same goes for the new 'Virtual Class', that social segment which--according to Arthur Kroker's observation(9)--benefits most from the virtualization, and which defends information against any contextualization, with its goal of a total 'cultural accommodation to technotopia' exterminating the social potential of the Net.

Intellectual discomfort

While thousands of websites blossom, most intellectuals feel instinctively uncomfortable with this process. Traditional Homo Academicus all ash and sack, has not much clue to what is going on in the flashy online world. Further to their distance, random ASCII fetishists become the new iconoclasts of the Net. Having invested in all that textualism, and having formed this distinctive usenet community, now coping with the masses again, with those impositions of the World Wide Wedge - accompanied with an unquenchable thirst for new software, new applications, more pictures, more entertainment, and more prefab interactivity!

In the beginning, there was the word, then there was programming. In terms of cultural technique, the computer itself substantially changed, as well as our relationship to the machine, in a relatively short time, from numbercruncher to wordprocessor to thoughtprocessor. (10) Moving from mainframe to personal computing (PC) to net computers (NC) and now all of a sudden computers, as we painfully learned to know them, seem to vanish again. Not only they become less significant parts of an integral whole, but also widely integrated into everyday's appliances as in 'intelligent' cars, household machines, shoesoles, and the like. Culture moves towards a state of ubiquitous computing, where these machines form the new environment. Amongst many other things, this indicates new forms of social integration and a new involvement in societal relations. Kant's transcendental subject seems to exist not longer in terms of common categories of sensual perception and logical thought but those of the global electronic datasphere. Which brings to mind McLuhan's phrase, that "in the electric age we wear all mankind as our skin."

All mankind, one world! Should this be the heritage of the age-old philosophical dream of a universal language and a common understanding come true? The misleading term of the Global Village forgot to discuss the severe social constraints which determine life in a village. There is a possibility that the information society becomes as culturally homogeneous as any village lifestyle is. But we will never forget that we live in different worlds.

The ideology of individual liberalism can be seen as a cultural movement from west to east, from north to south, a doctrine of salvation, which sells the benefits for a technocratic elite of the Virtual Class as a paradigm for the global social sphere. The electronic frontier actually is a retro-movement across the Atlantic towards Europe, which proceeded within Europe towards the East with considerable delay. The relatively homogeneous character of 'Cyberspace American Style' was perceived critically from a European perspective, where the loss of cultural diversity was and still is feared. Besides demographic factors, there are several other hindrances for coping with this specific change. The problems with the new electronic boundaries between East and West are not of a mere technical but also a cultural nature. Cultural differences express themselves through different use of communication and techniques: a technical interface always also is a cultural one.

Winds of change, battle on content

Basically, ICT is grossly overestimated as a tool or instrument of change, especially when its brief history (with an open end) is being considered.

Will technology change people, or are new technologies already the expression of change? But then, technology is always only a part of the problem. In the end, we have to ask what will determine the shape of Cyberspace: Asian hardware and American software alone? Cyberspace holds political, socio-economical and cultural issues as well, all of which are up to thorough scrutiny by social and political science--I would like to promote this as a specifically European task. As there is cyberspace, what does it mean for 'us', living in a fragmented world?

Needless to say, that task is a critical one. Why? It once was argued by philosophers that the bourgeois utopia of a democratic, participatory society was the "natural child" of absolutist sovereignty. The critical task of enlightenment was being performed in a time of societal crisis, and thus took on some hypocritical measure. The object of critique firstly being texts and their social implications, e.g. the Bible, enlightenment failed in its task to replace these texts with new content when its critique explicitly was extended towards politics and society as a whole. The benefits of enlightenment meant business for some.

In his critique of aesthetic reason, Kant argued in train of the biblical prohibition of images for an enlightenment which is "just negative" in respect to its task: he not only carried on the age-old quest of intellectuals-- defending their cultural privileges, i.e. textual against any easier accessible cultural techniques, wanting to be the 'true' mediators against any kind of 'deceiving' media -- he also refused to name what this non-pictorial 'Denkungsart' should be, if simple demystification (of the 'childish apparatus' provided by religion and corresponding politics to keep people as their subjects) would not do.(11) Ages before Kant, nominalism already failed to win its battle on content, which started with the intention to distinguish real content from mere metaphysical noise (flatus vocis), and true thought from ideology by ways of, let's say, a proper information economy. Now history shows that a simple purification filter--from thoughts to words, from images to texts, from texts to programs--is not the way it works. Such self-righteous critique easily becomes delusive. This happened to the bourgeois filter of content against transcendence, as the Encyclopedie necessarily failed to be the new Bible for modernity.

Virtual intellectual task force

Re-thinking enlightenment! Still an academic endeavour. Re-programming society! A fading socialist dream. The elements of a data critique are at hand: a task not to be left to the neo-luddites.(12) The Virtual Intellectual--a new figure discovered by Geert Lovink -- will be constituted through his/her specific mixture of local and global cultures: "The Virtual Intellectual is conscious of the limitations of today's texts, without at the same time becoming a servant of the empire of images." Critical activities, being the heritage of the textual realm, "will now be confronted by the problem of the visualisation of ideas."(13)

Critique, according to Kant, concentrates on the form versus the content, on the realisation of 'negativism'. As critique always means differentiation, a data critique follows the modulations of information within a process of circulation. It works on the level of subjectivity, while this implicates some sociological sobriety, some demystification, and some diversity. Since digitalisation alone is not the issue, the question is whether there are alternatives within the pretentious information society project!

Philosophically, it keeps its sceptical distance towards ontological questions concerned with 'truth', and similar traditional encumbrance. In a kindred spirit, Peirce's pragmatism -- stating the fact that "We have no power of thinking without signs"(14) -- made clear that because sign and signified differ according to an ever changing 'interpretant', we rarely have a chance to recall qualities in communication which relate to anything beyond actual sign-use and therefore, media-practice. Thus, the irrelevance of any metaphysical 'meaning' as in 'true representation' of ideas through texts becomes a notion of enlightenment revised, for generations after the overwhelming encyclopedic project of a thesaurus with all available knowledge (as cognitive possessions), or even the notion of 'unified science' (further to d'Alambert or, more recent, Charles Morris, Otto Neurath and others who historically struggled to create a new symbolic 'unification').(15)

Information on information

Hypermodern communication tends to synchronise all aspects, and under these conditions to publish, means instant access to all utterance. The immediacy of media is getting scary. Thoughts are phrases made while having media presence. Simulation and speed are the two concepts which dominate media philosophy. Language is but the soft currency in an economy to increase the turnover of the information industries. After texts there are documents, after structure there is HTML, after style there is VRML. Meanings are offset in dot com. All content is but chunks of inert digital information, waiting for the copy pirates. At any common workplace, no

material objects are being processed, but information. What are the resources of information work? When information becomes decontextualised, as it does, then what we need is more information on information.

Any information which is not contextualised is worthless. Phil Agre imagined intelligent data as he put forward the idea of "living data" by thinking through all the relationships data participate in, "both with other data and with the circumstances in the world that it's supposed to represent".⁽¹⁶⁾ Geert Lovink and Pit Schulz established the notion of a Net Criticism, introducing the fuzzy concept of something like ESCIL, a European Standard Code for (critical) Information Interchange.⁽¹⁷⁾ One could further elaborate on this list; elements of data critique are there. A data critique, in terms of the announced information society, is not. It may be all about creating context, and defining the conditions. About the power of techno-imagination (Einbildungskraft), as media philosopher Vilem Flusser (18) announced it. And content, what content? The Net is a part of creating and/or reinventing cultural context as form, not as content. Concentrating on the form means to keep up cultural tradition. The Net's problem is that the social motive which made it possible is seen totally detached from the technological process, and vice versa. While deconstructing illusions, the age of enlightenment produced some illusions of their own. What is needed is not a New Enlightenment through technically enhanced individuals, as Max More suggested for the hypermodern age (19), but a renewed epistemological agnosticism of sorts, an anti-dualism set against the notion of that 'inner nature' of things which leads to any 'true' forms of representation. Why not call it a data-critique?

<nettime> Net Criticism 2.0: a dialog
From: Geert Lovink
To: nettime-l@desk.nl
Date: Tue, 21 Jul 1998 13:37:48 +0200 (MET DST)

Net Criticism 2.0 A Fast Conversation of Two Moderators with Ted Byfield and Geert Lovink

[in preparation for the 'nettime bible', the upcoming book which will be released in november at the Dutch Electronic Arts Festival, V2, Rotterdam]

GL: So let us have an exchange about the current and possible 'net criticism' and how we think this genre should be (further) developed. Who are your masters, big examples? Is NG different from IT-business reporting, investigative journalism, essays? I wonder, for example, what you think of all these books with examples of 'successful' websites and their design. Few people question that genre and discourse. The same counts for software manuals, the dummy books etc. Well, there is (or was) a Wired critique, yes. But how to get beyond that?

TB: You may remember that when phrase like 'net criticism' and 'net discourse' first cropped up, I was pretty skeptical about them. Not about the work being done under those rubrics, but about the possibility of these fields or disciplines: whether the subjects or objects were understood clearly enough to hold together as a project. At the time I drew a parallel to a distinction floating around in some newsgroups devoted to various problems of the net, between abuse *on* the net (flaming, basically) and abuse *of* the net (spam, forged cancels, etc.). We still see this ambiguity, in efforts to elaborate genres that are somehow 'native' to networks and claims that 'the net was used to organize the opposition in Indonesia'. There is that kind of confusion, which hasn't really been worked out, and then there's another kinds of confusion that stems from how quickly the medium (however you want to understand that term) has changed. So I don't think these efforts have come together clearly, but the more recent confusion may be a sign that, as you've called it, a 'Net Criticism 2.0' is coming together. It's certainly needed.

GL: I wonder if we can harass the masses to join a competition about 'net criticism 2.0' and what it should be all about. Or is this already too self-referential? the problem here is really one of positive or rather negative role models, types of text one falls in love with, mind-blowing critiques that shake the fundaments of the current Net (business)...

TB: That's a question for future historians to ask, whether it was all too self-referential. As for 'harassing the masses', who knows? This relates to another ambiguity, namely, what is the net for? Is it instrumental, a means of communication? Is it a medium,

whether for art or for publishing? Is it an empty notebook, or a television, or a telephone, or an arena? It's very easy to think of a particular forum on the net as a kind of context, but what's harder to understand, I think, is the reception of that context--as something for passive edification or entertainment, or as a 'push-back channel' for finished works, or even as a testing ground for unfinished experiments? Some combinations of these possibilities are very vital, others not so vital. So the question might be what's the most vital option? But maybe *that* is too self-referential.

GL: The best discourses are perhaps those which cultivate and differentiate their language and internal reference system without becoming completely obscure, a seductive game of closures and openness. The relatively closed system of the mailinglist can be a good environment to develop a rich set of ideas, before the army of recyclers like academics, journalists, and cultural mediators take over. But by and large it is an irrational process that can not be simulated or even staged. And it should have a certain radical approach. Moderate voices can only come up with sweet synthesis at the end. So the NC 2.0 is in need of new forms of narrowness. The cyber ideology now needs new directions, enemies, targets, and positive goals also, of course.

TB: I used to wonder if, as the net became a normal part of life like the telephone, the possibility of 'net critique' would somehow seem like 'phone critique' --a quaint historical wrong turn. But I don't think so: one reason net 'exploded' was the possibility it opened for circumventing the various establishments of only slightly older generations who had become quite comfortable in their professionalized forms of discomfort: enforcing suddenly stratified structures in academia, journals, galleries, activist organizations, and so on--very much at the expense of those who sought to continue critique, if not 'follow in their footsteps'. And so we saw this fast proliferation of soapboxes, networks, and so on. I don't believe the dissatisfactions and ideals that drove that move are gone, done, settled, we're all happy now, no more problems, everyone is all of a sudden moderate. So there is your potential radicalism. But what are the frustrations and goals these few years later?

GL: Avital Ronell would love your 'phone critique', but anyway, the question now is if we, the users of the Net, simply accept the standard as are now being developed. No more research and development. This is also the starting point of that brilliant 'anti mac' piece that was on nettime a little while ago. It states that the Apple Mac interface has not changed for a long time and that the human-machine interface are lot likely to be revolutionized some time soon. The same can be said of Microsoft and its critics. We are in danger of getting stuck into web normalcy. This could be the point where the real existing frustration comes up. After all the sell outs, mergers, bankruptcies we can think of organizing the discontent of the more experienced users that did not get trapped into cheap cyber fascinations, through new models of trade unions, consumer organizations, and the appearance of the dissatisfied masses that are committing 'electronic civil disobedience'.

TB: I wish I could say that I loved her 'Telephone Book', but no--in part because it 'anticipated' in print some of the big dead-ends that have trapped electronic media ('event' instead of continuity, melange instead of synthesis, hype instead of substance, etc., etc.). There's a danger in falling for the seductive cosmopolitanism or worldliness that the net offers: eclecticism very easily devolves into a reactionary mode, but rarely reveals itself as such because its concern for input and reception provides no basis for saying 'OK, enough for now, we know what our principles are, time to act on them.' I think this is the fascination with the free or open-source software movement: ah, this eclecticism has paid off, now we've found an ideal that's native to network. All well and good, but then these forces come out with a silly 'Open

Content License,' it's like they jumped through Alice's mirror and into the wonderful world of hypertext, but they're 'back' button is grayed-out; they forget that content always was open and still is. Some freedom: so now the 'Communist Manifesto' becomes the compiled binary, and you can only distribute it under OCL, with the 'Grundrisse' 'comments' and 'Das Kapital' 'source code.' David Bannahum jokes about the 'gif economy' and 'wysiwyg society'; what I'd like to see is an 'ascii revolution.'

GL: OCL is one thing, but have you seen the expensive coffee table edition of the Communist Manifesto, published for the 150th anniversary of that text? ascii is now what pulp for the newspapers used to be in the 19th century, a fundamental resource which is driving all these virtual and spacial revolutions forward. But this is not obvious! Code is rapidly becoming less and less visible. We are essentialists in that we like to believe that the elements behind the spectre is that which counts. The same can be said of certain media theories stating that war is the mother of all media technologies. That might be all be true. But the on-line masses are blinded by interfaces, funky imagery. Net Criticism cannot only have that one strategy, to constantly 'uncover' and deconstruct other people's java scripts and clever HTML... We should also understand and 'trust the masses' in their cheap admiration for the ephemeral.

TB: It'll be interesting to see whether the trend toward making code visible (open source) will make it more legible. For many, no: it will be like transliterating hieroglyphs into phonetics. But literacy is a 'technology' too, and from the 11th century it went from being rare in the 'upper classes' to a basic tool for tradesmen; and that 'renaissance of literacy' brought about a 'renaissance of heresy' --people exercising literacy outside of the institutional structures that taught not just the technology but how to interpret, explain, and apply it. (And this wasn't the result of a programmatic push by a progressive intelligentsia; on the contrary, the 'intelligentsia' *fought* it.) So maybe there's a historical wisdom, a new kind of technology in this melange of barely understood code, funky graphics, ephemera--maybe somewhere in that combination that seems so disorderly is the historical force. Let's assume for a minute that the model we've been taught to trust--an intellectual vanguard that supposedly learned compassion from its excesses and respect for 'the masses'--is in fact a reactionary force trying to protect its political patrimony by imposing traditional interpretations and ideals. What could come from this incredible soup of visual and instrumental techniques? We complain and worry about how interfaces are 'stopping' people--but what if those interfaces don't matter at all?

GL: That would be heaven, perhaps even the end of the NC project. Instead of an ecstasy of collective net constructivism, we might expect a return of the (cyber)cultural pessimism. In the end, all the cynical outsiders will be right. But that's unbearable. Recently I was inspired by the idea that the virtual class, venture capitalists and all these suits are not more than 'paper tigers' we should not be afraid of. We still have the ability to organize ourselves (in new ways, yes) and claim hegemony against microsoft, apple, UUNet, compaq, netscape, sun, worldcom and whoever. This had not even been tried. The lonely freelance subjects are so tamed, numbed, still captured in old stories but that will change as soon as this 20th century is over and certain traumatic events have faded away. NC 2.0 should be social science fiction and be ready once the temporary lapse of reason (over the Question of Organization) will be over.

TB: OK, a compromise definition: NC 2.0 should be the atomized foundations of a future we can't imagine. But what we *do* know is that new forms of organization will get caught in the same old traps if they rely on same old analytical tools. So let's break some of those. I nominate the 'Conspiracy' as the first idiotic idea to smash: it involves everything you

say--pessimism, suits, hegemony, and a lonely freelance subject captured by old stories. What is a 'Conspiracy'? An organization that's effective, hierarchical, doesn't talk, and plans to 'rule the world.' So, if someone opposes this organizational model, what values is s/he *supporting*? Ineffectiveness, a happenstance program, hype, and individuated powerlessness. Oh, and 'Conspiracies' are 'Evil.' But what does that mean, other than attributed motives? Yeah, killing people, imprisoning people, people, and exploiting people are unethical--but do we need to consider 'motives' to condemn these things? No, we can condemn them on objective grounds. So what if we ignore this motive of a 'Conspiracy'? We end up with the idealized model of a corporation: effective, responsive, organized, forward-thinking, and growing. Perfectly good ideals for many social organizations. So let's throw this idea of the 'Conspiracy' out--and throw out this fascination with 'motives' while we're at it. So that's my nominee for how to proceed with NC 2.0. What do you suggest?

GL: Conspiracy theories do not honor the Enemy, they want to erase, kill, and delete. But you do really suggest that this line is dominant these days? Because there is little else! I can see similarities with the 'ascii movement' in the sense that it is all about tearing down the corporate-state masks under which a self-explanatory truth will reveal itself, without answer the urgent question of new ways to organize and gain hegemony outside of the neo-liberal project of the global market. It is prolonging a desperate form of individualism which is not even suitable for networks. So NC 2.0 could also be about making free space to design new forms of (collective) subjectivity.

TB: Dominant, I don't know, but growing? Yes. We're building tools that we designed with naive, limited, or idealized assumptions, but the world produces other conditions: so maybe the tools 'break' or maybe they do exactly what we specified but with consequences we never intended--for example, they will run amok. And they provide new metaphors for thinking about older problems, social configurations: society as agriculture, society as steam engine, society as chaos theory, society as cybernetic process. *This* is 'interface culture.' So now the neo-liberal global market likes to talk about itself as 'information flows,' 'frictionless microtransactions,' etc. There is no self-explanatory positive truth 'underneath' these metaphors, just a dialectical relation between them, on the one hand, and where we are and where we want to go, on the other. So I think we agree: NC 2.0 should be a project to articulate and create new powers, new freedoms. When you tear down a wall, you have to put the stones somewhere. So when we tear away at a dumb idea, we find we criticized ideals we need. And you say: The problem is the neo-liberal project of the global market. OK, then: Which parts of it should we tear away at, which parts should we keep, and how do we reconfigure those parts? The answers to this question will begin to give us priorities and the seeds of a plan.

GL: George Soros and others have suggested that we introduce a tax on global trade of stocks and currencies. We could reduce global trade and traffic, stop the silly sale of Dutch flowers in Chile and New Zealand (for example), while at the same time fight for the right of people to freely move from one country to the other. Why this the right only of flowers and dollars? One could focus on local networks and forget the whole international English media culture for a while. And re-enter on the global stage, if necessary. Universal accessibility should not be our principle--it is just one option among many. Attacking the standardized department stores, shopping malls and hotel cultures is another strategy besides the struggles against multinationals like Shell, McDonalds, Nike etc. (this is somehow obvious); and at the same time building up truly numerous transnational networks from below, not merely to exchange but also to collaborate in a direct way, without intermediaries, free of ideology and control, eager to express anger, not afraid to organize and fight back. That is my, very private, vision of net

criticism, the next generation.

 >tear away at, which parts should we keep, and how do we
 >reconfigure those parts? The answers to this question
 >will begin to give us priorities and the seeds of a
 >plan.

Net Criticism needs clarity to cut through the maze and detect new spaces that are opened by the changing conditions created by the Net, not so much only with in the Net but in the societies and culture which are reorganized by using the technologies.

The 'global market' as a catch phrase is one of the 'mazy' things that create confusion and this confusion is instrumental. It makes any critique seem impossible by presenting something that seems so big and complex that nobody knows where to begin the detailed work which any critique needs to engage in if it doesn't want to be just another layer of 'novelty'.

Let's look at the parts into which the 'global economy' can be dissected:

- * Globalization
- * Globality
- * Globalism

Globalism means the neo-liberal ideology which argues that the market is a 'force of nature' which by its character is out-side the realm of the political and any political invention is to disturb or hinder the way things develop most efficiently, thus creating a situation of additional stress. Globalism is the political ideology that promotes the 'end of politics'.

Globality acknowledges the fact the decisive aspects of our economy, and of our culture -- just count the continents you have recently been to -- are already organized on, or at least being influenced by, a global scale. It furthermore acknowledges that this process is irreversible and that any critique needs to start from here. This is fairly obvious.

Globalization, at last, is where the action is. These are the processes that underlie the further expansion of the scope of Globality and its systems of ordering and reproduction. Globalization, however, does not need to be a one-way street, as the dominant ideology of Globalism suggest, globalization does not mean that 'everything that is solid melts into air', that we are all to succumb under the abstract logic of a deregulated, read market-regulated, economy of behemoths. Globalization also means that previous isolated people and groups can communicate, that strategic action at key nodes can be disruptive for the whole network, that grassroots can coordinate themselves globally, in short, that the local can gain an enormous power.

When we start to separate the ideology of Globalism from the process of Globalization, which are much more diverse and culturally oriented than the neo-liberal model is able to understand, then we will find the in the falt-lines space for action and hope, something not just to criticize but to look forward to.

[The distinction of the three terms is borrowed from Ulrich Beck: Was ist Globalisierung?, 1997]

>Regarding the Net Criticism 2.0 dialog:

[...]

>Net Criticism 2.0 is spoken about as if it could facilitate the "design"

>of something -- specifically, that it could be about "making free space"

>to design new forms of (collective) subjectivity." As if! An

>alternative position would be to place oneself in the fray, and rather

>than facilitate the design of new forms of subjectivity, the objective

>would be to discover the new forms of subjectivity that are emerging -

>and these not apart from, but deep within the guts of consumer society.

>How is contemporary subjectivity defined today? You can bet it is not

>"outside" of market culture in any sense. You have to come down off the

>perch and enter into the market to understand it. Otherwise, you are

>losing the ability to speak to an entire generation.

jordan - you didn't get the response you wanted, did you! :-)

i'm glad you spoke up because i'm also a little skeptical of the old school
speak.

here's what i heard you saying:

enter in strategic ways

organize and set our own prices

develop critical and resistant market ideologies

extend the market as a network

i like this model... articulation rather than rejection. i think one of the
most exciting things about new media is that it allows us, the programmers,
the freedom to manufacture the core substance of our work. at rhizome (and
i guess at blast too) the model is actually to produce an "organization"
that facilitates cultural production. nettime, with no employees, no
offices, etc., i guess would be the opposite of that--although both are
successful in different ways.

to the skeptics of engagement, a perfect example: rtmark. they are
completely embracing both a corporate aesthetic and a corporate business
model, and they're still punk rock. others like etoy, BIT and technologies
to the people are also embracing the corporate aesthetic.

the responsibility of Net Crit. 2.0 should be to analyse the real workings
of the new media--the "logics" of computer networks, how technology
produces subjects, new aesthetic forms, the structure of online
communities, biometrics, collaborative filtering. i'm less interested in
the back and forth arguments around economics and consumerism.

<nettime> My Lawyer is an Artist

From: Aymeric Mansoux

To: nettime-1@kein.org

Date: Fri, 11 Nov 2011 14:23:23

+0100

Most discussions around the influence of the free software philosophy on art tend to revolve around the role of the artist in a networked community and her or his relationship with so-called open source practices. Investigating why some artists have been quickly attracted to the philosophy behind the free software model and started to apply its principles to their creations is key in understanding what a free, or open source, work of art can or cannot do as a critical tool within culture. At the same time, avoiding a top down analysis of this phenomenon, and instead taking a closer look at its root properties, allows us to break apart the popular illusion of a global community of artists using or writing free software. This is the reason why a very important element to consider is the role that plays the license as a conscious artistic choice.

Choosing a license is the initial step that an artist interested in an alternative to standard copyright is confronted with and this is why before discussing the potentiality of a free work of art, we must first understand the process that leads to this choice. Indeed, such a decision is often reduced to a mandatory, practical, convenient, possibly fashionable step in order to attach a "free" or "open" label to a work of art. It is in fact a crucial stage. By doing so, the author allows her or his work to interface with a system inside which it can be freely exchanged, modified and distributed. The freedom of this work is not to be misunderstood with gratis and free of charge access to the creation, it means that once such a freedom is granted to a work of art, anyone is free to redistribute and modify it according to the rules provided by its license. There is no turning back once this choice is made public. The licensed work will then have a life of its own, an autonomy granted by a specific freedom of use, not defined by its author, but by the license she or he chose. Delegating such rights is not a light decision to make. Thus we must ask ourselves why an artist would agree to bind her or his work to such an important legal document. After all, works of art can already 'benefit' from existing copyright laws, so adding another legal layer on top of this might seem unnecessary bureaucracy, unless the added 'paper work' might in fact work as a form of statement, possibly a manifesto. In this case we must ask ourselves what kind of manifesto are we dealing with, what is its message? What type of works does it generate, what are their purpose and aesthetic?

The GNU manifesto

In the history of the creation and distribution of manifestos the role of printing and publishing is often forgotten or given a secondary role. But, what would have become of the Futurist Manifesto without the support of the printing press and the newspaper industry in France and the rest of Europe? Not much, probably. So it is not without irony that one of the anecdotes often given to illustrate the motivations of Richard Stallman to write the GNU Manifesto, the founding text behind the free software movement, is rightly linked to the story of a defective printer. Indeed, very often, the origin of the document starts with a story about a problem Richard Stallman and some colleagues of his faced when Xerox did not give away the driver source code of the printer they had donated to MIT, preventing the hackers at the lab to modify and enhance it to fit their specific needs. In this case, this particular printer model had the tendency to jam and the lack of feedback from the machine when it was happening made it hard for the users to know what was going on.^[1] Beyond the inability to print, and behind what seems

to be a trivial anecdote, this event still remains one of the best examples to illustrate the side effects proprietary software can have in terms of user alienation. The programmers and engineers that were using the printer could have fixed or found a workaround for the jamming, and contributed the solution to the company and other users. But they were denied the access to the source code of the software. Such a deadlock is one of the reasons why the GNU manifesto was written. What is unique in this manifesto, is the idea that software reuse and access should be enforced, not only because it belongs to a long history of engineering practice, but also because software has to be free.

Looking at the text itself, we can see that the tone and the writing style used by Stallman make the GNU Manifesto closer to an art manifesto, than to yet another programmer's rant or technical guideline. As a matter of fact, we can read through the document and analyse it using the specific art manifesto traits that Mary Ann Caws has isolated based on the study of art manifestos produced during the twentieth century.^[2] For instance Caws explains that "it is a document of an ideology, crafted to convince and convert." This is correct, the GNU manifesto starts with a personal story, turns it into a generalisation including other programmers and eventually involving the reader in the generalisation and explaining to her or him how to contribute right away. Caws also characterises the tone of manifestos as a "loud genre", and it is not making a stretch to see this feature in the all-capital recursive acronym GNU and the way it is introduced to the reader. It is the first headline of the manifesto and sets the self-referential tone for the rest of the text, as well as embodying a permanent finger pointing to what it will never be: "What's GNU? Gnu's Not Unix." Furthermore, she reminds us that the manifesto does not defend the status quo but states its own agenda in its collective concern³, which is what Stallman does with the use of headlines to announce the GNU road-map and intentions clearly: "Why I Must Write GNU," "Why GNU Will Be Compatible with Unix," "How GNU Will Be Available," "Why Many Other Programmers Want to Help," "How You Can Contribute," "Why All Computer Users Will Benefit," the GNU Manifesto also instructs its audience on how to respond to the document with the presence of a final section "Some Easily Rebutted Objections to GNU's Goals" that lists and answers common issues that come to mind when reading it. Last but not least, manifestos are often written within a metaphorical framework that borrows its jargon from military lingo and for many the GNU Manifesto is being perceived and presented as a weapon, essential in the war against the main players of the proprietary software industry, such as Microsoft. In fact many hackers saw in the GPL an effective tool in "the perennial war against Microsoft."^[3] Thus, when the copyleft principle, the mechanism derived from the GNU Manifesto, is introduced in the 1997 edition of the Stanford Law Review, it is precisely described as a "weapon against copyright"^[4] and not just a 'workaround' or 'hack'.>From the manifesto to the license...

This particular concept of freedom, as it is expressed in the manifesto, is focused on the usage and the users of software. It will eventually lead to the maintenance by the Free Software Foundation (FSF) of a definition of free software and the four freedoms that can ensure its existence. On top of that, the GNU Manifesto is practically implemented with the GNU General Public License (GPL), that provides the legal framework to enable its vision of software freedom. It means every work that is defined by its author as free software, must be distributed with the GPL. The license itself works as a constant reference to the manifesto, by the way it is affecting the software and its source code distribution. Every software distributed with the GPL becomes the manifestation of GNU, and the license's preamble is nothing else but an alternative text paraphrasing the GNU Manifesto. This preamble is not a creative addition to the license, on the contrary the Frequently Asked Questions (FAQ) of the FSF even insists that it is an integral part of the license and cannot be omitted, thus making form and function coincide.

Even though the GPL was specifically targeting software, it does not take long for some people to see this as a principle that could be adapted or used literally in other forms of collaborative works. As early as 1997, copyleft is mentioned as a valid framework for collaborative artworks in which artists would pass "each work from one artist to another."^[5] Of course, this is suddenly brought to our attention not because of the collaboration itself, but because of its sudden legal validity. Indeed the idea of passing works from one artist to another and encouraging derivative works is nothing new. For instance, back in the sixties, mail artists such as Ray Johnson even used the term "copy-left" in their work,^[6] and it was possible on some occasions to spot the now very popular copyleft icon, an horizontally mirrored copyright logo, marking a mail art publication. In this context copy-left was seen as a symbol of "free-from-copyright relationships" with other artists in a way that was "not bound to ideologies."^[7] In a strange twist, the use of this term is echoing years later, not without cynicism, in some reproductions of Johnson's works which are now stamped "Copyright the estate of Ray Johnson."^[8]

So why a sudden interest in such practices? Precisely because of the growing development of intellectual property in the field of cultural production. At the time, under the 1976 copyright act, the only recognised artistic collaborative work was the joint work, in which it is required that all the authors agree that all their contributions are meant to be merged into one, flattened down, work. This made perfect sense in the context of the print based copyright doctrine but was clearly not working for digital environments where the romantic vision of the author is dissolved in the complex network of branches, copies and processes inherent to networked collaboration. This situation provided much headache to lawyers focused on the copyrighting of digitally born works. One of these works is for instance Bonnie Mitchell's 1996 *iChainArt* project, in which her students and fellow artists were invited to modify a digital image and pass it to someone else using a file server. In such a project the whole process and its different iterations are the work itself, not the final image at the end of the chain. The work exists as a collection of derived, reused and remixed individual elements that cannot be flattened down into one single 'joint work' and as a consequence, from a legal perspective, could neither be protected nor credited properly under the limited copyright regulations.^[9] No surprise then that Heffan picked the Chain Art project as an example of artistic work that could greatly benefit from the GPL and the use of copyleft that can encourage "the creation of collaborative works by strangers".^[10]

...and back to the manifesto

Although this conclusion makes perfect sense legally, it clearly overlooks and diminishes the artistic desire to reflect upon the nature of information in the age of computer networks. Many artists adopted the GPL early on, not because of their wish to collaborate with strangers, but instead to augment their work with a statement derived from the free software ideology. For instance Mirko Vidovic used the free software definition to develop the GNU Art project,^[11] in which suddenly, the GPL becomes a political tag, a set of meta data that could be applied to any work of art. By choosing the GPL as a means of creation and distribution, artists are aiming at implementing an apparatus similar to the digital aesthetics that Critical Art Ensemble (CAE) had described "as a process of copying [a] that offers dominant culture minimal material for recuperation by recycling the same images, actions, and sounds into radical discourse".^[12] The weapon against copyright becomes a flagship for the recombining dreams of the digital resistance as envisioned by CAE. But by directly reusing the GPL, projects such as GNU Art failed none the less to really break through the position of Stallman that refuses to take part in judging if whether or not works of art should be free.

This is why a few lawyers, M^llanie Cl^lment-Fontaine, David Geraud, as well as artists, Isabelle Vodjidani and Antoine Moreau, felt the need to make more explicit the artistic context and motivations of a liberated work of art by creating the Free Art License (FAL), equivalent to the popular free software GNU public License and articulated specifically for the creation of free art.^[13] Suddenly, the license becomes an art manifesto. In the FAL the rules of copyleft are exposed, they stand on their own and enable the artistic creation, not for the sake of creating but as a means to produce singular and collective works. What is seen as freedom is just a very specific definition as envisioned in the GNU manifesto and that can only exist within the set of rules it represents. Moved to an artistic context, the rules to define freedom become a system to make art. In the same way that 'cent mille milliards de po^lmes' was the 1961 Oul^lPo manifestation of creative rules, the free art license is also a combinative manifesto, one that enables free art. It is not a simple adaptation of the GPL to the French copyright law; it is a networked art manifesto that operates within the legal fabric of culture.

Anyone who respects the rules of the FAL is allowed to play this game. Just like the ludic aspect in Oul^lPo's work, and its probable root from Queneau's flirt with surrealism, artists who start to consciously use the GPL and the FAL solely for its 'exquisite' properties might start a superficial relationship with the creative process. Indeed, Raymond Queneau, co-founder of the Oul^lPo reminded us already that we should not stop at the process' aesthetics itself because "simply constructing something well amounts to reducing art to play, the novel to a chess game, the poem to a puzzle. Neither saying something nor saying something well is enough, it is necessary that it be worth saying. But what is worth saying? The answer cannot be avoided: what is useful."^[14] In other words and adapted to the FAL, the network aesthetics are not enough, their existence must be contextualised and positioned to escape its fate of a convenient technological and legal framework. This is why if the game aspect is obvious in the collective works that surround the FAL, we must see beyond the rules that are presented to us to perceive that such an artistic methodology aims to be an answer to the issue perceived by Chon in the analysis of the *iChainArt* project. Namely, to

engage with the fluidity of information and try to turn the clich^lAd attitude of artists towards their unique and immutable contributions to art into a useful game. At the same time the emphasis is put on the collective nature of production and not community work.

The main issue with the intention of the FAL is that unlike the digital aesthetics modeled by CAE from L^lutru^lAamont's ideas,^[15] the mechanism of a free art, against the capitalisation of culture and for the free circulation of ideas within the network can only work by making the machine responsible for this very same capitalisation legitimate. While the mail art derivatives are happening outside of any obvious legal regulations, the copyleft art is literally hacking the system to reach a symbiosis and establish a kingdom within the kingdom. As a consequence these political works are very different from the artistic politics developed after the Russian revolution and World War I. Here, the artist is not an agent of the revolution but the vector of an 'arevolution'. A copyleft art is in the end not so much a critical weapon but instead a cornucopia that operates recursively and only within the frame of its license. Artists that are engaging with it, thus turning the license into a shared manifesto, cannot materialise an anti-culture, a counter culture, nor a subculture, they must create their own from scratch. Instead of seeking opposition and destruction of an enemy, they aim at founding and building.

Conclusion

If we look at 1897 Mallarm^l's 'Un coup de d^lAs jamais n'abolira le hasard', it is possible to only see it as an interesting visual design experiment in poetry. This approach misses the reason why this work exists in the first place. By turning art into the gathering and composing, even painting of both time and space within a text, it reached the apotheosis of parnassianism and symbolism upon which modernism broke through.^[16] A similar issue of complex lineage and contextual information surrounds a document such as the FAL and leads to concurrent 'raisons d^lAtre'. Indeed, the FAL is not just an 'exercice de style', it is the embodiment of several elements that are announcing important changes in artistic practices: a call to turn legal rules into a constrained art system, a reflection on the nature of collaboration and authorship in the networked economy, a living archeology of the creative process by bringing traceability and transparency, and ultimately, the mark of an age of copyright and bureaucratic apotheosis that is pushing artists to develop their practice within the administrative structure of society and embed it in their creative process.

Unfortunately, and this is one of the reasons there is so much confusion and misunderstanding about the use of such licenses by artists and theoreticians, is that, with such a manifesto where form meets function, once the license is used, it triggers a process of rationalisation that leads to a fragmentation of the original ideology and intention into different, possibly contradictory, elements:

* A toolkit for artists to hack their practice and free themselves from consumerist workflows.

* A political statement against the transformation of the digital culture into what CAE calls the "reproduction and distribution network for the ideology of capital".

* A legal and technical framework to interface with the current system and support existing copyright law practices.

* A lifestyle, and sometimes fashion statement.

In practice it is possible for an artist to only see one of these facets and either ignore or not be aware of the others, making the license as manifesto multidimensional, open to different interpretations, not unlike the medium it was drafted in: the law.

The only thing that I'd like to propose is an encouragement to artists interested in the topic to keep in mind that free culture is a hub where many agendas and interests will collide and overlap regardless of their personal intention and the one of the license creator. Knowing that might be a beginning of a strategy.

That said, it is worth mentioning the existence of projects that attempt to break down the "multidimensional" nature of some free cultural or open content licenses. Some of which will be familiar to this list's members: the Peer Production License, the Open Art License, the exception GPL aka ethical GPL, personal "forks" of the Free Art License, etc.

In each case, the recipe is the same: isolate an issue that is not compatible with a mode of production, a creation process, a belief or philosophy and then forbid/manipulate it as a condition hard coded in the license.

Such licenses are more than an artistic statement, in the sense of a purely artistic phantasy, they also aim at founding and building a body of cultural expressions. But none of them are a way out, instead it is a

way in, a further nesting into some strange legal matryoshka, building on top of the original copyleft nest within copyright.

Best,
a.

This is IMHO pure nonsense. IMHO nothing can stop a producer from changing his mind for the future. Why should it be the way you imagine? What should be the reason for such a limitation ("no turning back") of his freedom? Can you show me, sorry, ONE case where a court has decided in your way?

This artist is a lawyer,
very best,

With a licence such as the GPL my understanding was that the "no-turning

back point" happens whenever someone else contributes or forks the work
- from this point on agreement has to be reached from all authors before
the licence can be changed - in practice this is not generally possible.

In terms of software, the freedom considered important by the GPL is
that of the users of the work, not the developers (i.e. it should remain
free/open for the users benefit).

They cannot however prevent the people who have received copies of their
work under a licence offering that work to other people under the same
licence.

So yes the artist can stop offering the work under that licence, but
they'll have a hard time suppressing it.

This is what I am asking myself. I dont think the GPL produces any
obligation, it is just the actual consent of the author that matters and
may change.

IMHO,

This is a beautifull idea but is it true?

What is "a licence"?

Is it a thing that you get? No, it is a set of rules on what you can do
with something else, some code or whatever.

And all rules have to be interpreted. Transfers of the code according
to the words of the licence have to be valid.

I would make a difference between the relation between creator A and
user B and the relation between user B and C.

Even if creator A would OWE something to user B, he would owe nothing to
user C.

But I doubt that there is any DUTY of creator A against anybody in those
licences in any legal sense and think that there is nothing but a poem
and actual consent on creator A, that can change.

Best, H.

Yes.

> What is "a licence"?

A legal grant of permission. In some jurisdictions it is a form of legal contract.

> Is it a thing that you get? No, it is a set of rules on what you can > do with something else, some code or whatever.

Which affect whether you get a particular thing or not.

> And all rules have to be interpreted. Transfers of the code > according to the words of the licence have to be valid.

All legal documents have to be interpreted. The GPL and various Creative Commons licences have been interpreted and upheld by the courts.

> I would make a difference between the relation between creator A and > user B and the relation between user B and C.

> Even if creator A would OWE something to user B, he would owe > nothing to user C.

B owes something to C, though, and B got it from A. A cannot change B's ability to give A's work to C. What A "owes" C depends on how Romantically we view A's work. But C will certainly end up with A's work.

You are right that A and B have different relationships to C: under copyleft A can relicence adaptations of the work, B can't. But that's very different from being able to prevent C from receiving the original work from B.

> But I doubt that there is any DUTY of creator A against anybody in > those licences in any legal sense and think that there is nothing > but a poem and actual consent on creator A, that can change.

As I say, the courts have upheld these "poems". A has no power to prevent C receiving the work from A. We can phrase this as a duty not to prevent C from receiving the work if we really want to.

<...>

Just to add to what Rob and the others have already said, I think there is also a confusion between copyright, moral rights and the effectiveness of the latter within copyleft practices. In theory A can still stop C to keep on making a particular usage of A's work if there is a way to demonstrate that this particular usage, even though fully respecting the terms of the license, is damaging for A's honor and reputation.

That's the simplified general idea. In practice every jurisdiction has its own way to define moral rights and by extension its own cases of

what is considered "damaging". To make things worse the very concept of moral rights does not exist in all jurisdictions. Overall, whether it is defined or not, the whole idea is difficult to put in practice, if not hard to make relevant to a specific context.

In the end, this only concerns very specific situations that will only change the nature and possibly terminate the license or the contract between A and C. B's rights will remain unchanged, as well as the ones from D, E, F, ..., Z because free culture licenses are irrevocable. The GPLv3 and CC licenses are very explicit in that regard. A good illustration of the difficulty to deal with moral right issues is by checking all the mechanisms in CC licenses to make sure A is not wrongly credited for changes that were not endorsed.

So, as stated previously, once the decision is made, is public and that the licensed work has been already copied/distributed, there is no turning back.

It appears we cant even agree that one major difference between Free Software and Open Source/Linux is the attitude to money and hence to capitalism. Jaromil (below) thinks a statement posted on the net by the politburo settles the issue. But read Florian's 'in it for the money' and even more Stefan Merten's interview, where he imagines a society 'beyond labour, money and exchange' (both below).

Jaromil:

>Free software is a matter of freedom, not price; the word "free"
>has to be intended in this way here. Furthermore, referring to the
>wrong assumption by Keith Hart in this thread:
>> The open source movement is split on the issue of exchange and money
>> payment. Those who follow the Free Software Foundation appear to
>> consider that any hint of money and exchange, even of reciprocity,
>> leads directly to unacceptable compromise with capitalism.
>refer to <http://www.gnu.org/philosophy/selling.html> to have a clear
>point about the free-speech / free-beer issue.

Florian Cramer:

>The real amount of altruism in Free Software
>development may be debated, but any programmer who's mostly or even only
>in it for the money would be stupid to program anything but proprietary
>software (which, no doubt, is more profitable).

Interview with Stefan Merten, Oekonux, nettime, 7/12/01:

>But whereas Free Software
>emphasizes the freedom Free Software gives the users,
>Open Source does not care about freedom. The Open
>Source Initiative (OSI) was founded exactly for the
>reason to make Free Software compatible with business
>people's thinking, and the word "freedom" has been
>considered harmful for that purpose.

>I had the idea that Free Software is something very
>special and may have a real potential for a different
>society beyond labor, money, exchange - in short:
>capitalism - in 1998.

As it happens, I had come across the free speech/free beer distinction without having to consult the gnu website. It still seems to me that the freedom of Free Software is largely, but not exclusively tied up with the normative absence of money. This allows the purists to insist that those who wish to work across the divide 'do not care about freedom' or are 'only

in it for the money'. And behind that, of course, is a desire to preserve the mystique of a hacker elite.

>As it happens, I had come across the free speech/free beer distinction
>without having to consult the gnu website.

I think the free speech / free beer distinction is really counterproductive at this point. I understand its historical value in rallying US hackers in the context of a culture that fetishises "individual freedom" to a degree that it's something that one has no longer to explain or argue for. Free speech = good, in all circumstances. I'm not arguing against free speech, what I'm arguing against is the idea that free speech offers a good metaphor to understand the value of free software / open source.

Lessig, in his new book *The Future of Ideas*, offers a much better definition for what "free" in this context means. He writes, "a resource is 'free' if (1) one can use it without permission of anyone else; or (2) the permission one needs is granted neutrally" (p.12). Our roads, for example, are free in Lessig's sense. This is the case even if a toll charge is levied because the charge is imposed neutrally. Everyone pays the same price independent of the purpose of driving on the road. A road would no longer be free if, say, Coke had sponsored its construction and therefore could prohibit Pepsi trucks from using it.

In this definition, there is no difference in the freedom created by open source or free software.

>It still seems to me that the

>freedom of Free Software is largely, but not exclusively tied up with the

I agree with Keith, the absence of money per se is not a virtue. Insisting on the evils of money in all contexts, is the simple inversion of the capitalist logic which says making money per se is good. The transformation of resources and their impact is what really matters. And so far, I haven't seen anyone who could show the open source approach transfers time and money (or donated hardware if you prefer) into worse code or less code than the FSF approach.

By all probability not, because Free Software and Open Source are technically the same - the "Open Source Definition" is almost identical to the "Debian Free Software Guidelines" [and was drafted by the very same author, Bruce Perens]. The both terms don't even describe differences in development methodology. They are diverge in philosophical and political terms: "Open Source" is, according to those who launched the term, about technically better software ('software that sucks less'), "Free Software" is about old-hacker-school freedom of information. -

It's quite ironical that other net cultures - such as this one here - has gotten it the other way round.

Felix, one may of course say that the "Free Software" notion of freedom is naive, but on the other hand the GNU-style "Free Software" movement remains the only one to date that had a consistent agenda and politics against the proprietarization of code and knowledge. (And many of those who dismissed the FSF positions as obnoxious hippie fundamentalism have changed their mind since DMCA, DCSS and Sklyarov.)

The point is not that, say, "Linux" would stand (as "Open Source") against "GNU" (as "Free Software"). The term "Open Source" was coined and disseminated by Eric S. Raymond very late, in 1998, as a rebranding for code that preceded the term for ears or even decades (including GNU, Linux, BSD, Apache, Perl, sendmail etc.) and which had simply been called Free Software before.

Florian Cramer:

> By all probability not, because Free Software and Open Source are
> technically the same

This is true, and the fact may be demonstrated by examining the two lists of licenses evaluated by the Open Source Initiative [1] and the Free Software Foundation [2] respectively. Of the dozens of software licenses that may be clearly identified as being on both lists, only the Apple Public Source License is considered "open source" by the OSI but "Non-Free" by the FSF. That one exception may, moreover, be due more to political than technical reasons. The FSF accepts the rest as "free software" licenses, although it nonetheless deprecates many of these as "GPL-Incompatible."

Keith Hart:

> It appears we cant even agree that one major difference between Free
> Software and Open Source/Linux is the attitude to money and hence to
> capitalism.

The two camps have indeed taken very different rhetorical paths to what are demonstrably identical conclusions. I am less optimistic than Felix, who interprets this as evidence of a great movement that is capable of absorbing "very different, even contradictory ideas." I see it the other way around, namely as a single idea that has been absorbing different movements.

There's no other explanation, I think, for the fact that we're hearing so much gung singing lately between left-leaning communitarians and the

libertarian right, and not only on the finer points of software license agreements. Keith's recent proposal in this thread to vacate the legal monopoly of central banks on the issue of legal tender certainly has the potential to throw yet another log on this cozy campfire.

You take this blabla much too serious. "Open Source" for example isn't just an idea, a good idea like BSD licences, GNU etc, but first of all it is a label. Something for the "No logo" book. This labelism of the different initiatives has nothing to do with the central concept. Maybe this is why I don't like Linux. So much chaos and desktop cosmetics. I stay with FreeBSD. And I like GNU.

// FREE SOFTWARE & GPL SOCIETY //

<< Interview with Stefan Merten, Oekonux, Germany
>> by Joanne Richardson, November 2001

>> Q: Oekonux - an abbreviation of "OEKOnomic" and "liNux" - is a German mailing list discussing the revolutionary possibilities of Free Software. Many people speak of Free Software and Open Source Software interchangeably - could you explain how you understand the differences between them?

The term "Free Software" is older than "Open Source". "Free Software" is used by the Free Software Foundation (<http://www.fsf.org/>) founded by Richard Stallman in 1985. The term "Open Source" has been developed by Eric S. Raymond and others, who, in 1998, founded the Open Source Initiative (<http://www.opensource.org/>). It's not so much a question of definition as of the philosophy behind the two parts of the movement - the differences between the definition of Open Source Software and Free Software are relatively few. But whereas Free Software emphasizes the freedom Free Software gives the users, Open Source does not care about freedom. The Open Source Initiative (OSI) was founded exactly for the reason to make Free Software compatible with business

people's thinking, and the word "freedom" has been considered harmful for that purpose.

>> Q: Free software means the freedom to run, copy, distribute, study, change and improve the software, and these freedoms are protected by the GNU General Public License. The definition presupposes open sources as the necessary condition for studying how the software works and for making changes, but it also implies more. The definition of Open Source is quite close: it means the ability to read, redistribute, and modify the source code - but because this is a better, faster way to improve software. Openness = speed = more profit. The Open Source Initiative proclaims quite proudly that it exists in order to persuade the "commercial world" of the superiority of open sources on "the same pragmatic, business-case grounds that motivated Netscape." But recently, it is the term "Open Source" that has gained popularity - and by analogy everything has become "Open" -- open source society, open source money, open source schooling (to echo some of the titles of panels of the last Wizards of OS conference in Berlin.)

Indeed the Open Source Initiative has been extremely successful in pushing the freedom-subtracted term into people's heads. Today people from the Free Software Foundation always feel the need to emphasize that it's the freedom that is important - more important than the efficiency of production, which is the primary aim behind open source. Of course open sources are a precondition for most of this freedom, but open sources are not the core idea of Free Software and so Open Source is at least a misnomer.

>> Q: How do you mean it's a "misnomer"? The two movements exist and the names correspond to the different ideas behind them. And "Open Source" is the name the people from this initiative chose for themselves, and seems quite an accurate characterization of their focus.

Free Software and Open Source Software are not two movements, but a single movement with two factions, and as far as I can see the distinction plays a major role mostly in the more ideological discussions between members of the two factions. They are collaborating on projects, and sometimes unite, for instance, when it is a question of defending against the attacks of Microsoft
(<http://perens.com/Articles/StandTogether.html>).

And, no, "Open Source" is not an accurate characterization of this faction, since their focus has been making Free Software compatible with business people's thinking. A more correct name would have been "Free Software for Business" - or something like that.

>> Q: What seems misleading to me is that the leftist intelligentsia has begun to use "Open Source" as a cause to promote without realizing the pro-capitalist connotations behind the term.

Today the widespread inflation of the term "Open Source" has a deep negative impact. Often the core idea behind Free Software - establishing the freedom of the user - is not known to people who are only talking of Open Source - be it leftist intelligentsia or other people. I think this is a pity and would recommend using only the term Free Software because this is the correct term for the phenomenon. You don't call "green" "red" if "green" is the right term - do you? After all, even "Open Source" software would not be successful if the practical aspect of freedom was not inherent in its production and use. Interestingly, in an article entitled "Its Time to Talk about Free Software Again," one of the founders of the Open Source Initiative also considers the current development as wrong.
(http://www.perens.com/perens_com/Articles/ItsTimeToTalkAboutFreeSoftwareAgain.html)

>> Q: The idea behind Oekonux began, in kernel form at the first Wizards of OS conference in Berlin in 1999. How did the motivation to begin Oekonux develop from

this context?

I had the idea that Free Software is something very special and may have a real potential for a different society beyond labor, money, exchange - in short: capitalism - in 1998. In September 1998, I tried to make that a topic on the Krisis mailing list. However, next to nobody was interested. In July 1999, I attended the first "Wizard of Open Source" [<http://www.mikro.org/Events/OS>] conference organized by mikro in Berlin, and was especially interested in the topic "New economy?". However, in the context of the idea I mentioned above - the potential to transform society - I found the ideas presented there not very interesting. After the talks I took the opportunity to organize a spontaneous BOF (Birds Of a Feather) session and luckily it worked well. So we sat there with about 20 people and discussed the ideas presented in the talks. At the end I asked all the people to give me their e-mail address.

After the WOS conference, mikro created a mailing list for us - and that was the birth of the Oekonux mailing list which is the core of the project. In December 1999 I created the web site [www.oekonux.de]. Its main purpose is to archive the mailing list. Texts and other material created in the context of the project is presented there as well as links to web sites and pages relevant to our discussion in some way. There is also an English/international part of the project ([www.oekonux.org/archiving] [list-en [AT] oeconux.org]), which, however, is still nearly non-existent. I find this a pity but unfortunately until now there is nobody with enough free time and energy to give this part of the project a real start. So until today all the material is in German and there are only a few translations of the texts. In June 2000 I created another mailing list ([projekt [AT] oeconux.de]) which is concerned with the organization of the project.

During April 28-30, 2001 in Dortmund we had the first Oekonux conference ([<http://www.oekonux-konferenz.de/>]), which brought together people from different areas who were interested in the principles of Free Software and the possible consequences of these principles on their particular field. The conference was attended by about 170 persons from a very broad range of ages and backgrounds, from software developers, to political theorists and scientists. It was a very exciting conference with a perfect atmosphere and another milestone in the way we and - if we're not completely wrong - the whole world is going. The next conference is planned to take place in Nov 1-3, 2002.

>> Q: How active and large is the list?

>From the start we have had very interesting discussions with some silent periods but usually an average of 6-8 mails a day. The atmosphere on the list is very pleasant and flames are nearly unknown. Fortunately it has not been necessary to moderate the list, as it regulates itself very well. The discussions are very contentful and this interview would not have been possible without them. They cover a wide number of details but nearly always stay on the central topic of the list: the possible impacts of Free Software on society. At the moment we have about 200 subscribers at [liste [AT] oeconux.de], who come from a wide range of intellectual traditions and areas of interest. Though of course they all share a common interest in political thought, there are people from the Free Software and Hardware areas as well as engineers of different brands, hard core political people as well as people with a main interest in culture and so on. Though the traffic is quite high we have nearly no unsubscriptions which I think is a proof for the quality of the list.

>> Q: In a previous interview with Geert Lovink [http://www.nettime.org/cgs-bin/wlma_hiliter/nettime/200104/msg00127.html#line=8]

you mentioned that the relationship between free software and Marxism is one of the central topics debated on the list ... Do you think Marx is still

relevant for an analysis of contemporary society?
Could you give an idea of the scope of this debate on the list?

First of all we recognize the difference between Marx' views and the views of the different Marxist currents. Although different brands of Marxism have distorted Marx' thought to the point where it has become unrecognizable, I tend to think that only Marx' analysis gives us the chance to understand what is going on today. The decline of the labor society we are all witnessing in various ways cannot be understood without that analysis. The Krisis group [<http://www.krisis.org>] has offered a contemporary reading of Marx, claiming that capitalism is in decay because the basic movement of making money from labor works less and less. This doesn't mean that capitalism must end soon, but it won't ever be able to hold its old promises of wealth for all. A number of people on the Oekonux mailing list have built upon the Krisis theories and carried them onto new ground. On the list among other things we try to interpret Marx in the context of Free Software. It's very interesting that much of what Marx said about the final development of capitalism can be seen in Free Software. In a sense, we try to re-think Marx from a contemporary perspective, and interpret current capitalism as containing a germ form of a new society.

>> Q: According to many circles, Marx is obsolete - he was already obsolete in the sixties, when the mass social upheavals and the so-called new social movements showed that not class but other forms of oppressive power had become determining instances and that the economic base was not the motor that moved contradictions.

I think that at that time the economic base was not as mature as it has become today. In the last ten to twenty years Western societies started to base their material production and all of society more and more on information goods. The development of computers as universal information processors with ever increasing capacity is shifting the focal point of production from the material side to the immaterial, information side. I think that today the development of the means of production in capitalism has entered a new historical phase.

The most important thing in this shift in the means of production is that information has very different features than matter. First of all, information may be copied without loss - at least digital information using computers. Second and equally important, the most effective way to produce interesting information is to foster creativity. Free Software combines these two aspects, resulting in a new form of production. Obviously Free Software uses the digital copy as a technical basis. Thus Free Software, like any digital information, is not a scarce good; contrary to the IPR (intellectual property rights) people, the Free Software movement explicitly prevents making Free Software scarce. So, scarcity, which has always been a fundamental basis for capitalism, is not present in Free Software: Existing Free Software is available for next to zero price.

More importantly, however, the organization of the production of Free Software differs widely from that of commodities produced for maximizing profit. For most Free Software producers there is no other reason than their own desire to develop that software. So the development of Free Software is based on the self-unfolding or self-actualization of the single individual. This form of non-alienated production results in better software because the use of the product is the first and most important aim of the developer - there simply is no profit which could be maximized. The self-unfolding of the single person is present in the process of production, and the self-unfolding of the many is ensured by the availability of high quality Free Software.

Another important factor is that capitalism is in deep crisis. Until the 1970s capitalism promised a better

world to people in the Western countries, to people in the former Soviet bloc and to the Third World. It stopped doing it starting in the 1980s and dismissed it completely in the 1990s. Today the capitalist leaders are glad if they are able to fix the biggest leaks in the sinking ship. The resources used for that repair are permanently increasing- be it financial operations to protect Third World states from the inability to pay their debt, or the kind of military operations we see in Afghanistan today.

These processes were not mature in the 1960s but they are today. Maybe today for the first time in history we are able to overcome capitalism on the bases it has provided, by transcending it into a new society that is less harmful than the one we have.

>> Q: How can Free Software "overcome" capitalism from the bases it has provided? The idea of a dialectical negation of capitalism (an immanent critique from the inside that takes over the same presuppositions of the system it negates) has frequently been discredited. Both Marx and Lenin's ideas of a dialectical negation of capitalism preserved the imperative of productivity, the utility of instrumental technology, the repressive apparatus of the State, police and standing army, as a necessary "first stage." And if you start from the inside, you will never get anywhere else ... the argument goes.

Free Software is both inside and outside capitalism. On the one hand, the social basis for Free Software clearly would not exist without a flourishing capitalism. Only a flourishing capitalism can provide the opportunity to develop something that is not for exchange. On the other hand, Free Software is outside of capitalism for the reasons I mentioned above: absence of scarcity and self-unfolding instead of the alienation of labor in a command economy. This kind of relationship between the old and the new system is typical for germ forms - for instance you can see it in the early stage of capitalist development, when feudalism was still strong.

>> Q: In what sense is the production of Free Software not "alienated"? One of the reasons that labor is alienated is because the workers sells a living thing - qualitatively different forms of productive activity which in principle can't be measured - in exchange for a general measure, money. As Marx said somewhere, the worker does not care about the shitty commodities he is producing, he just does it for this abstract equivalent, the money he receives as compensation.

It seems you're talking about the difference between use value - the use of goods or labor - and exchange value - reflected in the price of the commodities that goods or labor are transformed into by being sold on the market. It's true that the use value of goods as well as labor is qualitatively different. It's also true that the exchange value of a commodity - be it a commodity or wage labor - is a common measure, an abstraction of the qualitative features of a product. But after all you need a common measure to base an exchange on. One of the problems of capitalism is that this abstraction is the central motor of society. The use of something - which would be the important thing in a society focusing on living well - is only loosely bound to that abstraction. That is the basis of the alienation of work performed for a wage. In Free Software because the product can be taken with only marginal cost and, more importantly, is not created for being exchanged, the exchange value of the product is zero. Free Software is worthless in the dominant sense of exchange.

Free Software may be produced for numerous reasons - but not for exchange. If there is no external motivation - like making money - there must be internal motivations for the developers. These internal motivations, which are individually very different, are what we call self-unfolding (from the German term "Selbstentfaltung", similar but not completely the same as "self-development"). Without

external motivations, there is not much room for alienation.

Of course self-unfolding is a common phenomenon in other areas, such as art or hobbies. However, Free Software surpasses the older forms of self-unfolding in several ways and this is what makes it interesting on the level of social change:

- * Most products of self-unfolding may be useful for some persons, but this use is relatively limited. Free Software, however, delivers goods which are useful for a large number of persons - virtually everybody with a computer.

- * Most products of self-unfolding are the results of outmoded forms of production, like craft-work. Free Software is produced using the most advanced means of production mankind has available.

- * Most products of self-unfolding are the fruits of the work of one individual. Free Software depends on collaborative work - it is usually developed by international teams and with help from the users of the product.

- * All products of self-unfolding I can think of have been pushed away once the same product becomes available on the market. By contrast, Free Software has already started to push away software developed for maximizing profit in some areas, and currently there seems to be no general limit to this process.

So contrary to older forms of self-unfolding Free Software provides a model in which self-unfolding becomes relevant on a social level. The products of this sort of self-unfolding can even be interesting for commercial use.

>> Q: Some theorists have analyzed the internet as a kind of "gift" economy. In other words, it is not subject to measure and exchange. Things are freely produced and freely taken. And unlike exchange, which has a kind of finality (I pay one dollar I buy one bottle of Coca Cola, and it's over), the gift, since it cannot be measured, is a kind of infinite reciprocity. Gifts are not about calculation of value, but about building social relationships. Do you see Free Software as a gift 'economy'?

I don't like talking about gifts in Free Software or in terms of the Internet in general. There is no reciprocity in Free Software as, similarly, there is no reciprocity on the Internet. I have used thousands of web pages and millions of lines of code contained in Free Software without giving anything back. There simply is no reciprocity and even better: there is no need for reciprocity. You simply take what you need and you provide what you like. It's not by chance, that this reflects the old demand of "Everybody according to his/her needs".

Indeed there are several attempts, which are at best misleading, to understand the Internet and/or Free Software in terms of capitalist dogmas. The talk about "gift economies" is one of them, because it focuses on gifts as some sort of - non-capitalist but nonetheless - exchange. Even worse is the talk of an "attention economy" which defines attention as a kind of currency. The Internet, and especially Free Software are new phenomena which can't be understood adequately by using the familiar thought patterns of capitalism.

>> Q: In what sense is "GPL Society" beyond the familiar thought patterns of capitalism?

With the term "GPL Society" we named a society based on the principles of production of Free Software. These principles are:

- * self-unfolding as the main motivation for production,
- * irrelevance of exchange value, so the focus is on the use value,
- * free cooperation between people,

* international teams.

Though the term has been controversial for some time, today it is widely accepted in Oekonux. I like the term particularly *because* you can't associate anything with it that you already know. GPL Society describes something new, which we try to discover, explore and understand in the Oekonux project. Ironically, part of this process of understanding has reached the conclusion that a GPL Society would no longer need General Public License because there won't be any copyright. So at least at this time maybe it should be renamed :-).

As I tried to explain Free Software is not based on exchange so neither is a GPL Society. How a GPL Society may look like concretely can't be determined fully today. However, at present there are many developments which already point in that direction.

* One development is the increasing obsolescence of human labor. The more production is done by machines the less human labor is needed in the production process. If freed from the chains of capitalism this development would mean freedom from more and more necessities, making room for more processes of self-unfolding - be it productive processes like Free Software or non-productive ones like many hobbies. So contrary to capitalism, in which increasing automation always destroys the work places for people and thus their means to live, in a GPL Society maximum automation would be an important aim of the whole society.

* In every society based on exchange - which includes the former Soviet bloc - making money is the dominant aim. Because a GPL Society would not be based on exchange, there would be no need for money anymore. Instead of the abstract goal of maximizing profit, the human oriented goal of fulfilling the needs of individuals as well as of mankind as a whole would be the focus of all activities.

* The increased communication possibilities of the Internet will become even more important than today. An ever increasing part of production and development will take place on the Internet or will be based on it. The B2B (business to business) concept, which is about improving the information flow between businesses producing commodities, shows us that the integration of production into information has just started. On the other hand the already visible phenomenon of people interested in a particular area finding each other on the Internet will become central for the development of self-unfolding groups.

* The difference between consumers and producers will vanish more and more. Already today the user can configure complex commodities like cars or furniture to some degree, which makes virtually each product an individual one, fully customized to the needs of the consumer. This increasing configurability of products is a result of the always increasing flexibility of the production machines. If this is combined with good software you could initiate the production of highly customized material goods allowing a maximum of self-unfolding - from your web browser up to the point of delivery.

* Machines will become even more flexible. New type of machines available for some years now (fabbers, [http://www.enx.com/fabbers/index.shtml]) are already more universal in some areas than modern industrial robots - not to mention stupid machines like a punch. The flexibility of the machines is a result of the fact that material production is increasingly based on information. At the same time the increasing flexibility of the machines gives the users more room for creativity and thus for self-unfolding.

* In a GPL society there is no more reason for a competition beyond the type of competition we see in sports. Instead various kinds of fruitful cooperation will take place. You can see that today not only in Free Software but also (partly) in science and for

instance in cooking recipes: Imagine your daily meal if cooking recipes would be proprietary and available only after paying a license fee instead of being the result of a world-wide cooperation of cooks.

>> Q: This sounds very utopian: Free Software as the sign of the end of capitalism and the transformation of the new society? How do you predict this transformation coming about - spontaneously, as the economic basis of capitalist production just withers away?

I hope these more or less utopian thoughts give an idea of the notion of a GPL Society as it is currently discussed within the Oekonux project. And it's not Free Software in itself which may transform capitalism. Instead, the principles of the production of Free Software - which have developed within capitalism! - provide a more effective way of production on the one hand and more freedom on the other. The main question is how is it possible to translate these principles to other areas.

I tried to explain how Free Software - as a germ form of the GPL society - is inside as well as outside of capitalism. I think Free Software is only the most visible of the new forms which together have the potential to lead us into a different society. Capitalism has developed the means of production to such an extent that people can use them for something new. Of course, the transformation also requires a political process and although historically the preconditions now are better than ever before there is no automatic step that will lead to the GPL society. People have to want this process. However, I'm quite optimistic that they will, because Free Software shows us, in microcosm, how a better life would look, so the GPL Society is in the best interest of people. And Oekonux is there to understand the process of this change, and perhaps at some point our thoughts may help to push the development forward :-).

In an interview on <http://kerneltrap.com/article.php?sid=459>, Matt Dillon, a major developer of the FreeBSD operating system (and former Linux kernel hacker), has his own answer on whether Free Software is altruistic or not. It is, without knowing it, quite a good response to the recent on the economy of Free Software in Nettime (and, apparently, Oekonux):

Matt Dillon: Well, I could say something about open-source in general. Specifically I would like to say something about open-source and making money. There are two kinds of open-source programmers in the world. No, make that three kinds: There is the open-source programmer who is still in school, the open-source programmer who has a real job, and the open-source programmer who tries to make a living

out of his open-source programming.

In many respects, each individual goes through ALL of the above phases. We've all been in (or are in) school, we all must eventually make a living, and having been somewhat disillusioned by real work we have all either tried or will try to make a living from our open-source endeavours. This last item -- making a living from open-source, has been over-stressed by the open source community (mainly Linux related developers) over the last few years. Guys, if you haven't figured it out by now it is mostly an illusion! The hype made it possible. The crazy stock market made it possible, but it didn't last now did it? If I take a hundred people I know only two or three can make a living from their open-source work (and I'm not one of them today!).

The open-source community has to come to terms with this. Don't let it get you down! I read LWN.NET (Linux Weekly News) every week and I see a definite trend towards mass depression as the internet craze settles down into something a bit more sustainable. Don't let it get to you! Face the issue squarely and come to terms with what it means for your own work. If an older generation (that's me! At 35! God I feel old!) can teach the younger generation of programmers/hackers anything it is that the character of open-source will always be with us, with or without wall-street, and that we open-source programmers do not do these things for a 5-minute spot on CNN, we do these things because they are cool, and interesting, and make the world a better place for everyone. That is our legacy. We are not an anarchy, we are a charity. A very *LARGE* charity I might add!

[Nettime-bold] Re: <nettime>The Fading Altruism of Open Source
From: Keith Hart
To: nettime-bold@nettime.org
Date: Wed, 19 Dec 2001 04:32:30 -0500

It appears we can't even agree that one major difference between Free Software and Open Source/Linux is the attitude to money and hence to capitalism. Jaromil (below) thinks a statement posted on the net by the politburo settles the issue. But read Florian's 'in it for the money' and even more Stefan Merten's interview, where he imagines a society 'beyond labour, money and exchange' (both below).

Jaromil:

>Free software is a matter of freedom, not price; the word "free"
>has to be intended in this way here. Furthermore, referring to the
>wrong assumption by Keith Hart in this thread:
>> The open source movement is split on the issue of exchange and money
>> payment. Those who follow the Free Software Foundation appear to
>> consider that any hint of money and exchange, even of reciprocity,
>> leads directly to unacceptable compromise with capitalism.
>refer to <http://www.gnu.org/philosophy/selling.html> to have a clear
>point about the free-speech / free-beer issue.

Florian Cramer:

>The real amount of altruism in Free Software
>development may be debated, but any programmer who's mostly or even only
>in it for the money would be stupid to program anything but proprietary
>software (which, no doubt, is more profitable).

Interview with Stefan Merten, Oekonux, nettime, 7/12/01:

>But whereas Free Software
>emphasizes the freedom Free Software gives the users,
>Open Source does not care about freedom. The Open
>Source Initiative (OSI) was founded exactly for the
>reason to make Free Software compatible with business

>people's thinking, and the word "freedom" has been
>considered harmful for that purpose.

>I had the idea that Free Software is something very
>special and may have a real potential for a different
>society beyond labor, money, exchange - in short:
>capitalism - in 1998.

As it happens, I had come across the free speech/free beer distinction without having to consult the GNU website. It still seems to me that the freedom of Free Software is largely, but not exclusively tied up with the normative absence of money. This allows the purists to insist that those who wish to work across the divide 'do not care about freedom' or are 'only in it for the money'. And behind that, of course, is a desire to preserve the mystique of a hacker elite.

>without having to consult the GNU website.

I think the free speech / free beer distinction is really counterproductive at this point. I understand it's historical value in rallying US hackers in the context of a culture that fetishises "individual freedom" to a degree that it's something that one has no longer to explain or argue for. Free speech = good, in all circumstances. I'm not arguing against free speech, what I'm arguing against is the idea that free speech offers a good metaphor to understand the value of free software / open source.

Lessig, in his new book *The Future of Ideas*, offers a much better definition for what "free" in this context means. He writes: "a resource is 'free' if (1) one can use it without permission of anyone else; or (2) the permission one needs is granted neutrally" (p.12). Our roads, for example, are free in Lessig's sense. This is the case even if a toll charge is levied because the charge is imposed neutrally. Everyone pays the same price independent of the purpose of driving on the road. A road would no longer be free if, say, Coke had sponsored its construction and therefore could prohibit Pepsi trucks from using it.

In this definition, there is no difference in the freedom created by open source or free software.

>It still seems to me that the

I agree with Keith, the absence of money per se is not a virtue. Insisting on the evils of money in all contexts, is the simple inversion of the capitalist logic which says making money per se is good. The transformation of resources and their impact is what really matters. And so far, I haven't seen anyone who could show the open source approach transfers time and money (or donated hardware if you prefer) into worse code or less code than the FSF approach.

By all probability not, because Free Software and Open Source are technically the same - the "Open Source Definition" is almost identical to the "Debian Free Software Guidelines" [and was drafted by the very same author, Bruce Perens]. The both terms don't even describe differences in development methodology. They are diverge in philosophical and political terms: "Open Source" is, according to those who launched the term, about technically better software ("software that sucks less"), "Free Software" is about old-hacker-school freedom of information. -

It's quite ironical that other net cultures - such as this one here - has gotten it the other way round.

Felix, one may of course say that the "Free Software" notion of freedom is naive, but on the other hand the GNU-style "Free Software" movement remains the only one to date that had a consistent agenda and politics against the proprietarization of code and knowledge. (And many of those who dismissed the FSF positions as obnoxious hippie fundamentalism have changed their mind since DMCA, DCSS and Sklyarov.)

The point is not that, say, "Linux" would stand (as "Open Source") against "GNU" (as "Free Software"). The term "Open Source" was coined and disseminated by Eric S. Raymond very late, in 1998, as a rebranding for code that preceded the term for cars or even decades (including GNU, Linux, BSD, Apache, Perl, sendmail etc.) and which had simply been called Free Software before.

Florian Cramer:

> By all probability not, because Free Software and Open Source are
> technically the same

This is true, and the fact may be demonstrated by examining the two lists of licenses evaluated by the Open Source Initiative [1] and the Free Software Foundation [2] respectively. Of the dozens of software licenses that may be clearly identified as being on both lists, only the Apple Public Source License is considered "open source" by the OSI but "Non-Free" by the FSF. That one exception may, moreover, be due more to political than technical reasons. The FSF accepts the rest as "free software" licenses, although it nonetheless deprecates many of these as "GPL-Incompatible."

Keith Hart:

> It appears we cant even agree that one major difference between Free
> Software and Open Source/Linux is the attitude to money and hence to
> capitalism.

The two camps have indeed taken very different rhetorical paths to what are demonstrably identical conclusions. I am less optimistic than Felix, who interprets this as evidence of a great movement that is capable of absorbing "very different, even contradictory ideas." I see it the other way around, namely as a single idea that has been absorbing different movements.

There's no other explanation, I think, for the fact that we're hearing so much group singing lately between left-leaning communitarians and the libertarian right, and not only on the finer points of software license agreements. Keith's recent proposal in this thread to vacate the legal monopoly of central banks on the issue of legal tender certainly has the potential to throw yet another log on this cozy campfire.

You take this blabla much too serious. "Open Source" for example isnt just an idea, a good idea like BSD licences, GNU etc, but first of all it is a label. Something for the "No logo" book. This labelism of the different initiatives has nothing to do with the central concept. Maybe this is why I dont like Linux. So much chaos and desktop cosmetics. I stay with FreeBSD. And I like GNU.

Just thinking about this a bit....

The Open Source examples, seem almost like 'terra' for the net... BSD, Apache, Perl, sendmail...
Something like 'Open Source' becomes 'Open Space'...
Overgrown from some feudal practice of power... Beyond Governance... Great Plains...

... And I do like GNU/Linux, cause it's both Free Software, and I really like plurality (or "chaos" in other words). In addition I like "desktop cosmetics" and a command line interface on the same time on the same machine, cause I can use both on specific tasks and I like the idea of "non-proprietaryization of code and knowledge", which is the main difference between Open Source and Free Software and which is one of the most valid argument in this debate (thanks to Florian Cramer). And this idea of non-proprietaryization is the lesson, which has to be learned by the proprietaryization of Unix in the 80s. Harald.

> The Fading Altruism of Open Source Development by David Lancashire
> First Monday, volume 6, number 12 (December 2001),
> URL: http://firstmonday.org/issues/issue6_12/lancashire/index.html

Thanks for providing the link!

To quote from the article and attempt some answers:

>> The most fundamental question of all: why does open source
>> development occur in the first place?

This question applies as well to, say, Nettime (where people freely give away their some of their intellectual work) and all other non-profit volunteer projects. The work of Free Software may just be more pervasive and hence visible to scholars than other volunteer projects because (a) it translates very immediately into everyday use value, (b) its products are infinitely reproducible (also true for Nettime, but not true for all non-Internet volunteer work). - And: Free Software may be the most sophisticated non-profit volunteer project in the way it ensures the free circulation of its products, through the copyleft.

David Lancashire's article is an interesting read about the regional distribution of Free Software development, yet as I think problematic or even wrong in many of its core assumptions. But, after of all, I do not see the claim the title makes, "The Fading Altruism of Open Source Development" backed up or elaborated anywhere in the text.

While the First Monday article recognizes the entanglement of Free Software development with academia to some degree, it fails, in my view, to interpret this entanglement in cultural and economical terms. Free Software development grew and continues to grow out of student projects at university computer science departments (MIT: GNU project and X11, UC Berkeley: BSD Unix, University of Helsinki: Linux, Universität Tübingen: KDE), and the Free Software copyleft was invented to preserve the traditional academic freedom of information for computer code.

Other points:

>> The combination of highly-complex and anti-proprietary projects offers
>> the only quadrant in which the tension - between economic and cultural
>> assumptions about underlying human behavior can meaningfully be
>> compared. It is an unfortunate fact then, if a somewhat revealing one on
>> its own, that there are so few successful projects which fall into this
>> category.

To me it rather seems an unfortunate, if a somewhat revealing fact what the author David Lancashire thinks are facts of Free Software:

>> Linux, an operating system begun in 1991 in order to provide a
>> free alternative to commercial UNIX systems, is the most prominent
>> example. The second-most so is undoubtedly GNOME, a free graphical-user
>> interface (GUI) for UNIX-compatible systems begun in 1996 to compete
>> with the partly privately-owned K-Desktop Environment (KDE) suite for
>> UNIX and the completely proprietary Microsoft Windows.

- Linux is an operating system kernel started in 1991 which, by itself (i.e. without a compiler, linker, boot loader and core system libraries, init and login daemons and userspace operating system tools), is a non-functional piece of software. As a matter of fact, it was started not to provide a free alternative to proprietary Unices, but a POSIX-compliant (i.e. more functionally more complete) alternative to Andrew Tanenbaum's free Minix operating system.

- Not Linux, but GNU was started (in 1984) in order to provide the free alternative to commercial (proprietary) Unix systems. It ended up creating fully functional free equivalents of all core Unix components (compiler, linker, system libraries, userspace operating system tools - the contents of /bin, /sbin and /lib on any "Linux distribution" is almost 100% GNU) except the kernel.

It's easy to claim, as in the above quote, there is a lack of "highly-complex and anti-proprietary" Free Software if one doesn't seem to know GNU, the free BSD operating systems (FreeBSD, NetBSD, OpenBSD), the X Window System, Mozilla, the Debian GNU/Linux distribution - and wilfully excludes gcc, Perl, Python, PHP, PostgreSQL, Emacs, Apache, sendmail and other highly complex Free Software projects from one's consideration.

What's more, Lancashire makes questionable assumptions about Gnome, KDE and Windows:

- KDE is not "privately owned" in any way, but one of the most decentralized and non-corporate Free Software projects. Its code is released under the GNU General Public License (GPL); it relies on a library ("Qt") which is developed by a company, but equally available under two Free Software licenses including the GPL since a couple of time. (The fact that Qt was proprietary is history; and Qt never was a part of KDE itself.)

- Quite on the contrary to the assumptions of the article, Gnome development is much more in corporate hands: The core developers are employed by Ximian and Red-Hat (with Ximian, the company of Gnome's founder and project leader Miguel de Icaza, being the major driving force).

In addition, Gnome development is supervised by the "Gnome Foundation" whose function is to, official quote, "coordinate releases of GNOME and determine which projects are part of GNOME" and "act as an official voice for the GNOME project" - <http://foundation.gnome.org>. Members of the Gnome Foundation include, next to free developers, Ximian, Red-Hat, Hewlett-Packard and Sun. (Sun also made Gnome the new desktop interface of its proprietary Unix "Solaris".)

- The comparison of KDE and Gnome to Windows is mismatched. Both KDE and Gnome are only sets of (a) high-level libraries and component models and (b) basic graphical desktop user components (menus, window manager, file managers, configuration panels, utilities) they are not desktop operating systems on their own, but operate on top of "third party" graphical user interface libraries (Qt and GTK respectively)

which in turn operate on top of a "third party" graphical display engine (= the X Window System) which in turn operates on top of "third party" core operating systems (GNU/Linux, *BSD, proprietary Unices etc.).

Windows, on the other hand, has always been a unit of a graphical display engine (GDI), graphical user interfaces libraries (MFC), high-level desktop components (OLE/Com) and basic graphical desktop user components (Explorer, Start menu etc.) on top of a core operating system (DOS) and has become a fully self-contained operating system including kernel, OS userspace, graphical display engine at least since Windows NT 3.51.

>> With a combined total of over 430 developers, no other two projects
>> approach the "authority" of these cases as benchmark examples of
>> their kind.

This is wrong, and so I doubt the study has a good empirical base. The (truly non-corporate) Debian project <<http://www.debian.org>> alone has 908 regular developers. In the case of Gnome, the results concerning US-American and non-US-American involvement are likely to be distorted by the fact that it is largely an American project with US-American companies involved - while the (more or less competing) KDE project is largely a project of European developers. (This interesting cultural split has been noted several times on Slashdot.org, an American forum which, since a couple of months, shifted its own bias from Gnome to KDE).

After all, the study's _economical_ analysis seems questionable to me because it does not - but should - differentiate between "private"/"privately owned"/"commercial" on the one hand and "proprietary" on the other (as in the second-last quote). As many Free Software projects - like the RedHat GPL Edition, RedHat's/Cygnus' GNU C compiler, GNU Ghostscript, Ximian Gnome, Ximian Evolution, Trolltech's Qt - demonstrate, "commercial" doesn't have to mean "proprietary". In fact, the GNU project involved commercial operations from the beginning on. Richard Stallman financed the Free Software Foundation (and kept himself alive) by expensively selling GNU software on streamer tapes. Interviewed in 1984, the BSD project leader and inventor of the "vi" editor Bill Joy said about GNU Emacs that it was "a nice editor too, but because it costs hundreds of dollars, there will always be people who won't buy it." <<http://www.cs.pdx.edu/~kirkenda/joy84.html>>

Some other quotes:

>> Mexico contributes three times as many developers to Gnome as Linux,
>> and Finland (perhaps understandably considering its status as the
>> homeland of Linus Torvalds) appears unwaveringly in the Linux camp.

The high involvement of Mexicans in Gnome would probably have surprised the author as little as the high involvement of Finns in Linux if he knew that the Gnome project was founded in Mexico by a Mexican, Miguel de Icaza, who continues to be its chief developer.

Perhaps another proof for the problematic empirics of the study:

>> If this simplified model can explain the relative erosion of open
>> source production in the United States, can it explain the rise of it
>> Europe? Primarily, it should be clear that if the opportunity cost of
>> working on open source projects is lower for European developers than

>> mobile counterparts, given less time in which to amortize its
>> immediate costs.

My own casual insight into free software hacking rather suggests that

(a) free software developers are younger because they are typically students or freshly graduated - and probably more idealistic than older people,

(b) free software developers are disproportionately located in Europe because the public acceptance and deployment of free software is higher (in relative terms) in Europe than in the US, resulting in a condition

where

- many computer science departments make Free Software development part of their curriculum and encourage to write Free Software as C.S. diploma projects. (Linux, for example, was Linus Torvald's diploma project at the C.S. department of the University of Helsinki.) After all, C.S. departments and university computing centers had a pressing need for a free Unix-compatible operating system. (AT&T Unix used to be almost free for universities in the 1970s but was relicensed after the AT&T breakup.)

When I first visited meeting of my local Linux User Group in 1996, they took place in the C.S. department of a local university whose department white board proposed several Linux kernel hacks as diploma projects.

- Because of the higher deployment of Free Software in Europe, European C.S. graduates may have a higher chance to work in Free Software environments on in-house projects (databases and network infrastructures, embedded controllers etc.). Even if these projects are not for public release, they typically generate free code (or free documentation) on the side, because other free software had to be bugfixed/extended for the project purpose or simply because a certain tool had to be written to accomplish a certain task within a project.

While Linus Torvalds and Miguel de Icaza used their reputation to go abroad and work in the U.S., proving that this indeed may be a motivation to write Free Software, this certainly fails as a general model and explanation. - Why, then, is it that Indian and Russian programmers hardly contribute to Free Software development at all?

Many Free Software developers I know have left-wing political views though and see work on Free Software as unalienated labour for which they are willing to make economical sacrifices.

- A motivation and lifestyle that I guess everyone who works in the arts, academia or media (and probably everyone on Nettime) knows quite well...

Florian

P.S.: While I have great sympathy for the conclusion that...

>> the insights political economists can shed on these movements allow
>> for a much more nuanced view of development than is made by advocates
>> of post-scarcity gift cultures.

...and think it is necessary

(a) to revise Raymond's enthusiastic distortion of the (quite nonideal) gift cultures described by Marcel Mauss

(b) not to speak of "post-scarcity economics" by falsely drawing from non-scarce immaterial goods (= software and information which is scarce only in its dependence on material carriers/hardware) to scarce material goods (energy, food, clothing, housing, etc.).

it still remains true that, since the 1980s, the software industry has made software artificially scarce by declaring it a material commodity. A questionable and, via the enforcement of "intellectual property" laws, increasingly totalitarian commodification to which Free Software provides an alternative. (- An alternative with the well-known downsides of economic self-exploitation of its producers, although they [still] are in an economically more comfortable position than those working in other fields of culture.)
P.P.S.: The fact that the Debian GNU/Linux distribution, probably the largest high-quality collection of Free Software, has grown to six full CD-ROMs/4 GB of compiled binaries (from two CD-ROMs back in 1997) is my empirical evidence against any claim about "the fading altruism in Free Software development".

[Nettime-bold] Re: <nettime> The Fading Altruism of Open Source Development

From: Felix Stalder
To: nettime-bold@nettime.org
Date: Wed, 12 Dec 2001 12:39:49
-0500

I never understood why people think of Open Source in terms of „altruism“.
Perhaps, it's due to some confusion related to the "saintly" image of
Richard Stallman, but it's the completely wrong approach and shows a very
limited understanding of economic relationships where things are more
varied than than selling things vs giving them away.

To make a long argument short, altruism is, if anything, the effect of Open
Source but not its cause. For Open Source to work, people do not need to be
altruistic, or at least not all of them. As far as I can see, many of the
developers who contribute to Open Source do so in the context of their
professional work, be it as members of academic institutions -- where
publishing and visibility has nothing to do with altruism but is a
necessity of survival -- or in the context of companies who use and extend
Open Source software in the work they do for clients.

But let's forget for a moment software and look at another great Open
Source project: the law. Nobody would claim lawyers as a profession to be
altruistic, even though there are certainly individuals with altruistic
motives. Many of them are highly paid and some are very much motivated by
money. Nevertheless, they all contribute to a great Open Source project.
The law and the court proceedings (ie. the code) are public and if you
want, you can use an argument made in one case by someone else in your own
case. In fact, this is standard practice and crucial to the efficient
working of the legal system. This is how the system learns and evolves and
how it avoids to be clogged with an endless numbers of identical cases. If
lawyers could copyright their arguments (i.e. restrict other lawyers from
using them), the system would break down, particularly the Anglo-American
system of common law.

In some ways, creating the law is similar to creating software. The first
copy (i.e. deciding the first case in a new area) tends to be very

expensive, but subsequent copies (i.e. deciding further similar cases) are
much cheaper.

The problem -- and the reason why lawyers make a good living -- is that
there are rarely identical cases, or, at the very least, it is very hard to
tell if a case is identical to one that has already passed through system.
What you pay a lawyer for is her knowledge of the relevant cases and her
work to take whatever necessary from them and then customize it for your
own context and needs. Sometimes this "customization" is relatively
trivial, sometime this includes a significant contribution to the evolving
public knowledge base.

To some degree, the same model applies to Open Source Software development.
What you pay, say, IBM for when they install a new server with Linux on it,
is the service they provide to you for customizing what is out there (Linux
etc.) to your own idiosyncratic needs. And rarely, your needs are exactly
the same than other people's needs.

Many people who contribute to Open Source Software work in contexts that
produce software but don't sell it. Be it that they are academics/students
or be it that they sell services. Taking from and contributing to free code
is in both cases a strategy that makes sense for very "selfish" reasons,
even though they also contribute to the free knowledge base.

> other highly complex Free Software projects from one's consideration.
>

this is true but there are a lot of "parallel projects" trying to make
money from free software (through consulting mainly, in accordance with
stallman's views, or customization of free software).

e.g. activestate tries to make money from perl, python, mozilla, php ..
(www.activestate.com)
"Sendmail, Inc. develops commercial products and services
that simplify the deployment of sendmail" (www.sendmail.org)

postgresql offers commercial support
<http://www.ca.postgresql.org/users-lounge/commercial-support.html>

a lot of development on the gnu c (and others) compiler system was
traditionally done by the cygnus corporation (now integrated into redhat)

when you look at a lot of recent projects like e.g. JBOSS (www.jboss.org)
that use "industry standards" like the j2ee (java2 enterprise edition) it
is clearly not the fun that is the primary motivation for the free
software programmers in this field.

I do not criticize people making money through consulting etc. but it I
think you need to take that into consideration as the author of the
article does.

I think you are right in stressing the difference between commercial
(what? software? enterprises? ..) and proprietary software. But if you
take into consideration that "free" software does create complex

relationships I find it hard to accept a synthetic separation between the software product "as such" and the dependencies it creates. Think of the creation of industry standards making users and developers somehow dependent on the original creator, complex software makes its users dependent in the developers.

There are some developers from Russia. E.g. Alexey Kuznetsov has done a lot of work on the networking code. This shows a weakness of Lancashire's empirical research: it neglects the quality of contributions to free software, even the quantity of contributions per developer.

> Many Free Software developers I know have left-wing political views though

many software developers I know have right-wing libertarian views, with a strong disregard for what any possible end user might want, usually a lot of free software developers don't even regard other human beings as equal to any degree (this is what Lancashire describes in the paragraph about Neuronancer, Turtle etc.). You might recognize a certain misogynous attitude in hacker culture in general ("GUIs are for girls", "real men use command line", "real men use linux", you could go on like this for quite a while). The same goes for "gay operating systems" and so on. It would be interesting to analyze the composition of the "free software community" in terms of race for this matter (I remember irc sessions with about 100 people doing free software development with participants mainly from the US, among all one african american, having to fight permanent harassment). For me this shows that any explanations in terms of gift or even GPL culture are less plausible than Lancashire's analysis which still might have its own flaws.

Well, look at the Jakarta Tomcat servlet engine, which is "the" standard servlet engine, not just "a" standard servlet engine. Tomcat is the "reference implementation" of the Servlet specification of Sun Microsystems' J2EE standard.

And IBM gave away a big chunk of its IDE code to the Eclipse project: the idea is an open source development environment that is modular and can be extended with both proprietary and open source solutions. Also part of IBM's Websphere use the Jakarta ANT product in it, as well as the fact that their webserver technology is based on Apache. IBM, and lots of other big IT corporations like Oracle, have embraced both Java (ultimately owned by their competitor, Sun Microsystems, although now opened to a "community process"), and indeed, Linux and Open Source.

The open source paradigm has been well embraced by many large IT

corporations. Jakarta project products are found in widespread use throughout corporate development.

regards
scot.

Isn't the legal system in some form "altruistic" per se?

But I wouldn't call it "Open Source". Casebooks are books. Ideas are free anyway. At least outside of the world of patents for gifts etc..

[Nettime-bold] Re: <nettime> The Fading Altruism of Open Source Development
From: Keith Hart
To: nettime-bold@nettime.org
Date: Thu, 13 Dec 2001 13:51:18 -0500

This message is triggered by Felix Stalder's of the above header. Felix and I appeared together on a panel he organised for the wos2 conference in Berlin during October. It was entitled open_money, a subject I will return to below, as a way of introducing my own writing. But first I want to comment on his remarks about altruism and the law in relation to open source. I should say that I find us in broad agreement on the general issue of open source, the internet and democracy.

The opposition selfish/altruistic is depressing because it speaks of a huge gap between the individual and society. This corresponds to our experience, where we are told on the one hand that each of us is a unique subjective personality, while society is a mass of remote objects governed by forces we neither understand nor can influence. The task of personal development and social organisation is rather to find way ways of integrating the two, the individual and the collective, self-in-the-world. And the most longstanding human arrangements do precisely that. We have to be self-reliant to a high degree and we have to learn to belong to others, to be connected at the same time. This is the human predicament and few entirely succeed. The issue therefore is not to be either selfish or altruistic -- each position is childish -- but to aim for what I think of as the human idea, to combine self-interest with recognition that the interest of everyone else in society affects us too, thereby dissolving the contradiction between the individual and the collective. I would claim that this principle was independently invented twice, by Gautama and John Locke.

But that would take us a bit far from what I want to say.

I wish to take issue with Felix's argument that the law in contemporary western societies offers an unambiguous point of reference for assessing the value of open source software development. It is true that English common law is unusual in making public law the normative outcome of individual citizens exercising their rights, with a heavy reliance on judicial precedent over statutory law. It is also true that the body of case law is available to lawyers as a basis for their arguments. But I think it would be wrong to say that the law is therefore open in the sense that all citizens have free access to it. First, as Felix implies, the law in many cultures is dualistic in a way that English common law was intended not to be. In most European languages there are two words for law, not one (eg loi/droit), reflecting a sharp division between public and private law, between the state and the people. Second, for centuries the judges and the legal profession have operated with a jargon that is closed to the general public. Third, access to the law, never mind justice, has been highly stratified. I could go on. Michael Lewis's recent book on the astonishing achievements of kids using the internet (The Future Just Happened, 2001) includes the case of a 15 year old who became the most highly ranked legal adviser on an internet site heavily populated by professional lawyers. The medical profession likewise once offered little hope that people might win some measure of control over their own minds and bodies, a situation that the internet may be changing. And surely one test of a civilisation is whether or not it helps its individual members to be self-reliant or autonomous. Ours does not. The law then is a bad example for arguing that open source software development can safely cross the border separating sharing without payment from commerce.

The open source movement is split on the issue of exchange and money payment. Those who follow the Free Software Foundation appear consider that any hint of money and exchange, even of reciprocity, leads directly to unacceptable compromise with capitalism. Linux, on the other hand, is rapidly being integrated with big business. Feelings run high on both sides, but especially on the first, which I would call purist, if not puritan. At the same time, the controversy over Microsoft's monopoly and the attempts to break it have pushed the open source movement into the mainstream of political debate. It raises interesting questions about whether some software developers are at the cutting edge of a new democratic politics or perhaps are little different from lawyers and doctors, in that their arcane practices are beyond the grasp of the vast body of citizens. Does it matter if some of them do it without money payment?

Perhaps a much bigger and related issue is whether the internet is fast losing the freedom of its early years. Here the case of writers like Lawrence Lessig (The Future of Ideas) is that private copyright, pushed by corporate capital and the legal profession, is breaking up the internet commons. The example of software development remains central to this case. It all seems to me an entirely healthy recasting of the political debate in terms that invite each of us to interrogate what we may have taken for granted. What is the commons and does it matter whether we lose free access to it? It means that the long argument about the social effects of markets and capitalism can be extended not just to software engineering, but to the street and parks, to language and literary traditions, indeed to the whole social infrastructure we live by. My interest is in exploring the possibility that money itself might become a commons to which all of us would have open access, open source money; if you like, a money that, instead of being supplied remotely by central agencies as a scarce commodity, might be something we could all make for ourselves.

To this end, I have been working on community currencies for over a year now with Michael Linton and Ernie Yacub in British Columbia. We are writing a book called Common Wealth. The subtitle is less stable than the title. At present it is 'building community and economic democracy with open money'; but it might be 'open money as a commons' or something like that. I hope to share some of this writing in progress with the nettime list. But at this stage, I would point readers towards a website: www.openmoney.org.

This is the second book on money I written recently. The first is Money in an Unequal World (Texere, 2001), first published as The Memory Bank (Profile, 2000). There is more about the book, including various downloadable items at www.thememorybank.co.uk. My concern there is with the consequences of the communications revolution for the forms of money and exchange. I suggest that money and language are the two great vehicles of communication we have and that their development is converging. I also set out to disentangle the market from capitalism, in the belief that more humane and equal forms of exchange involving money are both possible and necessary. This is the broad basis for my underlying agreement with the position outlined by Felix in his message to the list. There is a lot more to be said, but this is my way of introducing myself to the conversation constituted by nettime.

Keith Hart

I never understood why people think of Open Source in terms of „altruism“. [Nettime-bold] RE: <nettime> The Fading Altruism of Open Source Development
From: Kermit Snelson
To: nettime-bold@nettime.org
Date: Fri, 14 Dec 2001 23:37:51 -0800

The open source paradigm should not be identified with altruism. This was Felix's main point, and I very much agree. I also agree that software developers, like lawyers, can make a good living by selling their time rather than licensing their product. This is hardly news, however. (And the example of US legal celebrities such as Alan Dershowitz and Melvin Belli shows that the path to true riches in the law lies not on billable hours, but on widely distributed and copyrighted product.)

But then Felix goes on to call the law "a great Open Source project." Although it's clear to me that he intended this statement to serve only as a qualified analogy, I think it's politically important for the record to show

that this is far from being the case in practice. The fact is that large amounts of the legal apparatus and of the law itself are copyrighted and commercially licensed.

As Felix points out, the common law system requires that prior court decisions be published and indexed. This massive publishing task, however, is carried out not primarily by governments, but for profit by large commercial entities such as Thomson and Reed Elsevier. The actual practice of precedent-based law today depends on case, statute and authority finders, nearly all of which are the extremely expensive and copyrighted products of commercial publishing empires.

Not only is the legal research apparatus licensed at great expense, but sometimes so are the statutes themselves. Building codes, fire codes and commercial codes provide many examples of laws that are written and copyrighted by private organizations and then adopted as public law by the legislatures. In the USA, this has resulted in counterintuitive (to say the least) situations in which state governments cannot hold copies of their own laws without paying large royalties to the private corporations that wrote them. Needless to say, US citizens in such cases are also obliged to pay these private organizations in order to learn the laws to which they are subject.

In the UK the Crown asserts copyright on all laws, although it currently waives its rights with respect to legislation. But with respect to other public assets such as Ordnance Survey mapping, it vigorously exercises the Crown copyright with the express purpose of commercial exploitation. The assertion of Crown copyright on legislation makes it entirely legal for the Crown to do the same with the public statutes should it so choose.

If the law holds a lesson for the open source software development paradigm, it is that it is becoming extremely difficult even for governments to finance the increasingly technical and massive task of creating and administering the law without resorting to copyright and other restrictive measures. Universities are in a similar situation with respect to research. Any political response to the threats posed by these developments to democracy, free inquiry and free software must be based upon an objective and accurate understanding of the economic and technical realities upon which this political situation is based.

Kermit Snelson

By reading David Lancashire's article and by following this thread i still don't understand if you're voluntarily blurring differences between "free software" and "open source" or you are simply ignorant: in the latter case please refer to <http://www.gnu.org/philosophy/free-software-for-freedom.html> and

<http://www.gnu.org/philosophy/drdoobs-letter.html>; to be sure you have it clear, i quote here a brief statement from the second document:

The GNU GPL embodies the firm philosophy of the free software movement; it doesn't come from the open source movement. I am not a supporter of the open source movement, and never have been.
(Richard Stallman)

Once cleared such a crucial difference for the discussion i'd like to add my point of view about free software: _it is_ altruism, it has a philosophical background which is a solid spark in a free software developer's mind; furthermore motivation is given as well by the possibility to learn from and reuse code of other experienced programmers willing to share knowledge and much is done also by a development framework which finally _works_ as it should (and it's free[i]) anybody here knows about the costs a programmer had to sustain to distribute bytecode produced with a reliable compiler, about 10 years ago anyone ever read about the industrial revolution and the role property of production systems played into it?; it's about the pleasure to research into a field one is sincerely interested, about the craftsmanship spirit of self production which is dramatically disappearing IRL substituted by mass-production omologation.

Free software is about solidarity, quoting Richard Stallman in one of his first theorizations on free software:

Why I Must Write GNU

I consider that the golden rule requires that if I like a program I must share it with other people who like it. Software sellers want to divide the users and conquer them, making each user agree not to share with others. I refuse to break solidarity with other users in this way. I cannot in good conscience sign a nondisclosure agreement or a software license agreement. For years I worked within the Artificial Intelligence Lab to resist such tendencies and other inhospitalities, but eventually they had gone too far: I could not remain in an institution where such things are done for me against my will.

So that I can continue to use computers without dishonor, I have decided to put together a sufficient body of free software so that I will be able to get along without any software that is not free. I have resigned from the AI lab to deny MIT any legal excuse to prevent me from giving GNU away.

[...]

"The GNU Manifesto", Richard Stallman
Copyright (C) 1985, 1993 Free Software Foundation, Inc.
Permission is granted to anyone to make or
distribute verbatim copies of this document.

and of course it's about reputation which i would nt define "ego-boost": i see such a phenomenon much more present in other contexts which right here i see engaging the katarutical exercise of blurring a different philosophy to make it easier to reach.

enfin, to mark distances, i must state "je ne parle pas logique, je parle generosite" : this answer Andre Breton gave in an analog situation makes me once again comfortable in underlying the differences i see in our languages, and approaches.

[1] Free software is a matter of freedom, not price; the word "free" has to be intended in this way here. Furthermore, referring to the wrong assumption by Keith Hart in this thread:
> The open source movement is split on the issue of exchange and money
> payment. Those who follow the Free Software Foundation appear
> to consider that any hint of money and exchange, even of reciprocity,
> leads directly to unacceptable compromise with capitalism.
refer to <http://www.gnu.org/philosophy/selling.html> to have a clear point about the free-speech / free-beer issue.

Kermit Snelson wrote:

>But then Felix goes on to call the law "a great Open Source project."
>Although it's clear to me that he intended this statement to serve only as a
>qualified analogy, I think it's politically important for the record to show
>that this is far from being the case in practice.

I entirely agree with your qualifications. Indeed, I intended the law analogy as a very partial one. Besides the limitations that you point out, there are obviously further aspects that make the legal system very different from Open Source. Perhaps the most important is that in many cases only members of a select group, e.g. barred lawyers, are allowed to practice the law. There is a clear, and vigorously maintained, difference between professionals and lay people. The same difference exists in closed source software. In the open source community, however, the boundaries between developers and users are sliding and primarily dependent on dynamic knowledge and commitment, rather than on static certification. This, I think, is a really important factor in the vitality of the movement.

The reason why I brought up the shaky analogy to law is to highlight that there are other areas of our society that are based on a public knowledge base (with the qualifications you added) and that this does not preclude, for the better or worse, their inclusion into the main stream and nor their economic viability.

Indeed, one could argue that many of the most sensitive aspects of a democracy are based on publicly accessible knowledge (at least in theory) and that it might be time to include the emerging information infrastructure into this category. What a democracy needs is transparency, accountability and participation, and open source can contribute to this on a technical level.

Keith Hart wrote:

>The opposition selfish/altruistic is depressing because it speaks of a huge
>gap between the individual and society. This corresponds to our experience,
>where we are told on the one hand that each of us is a unique subjective
>personality, while society is a mass of remote objects governed by forces
>we neither understand nor can influence. The task of personal development
>and social organisation is rather to find way ways of integrating the two,
>the individual and the collective, self-in-the-world.

When I talked about 'selfish' versus 'altruistic' motivations of open source contributors, I took them as opposites which are usually regarded as mutually exclusive. What I meant was that the way the process is currently organized there is no real difference between the two, or, to be more precise, the difference is on the level of the personal input, rather than in the systemic output. In other words, no matter why you produce open source code, the result is always open source code, which someone else can you to whatever purpose she sees fit. Because the code is open, it is impossible to program a hidden agenda into open source code, in the way MS software is rumored to have hidden backdoors and secret keys. This, to some degree, keeps the software neutral and prevents personal motivations to be translated into code that would conflict with the motivations of other members of the community.

There is a long-standing discussion over whether Open Source is left wing or a right wing movement which also crept up in this thread.

Florian Cramer wrote:

>Many Free Software developers I know have left-wing political views though
>and see work on Free Software as unalienated labour for which they are
>willing to make economical sacrifices.

To which oliver frommel replied:
> many software developers I know have right-wing libertarian views.

And I'm sure there are many open source developers who are totally apolitical....

What I'm trying to understand is this: Does the shift from an impersonal commodity to a personal service relationship (on the economic level) combined with an abundant pool of resources and a task so complex that it is managed most effectively in a collaborative way, does this to some degree mitigate otherwise competing interests between the 'self' and the 'community'?

It is certainly not a given, but perhaps the open source experience shows a way into this direction.

Felix

Yes, it is indeed disappointed that a term that was (quite consciously) coined as a depoliticized new economy marketing buzzword for Free Software has so widely been adopted in "critical" net cultures.

The "Open Source FAQ" of the Open Source Initiative says:

The Open Source Initiative is a marketing program for free software. It's a pitch for "free software" on solid pragmatic grounds rather than ideological tub-thumping.
<<http://www.opensource.org/advocacy/faq.html>>

> Once cleared such a crucial difference for the discussion i'd like to

In fact, I argued along similar lines in my initial response because I had jaromil - a great hacker, btw. - in my mind, regardless the fact that much if not all Free Software development is coupled with commercial software enterprise or side-projects. The real amount of altruism in Free Software development may be debated, but any programmer who's mostly or even only in it for the money would be stupid to program anything but proprietary software (which, no doubt, is more profitable).

I quite deliberately (con)fuse the two, though I'm sure I'm also ignorant.
 I think separating now FSF/GNU and Open Source/Linux is like trying to
 separate the ingredients of a meal after it has been cooked. It's pretty
 pointless. It's clear that Linux and other Open Source projects heavily
 built on FSF work, however, I think it's also clear that without Linux (and
 other projects) the great FSF would have remained a rather closed, albeit
 pure, medium-sized club.

One of the most interesting aspects in this entire movement is the degree
 to which it has been able to absorb very different, even contradictory
 ideas. Any attempt to purify this heterogeneous beast (to use a
 semi-Latourian term) is pedantic at best, destructive at worst.

So far, I think the politics are still in the code, not in the label, and I
 cannot see much difference between Open Source/Linux GPL code and FSP
 GPL
 code. But then again, I'm not a hacker.

> but any programmer who's mostly or even only

Which is not necessarily true. I guess John Gilmore is still quite wealthy
 (good for the EFF). However, this is totally besides the point. Whether
 someone makes money or not is not really the question, the question is the
 quality of the output and its impact on others. The rest, from my point of
 view, is a life-style question.

<nettime> gentrification of hacking

From: biella
 To: nettime-l@kein.org
 Date: Sat, 15 Aug 2015 12:16:23
 +0200

Hi,

I want to chime in but can only do so briefly as I am at CCC camp and
 not online much. I found the essay provocative and it is undeniable that
 these processes are under way but two things come to mind: this cycle has
 long existed and in many quarters of the hacker community from the
 security industry to hardware (the Homebrew club went from an informal
 association of hackers building association to a capitalist gold mine).
 These processes are deeply cyclical and on going and I don't really
 expect them to go away given how central computing is to capitalism.

What was omitted was the rather expansive politicization of hacking we
 have witnessed in the last five years thanks to the likes of Wikileaks
 and Anonymous (or as Julian Assange put it "The political education of
 apolitical technical people is extraordinary.") This is not to say we
 should not worry about cooptation/gentrification/recuperation. But it is
 as important to understand what has helped secure this flowering of
 political activism today so that we can protect it in the future.

I wrote a paper, Weapons of the Geek about the political turn in
 hacking. It is under review but am happy to share for those who want to
 see an early copy. I am also pasting a section of the introduction below.

Biella

Even as they attain to a social primacy alongside the global
 communications technologies they have helped steward, entrenched
 stereotypes have precluded serious studies of the contemporary politics
 of hacking. Peering past the caricatures, we can see that hackers have
 long used their skills for protest and overt political transformation
 (Jordan and Taylor 2004). Hacking itself has long exhibited a powerful,
 albeit latent, political sub-text (Soderberg 2012; Wark 2004). But in the
 past five years, activist-motivated hacking has significantly enlarged
 its scope and continues to demonstrate nuanced and diverse ideological
 commitments. Many of these commitments cannot be reduced to
 "libertarianism," that ideology universalized by many observers as the
 crux of hacker politics. For one, civil disobedience has surged in a
 variety of formats and styles, often in relation to leaks and
 exfiltration. We see lone leakers, like Chelsea Manning, and also
 collectivist and leftist leaking endeavors, perhaps best exemplified by
 Xnet in Spain. Other political engagements, similarly irreducible to
 libertarian values alone, center around collective engagements at the
 level of software: hackers have recently coded up protocols (like
 BitTorrent) and technical platforms (like The Pirate Bay) to enable
 peer-to-peer file sharing and anti-copyright piracy (Beyer 2014).

McKelvey, forthcoming); since the 1980s, free software hackers have embedded their collectively produced programs with legal stipulations that have powerfully tilted the politics of intellectual property law in favor of access (Kelty 2008; Coleman 2013). Across Europe, Latin America, and the United States, anti-capitalist hackers run small but well-functioning collectives that offer privacy-enhancing technical support and services for leftist crusaders: Anonymous, a worldwide protest ensemble specializing in digital direct dissent, has established itself as one of the most populist manifestations of contemporary geek politics -- requiring no technical skills to contribute (Coleman 2014); and finally, on the more liberal front, civic and open government hackers throughout North and South America have sought to improve government transparency by creating open standards and applications that facilitate data access and sharing (Gregg and DiSalvo 2013; Schrock, forthcoming). Julian Assange, one of the most prominent activist hackers, has recently highlighted the rather dramatic turn to activism and political engagement among geeky technologists. "The political education of apolitical technical people is extraordinary" (2014: 116), he noted during an interview.

There are no obvious, much less given, explanations as to why a group once primarily defined by obscure tinkering and technical exploration now engages so frequently in popular media advocacy, traditional policy and lawmaking, and activism -- including forms of civil disobedience so risky that some in the community are currently in prison or living in exile. Working technologists are economically rewarded in a step with doctors, lawyers, and academics -- and yet these professions produce far fewer politically-active practitioners. Why and how have hackers who enjoy a significant degree of social and economic privilege managed to preserve pockets of autonomy? What historical, cultural, and sociological conditions have facilitated their passage into the political arena, especially in such large numbers? This does not mean hackers should be blindly celebrated or denigrated, (as has often been the case in the popular literature on hackers), but it does beg for analysis and explanation.

Ideally, the beginnings of an answer would deeply chart hacker activity along two distinct vectors: the historical and the socio-cultural. However, an article of this length affords only a single thread of analysis. While my article will gesture at historical events and circumstances, this article will foremost provide an introductory inventory of a basic outline of an explanation -- of the sociological and cultural attributes most likely responsible for the unprecedented and multitudinous intensification of hacker politics during the last five years. To begin, let's consider the idea of the 'hacker' itself.

Dear Brett,

your essay is brilliant and obvious at the same time. I did enjoy reading it, but still feels like scratching the surface as it does not dig into other historical examples of cultural gentrification.

Date: Sun, 16 Aug 2015 20:58:32 +0200

Thanks Biella,

You're much more of an expert on this than I am, so it's good to see this. My main objective was to stir up debate a bit to keep people on their toes, rather than necessarily believing in the 'death of the hacker'. A lot of my writing has an ambiguous relationship to factual reality, or I often deliberately mix together descriptive accounts of things with normative accounts of things I'd like to see, and sometimes they blend into one... well, perhaps this is a way of saying that I am less an academic than I am a shit-stirrer, and sometimes I will make things cruder than they actually are in order to push a political agenda. I want the politicization to continue, and pointing out the forces against politicization is one way I do that. Hope this makes sense

Looking forward to seeing 'Weapons of the Geek' when it comes out!

Hope CCC camp is fun

Cheers!

Brett

Gentrification of hacking is by those studying, reporting, historicizing, philosophizing, theorizing, aestheticizing, curating (spit) it. As with gentrification in general, it refines the reification, a deft academic opportunism, one might be so vulgar as to say the very product of nettime and every growing crowd of cohorts. Amazon-ian in intent.

Gentrifiers dare not hack, but do inveigle their way into hacker havens, publish about hackers, testify against hackers, consult with governments about hackers, speechify hackerdom at security fora, advise film and media about hackers, produce hacker-derived aesthetic objects, even advise crude and obnoxious hackers about advancing careers as hacker, ex-hacker, hacker informer, undercover cop, covert agent academic with hacker cred, and if all goes well sign on to distinguished institutions, cybersecurity corporations, and duplicitous NGOs like In-tel-Q where PhDs are taxidermied for showboating at DefCons and CCCs, then on to global appearances via speaker bureaus and paid conferences.

Gentrifiers are allergic to jail themselves but do exploit the few hackers who get nabbed through the assistance provided to law enforcement by gentrifiers, not least by cedebrifying hackers so that officials are induced to go after them for budget enhancement.

So goes gentrification in all its vile piggish manifestations. Behold the origin of the term to cloak, deceive, defuse dissent, advance the interests of property holders. White hat hacker cartels are making a killing policing gentrification cyber real estate.

Thanks Biella,

You're much more of an expert on this than I am, so it's good to see this. My main objective was to stir up debate a bit to keep people on their toes, rather than necessarily believing in the 'death of the hacker'. A lot of my writing has an ambiguous relationship to factual reality, or I often deliberately mix together descriptive accounts of things with normative accounts of things I'd like to see, and sometimes they blend into one... well, perhaps this is a way of saying that I am less an academic than I am a shit-stirrer, and sometimes I will make things cruder than they actually are in order to push a political agenda. I want the politicization to continue, and pointing out the forces against politicization is one way I do that. Hope this makes sense

It does, to a point. We clearly reside in the same camp: we want to encourage the processes of radicalization among the technorati. And your piece is provocative enough (and written well enough) so that people read it in large numbers and it ricocheted far and wide across many sites. You did stir the pot of conversation, which is a really good thing.
Still as already stated, my worry, which is less academic and more pragmatic, concerns precisely how to most productively push a political agenda. The window of activist activity we are witnessing is both remarkable (and remarkably robust) but completely fragile--and again precisely due to the economic dynamics you lay out. Your piece may have identified a problem (one again that is more cyclical, and on going than new) but it also missed an opportunity to nudge those who harbor a political/activist sensibility toward the site of struggle. These are exciting times precisely because there is rich and active terrain of struggle with large numbers of hackers and geeks willing to enter fully into the political arena. A number of folks tweeting your piece made it seem like there was once possibilities and now they have slipped through our fingers. That is a dangerous (and empirically wrong message) to send to the public at large.
There is no need to belabor the point but I guess I raise it a final time for the sake of future writings. I just think you could have been more effective--as a shit-stirring provocateur--had you loudly and proudly pointed to those who have decided not to accept the path of gentrification for the sake of a better world so that others with a activist sensibility could join their rabble rousing party :)

Take care,
Biella

When Stephen Levy wrote "Hackers" in 1984, his description of hacker culture and his write-up of the hacker ethic were, to a considerable part, based on Richard Stallman. Already in that year, Levy called Stallman the "last of the true hackers". Stallman created the GNU Project in the same year out of frustration of what had become - or how little had remained - of the original M.I.T. hacker culture. Even the GNU Project itself involves "gentrification" in the sense that development of some of its subprojects (such as the GNU C Compiler, the GNU C Library and the GNOME desktop) has become largely corporate. GNU intentionally never imposed prohibitions on commercial and particular political/military uses of software licensed under its terms. This position continues to be criticized by other hackers, for example by Felix von Leitner from Chaos Computer Club.
All this suggests that the "gentrification of hacking" is not a new phenomenon, but that it has been a part of hacker culture since its early days.

Right. And these hacker ethics are derived from the "ham spirit" of the early 1920ies. That was right after the first ever machine centric war "Gentrification?". Ladies and gents of nettime-list are you for real? cccamp2015 was like an amateur radio fieldday, but futuristic and steampunk as well.
Can you imagine a five days outdoor event of 4.800 people in the midst of nowhere without any blue lights or uniforms ever visible? No fights none stone drunk, nothing. But 40 GBit local, 10 GBit uplink. 8 GSM stations, own SIMs, 2.700 fones on the DECT wireless network, all interconnected. Not to forget the military field 4 KM telephone system and the ham UHF repeater station. The latter technologies were really in use, when the nets were run down and +2000 people had to be evacuated temporarily because all these high tents, antenna masts were not grounded adequately any more. 5 days of 37 C and a sandy ground, surrounded by water. An evil high power capacitor eye in the landscape facing a another pole in the troposphere potentially VERY evil.
Here is a report what happened...

<http://fm4.orf.at/stories/1761897/>

This is all not about gentrification which is a ridiculously useless because purely ideologic term btw.
cccamp has always been the breeding ground for projects presented at congress thereafter.
You could not distinguish between hackers, hams or makers. Rather young families, even singles or pairs in their 30ies or 60ies.
Wait what? gentrification? What about adding some field research to your

free flow of hypotheses'

I am sure that many of you already read these articles or they know them by heart

Nonetheless I feel like refreshing your memory:

<http://peerproduction.net/issues/issue-3-free-software-epistemics/peer-reviewed-papers/free-software-trajectories-from-organized-publics-to-formal-social-enterprises/>

<http://peerproduction.net/issues/issue-3-free-software-epistemics/debate/there-is-no-free-software/>

Also, since "gentrification" is the key issue in here, I would like to quote this passage from Blake in his review of Richard Smith (2003) work which I think could fit the ongoing discussion: A

"In actuality, networks may contain ubiquitous actants occupying fluid positions, who like Deleuze and Guattari's (1987) 'journeymen' and 'monsters' operate in relation to mechanisms of control but also retain lines of escape of their own. This can be illustrated by Neil Smith's (1999) analysis of the position of artists in the gentrification process. In the Lower East Side artists can be seen to have a meditating influence in gentrification, since low rents and government subsidy may attract them to an area, raising its cultural image enough to attract gentrification. Nevertheless they have a ubiquitous role in this process, since rising prices may finally push many artists out of the neighbourhoods and some may therefore support activities from original residents resisting gentrification. At the same time however, artists may benefit from new markets created by the gentrifiers, leading to the presence of oppositional art in mainstream galleries. In this sense artists can be seen to occupy a fluid position in the networks linking gentrifiers with the established community. Thus they may be seen as an example of the non-conforming identities described by Star (1991: 39), in that they operate 'between the categories, yet in relationship to them'."

A good example are "Open Content" licenses. They have departed significantly from Free Software/Open Source licenses wherever they allow to restrict modification and commercial distribution of a work. Therefore, the two major "Open Content" licenses, the GNU Free Documentation License (used by, among others, the Wikipedia) and the Open Publication License, are non-free or non-Open Source. As a consequence, the Debian project recently considered moving software documentation released under the GNU GDL into its non-free section. - The same is true, btw., for the 12 licenses "Creative Commons" <<http://www.creativecommons.org/>> offers of which only 4 qualify as "Free" or "Open Source" according to the Debian Free Software Guidelines and the Open Source Definition. If "Open Content" needs other legal regulations than Free Software, then obviously because of the different social issues of writing, for example, books as opposed to writing software. (Which doesn't mean that these fields couldn't converge very soon - for example through the need for authors to write complex XML markup, use revision control and content management systems etc., so that the traditional distinction will get more and more blurred.)

Nevertheless, this is a good opportunity to question the venerable copyright statement of Nettime:

"distributed via <nettime>; no commercial use without permission".

In order to turn Nettime into a truly public and free resource, I suggest to change this line into

"distributed via <nettime>; unless stated otherwise by the author, permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.1"

<nettime> Free Software as Collaborative Text
From: Florian Cramer
To: nettime-l@bbs.thing.net
Date: Tue, 19 Sep 2000 11:39:31 +0200

(This is the manuscript of a lecture I held on the panel "Minor Media Operations" at the Interface 5 conference in Hamburg. I hope it's of some interest to Nettime subscribers. The text is also available in PDF and html format from my homepage <<http://userpage.fu-berlin.de/~cantsin/>> -FC)
Free Software as Collaborative Text

Florian Cramer
<[cantsin \[AT\] zedat.fu-berlin.de](mailto:cantsin [AT] zedat.fu-berlin.de)>

September 15, 2000 [1]

What is Free Software?

Why discuss Free Software in the context of net arts and net cultures?

Since about two years, Free Software--or "Open Source"--has drawn increasing attention from artistic net cultures. The Wizards of OS conference, first held in Berlin in 1999, was the most prolific event to bridge the gap between the arts, humanities and social sciences on the one hand and Free Software culture on the other. The politics of copyleft and free distribution of code and knowledge soon turned out to be a common ground of discourse. In this paper, I will take a different aspect into consideration by reading Free Software as a net culture and its code as a multi-layered, collaborative text. Seen as a literary practice, Free Software development is an avant-garde of writing in digital networks, and even more: Since Free Software is at the heart of the technical infrastructure of the Internet, it has--to a large extent--written its own digital network.

Definition of Free Software

In this paper, "Free Software" does not refer to "Freeware", "Shareware" or other proprietary software given away at no cost--like Microsoft Internet Explorer, QuickTime and Real Player--, but is understood in accordance with the definitions of Free Software Foundation <http://www.fsf.org> as software which is "free as free speech, not as free beer". Among the best-known examples of Free Software are the Linux kernel, the GNU tools and the Apache web server.

Since 1998, the term "Free Software" competes with "Open Source", a term launched by a group around the writer and programmer Eric S. Raymond. According to this group, "Open Source" is only a different name for the same thing to gain more mainstream acceptance in the world of computing.[2] The Open Source Definition [Opeb] therefore draws upon the older Free Software Guidelines [Deb] of Debian, a non-commercial GNU/Linux distribution made by volunteers.[3] The guidelines can be summarized as follows:

1. Free Software may be freely copied.
2. Not only the executable binary code, but also the program source code are freely available.
3. The source code may be modified and used for other programs by anyone.
4. There are no restrictions on the use of Free Software. Even if Free Software is used for commercial purposes, no license fees have to be paid.
5. There are no restrictions on the distribution of Free Software. Free Software may be sold for money even without paying the programmers.

Since the same criteria apply to "Open Source", the two concepts indeed do not differ in technical terms. Yet each of both terms has its ambiguities: While "Free Software" tends to get confused with Freeware and Shareware,[4] "Open Source" is easy to be mixed up with "open standards"--like the HTML format and the http protocol--and with software like Sun's Java whose source code is publicly available, but only under a restrictive license. It is particularly important to differentiate "Open Source" and "Free Software" from open standards. While open standards are unified technical specifications set up by committees like the Internet Engineering Taskforce (IETF) and the World Wide Web Consortium (W3C), "Open Source" or "Free Software" developers code whatever they like for their own fun, and they are free to split their projects and develop the code into separate directions if a consensus can no longer be reached.[5]

Since misconceptions of "Open Source" are so common, I will stick with the less popular, but somewhat clearer term "Free Software".

Free Software History

It is not accidental that history of Free Software runs parallel to the history of the Internet. The Internet is built on Unix networking technology. Unix used to be free for academic institutions in the 1970s, and it has been either the base or model of the common Free Software operating systems BSD and GNU/Linux.

Any ordinary E-Mail message still reveals the affinity of the Internet and Unix technology: E-Mail itself is nothing but the Unix mail command. An E-Mail address of the form xy[AT]z.com is made up of what's historically a user name on a multiuser Unix system and, following the "[AT]", the system's host name. This

host name is resolved via the free Unix software bind according to the Internet domain name system (DNS); DNS itself is nothing but a networked extension of the Unix system file /etc/hosts. Since the Internet has marginalized or even replaced proprietary computer networks like IBM's EARN/Bitnet, Compuserve, the German Btx and the French Minitel, Unix networking technology is standard on all computing platforms.

In the 1970, Unix particularly attracted student hacker communities at the MIT and at the University of California at Berkeley. The concepts of open, decentralized computer networks and free Unix-like operating systems originated in the computer science labs of these institutions. By the early 1990s, the "hacker" software written there had evolved into

1. the BSD family of operating systems with the free versions FreeBSD, NetBSD and OpenBSD. All of them use a codebase that was originally developed in Berkeley under the project leadership of Bill Joy.
2. the GNU/Linux operating system. All major Linux-based operating system distributions--RedHat Linux, SuSE Linux, Turbo Linux, Debian GNU/Linux, Mandrake Linux, Corel Linux OS and Caldera OpenLinux, to name only a few--build on the GNU software written since 1984 by the Free Software Foundation (FSF) and on the Linux kernel written since 1991 under the project leadership of Linus Torvalds.[6] The FSF was founded and is still being led by former MIT hacker Richard M. Stallman.

Open technology has been a key factor for the acceptance of computers and networking: The open architecture of the IBM Personal Computer made computers cheap and popular since the 1980s, and with the open architecture of the Internet, networking became popular in the early 1990s. Lately, Free Software has made high-end Unix server computing available to anyone willing to learn the technical details. Whether Free Software can become as popular on mainstream desktop computers and eventually de-commoditize all computer software, remains to be seen, but is not the question I want to investigate here.

Free Software as a Net Culture

In the middle of the 1990s, "net culture" became the keyword for artistic, art-critical and political discourse in the Internet. The term was closely identified with mailing lists like Nettime <http://www.nettime.org> and Rhizome <http://www.rhizome.org>, conferences like the one where I present this paper and print publications like the Nettime anthology [BMBB*+99]. "Net culture" used to be pronounced as a singular noun in these forums and media referring only to the discourse they created.

Free Software is an outstanding example that there is not one, but many net cultures. It predates artistic net cultures in the Internet by roughly twenty years. The Free Software copyleft can be seen as the quintessential reflection of this long experience. Invented to preserve the traditional academic-artistic freedom of speech and citation in the digital realm, the copyleft has radically rewritten it nevertheless. The concept that code, i.e. text, may not only be freely copied, but even modified ("patched"), willfully recycled and commercially redistributed by anyone without the author's permit is foreign to the post-medieval Western arts and sciences. In print culture, such practices are considered plagiarism and theft.

Even for the digital net arts, the copyleft remains an unresolved challenge. Many, if not most net artworks depend on proprietary authoring and display software.[7] and the distribution terms of their code are rarely clarified.[8] Yet Free Software has as subtly as significantly influenced the digitally networked arts. Without free E-mail server software like Majordomo <http://www.greatcircle.com/majordomo/> and Sendmail <http://www.sendmail.org>--and the overall possibility to set up inexpensive servers using the GNU/Linux and BSD operating systems on stock PC hardware--, the artistic net cultures of Nettime et.al. hardly could have operated non-commercially and with free participation.[9] Friedrich Kittler's observation that artistic tools conceptually shape what is made with them [Kit85] also applies to the net arts. The fact that Majordomo and Sendmail became major tools of artistic net activity is an important--but of course not the

sole—explanation why contemporary Net.art tends towards conceptual, discursive and text-heavy work instead of the immersive “virtual reality” environments many critics had expected them to deliver. The latter would have required expensive proprietary software for design and display, closed high-speed networks and, as a result, dependence on highly funded institutional infrastructures, limited community participation and top-down instead of bottom-up organization of this particular net culture.

Free Software as Writing

The relevance of Free Software for other net cultures is not limited to the tools it has created and the infrastructures it has made possible, simply because those tools themselves are the very object of Free Software culture: they are text, results of complex textual processing. Moreover, this text is being produced with tools which themselves are free code.

While the phenomenon that text is being built with tools which are source text themselves applies to the proprietary software as well, there is an important difference: Free Software source text is not withdrawn from the public. It cannot be abandoned by company management and does not disappear when development has ceased. All Free Software builds up to a public repository of text-coded, free-to-use knowledge. It accumulates to an archive. Instead of being written from scratch, new Free Software can be built from whatsoever is in that archive. Free Software therefore is highly intertextual. Free Software development is the earliest and still most successful practice of collaborative writing in computer networks. With its system of textual production and politics of code, Free Software is by far the more advanced net literature than what is commonly understood as net poetry and net fiction.[10] Free Software may be seen simultaneously as

- * a freely accessible, ever-growing body of code—a text archive;
- * recursive (i.e. self-applied) text processing, since available text is used both as a source and as a building tool to create new code;
- * text processing even through the medium of text, because Free Software development infrastructures mostly depend on mailing lists and command-based version control systems.
- * a “hacker” culture which advocates freedom of information and codes its politics into the legal texts of the copyleft.

The coded copyleft might be the clearest interstice between Free Software as a net culture and Free Software as net text. Both these aspects already come into play when Free Software is being written. Free Software development is typically achieved by self-organized volunteer projects whose members communicate and collaborate via the Internet. The development work consists of:

1. Writing program source text

This involves evaluating of available Free Software source code for possible inclusion and adaption. It also involves picking—and compiling—the coding tools which themselves are Free Software source text.

To accommodate its own needs, Free Software has developed the arguably most sophisticated writing tools for the distributed authoring of text. Particularly outstanding is the Concurrent Versioning System (CVS)[11] (Ced99) which allows authors to take portions of text—regardless whether it is written in programming language or in natural language—over the Internet, work on them at home, and synchronize the changes with the revisions of other collaborators any time. CVS-based writing might be the technically most radical departure from the typewriter-and-mail paradigm in text editing to date.

2. Writing documentation text

Documentation is both internal and external to the program source text when the latter contains annotations and separate reference documentation is being written. Free manuals remain a political issue within Free Software development. A number of companies base their business model on giving away the software under free licenses and charging for documentation and support.[12] In the ideal case however, a second textual recursion occurs within in Free Software which is common in all modern knowledge systems since Diderot’s and d’Alembert’s Encyclopédie[12]. The text teaches the reader all steps which were necessary for its creation so that all the information it contains

may be re-applied to itself.

3. Communication over mailing lists, bugtracking systems and IRC

Free Software development teams almost exclusively constitute themselves and communicate over the Internet, in mailing lists and on IRC servers. Interpersonal communication therefore is a third layer of text which regulates the design of both program and documentation source text. It operates as a cybernetic feedback loop for the development process.

4. Writing legal text

Free Software is legally defined. It is software under certain licenses, i.e. legal documents. The most common types of copyleft include the GNU General Public License <http://www.gnu.org/copyleft/gpl.html>, the BSD License and the Perl Artistic License. Whether program source text is free solely depends on whether it is copylefted. Legal text therefore is the fourth layer of text regulating the entire flow of text generated in Free Software projects.

Free Software is thus a highly sophisticated system of recursive text generation for a public pool of knowledge. It is text code created from text code with text-coded tools and textual communication over networks. The types of texts processed in Free Software are extremely diverse: They include executable binaries,[13] text written in programming languages, text written in natural languages for documentation, text written in natural languages for communicating and steering development, and legal texts defining the fair-play rules of the recursive textual processing.

Objections

Both the Free Software engineering and the net artistic camps are traditionally skeptical about attempts to read Free Software in terms of the net arts. The objections were particularly voiced when the Linux kernel was awarded the Golden Nica in the “net” category of Ars Electronica 1999. At the Wizards of OS conference in the same year, the net artist Alexej Shulgin argued that Free Software is “functional” while Net.art is “non-functional”, self-sufficient code.[14]

I do not find this point viable from an analytical perspective, since the division between “functional” and “non-functional” is purely arbitrary and subjective. I/O/D’s Web Stalker [I/O97], an experimental Web browser and well-known Net.art work, is arguably more “functional” than the teddy bear desktop emblem txdy which is contained in all major GNU/Linux distributions. Moreover, the distinction between “functional” Free Software and “non-functional” Net.art falls back into late-romanticist notions of the absolute artwork versus lower craftsmanship. It also neglects that with its multiple self-applications of text, the development and use of Free Software is to a large extent its own purpose. No other operating system is as open and seductive to be used as an end to itself as GNU/Linux.

Just as arbitrary as the distinction between “functional” and “non-functional” software is that between program source code and poetry. To date, all attempts to formally define poetry and poetic language have failed. The decision whether a text is poetry will always be up to the reader. The notion of “program code” versus “poetry” was first put into question by the French poet and mathematician François le Lionnais, who co-founded the Oulipo group with Raymond Queneau. In 1973, le Lionnais released a volume of poetry written in the programming language Algol. The practice has been revived in the 1990s by people who write poems in the Perl scripting language.

Conclusion

Read as a net literature and a net culture, Free Software is a highly sophisticated system of self-applied text and social interactions. No other net culture has invented its computer code as thoroughly, and no other net culture has acquired a similar awareness of the culture and politics of the digital text.

Much Net.art, net literature and critical discourse about them has focused on the aesthetics and politics of desktop user interfaces. In its focus on code, Free Software shows that net cultures are about more than just what is between people and the network. To date, it remains a rare example of electronic

literature which does not confuse the Internet with web browsers.

(Acknowledgement: This paper was written using the Free Software programs LyX, LaTeX, bibtex, bibtex, pdflatex, latexhtml, lynx, XEmacs and GNU Ghostscript on an office and a home PC running Debian GNU/Linux with reiserfs, XFree86 and larswm.)

Footnotes:

- ¹ This paper was presented at the conference Interface 5 on the panel Minor Media Operations, Hamburg, Warburg-Haus, September 15, 2000
- ² To quote from Raymond's Frequently Asked Questions about Open Source: "The Open Source Initiative is a marketing program for free software. It's a pitch for free software on solid pragmatic grounds rather than ideological tub-thumping. The winning substance has not changed, the losing attitude and symbolism have." [Opea]
- ³ Both the Debian Free Software Guidelines and the Open Source Definition were originally drafted by Bruce Perens, a Free Software developer and editor of the website technocrat.net <http://www.technocrat.net>.
- ⁴ I.e. binary-only software which can be downloaded freely and used without licenses fees (Freeware) or by paying comparatively small licenses fees (Shareware).
- ⁵ A prominent example is the XEmacs <http://www.xemacs.org/text> editor which "forked" its codebase from GNU Emacs <http://www.gnu.org/software/emacs/emacs.htm>. The same would be impossible in open standards development. The social dynamics and institutional control of open standards development is excellently described in Jeanette Hofmann's (German) essay Der Erfolg offener Standards und seine Nebenwirkungen [Hof99].
- ⁶ There is an ongoing debate in Free Software culture whether operating systems based on the Linux kernel should be called "Linux" or rather "GNU/Linux". In order to be functional at all, a "Linux" setup relies upon the GNU C Compiler (gcc)

to translate all program sourcecode into machine-executable binary software, the GNU C Library (glibc) as the interface between the Linux kernel and userspace applications, and the GNU tools for the basic user commands. Although it is possible to replace at least the GNU tools and the glibc with non-GNU workalikes, all common "Linux" distributions use the Linux + GNU software setup. I will therefore stick with the name "GNU/Linux" where I refer not only to the kernel, but to the whole operating system.

⁷ Such as Macromedia's Shockwave and Flash in "Net.art", Opcode's MAX in electronic music and Eastgate's Storyspace in hypertext fictions.

⁸ The artist group 0100101110101101.ORG
<http://www.0100101110101101.org> put this issue up front when it mirrored and partially modified well-known Net.art web sites on its own web site.

⁹ Early artistic computer networks like the Thing BBS <http://www.thing.net> changed their subscribers (at least in Berlin) before they migrated into the Internet.

¹⁰ How net literature-- "hyperfiction" and "new media poetry"--relates to poetic practices rooted in programmer's cultures is discussed in more detail in my (German) paper [Cra00].

¹¹ Among those companies are O'Reilly publishers, Sendmail Inc., VA Linux, Scriptics, Helix Code and Eazel. All of them are involved in the development or documentation of critical components of GNU/Linux operating systems.

¹² I thank Wau Holland for pointing this out to me in a preparatory meeting for the first Wizards of OS conference.

¹³ Which can be read as "text" if text is linguistically and semiotically defined as a finite number of discrete signs chosen from a finite set of signs. In computing, "text" is rather colloquially understood as code from natural-language alphabets as opposed to binary code. Being a philologist, I refer to the prior concept of "text".

¹⁴ According to [Bos98] the label "Net.art" was coined in 1996 by the net artist Vuk Cosic. It has been associated with a particular generation of net artists since (involving, among others, Cosic himself, Heath Bunting, Olia Lialina, Alexej Shulgin, jodi and I/O/D).

Actually Unix wasn't free in its earliest days, when John Lion in Australia and Robert Fabry wrote and asked for the sources from AT&T. It

was available at a "nominal fee". It was a token payment, I think \$110 Australian (\$150 US).

That was in the 1974 period.

I don't know what the situation when the Australians or the folks sending their tapes or Berkeley began sending out the BDS tapes.

(There is some discussion of all this in chapter 9 of Netizens.
<http://www.columbia.edu/~hauben/netbook>)

Actually the Unix networking character was the bang symbol ! and an address might look something like utzoo!utcsrgv!peterr That was the path for the address on uuup.

The agreement to use "[AT]" which was the Internet meeting came at a meeting in I thought the 1980's where people like Mark Horton and Jon Postel and others were there to figure out a common addressing mechanism.

So the "[AT]" doesn't come historically from the UNIX side of all this

Bernard Lang has an interesting article in the Feb 2000 issue of La Recherche which describes in a bit of a different way the connection between early Unix and the ARPANET, and he refers

- > In the 1970, Unix particularly attracted student hacker
- > communities at the MIT and at the University of California at

- > evolved into

Actually at MIT it was the AI labs and they used the pdp 10 machines -- one was the ITS (Incompatible Time Sharing).

I didn't think these were UNIX machines at this period.

Actually UNIX was only created at Bell Labs in 1969-1970's and announced in 1974. Chapter 9 in Netizens gives this background.

(...)

Also it is interesting to see your references to "open architecture".

I recently wrote something for an encyclopedia on computers and computer history about open architecture and found very little has been written about it even though it is indeed the basis for the Internet's architecture.

- > Open technology has been a key factor for the acceptance of

I thought the bbs culture also supported the spread of a free software in the 1980s.

Perhaps also looking at the ARPANET tradition of the free spread of software would be of interest. And on early Usenet there were newsgroups dedicated to spreading software.

Usenet was an early means of not only spreading Unix software but also discussion about how to deal with the bugs. Chapter 10 in Netizens describes this evolution.

That's all I have time to comment on now. Good to see the effort to take on such topics, and it is important to put them in their historical

context as that gives an idea of what is being built on and hence helps provide a sense of direction forward and of the progress being made.

The BBS culture I know from here (Germany) was rather commercial and inclined towards WareZ. Most BBSs were run against subscription fees and frequently charged additional fees for their download areas. The software available on them were DOS, Amiga or Atari Shareware/Freeware binaries. Still in the early 1990s (i.e. between 1990 and 1993), the GNU, BSD &c. software was available in the academic computer networks (EARN/Bitnet w/ Internet gateway at the university where I first went online).

Dear All

It would be great to get your opinion on the following:

I am looking at open source and implementing this metaphor to a curatorial practice. What effect would this have on exhibiting artists? Would the audience benefit?

Also anyone with an interest in Eric S. Raymond's free software development model. I would like to know the following:

1. What are your personal views about the 'Cathedral' and the 'Bazaar'?
2. If you subscribe to one of these models how much of it applies to the whole of your life?
3. Do you jump from one to another to suit your needs?
4. Besides in a software engineering world, can the Cathedral and the Bazaar be seen anywhere else? or could it be applied to something else?

I believe we need to get art out of its Cathedral & could this metaphor work?

Many thanks
Donna

Hello Donna,

> I am looking at open source and implementing this metaphor to a curatorial
> practice. What effect would this have on exhibiting artists? Would the
> audience benefit?

There already is a rich tradition of applying Open Source/free software principles to art; "curatorship" seems a bit problematic as a term (which it is not only in this context), self-organization may be more appropriate. Examples can be found in the hack meetings which, particularly in Italy, were hybrids of activist and artistic events, and many related Internet art projects. But actually, the tradition is older than even the terms "Open Source" and "free software". Since Ray Johnson's New York Correspondence School in the 1950s, the Mail Art network had its own codified system of decentralized, international, open participation art exhibitions, events and publications, with the festivals and non-juried exhibitions of older avant-garde movements forming yet another historical pretext.

> Also anyone with an interest in Eric S. Raymond's free software development
> model.

He pitched it "Open Source" as a more business-friendly term, against the older, more activist term "free software".

> I would like to know the following:
>
> 1. What are your personal views about the ?Cathedral? and the ?Bazaar??

Again, a lot has already been written about this (for example, in "First Monday" shortly after the Raymond's text appeared). Retrospectively, I think there have been many confusions and urban myths about this essay. Like Roland Barthes' "The Death of Author", it is a text that, polemically speaking, nobody seems to have read yet everybody has an opinion about. Among those urban myths are:

- that Raymond pitches an Open Source "bazaar" model against a proprietary Microsoft-ish "cathedral" model of software development. But in fact, it is about the decentralized development of Linux, the operating system kernel supervised by Linus Torvalds (and not what is commonly referred to as the whole Linux operating system), versus the classical small, closed committee style of development that had been characteristic for GNU software, the free BSDs and the X Window System. On top of that, the text is not even literally about Open Source because the term did not yet exist when it was first published.

- Looking back at the above point more than ten years later, it is probably fair to say that a clear-cut division of "bazaar"- and "cathedral"-style development methods no longer exists in Free Software development. The development of the Linux kernel has become more hierarchical, with several layers of developer hierarchies that a patch needs to go through in order to be accepted into the main line kernel, while on the other hand the development culture of GNU and BSD software has adapted itself better towards the Internet than in the 1990s. (The now-standard use of networked version control systems like Subversion and git is a clear empirical indicator.)

- While not using the term "Open Source" in its initial version, the essay fully preempts the later Open Source-vs.-Free Software controversy by

discussing open, distributed development processes as technically superior to closed processes. (There are striking similarities to Bertalanffy's earlier General Systems Theory with its claim that in nature and society, only open systems survive while closed ones die of entropy, and of course to Popper's theory of the open society as the counter-model to societies founded on philosophical idealism.)

I remember an article from the German IT journal iX that, ten years after the manifesto, checked those claims and soundly disputed their black-and-white rhetoric. For example, Open Source and distributed development are clearly not a 100% cure against software bugs and security leaks (as opposed to Raymond's statement that "given enough eyes, all bugs are shallow"). There have been terrible bugs and security nightmares - such as the recent Debian OpenSSL bug - even in high profile FLOSS software projects. And the dialectics is also true: If there are not enough eyes, bugs can be annoying, for example in FLOSS multimedia authoring software from Cinelerra to PD that thrive on very small and often amateur programmer communities (as opposed to the OS kernels, file systems, network stacks, database servers etc.).

It is probably fair to put Raymond's essay into the context of other optimistic late-1990s Internet theories of "crowd wisdom", "smart mobs" etc., that promote a similar cybernetic vision of a self-organizing critical mass that is the magic solution to all problems. Linux and, more recently, Wikipedia show that these theories are not completely off and that networked collaboration can amount to critical mass. But none of these projects are without their own issues (such as conservatism: Linux reimplemented Unix instead of the arguably more advanced and interesting Plan9 or Lisp Machine kernel architectures because Unix kernel architecture is the textbook knowledge of every computer science student; Wikipedia nowadays insists, in its angst-ridden compliance to culturally conservative Wikipedia-bashing, on print publication references for everything that is claimed in a Wikipedia article), and "open collaboration" is not a magic bullet.

Mail Art may again serve as a good example, because it was so obsessed with egalitarianism that participation implied to never reject other people's project contributions although the phenomenon of "junk mail" was common and deplored even in the 1970s and 80s.

It should be noted, in case you're not familiar yet with Raymond's ultra right-wing libertarian political background, that he chose metaphors of the "bazaar" versus the "cathedral" quite on purpose - referring to a free market model versus regulated production.

> I believe we need to get art out of its Cathedral &

It is certainly true that art, inasmuch we speak of the contemporary (visual) art system, is still feudalist in its structure. It is the only of the modern arts whose economy is firmly based on the notion of one material fetish object, with reproduction (unlike in books, music records, films, software) being merely a second-rate, plebeian illustration of the "original". Its sponsors are the modern successors to the old feudal authorities; back then, the church and the courts, nowadays rich people as the new aristocrats and, through its grants and subsidies, the state as the authority that has replaced the church.

Re: <nettime> the ?Cathedral? and the ?Bazaar??
From: John Young
To: nettime-l@kein.org
Date: Sun, 08 Feb 2009 11:33:05 -0500

It should be noted that "open source" has been appropriated by

the spy-media-education industry as an asymmetrical method for taking from open sources but not giving back, instead classifying putting within password-gated campuses the open source material in order to obscure that the filchers have a pecuniary interest in freely cultivated goodies.

So say the SMEs and their beneficiary contractors in their openly proclaimed suck-you fuck-you policy to advertise for adjunct-academic and edu-start-ups to participate in (get bribe money for) in national security (spit) national patriotism (spit) endeavors, hand out a few contracts to the willingly witting desperately-seeking down but not out bazaarists, and shut-out the disfavored with cathedral-like secrecy (tenure) orders, learning from the churches and banks to profess uncton for believers and tithers while gathering wealth for the belly laughers of TARP for the top.

Bill Gates himself did that, preached that, as did Steve Jobs. It is the golden egg luring millions to the openly promise medals of freedom from merciless religion of higher pecking order education then reap the profits from the bloodsucked students are dunned for ursurous loan-repayments into the sky-high-paid admins' baskets. Consider Wikipedia and a host of like openers savaging of contributed labor, abetted by herds of martines enforcing just what can be reputably (spit) published.

Net non-profits (spit) are no different than the others in bait and switch via oh so weary rules of engagement for the unruly. Extreme unctuousity is bedevilment with strapped-on angel wings.

Now, for free my gang offers surefire immortality and depthless wisdom, PayPal us \$100 for the top secret URL at golden-egg. domain. Don't believe anything else, motley fool.

<nettime> Open letter to the Free Software Movement

From: Jaromil

To: nettime-l@kein.org

Date: Thu, 26 Sep 2019 17:02:33 +0200

This is an open letter to all the people who, in their good faith, are concerned about the recent events which have shaken the long-standing leadership of the Free Software Movement and the GNU project.

Online:
<https://www.dyne.org/open-letter-to-the-free-software-movement/>

RT: <https://twitter.com/DyneOrg/status/1177233578771591168>

Context:
<https://www.wired.com/story/richard-stallmans-exit-heralds-a-new-era-in-tech/>

Dear hackers, first and foremost let us say that, as a collective and in the true uncompromising spirit of the teachings of Free/Libre Software/Society, we are capable of doing much better than what has just happened.

Many of us work everyday towards ensuring that everyone, regardless of their ethnicity, religion, gender, or neurotypicality, can participate, learn and share in our communities. We do not claim we are perfect, we sometimes make mistakes, some of them guided by systemic patterns and structures of power still entangling us, and some of them just due to our human nature. But we claim our right to learn every day how to become better at including all contributions and opinions, and this implies the ability of making mistakes without being destroyed by them.

In the past years it has become clear that our movement and our ethos has transformed the world as we know it, with all the courage and all the mistakes considered; some of us rose to fame, while some others wore masks, both as a message and as a protection from the regime of global espionage. In any case, many of us have sacrificed a great deal of comfort in life to change what needed to be changed.

Let us not be mistaken about the cause that brought us here and let us not forget where the injustice comes from.

Let us not forget then what we, the people, have successfully built so far, resisting to the incredible pressure that corporate corruption and military regimes have put on us. Let us not forget that the battle is still raging and we are losing sight and positioning.

Open Source, as an economic model based on knowledge acquisition by corporate powers, is part of the problem.

Free/Libre Software, as an uncompromising philosophy and ethics focused on knowledge sharing and participation, is an important part of the solution.

The era of benevolent dictators for life in Free software projects is probably coming to an end. And we shall be relieved as well as empowered by that: it is now our turn to stand strong, united as a movement, to defend our values without compromise and to improve the quality of our interactions. It is now our turn to look beyond personal responsibilities, to acknowledge that if a context is poisoned by bullying, machism and sexist behavior, it is not just the fault of a single person, but of all those who tolerate and support those conducts. We have now the opportunity to point to the problem and to solve it and this will improve our movement, the Free Software movement.

What we really don't need to do is to ignore, denigrate or disown the values of the Free Software movement.

We need to honour the pride of the people of India who had the courage to stand up against the "free basic" campaign. We need to support the courage of all those defending network neutrality from attacks capable of putting under control the political integrity of entire continents. We need to facilitate the synergy between community networks in Oaxaca enabled by software written by activists all around the World. We need to empower the self-determination of entire populations in an age in which computing is as pervasive as our own social relationships.

We need to reclaim our freedom from an ever-watching system of control and prediction that judges us from the algorithmic projection of our own intentions. We need to defend our freedom to be able to denounce all of this and speak freely by means that connect us, all over the world, without borders, intermediaries and censorship.

We need to be conscious of where we are standing in this fight.

As a trans-national movement, united by solidarity, awareness and ethics, we shall not negotiate the motivations we fight for.

We would not publish this letter if we would not think it was extremely urgent to do so. The Free Software movement is losing ground, grip and resources, and the scarce resources available to the movement are not even shared equally. Global meetings that are vital to our legacy and development are at risk of being shut down or assimilated by corporate corruption: the Free Society Conference and Nordic Summit (FSCONS) will not take place this year, after many iterations that have hosted outstanding standards of diversity. The biggest community-based event for free software developers in the world, FOSDEM, is at risk of violating many of its foundational principles by welcoming corporate sponsors, who contribute to the dilution of meaning and ethical urgency of Free Software by supporting corporate Openwashing campaigns.

And this is just a small account from Europe. We know that, wherever you are in the world, if you have been in this movement, you are probably struggling as well. Believe us now when we say that it will not help to burn the Man, to obliterate the memory of our cause, to expunge someone's contributions to it by means of an angry mob; that would be an act of harassment we cannot be able to accept.

We will start improving as a movement when we show the highest notion of what a movement can be: capable of reflection, understanding and healing its wounds, ready to evolve and progress while maintaining the integrity of its aims.

We are not the problem, we are part of the solution.

The Free World needs the Free Software movement.

<nettime> 50 Ways To Leave Your Lover

From: Brian Holmes

To: nettime-l@kein.org

Date: Tue, 22 Jul 2008 23:57:08 +0200

50 Ways To Leave Your Lover,
Or, let's find a completely new art criticism

For most of the twentieth century, art was judged with respect to the previously existing state of the medium. What mattered was the kind of rupture it made, the unexpected formal or semiotic elements that it brought into play, the way it displaced the conventions of the genre or the tradition. The prize at the end of the evaluative process was a different sense of what art could be, a new realm of possibility for the aesthetic. Let's take it as axiomatic that all that has changed, definitively.

The backdrop against which art stands out now is a particular state of society. What an installation, a performance, a concept or a mediated representation can do with its formal, affective and semiotic means is to mark out a possible or effective shift with respect to the laws, the customs, the measures, the mores, the technical and organizational devices that define how we must behave and how we can relate to each other at a given time and in a given place. What you look for in art is a different way to live, a fresh chance at coexistence. Anything less is just the seduction of novelty - the hedonism of insignificance.

If that's the case (if the axiom really holds), then a number of fascinating questions arise - for the artist, of course, but also for the critic. Where the critic is concerned, one good question is this: How do you address yourself to artists or publics or potential peers across the dividing lines that separate entire societies? How do you evaluate what counts as a positive or at least a promising change in the existing balance of a foreign culture?

I'm sure you immediately see how difficult this is. Already in the past, it was hard enough to say that a particular aesthetic tradition and a particular state of the medium defined the leading edge, the point at which a rupture became interesting. Yet still there were times when all the painters seemed to flock to Rome, then later to Paris, then later to New York City; and so through the sheer aggregation of techniques and styles, the fiction of a leading edge could be maintained, at least by some. But in the face of a simultaneous splintering and decline of what used to be called "the West," and a correlative rise of some of "the Rest," who could seriously say that certain local, national or regional laws, customs, measures, mores and technical or organizational devices are really the most interesting ones to transgress or even break into pieces, in hopes of a better way of being? Or to be even cruder about it, and closer to the actual state of things: Who can seriously claim that the Euro-American forms of society are the benchmark against which change must be measured - even if those societies are still the most opulent and most developed and most heavily armed with all the nastiest of technological weapons?

Let's face it, the task of a transnational critique for the new arts of living within, against and beyond the existing states of the world's societies is daunting to say the least. However, I think all is not lost

in this domain, for three connected reasons. The first is that over the last, say, fifty years, and particularly over the last fifteen, we have seen the still very superficial but nonetheless real emergence of something like a world society. To put it another way, there is now some kind of connective tissue (call it the transnational economy, the transportation system and global English) that does bind our possibilities of life together, though without in any way reducing them to being identical. The second is that the vast proliferation of readily accessible archives (libraries, web pages, video banks, record collections, museums) offers at least some chance to rapidly sample all sorts of information and impressions about what kind of shape a particular society is in, and even what kinds of steps are being made to try and change it. And third, given the above and maybe a good translator too, what you can do is actually try to stage a dialogue with the people you are meeting, and hope that some of them respond, give you pointers, correct your mistakes, calm down your unconscious arrogance and add their own reflections and aesthetic productions into the mix - not only to obtain a better and more useful critique of their society, but also of yours. Which last, I might add, is something essential and desperately needed, particularly if you are a European or an American.

The above is a theoretical program, but also just a reflection on some experiences as a critic and activist out in the wide world. The most recent of these experiences was particularly interesting: I was invited to participate in and to evaluate a project of artistic remembrance and envisioning, focused on the American military bases that are now (maybe) in the process of closing and moving out of the South Korean city of Dongducheon, and indeed of a range of sites around the DMZ, even as a new megabase is prepared further to the south in a place called Pyeongtaek. This was an incredible chance to get a first-hand look at what I think is the scourge of American and Western democracy, namely what Chalmers Johnson calls the "empire of bases." (And I happen to think that the first-hand look, however fleeting and superficial, is of tremendous importance whenever you really want to learn anything). As it turned out though, this was also an incredible chance to start getting to know a unique spot on the earth, South Korea, which for the worst of reasons has been particularly close to the U.S. over the last six decades, despite the fact that many many Koreans would really rather close that never-ending chapter called the Cold War on the Korean Peninsula.

The trip was too short, but still amazing, and it got me to do some new things in criticism (maybe dubious ones), like using a pop song for starters rather than a quote from Foucault, and approaching street demonstrations via Korean feminists rather than Toni Negri. In the end I had to conclude that the old French saying, "Celui qui aime a toujours raison" (those who love something are always right), is in fact wrong, since we humans are capable of awful loves, and not only in aesthetics. That said, we're also uniquely capable of starting all over again, as y'all probably know in your intimate experience. And so let's ask the question: What would tomorrow look like without 750+ American military bases scattered across the earth? With a little help from some new friends, I tried to go further with that line of inquiry, as you can see right here:

<http://sunsetproject.wordpress.com>

And now the dialogue is open for whoever has inspiration.

best, Brian

Re: <nettime> 50 Ways To Leave Your Lover

From: Michael H Goldhaber

To: nettime-l@kein.org

Date: Wed, 23 Jul 2008 09:32:17 -0700

Brian,

I read your whole piece with interest, but I disagree with its two of its stated or inherent premises.

First, art does not have to justify itself by offering a different way to live or to coexist. To put it most simply art justifies life; it is why we are here, or it can be.

Second, while a visit to South Korea or any other host to our hundreds of bases can show what empire is like and what it does to its targets, to find the sources of the outlook that backs these bases, we have to look at American political life. A simple economic justification in terms of empire would be hard to demonstrate: China and India, which never had American bases, are far more important to us economically than countries that do have them. Likewise, Vietnam, which succeeded in throwing out our bases seems to be on a trajectory not terribly different from S. Korea or China. Nor is "cultural imperialism" strongly correlated with where the bases are. "Pirated" videos and music spread our culture far more effectively than does military occupation. Indian and Chinese immigrants with degrees in medicine, science or engineering increasingly fill occupational niches that Americans do not enter in enough strength, for whatever reason.

So what does cause continued imperialism? For one thing, America's inward looking. Our politics is mostly localist and parochial, and yet politicians end up making decisions to sustain foreign involvements on the basis of little knowledge. It is always safer to view the outside world as menacing rather than benign. It is always safer to refer to the US as the greatest country and to assume that the world needs our armies and weapons rather than not. A pointless patriotism helps hold this disparate country together, much as India is partially held together by such means. And, as in the case of the British empire, what keeps ours going is mostly habit / a bad habit, but hard to change / perhaps addiction would be the better word.

If the US is so inward looking, doesn't reporting such as yours from South Korea help create balance? Very little, I suspect. The internal "patriotic" reading would only be that some Koreans are "ingrates," who "don't know what's good for them," which implies they need our protection despite themselves. While "ingratitude" might be taken as a reason to leave, in practice it only seems to reinvigorate the myth of the necessity of staying, much as the American casualties so far in Iraq become, for the right at least, a reason not to leave. The possible difference there, as it was in Vietnam, and even in the Korean war, is really the threat of future casualties, but if these can be diminished, so will the pressure to pull out.

This imperialism can only be changed, I think, if it either becomes unaffordable or if a really different US self-conception can take hold, for instance of our being simply one country that ought to be striving to live cooperatively with the rest of the world. I think we should take heart that the Iraq war has proved so unpopular despite no draft and despite the US death toll being far below Vietnam levels. I think a new "Iraq syndrome" will sharply reduce the tendencies towards such active military adventures for another generation. But dismantling the existing network of bases is another story. To give up the addiction to military spending and the idea that the military offers a good career for certain young people will be less rather than more easy if the US monetary economy keeps declining. The only hope I see is the rise of an utterly new sense of who we are. That, of course, will be intensely resisted.

Best,
Michael

Hello Michael -

And first of all, thanks for your reading! Always interesting to hear your views.

> First, art does not have to justify itself by offering a different way
> to live or to coexist. To put it most simply art justifies life: it is
> why we are here, or it can be.

Well, art is also famously what people disagree about, which is OK by

me. I offered a distinctly political definition of art, one which does not simplify or deny all the subtle potentials of form and metaphor and reference that I do appreciate, but instead suggests that all those qualities come into strongest relief and offer the greatest resonance in ourselves when they stand out against the background of a society and, rather than justifying life as it is, open up possibilities of becoming different. A definition which seems relevant to much good art these days, and could be interesting to disagree about too!

> So what does cause continued imperialism? For one thing, America's
> inward looking. Our politics is mostly localist and parochial, and yet
> politicians end up making decisions to sustain foreign involvements on
> the basis of little knowledge. It is always safer to view the outside

> disparate country together, much as India is partially held together by
> such means. And, as in the case of the British empire, what keeps ours
> going is mostly habit — a bad habit, but hard to change — perhaps
> addiction would be the better word.

This seems to me a little naive, Michael, if you can excuse me saying so. I think that "their" empire (I would never call it "ours") is upheld not just by our localist politics (of course that lets it go unchallenged, you are right) but above all because it is in the interest of certain people to uphold it. I do not believe that America went to Iraq out of parochialism or ignorance, but because the party of war, oil and engineering saw immense profits in setting up shop there. Similarly, I think that the army, air force and navy all stay in South Korea because the maintenance of that Cold War standoff helps justify, not just U.S. presence in that particular country, but on outposts all over the world. Arms production, engineering contracts and the maintenance of high-paying officer jobs associated with rank, privilege and amazing technology to play with are some of the benefits of prolonging Cold War conditions, which is why the Pentagon set about looking for a "near peer" right after 1989, and finally decided to accept a "long war against terrorism" instead.

Beyond the direct military establishment, the free trade and free capital flows from which the United States has prospered so disproportionately since WWII are linked in the minds and strategies of the corporate and political elites to the regulatory presence of a world-spanning army, which has also been the reason that our huge debts have been shouldered by other countries such as Japan, since manufacturing exports declined in the 1970s. One of the most bald statements of this kind of "free trade guaranteed by the military" doctrine can be found in Thomas Barnett's recent books; but when you look closer at the intellectuals staffing the State Department over the last 60 years, the same doctrine is everywhere, from Kennan and Acheson on forward. That this is an addiction - to power, to profit, to oil, to big projects and machines - is something I would agree with.

> If the US is so inward looking, doesn't reporting such as yours from
> South Korea help create balance? Very little, I suspect. The internal

Along these lines, even a cursory scan of the Internet will dredge up exactly those kinds of opinions from the largest group of Americans having anything to do with the two Koreas, namely, ex- and current servicemen. It is much as you say. And I definitely agree that finding ways of convincing these kinds of people is a real problem. Even Mark Gillem, the author of America Town and himself part of the air force, does not read as very convincing from the viewpoint that one finds on these Internet sites about Korea.

Yes, I think you are right and I also think it is interesting to add to that feeling of rejection. The low American profile after Vietnam was a good thing imho.

> But dismantling the existing
> network of bases is another story. To give up the addiction to military

Yes, I think that's where art can become so interesting as a force of change! If all of us want it to, anyway. There again is another reason that I chose the definition of art that I initially put forth.

Thanks again, Michael, for your perspectives.

best, BH

Re: <nettime> 50 Ways To Leave Your Lover

From: Michael H Goldhaber

To: nettime-l@kein.org

Date: Wed, 23 Jul 2008 12:02:51 -0700

Brian,

Rather than being naive, I think I was engaging in a kind of shorthand, leaving out intermediate reasons. Of course there is military-industrial complex which tries to perpetuate itself, but it is successful only because others at times believe its clumsy arguments. Also, oil companies may indeed profit from invasions such as of Iraq, but mostly because the threat of war helps increase the price of oil, which would probably have gone up anyway. The threat of instability in Nigeria, say, without any US intervention, increases the price as well. So the military costs incurred by invading Iraq, say, are unnecessary on that score. Even if the oil interests believed otherwise, they would not have been able to invade Iraq if the public were not convinced that reasons entirely unconnected with oil were at stake. As for the argument that America's place in the world economy depends on our having bases and a round-the-world military presence, I think the examples I gave of the value to us of India and China show that view is itself naive. Finally, countries like German and the Netherlands demonstrate that having an imperial presence is quite unnecessary for economic success.

It could well be argued that US military expenditures drag down the US economy, as Seymour Melman used to argue, calling the result "Pentagon Capitalism." The counter-argument to that: military Keynesianism (mK) as a necessary economic stimulant to keep capitalism going internally. As I argued against Melman in the 80's, government spending on anything other than the military tends to compete with "private enterprise," which is why we have military expenditures rather than say single-payer health care (which would drive insurance companies out of business). We could spend the money on, say, going to Mars, but it is too clear to too many people that we don't need to do that, while "defending our way of life" is, as I noted, harder to argue against. While "national security" provides some rationale for confining military expenditures to non-out-sourced industries and so does to some degree prop up the internal economy, there is now too much "leakage," so that mK now is not particularly effective. Even at its bloated levels, it is also probably too small to be of substantial effect, certainly not what is needed when the US monetary economy turns down. The world today cannot afford the level of destruction commensurate with WWII that would do a similar economic job today. (At least I hope that is off the table.) So today, Melman would probably be right. American imperialism is an irrational (and naive) addiction that only helps the most narrowly defined interests. Still, tapering off will not be easy. Some will suffer directly, and they will shout much louder than the much larger group of those who would benefit mildly and mostly indirectly.

Best,
Michael

> Of course there is military-industrial complex which tries to perpetuate
> itself, but it is successful only because others at times believe its
> clumsy arguments.

There is indeed, Michael. Thanks for dialog-ing here about this about this matter of...

If we are to seize the means of production of truth itself in cyberneticscapes, it actually behooves, I think to ask not only what clumsy arguments are believed, but rather why the sales job for a bizarre complex that is directed at more and more excessive, spectacular, even arbitrary displays of power that will never be used is so successful. Here the image comes to mind of jet fighters that rotate on a dime. Something so insanely exorbitant in expenditure, flaming, flaring off, exploding in test after test.

I ask myself what it serves to reassure in a body politic that is profoundly insecure.

We promise "security", and a nice comfortable home, and an aggregate 10% return on your capital.

Here our comrade Sloterdijk-Diogenes is really helpful: Quaro Homines

As some kind of internet-cyberscape squatters I take us to be looking for the human agency in all this madness and circumstance. The question, the discussion now has a kind of squatter's right to lift up a lamp in the midday to enquire into how our personal political economy has actually siezed the means of the production of truth, the means by which a discourse listens to itself, the way "governmentality" understands itself in a kind of pidgin kynical nettime argot.

To Keith hart, a kind of storimasta, that entering into dialogue is going to look different than it is to you or Brian or I.

Brian keeps making some very fundamental points that I do not see mentioned enough, and he is thinking "with" them:

1. Is to think in terms of geocapital and the nation states and Empire(s) as a complex interweaving, a totality.

Here the agents of capital and the agents of nation states act in the mode of "on behalf of", in a kind of Empire that even as it exploits every new market, to excesses of gain and destructive creation, has to understand itself, to justify itself.

Too much discourse is too focused on a "naive" nation state, too much the kid blown away by the display, by the spycraft, the operations, by the show, when the apologists openly discuss and attempt to liberalize, to understand the very global order that they cannot quite map themselves even as they hold the levers of power.

Some of these agents view themselves as charged with maintaining regular prices and steady growth, to ensuring that world markets and economies are following along on their business cycling just fine act as they say. They fail spectacularly at times, and the prices reset.

We are in a completely unprecedented world that has seen and is seeing huge shifts. Many of the institutions of the previous era of geoeconomics are registering a profound shift. The dramatic rise of the central banks with their portfolio rounding little offshoot sovereign wealth funds. The presence of China felt everywhere.

The crisis in financialization is a child of surplus and a puncturing of cultural inflation (of a set of easy-debt inspired valuations) at the same time.

Brian asked Keith about the "looters". My minds-eye flashed with a headline: Dutch Pensioners Accused of Looting.

Dutch pension fund (world's third largest) Stichting Pensioenfonds ABP, in a press release in which they mentioned their intent to move some of the 40% of their portfolio that was invested in debt instruments (still bow tie pension fund respectable banking investment) revealed that the reason the only lost 5% this last half year is that well they had 13% in those evil commodities and I think 9% in hedge funds, the kids with the naked shorts in the global pool.

In the politics of global finance, the hedge funds are specialized, politically incorrect exploiters of new markets in financialization. There is something of a homologue to the excessive expenditure on the security state in the fact that the hedge fund niche emerged from portfolio security and risk management. What begins as a way to hedge up or secure something, gets up on a monkey's paw and takes revenge on its creators, cronos eats his own children. Structured investment vehicles, originally mandated to hedge bank portfolios bring them down. The very same broker-dealers are shorted down by their own trading arms.

The agile security state gets bogged down in a quagmire of its own making in afghanistan-pakistan-iraq-iran. What begins as Rummy's life force removal of despotry becomes the greatest sign up and organization of feudal-peasant jihadis against global security state capital and the place where the security state discovers its own powerlessness. The power is eating itself in gruesome Goya fashion and here I cannot remove the image of Kronos slurring in the ripped carcass of one of his children from my eyes.

In a game of endless deferral that is represented so perfectly by that still most stable investment in big central bank treasuries, debt rises as the perfect embodiment, even with its excessive self destroying aspects. Witness the gobbling up of treasuries by China and the petrodollar states in the last few months. Only a small percentage of their surplus goes to command capital investment, a small but no less important percentage.

And China piles up its own debt to its very bios.

This is most likely no end point, but a way stage in which the prosthetic net kritik is called short, as stunned as the tourists were and are who both walked around the world trade center towers stunned by their sheer verticality and then even more stunned by their absence.

The amero-european housing bubble is a crisis in the ideology of "Home Beautiful" and comfortable estrangement as our old friend Diogenes-Sloterdijk might say. Stunning in rise and fall.

"You are blocking my Sun light" says the kritik to the Emperor.....

I was wondering about exactly this today, as I read in the New York Times about four air force generals seeking \$16 million in public monies to build two-room designer-appointed "comfort capsules" for their personal transport through the imperial skies. But then my curiosity only mounted higher as my eye moved further down the page, where I read about the Bush administration plans to use \$230 million of "counter-terrorism" money to upgrade Pakistan's F-16s. "The officials... said the timing was driven by deadlines of the American contractor, Lockheed Martin." No further comment about those deadlines then ensued...

> 1. Is to think in terms of geocapital and the nation states and Empire(s)
> as a complex interweaving, a totality.

Thanks for noticing that, Ed. One of the real interesting things that became concrete for me in South Korea (though I already understood it theoretically) was the way that Fordist and military-industrial development has been driven, in both countries, by the deliberate maintenance of red-alert status at the 38th parallel. Far-off sites of conflict that Americans only see in the movies serve as pretexts for the development of the most sophisticated weapons imaginable (never forget that the US military budget is now as big as the rest of the world's combined). Meanwhile on the soil of that far-off site something different has been happening: build-up of heavy industry under dictatorial discipline until from 1960 to 1988, then rapid neoliberalization peaking with the 1997 Asian crisis to throw the country open to outside capital looking to feed on educated labor. The complex interweaving produces very different political and cultural outlooks as part of one internally differentiated system. Yet I would agree with Keith that this does not make "totality," not even the totality of something called capitalism. The imperial interweave is a system of power, it's dominant, it imposes its militarist will in staggeringly violent and absurd ways, yet there is so much else to life under the sun and the stars and the electric streetlamps. No less important than the act of looking into the eye of power is the act of looking away.

best, BH

Yes. Exactly, Brian. One system, human made, human struggled over which is something that I think that our squatting here on nettime is about.

Another way to look at power is at its insecurity, it's vulnerability. Not only is it not total in a deterministic sense, our sense of determinism being the index of a collective passivity, it is profoundly insecure and in need of constant reassurance.

Empire has always been so. When I first saw Velasquez's portrait of that grandly dominant despot, Felipe el Segundo, I could see as clearly as I see the profound weakness and insecurity and even pathos of our "fearless" pygmy leaders, Felipe's profound insecurity before the gaze and the brush of the artist, of the other.

The insecurity before the gaze of those who wield the means of the production of representation or vorstellung. The despot feels that profound insecurity because he has a first person seated view of the hallucinations, of the hallucinated reinvestment in old dead fig leaves, old dead emblems and magical insignia of a power that never was. The very form that power takes is of a reinvestment in what one hopes must have been a reassuring hallucination at some previous time by some prior regime of power.

Power, and here I mean very particular people acting as agents of power, hallucinates and reinvests in outmoded hallucinations first and then samples and tests and adapts as best it can it's very clumsy and unwieldy hallucinations and representations.

Prosthetic power is even more insecure as it adapts itself also to the technical apparatus and machine ontology that is coming into being even as the multitude is coming into being.

It's funny how as I typed that up, I replaced, in a kind of slip, Felipe el cuarto with el segundo, his dead ancestor, in comparison to which el cuarto came off as some kind of dandyish pygmy, even as Bush II is to his father. The state as Empire grows in power as it decays in form and representation. Velasquez's realism is a kind of leading, testing edge of a regime deeply committed to hallucination and counter-reformation. It needs the labyrinth of a tentative, delayed realism to keep alive the obscurity of its hallucination. Velasquez plays with and represents that labyrinth of representation in which the ghostly sovereign appears in a glass darkly.

+0200

Thank you Brian for a challenging and stimulating set of ideas and suggestions!

Also for your report from Korea.

A minor contribution here on two points you are making, some comments more than a criticism.

On Jul 22, 2008, at 23:57, Brian Holmes wrote:

> For most of the twentieth century, art was judged with respect to the
> previously existing state of the medium. What mattered was the kind of
> rupture it made, the unexpected formal or semiotic elements that it
> brought into play, the way it displaced the conventions of the genre or
> the tradition. The prize at the end of the evaluative process was a
> different sense of what art could be, a new realm of possibility for the
> aesthetic. Let's take it as axiomatic that all that has changed,
> definitively.

As I have come to understand this is that rupture is part of process of negation, a negative dialectics as some have called it (Adorno / Lyotard), in the case of the visual arts a 'negative dialectics of the image'. Now the point of negation is not the replacement of one mode of the visual by another, alternative one. Much rather the object of negation is to 'break' the image, to show its dysfunctionality, to expose that every image hides more than it reveals.

This negation then opens up an experiential void, a non-space and a non-time (Lyotard has discussed at length how Kant had already described

this as a "UnForm" (non-form) in his analytic of the sublime). In critical aesthetics this idea has been expanded and transformed further: In the experiential void opened up by the negation of the visual no imagination or life is possible. It is the very threat of the end of life as such. To put the threat to life at bay new modes of the visual are (immediately) put in place. Perhaps our brains are hard-wired to do this. But in this moment of negation, the breaking of the image, of the visual, an infinity is opened up, an infinity of possible modes of the visual, an infinite range of alternatives, one of which has to be (temporarily) adopted.

The real point of the negation and this negative dialectics as it was emblematically embodied by the bold quest of the avant-gardes, was not to find a somehow "better" alternative for that which was negated (perspective, unity of space, unity of time, surface, support, material, medium, etc etc...) but much rather to reveal the infinity of possibilities, the infinite space of alternatives.

Now what has changed and where I would follow you in most of your analysis is that the context in which art, criticism, and critical cultural production operate, has diversified to the point where multiplicity has replaced revolt.

The second important change is that I think that the kind of practices that were previously labelled as avant-garde have long been supplanted and taken over by actors in non-art contexts, stimulated and accelerated by the expansion of the digitised media infrastructures. The negation of symbolic structures now plays out and articulates itself in a much wider social and political domain, which makes your next remarks all the more present:

> The backdrop against which art stands out now is a particular state of
> society. What an installation, a performance, a concept or a mediated
> representation can do with its formal, affective and semiotic means is to
> mark out a possible or effective shift with respect to the laws, the

> you address yourself to artists or publics or potential peers across the
> dividing lines that separate entire societies? How do you evaluate what
> counts as a positive or at least a promising change in the existing
> balance of a foreign culture?

Adopting the formula outlined above I would say that the negation of dominant modes of symbolisation serves not just to point out and develop alternatives, but first of all to show that an infinite range of alternatives exists in which every possible mode of symbolisation (image, sound, text) hides more than it reveals (about actual social realities on the ground).

This is where I see the real significance of such 'symbol-hacking' practices, which can of course never stand on their own. They become a force for change when there is a local application and the material means to bring them further - but then we get into the discussion of strategies and tactics. Here I wanted first to comment on the theoretical proposition you made. How this then works for activists, artists, critics in oractice is the next step.

The second comment relates to the use of the concept of Empire. I wonder if the concept of Empire is really productive here to address your question of finding "a different way to live, a fresh chance at coexistence", which I read as a call for pluralism and multiplicity. Empire, however, suggest the rise of a hegemonic and more or less unitary form of social and economic/political organisation (along with its military extensions). Of course in Negri and Hardt's vision there are many internal struggles and conflicting actors within the body of Empire, but still they seem guided by a similar organisational logic and set of (hegemonic) objectives.

If, however, I look somewhat naively at geopolitical developments around me, I see much more of a fractalisation of Empire at the moment, i.e. the emergence of a multitude of self-similar, but self-contained empires. Importantly, these factual-empires also contest and counter-act each other to the point where their objectives and strategies become so heterogeneous that I wonder how productive the rather monolithic concept of Empire still is to analyse, let alone do something useful with this heterogeneity.

Much rather I would opt for an approach focused on a simultaneous localisation and multiplication of alternatives to such hegemonic forces and leave the concept of Empire behind.

Finally, on the reduction of American bases and how this plays out locally, in the case of your report in S-Korea, highly fascinating!

In such a localised address to a shift in 'hegemonic domination', I see the most productive approach to a new form of social and cultural critique. It will be very difficult to build that critique convincingly, given the lingual, cultural, material, economic and social rifts that separate the various actors that would need to be included in this, and also given the reliance on a global pigeon-English that many of us are struggling with..., but still this could be truly productive.

A problem that worries me on a more day to day basis and that follows directly from your account of the reduction and shifts of foreign US military basis is the question of the demilitarisation of society, and the technology and research sector in particular. It seems to me that there is a continuing legacy of the cold war era in which the military / industrial complex attempts to hold its ground, not just in the US, but also in the Russian Federation and many of the post-Soviet and other 'Western' powers, in terms of contracts, jobs, positions, production-infrastructures, international market-shares, entrenched financial positions. I.e. this is now a completely post-ideological space of political action.

Especially the domain of technological research and development has become so deeply militarised (fuelled even further by the 'war on terror' discourse) that it becomes difficult to imagine how to get rid of this condition. A reliable inside source told me years ago that even a relatively 'civil'-looking institution such as the MIT Media-Lab was at the time supported for more than 65 percent by military funding, carrying out projects that are conducted in utter secrecy, about which we can safely assume that they exist, but about which we cannot get any reliable information as to what they are and what they aim for. Stuff that you will never see on their public web pages. No doubt this percentage has only grown since, and it is presumably even worse in many other technological R&D centres.

How do "we" as cultural producers, critics, artists, deal with such realities if we are so prominently working in and with the products of this technological domain? How to bring this back to the civil domain?

Some 'help' might be expected from the apparent economic demise of the US, making it increasingly difficult to provide for the upkeep for the world's largest army (hence the reduction and re-alignment of foreign US military bases). In effect, the upkeep is currently mostly financed by China. This is, however, certainly not a problem of the US alone, and it plays out very differently in different contexts. The shared problem faced is how to turn this trend around (without a complete collapse), how to civilise the technological domain?

This is one area where the search for alternatives seems highly urgent, and it will require more than a process of mere 'negation' - A process of negation of dominant symbolic modes of hegemonic domination only serves to show that an infinity of other worlds is possible, I would say.

Well anyway, just some thought on a damp Sunday afternoon (it's hot and wet in Amsterdam).

bests,
Eric

This way of thinking, developed from Adorno to Lyotard among many others, is one of the more powerful and compelling stories that can be told about the vanguard "overcoming of art," and my thanks to Eric for bringing in this precise theoretical level of conversation. When I said, "let's take it as axiomatic that all that has changed," I was indeed thinking of the end of any transcendence of artistic representation, and therefore of any reason or art to go on referring to art alone, to its sequential evolutions and/or ruptures. Of course, the idea that there is one single story of the avant-gardes in the 20th century is itself totally dubious, but I think that many of the stories which have been elaborated lead to the point art serves as some sort of ever-changing mediation between an active multiplicity and an existing context of social reality. How that kind of mediation works is, I think, the subject for a micropolitical aesthetics - but I'd like to touch on that in a later reply to Snafu's excellent post on productivism. As Eric says here,

> How this then works for activists, artists, critics in practice
> is the next step.

Concerning the "existing context of social reality" which forms the backdrop to any next step, that is definitely where geopolitical thinking becomes an issue. How to name the context? Is there any overarching structure? If so, how to avoid supporting it with one's own conceptual activity?

> The second comment relates to the use of the concept of Empire. I wonder
> if the concept of Empire is really productive here to address your

> still they seem guided by a similar organisational logic and set of
> (hegemonic) objectives.

Well, what I am talking about is first of all best approached as classical imperialism, not Empire in Hardt and Negri's sense of a centerless, networked imperium -- because what we have seen in the past five years, with the Iraq war, is clearly an attempt to project a specifically American sovereignty onto a resource-rich country. Beyond the war, I think the case for American hegemony is very strong and tends to be understated, if only because people on the left would understandably like to see other alternatives. However, lucidity is also important. The acts of the Bush administration have forced me, as a responsible citizen, to look at the consequences of US military bases all over the world, military domination of space, financial domination through the continuing status of the dollar as international reserve currency, techoscientific domination through the fruits of military R&D spending, cultural domination through global English and the benchmark status of American universities, etc. etc. All of this is, to be sure, in decline, and that is probably why it has gotten so ugly in recent years. But decline can go on for a long time... and in the meantime, unfortunately, this whole construct of military-industrial imperialism continues to furnish the basic definitions of what is good in life, including the canonical measures of economic growth and prosperity inherited from the Fordist/Cold War era, which still hold sway among all the official bodies and orient, for the worst, the development of the EU in particular (not to mention China). The really obscene victory of US hegemony is making everyone desire and love this bloated form of overdevelopment.

Now, I definitely do not have a one-dimensional view of all this, because the geopolitical study that I have carried on within the Continental Drift project definitely suggests that regional

bloc-formation and the increasing sovereignty of countries that already have a continental scale (China, India, Russia) is the wave of the future. I see two likely scenarios over the next 20 years. Either continued American decline will allow other major actors to literally "buy in" to the American hegemony, eventually achieving a true intra-imperial distribution of power and consequent tempering of the US capacity to go lashing out with its military when the other major players do not agree -- and then we will really reach the state that Hardt and Negri described in *Empire*. Or, the existence of any worldwide hegemony will gradually fade, and much greater power will accrue to the continental ensembles, giving rise to some kind of truly multi-polar world. In the best of cases this could lead to the "fractalization" you suggest, with interesting roles for multiple kinds of plurality in the system (not that there isn't plurality already, but this would be quantitatively and qualitatively different, more heterogeneous). Or, in the worst of cases, we could easily get rivalries between blocs, resource wars, etc.

The obvious thing that keeps these scenarios at a distance is the gigantic disproportion between the US military and all the rest. But it may be that popular resistance of all kinds will finally prove that to be an "ineffective disproportion" -- finally answering Madeleine Albright's famous question by showing that having such a great army really is useless, and thus opening up the possibility, at least, of more positive scenarios. This is the geopolitical reason why I am antimilitarist. The other reason is unreflected and immediate: I don't think men with guns is the way to solve any problem.

> Much rather I would opt for an approach focused on a simultaneous
> localisation and multiplication of alternatives to such hegemonic forces
> and leave the concept of Empire behind.

It can be a very good philosophical approach and also the right one. I think, to base alternative strategies on (including aesthetic strategies). However the trick is keeping reality enough in mind that you can actually hope to change it, i.e. leave the military-industrial pimp behind and find some better lover.

Yes, to the extent that we have a world society, we do need a cultural critique that can work through global divides, with all the quite fascinating and, I think, rewarding difficulties that you mention. In my opinion, this kind of dialogical exchange is one of the ways to leave behind the imperial tendency to oppressive hegemony, but without falling back into essentialism and identity-thinking.

You are so right. The vampires are keeping the cold warbody "alive" so that they can maintain the dead-end mode of production that has been put in place since, or rather by, the Second World War.

I think this remains the key question. In my reading, for instance, A Thousand Plateaus is entirely about this question, it's about subverting and derailing the war-machine of the state, mostly from within, through the undermining of what they call "royal science." It is true that one always works largely on the state's domain (that's the very definition of hegemony, it sets the terrain for everyone). So the question you raise is really the central problem, culturally as well as politically.

> Some 'help' might be expected from the apparent economic demise of the US,
> making it increasingly difficult to provide for the upkeep for the world's
> largest army (hence the reduction and re-alignment of foreign US military
> bases). In effect, the upkeep is currently mostly financed by China.

Actually, Japanese capital remains tremendously important as well... Along with Middle Eastern and European money, the genius of empires has always been to get others paying tribute. Basically because they want the protection of -- or are frankly afraid of -- the empire's military. However, this seems to be headed for a change. A collapse of the dollar, a real run on the dollar, would signify a radical change. We will see... I am not betting on it as I think that everyone is afraid of such a violent turnaround. I think the strategy of the other world powers is to hollow the US out from the inside, and then just wait and see what can be done about the hard core of the military, wait and see whether it will really decline along with the middle class and the old bridges and levees and so on. The strategy of the US, as Brzezinski said flat out in *The Grand Chessboard*, is to hold on to hegemony as long as possible.

> This
> is, however, certainly not a problem of the US alone, and it plays out

Thanks, Eric, it is great to see that we can finally ask a big question again. All that tactical shyness was kinda buggin' me...

> This is one area where the search for alternatives seems highly urgent,
> and it will require more than a process of mere 'negation' - A process of

> show that an infinity of other worlds is possible, I would say.

Indeed, the continued return to avant-garde negation is pointless. I think it is intimately bound up with the tautological self-reference of art to itself alone, which is strangely persistent, mainly because it was institutionalized as the definition of modern art (another zombie category as Ulrich Beck puts it). My off-the-cuff manifesto was meant to say that self-reference and radical negation ought to be things of the past for art - stages which have truly been overcome - so I heartily agree with the above!

> Well anyway, just some thought on a damp Sunday afternoon (it's hot and

I happened to be in Seoul at what was I guess, roughly the same time as Brian and had some parallel thoughts on developments there that might be of

interest... (I was attending, as a Civil Society representative, an OECD Ministerial meeting on the Future of the Internet Economy...

(This is taken from a somewhat longer trip report...

2. Canada and the OECD Ministerial
Canada hosted the first event in this series in Ottawa in 1998 and much was made at various points particularly in the beginning about the Seoul event being somehow linked to the Ottawa event. Unfortunately for Canada the comparison between Canada in the Internet economy in 1998 and in 2008 is something of an embarrassment. Where in 1998 Canada was an active innovator in a wide range of areas concerning the Internet Economy and (not incidentally) Society, in 2008 it was clear that Canada had either been more or less stagnant in the interim period (and thus slipping behind its international competitors in whatever tables concerning the Internet Economy one might wish to focus on).

Where other countries notably in this instance Korea but also the EU had chosen to provide significant support for infrastructure development and R&D, Canada had (currently governed by Neo-Liberal ideologues) pretty much withdrawn from any public involvement in these areas. And where Canada in 1998 had had a very progressive/inclusive national policy approach to extending participation (and the related benefits of the Internet--Economy and Society) to all, this had by 2008 disappeared from the public agenda.

The benefits of a public policy approach to broad Internet inclusion are manifestly obvious in Korea where some 90 per cent of the populations is Internet connected almost all, with very fast broadband connectivity. This has proven to be a tremendous spur to various aspects of the Internet economy including the ever-receding grail of innovation but also to overall appropriation of the Internet into all aspects of both commercial life and daily life. Canada by losing sight of the social goals of the extension of Internet access and use has seemingly as a consequence allowed itself to drift backwards in those areas.

<nettime> Political Work in the Aftermath of the New Media Arts Crisis

From: Geert Lovink

To: nettime-l@keim.org

Date: Mon, 11 May 2009 21:29:14 +0200

On the event of the Montevideo/Netherlands Media Art Institute 30th anniversary, departing curator Susanne Jaschko put together a one day symposium entitled Positions in Flux. Régine Debatty at We Make Money Not Art blogged about it. Unfortunately, I was only able to attend the morning session. The event on May 8 2009 took place in Trouw Amsterdam, the followup of Club 11. From what I heard, Positions at Flux had a critical take towards the common media art discourse and asked relevant questions. It was a relief to see that the attention was, for once, not focused on history, preservation and conservation. Cultural heritage has already taken over way too much attention space--in part because this is one of the few areas where there is still plenty of funding. Sigh. Just for one day, no celebration of "medium religion" or "art meets science". Director Heiner Holltappels opened by noticing that new media art is not easily accepted by fine art. Traditional art has become eclecticism. According to Heiner, all art is technology based. The subject of the symposium was a visible break with the video art heritage that Montevideo has been known for. Politics topics, a courageous step! "Is there a future for us?" is a question not many institutions dare to ask. In the Dutch daily De Volkskrant of that day, ex-Montevideo curator Bart Rutten (now Stedelijk Museum) took up the role of expressing the ambivalent feelings of the Dutch art establishment towards the new but no longer young art form. Whereas he praised Montevideo's work, he himself had moved on. "You can ask yourself if Montevideo should continue to show only media art works. In this way they preserve their specialism. It was my main reason to leave."

In Zero Comments I mapped the current challenges for new media arts.

While society at large is inundated with (new) media, the art branch that deals with the digital moved itself in a ghetto. While this analysis still holds up, many in the sector openly admitted the shortcomings and are now putting in place strategies to escape the dead end street. Technology has lost its original fascination, while spreading even faster in society. Is this a reason enough to abandon the field? While experimentation with electronics and the digital might have lost its aura and the spirit of curiosity has somewhat faded, the field of new media arts at large is still growing, despite institutional setbacks here and there. What most participants shared was the feeling that, despite the intimidating institutional violence of the large players, museums will die or become a zoo if they do not deal with the Digital. Some say new media arts lacks the timeliness and the depth. Whereas ICA London closed its media lab, Laboral in the North of Spain, which opened in 2007, is now a large exhibition space, devoted to media art. Chairman Chris Keulemans emphasized that new media arts was always at it best when it criticized the media itself, with its codes and nodes. Each of the three presentations in the morning session gave a different answer to the question how relevant political work could be produced.

The Iraqi-American artist Wafaa Bilal is known from his installation Domestic Tension, in which the artist lived in a gallery space for a month, pointed at by paint ball gun operated by web users. Shoot an Iraqi had 80 million visitors and, according to Bilal, was a "strange mix of aesthetic pain and pleasure." What made the work so popular was the power of viral connections, in particular through chatrooms and video he put online. What happened here was a confrontation between conflict zone and comfort zone, disengagement and engagement, virtual versus physical platform -- both in the case of the artwork and war in Iraq itself. Bilal concluded that the body has its own language that is not in sync with the electronic reality. Bilal made a distinction between interactive works, in which the end-states is already determined, and dynamic pieces that are open ended. A lot of the old school new media art is interactive. Increased user participation was illustrated in Bilal's story of the "virtual human shield", a group of people that gathered to protect the artist from being shot at. Dog or Iraqi was a month long online debate who gets waterboarded: a dog or an Iraqi? Bilal also briefly discussed his modded version of a 2003 US shooting game that he renamed into Virtual Jihad. Instead of killing Saddam the user can now hunt GW Bush. This and other projects were documented in Wafaa Bilal, Shoot an Iraqi (City Light Books, San Francisco, 2008).

Former EtOy Hans Bernard of Uebermorgen.com didn't show projects but read a text concerning the role of "European techno fine art avant garde." I am great fan of Uebermorgen. It's in fact becoming impossible to list all their interventions and hacks. Uebermorgen is all about "surreal outcomes", not bound by any medium. "The transformation from digital to physical is important. The work is not pop art, it is rock art. We are not activists, we are actionists." For a while seeking large audiences was a thrill, but that's no longer the main motivation. There is a new strategy for each new project. Bernard did his best to prove that Uebermorgen's intentions were neither political nor ideological. The aim should be Art, not Politics. Communication is the 9-5 job, but that not the passion. Bernard's insistence on the non-political status didn't convince. Uebermorgen's claim, not to have any political agenda, refers to an ancient, rigid definition that was already problematic in the late seventies when I studied political science. Maybe in Austria politics is still associated with corrupt parties and fat, ugly politicians but elsewhere in the world people use a much broader definition of "the political". His insistence on artistic freedom is amiable but the idea that once art becomes political it turns into politics and seizes to be art, simply doesn't hold. His separation between the private opinion of the artist as a citizen and the Artist as a public figure is problematic for the same reasons. Bernard's insistence that "perception and production need to be separated" sounds good--but we all know that visual arts no longer operates outside "perception management." Autonomy, at least in the Dutch context, is the official state religion. We all anticipate aesthetic impact, even if we reject the categories of the day and undermine the dominant visual logic. Hans, there are no commissars anymore that control the ateliers. If there is any censor it's probably the Politically Correct Self. So, if we state, "in production we need to be free," there is no one who will stop us -- but ourselves.

Knowbotic Research, teaching and working in Zurich, was the third presenter. Their translocal distributed temporary works avoid--and seek--the Political in yet another manner. Christian Huebler showcased the Blackbenz Race project between Prishtina and Zurich, a city marketing proposal that was refused because of its negative image of the proper Swiss finance capital. The broader idea was to play with the Kosovo-Albanian-Swiss people that hover in-between places. Code words are fog, smoke, blurred spaces and multiple identities. The self-built

stealth boat project has a similar intention. The micro audiences become actors here. Activism doesn't need more exposure and transparency. Art doesn't need moral outcry. The celebrity industry took over this role. Art questions and creates new spaces for reflection. What's required are slow spaces. All three projects showed that new media art "doesn't need to be a monade, merely celebrating itself." (Huebler) This is the age of entering other contexts, times and spaces—assisted by production houses that have in-house knowledge about the specificity, and the Eigenartigkeit, of digital technologies.

<citaat van="Geert Lovink">

>Activism doesn't need more exposure and transparency.

I agree, the obsession with media by activists is killing activism and (re)producing mirrors of narcissism, aka transparency....

>Art doesn't need moral outcry.

It does not NEED it, but some kinda passion is imho an important generator. This passion can be questioned, exposed or reflected on. That is why I agree with you that

> Art questions and creates new spaces for reflection.

> What's required are slow spaces.
Yes, but why not also new confrontations, new dynamics, tactics, etc?
And indeed, why not reflect on morality as well!

This is too true, and that branch has to reinvent itself from scratch or it will collapse very soon (if it isn't already collapsing). But it goes for the entire 'new media' field, including academic new media studies which have used up their credit within the humanities. It's already happening in arts education where famous media art schools have been rolled back or integrated into Fine Art courses.

It's not even a question of too narrow technological focus, but one of perceived artistic quality. Historically, 'media art' has been a tactical alliance between radical artists from Nam June Paik to ubermorgen.com and high tech academic research lab art that has no

whatsoever contemporary art credits. From the late 60s to today, one hand washed the other - the former brought the artistic credibility, the latter the money and infrastructure. Festivals like STRP or ars electronica perfectly illustrate it. However, the research lab art, particularly in the form of 'interactive installations', has always dominated the field in sheer mass, quantity and visibility. A visitor who would visit an arbitrary new media festival with an interest in contemporary art would see, first and most of all, preposterous machine parks. Or, in friendlier terms, it's the kind of art that rather belonged, as an educational or aesthetic gimmick, into a museum of technology than into a contemporary art discourse.

However, I find it hard to get past a certain attachment to the "media art" ghetto because it tends to combine the very worst (even painfully, unspeakably stupid and monstrously worst) with - IMO - the very best to be found in contemporary art. Uberrnorgen are an excellent example, needless to drop further names here. And I'm afraid that abandoning that ghetto, although it's theoretically the right thing to do, will in the end result in even greater collateral damage.

Since the 1990s, the so-called Fine Arts do provide no really desirable environment either, likely they're even worse. It is telling enough that the term "Fine Art" suddenly has become a universally accepted standard while, not a long time ago, any self-respecting contemporary artist would have fiercely rejected it if not opposed it. In the past ten years of reading contemporary art magazines or visiting art biennales and Documentas, I've been flabbergasted by the lack of vision and radicalism in this field. It has morphed, somewhat comparable to New (composed) Music after the 1960s, into an academic discourse ruled by a neo-bourgeois jet set of hipster curators posing as cultural theorists on the basis of a not-even-half-baked knowledge and recycling of postmodern philosophy and cultural studies. The system consists of artists who have been academically trained to produce works - along with non-understood theory lingo - that fit the required curatorial buzz. Along with this development, the paradigm of the white cube and art works as good-looking exhibition objects has become stronger than ever before and rules out any art practice not fitting this format. All the while, the system thrives on the delusion that it still represents visual art as a whole although, unlike, for example, in film where 'highbrow' and 'lowbrow' still coexist, its popular forms like comic books, tattoos, fantasy figurines, t-shirt illustrations, wildlife paintings... have long been excluded from its system.

I dare to claim that under "saner" conditions, no Documenta and no Biennale curator would get around artists like uberrnorgen or the Yes Men, just like no Documenta curator got around Beuys in the 1970s and 80s. Instead, we get artists like Mike Kelley all over the art world in whose work I'm either not getting something or indeed seeing the Emperor's new clothes. ("Review" babble like http://www.frieze.com/issue/article/tomorrow_never_comes/ affirms the suspicion that the art world has no clue either.)

> Director Heiner Holtappels opened by noticing that new media art
> is not easily accepted by fine art. Traditional art has become
> eclecticism. According to Heiner, all art is technology based.

This is true, yet contemporary art has mostly given up on reflecting its media. [I can almost hear an iPhone-wearing curator saying that reflecting one's media is outmoded modernism.] It's most obvious in the way video installations have become its mainstream format, in the form of video loops shown in booths inside exhibition spaces. Video is just taken as a documentary TV or wannabe-cinematic format, as if radical video art from Paik to Infernal had never happened. (It seems as if most contemporary artists actually don't know it anymore which is comparable to painters no longer knowing about abstract painting.) One should perhaps advise Montevideo just not to leave its video art roots behind.

Mh, so let it be killing itself, the Reinvent Yourself-Discourse is a line from the Pet Shop Boys from the 90s and says nothing than "Nobody knows the trouble I've seen" in a 'modern' reinvented (sic!) way. But I cannot see the trouble of this hard front line between a Paik and a Uebermorgen. For example the "1001 Songs of eBay" of uebermorgen is just a funny funny project I can implement over the weekend dealing with online politics sex. And this confused and disoriented waiting for the new-old avantgarde like "Let's do many Paiks" is boring and does not have anything to do with the real world in which electronics are the basis of the doings. What was really radical in a Paik? Fucking the Porta Pack with Alternative TV-Ideas or the TV-Sets with a magnet? Were the neo-dada fluxus guys radical anyway or just radical?

I'd like to point out at this point that institutions like Monteideo are revolutionizers of money, e.g. they payed Jaromil for working on dynebolican stuff and by this means they are able to rescue the middle-class fantasies of a free arty market of software on the basis of electronics, a market without too much money and with lower prices, with all effects of an open source software "z" driven by the mediate support of the state.

But while talking to them some years ago the Monteideo people turned out to be very naive in political questions. They have no idea about economy and no idea of what is going on out of their field. That's okay, as long as they incorporate all folklore and avantgarde at the same time, because it is their mandate and mission.

re all,

first of all thanks Matze for your consideration of my activity, but let me warn you are overestimating the benefits of my collaboration with Monteideo / Time Based Arts ... which is now called Nederlands Instituut voor Mediakunst (NIMK, BTW): it takes more to be "rescuing the middle-class fantasies of a free arty market of software" as you say, if we speak of a national institute that started in a squat in Amsterdam 30 years ago and has seen a constant flow of contributions by various people through all these years, most of them really worth considering.

On Fri, May 15, 2009 at 05:23:12PM +0200, Matze Schmidt wrote:
> I'd like to point out at this point that institutions like

> working on dynebolican stuff

if it would be just the action of redistribution of wealth, then it wouldn't be revolutionary at all. Some artists produced and distributed by Monteideo did become rich, but for them Monteideo mostly contributed to the production quality of their artworks rather than direct funding.

just consider that if my lifestyle would be "middle-class fantasy" i could not afford to sustainably live in Amsterdam relying on my current employment, but lucky me i'm not a yuppie :) and i'm fine like that. for the minimum support i get, needed as i care to support me and my extended family when needed, i have to do much more than just developing "my own projects", but still all results can be free to the public: that shouldn't be special for a public institution, right? i believe this is the good signal NIMK gives - not such a revolutionary one, but pretty honest: there are often various degrees of corruption leading public institutions to play commercially with public resources.

other than that, we can call "progressive attitude" - rather than revolutionary" - when institutions are keen to interact with liminal contexts, with dwellers on the dystopian hearth pulsating in every metropolis of our "Free Western World". This kind of interaction (and the respect for the uncommon ground in between) is indeed part of the heritage of a city like Mookum A - unfortunately decaying rapidly as Europe is turning into a Fortress for the privileged and their fears of the disinherited children of the welfare mirage.

at last about the interaction i mention here: i'm not sure how to define it, its likely not a negotiation nor a compromise, i'm just sure it is necessary in any case: whether we accept the upcoming institutionalised "Reinvent Yourself" strategy or not. I would recommend a case-by-case analysis in this regards, rather than thinking universally... like institutions often do :^)

regarding your vague critiques let me reply:

> with all effects of an open source software "z" driven by the mediate
> support of the state.

dyne.org development is not driven by any state, corporation or institution rather than by the many problems these power structures generate. we dedicate most of our free time to peer reviewed free software development in socially relevant contexts (please note "development", not provision of services) and as hackers we operate pragmatically, on-line as well in various different on-site contexts.

> But while talking to them some years ago the Monteideo people

i'd be curious to know what you consider "naive in political questions": myself i've felt enriched by the past 4 and more years spent in Amsterdam, by my colleagues at NIMK (which is not so unformed in its composition BTW) as well by the squatters in A'dam, from De Bierkoning to the Waag Society.

backing my objection, i'll point you out some coverage on NIMK's 30 years symposium (just happened last week):

<http://www.we-make-money-not-art.com/archives/2009/05/the-netherlands-media-art-inst.php>

pasting you here the transcription of my intervention at this symposium, let it be also a contribution to this interesting discussion thread:

At the NIMK's symposium "Positions in Flux" I've taken the occasion to share thoughts on the current perception of Free Software and Open Source philosophy in art, along with some overdue criticism of the Creative Commons hollow hype, as well as the Creative Industries and their systematised processing of art for the global market. Even if not obvious, I believe the dynamics of these two phenomena are related; among the quoted in the intervention are Benjamin Mako Hill's "Towards a Standard of Freedom: Creative Commons and the Free Software Movement"[1] and Florian Cramer's post on nettime "The Creative Commons Misunderstanding"[2], while the vigorous critique of the Creative Industries stands on Rana Dasgupta's essay "The Next Idea of the Artist (Art, music and the present threat of creativity)"[3]

Here below a short transcript:

"Open Source" doesn't mean free access, nor open space or open air; it presumes a seamless[4] approach to design as a response to the increasing reliance on technology and its accessibility; it is interactive without prescribed boundaries, following a combinatorial, generative approach to development; it is peer to peer as no producer can control further interaction patterns; it is grassroot as creations are born out of initiative and cohesion based on needs felt and understood in first person by community members.

About Creative Commons, its motto "Some rights reserved," is a relatively hollow call: the slogan factually reverses the Free Software and Open Source philosophy of reserving rights to users, not copyright owners, in order to allow the former to become producers themselves. The dis/appropriating loop of creativity must be recursive to be fruitful: not only production means belong to the people using them, further creations should be free to be recombined, rights must be granted focusing on people interacting, not just those providing the interactive infrastructure.

Unfortunately there is a diffuse lack of perception for alternatives offered by the Open Source and Free Software approach over current profit models. As a present problem, also deriving from the lack of understanding of the importance of grass-root creativity, top-down cultural management is patronising art production: mass media aesthetics of an entirely sanitised and efficient creativity, of the sort that will not rely on unstable people and can therefore be globally rationalised.

That the great artists of modern Western culture managed to produce what they did, despite the danger and intensity of their effort, was due in large part to improvised social forms built around close-knit networks where thought and affect circulated with high velocity, and where it was possible to try out forms of non-conventional human relationships that would not destroy, nor be destroyed by, a life of art. Seen from an historical perspective, in the second half of the twentieth century many of the functions of creative networks were already taken over in Europe by institutions (government funding bodies, universities, museums, etc) and much of their excessive feeling was neutralised. This was only a small part of a general process of the time: the absorption of human emotion into bureaucratic channels, and the emergence of a social coolness, an inefficiency of feeling.

At this stage in the twenty-first century, we are in the middle of another large-scale restructuring of ideas of creativity and culture. As one of the most significant generators of image and value, creativity now has become a critical resource for the global economic engine. What creativity is, and how it can be systematised and circulated, are therefore urgent questions of contemporary capitalist organisation. As cultural producers are thrust into the full intensity of globally dispersed, just-in-time production, new images of creative inspiration and output are required that sit tidily within the systematised processes of the global market. Creativity must be rendered comprehensible, transparent and rational; there can be none of the destructive excesses evident in the lives of many of the greatest artists of European history. Creativity must circulate cleanly and quickly, and it should leave no dirty remainder. For what interests Hollywood, and the market in general, is not creativity as a complex human process, weighed down in bodies and relationships and empty days, but creativity as an abstraction, free of irrationality and pain, and light enough to hover like a great logo above the continents.

Perhaps, as the logic of systematised production occupies the terrain of human creativity more completely, we will reach a stage where we surrender all knowledge about this troubling domain, and it will become entirely alien to us. Perhaps one day we will be terrified of

what explosive dangers might rise up from the creativity of human beings.

 > if we speak of a national institute that started in a squat in
 > Amsterdam 30 years ago

Hello,

I did not remember that the 'Nimk' was started in a squat: isn't this the story of Paradiso and Melkweg?

As far as I know the 'Netherlands Media Art Institute' was born when 'Monte Video' and 'Time Based Arts' merged (1993).

Monte Video was founded by René Coelho in 1978, and initially operated from his house in Amsterdam. (was that squatted? I tend to doubt.) Monte Video focused on video art and provided equipment for producing works and space to show them (soon collecting and distributing... video-tapes!).

Time Based Arts was founded in 1983 by the Association of Video Artists, so it was an artists run association creating a network for distribution; it was more performance oriented than Monte Video, according to the story that was narrated to me, and which I deduced from the collection. (Can anyone confirm this, please?) Were they squatting? But they were getting funding... I am somewhat curious.

Maybe other people on this list know more.

There is a page of history on the nimk.nl, but I saw no wikipedia entry on this topic.

I find the *story of this institute quite beautiful and paradigmatic in the development of the (non-linear) chain of media mutations (which could off course be expanded):

happening/performance (art=life)
 electronic art
 video-art (art=registration)
 media-art, software-art (art=simulation)

I paste it below.

Best,
 Eleonora

== ==

****History****

1978

Monte Video is founded by René Coelho. From his home on the Singel in Amsterdam he makes equipment and documentation available, and furnishes one room as a gallery. The first video artist whose work is shown here on the Singel was Livinus van de Bundt. Coelho's inspiration. Other artists, such as Bill Viola, Gary Hill, Shelly Silver and Gabor Body, soon make contact. It is not long before Monte Video has a large selection of works available for rental.

1983

Thanks to government funding Monte Video is able to move to Amsterdam North. There is now sufficient space to offer regular presentations. Not only Dutch artists, but also those from other countries are given a chance to show their videos or installations.

1986

Government funding received by Monte Video is cut back to almost nothing. Monte Video does receive several small transitional grants from the city of Amsterdam.

Time Based Arts, which had been founded in 1983 by the Association of Video Artists, is fast becoming well-known as a distributor of video art, and continues receiving government funding.

1986-1993

René Coelho continues on his own. Monte Video moves back to his home on the Singel. The acquisition of production facilities, distribution, documentation and promotion goes on, financed from his own income and by organizing large projects. One of these, as an example, was 'Imago', an exhibition of Dutch video installations which toured worldwide for five years beginning in 1990. There were also plans laid for the first conservation programs for video art.

The chairman of Time Based Arts, Aart van Barneveld, died; his death was followed by many conflicts within the organization. In the early 1990s Time Based Arts also lost its subsidies and threatened to go under. Monte Video and Time Based Arts decide to provide a joint art program for Amsterdam cable TV, Channel Zero.

1993

Time Based Arts merges with Monte Video. Their work is continued under the new name of Netherlands Media Art Institute, Montevideo/Time Based Arts. This fusion does free up national funding. In both 1997 and 2001 the grants are expanded and converted into a structural subsidy for four years.

1993-2002

The Netherlands Media Art Institute moves twice, in 1994 to the Spuistraat and in 1997 to its present location on the Keizersgracht.

The Institute continues to grow through these years, and adopts the following mission statement: The Netherlands Media Art Institute supports media art in three core areas: presentation, research and conservation. At the same time, through its facilities it offers extensive services for artists and art institutions. Among these services are educational programs, to be developed to accompany all activities.

and

****History of the Collection****

The collection of the Netherlands Media Art Institute, Montevideo/Time

Based Arts reflects the turbulent history of the Institute. In addition to

the collection of Monte Video, the predecessor of the Netherlands Media

Art Institute, the Institute administers the collections of four

institutions: the Lijnbaan Center (1970-1982), Time Based Arts

(1983-1994), De Appel (1975-1983) and the Institute Collection

Netherlands. This combination of artists' initiatives (Time Based Arts, De

Appel and the Lijnbaan Center) and more formal institutions (Institute

Collection Netherlands and the present Netherlands Media Art Institute)

affords the collection a surprising diversity. In addition to renowned

artists like Bill Viola, Nam June Paik and Gary Hill (who were represented

in the collection as far back as the 1970s), there are internationally

known Dutch artists who experimented with the medium for only a short

period in the 1970s, such as Marinus Boezem, Jan van Munster and Pieter

Engels.

Before any institutions at all had yet been created for the purpose of

collecting small centers were set up in various parts of The Netherlands

which facilitated and promoted the use of video by and for artists. The

earliest examples of this were Agora Studios in Maastricht, the Lijnbaan

Center in Rotterdam (itself a merger of the studio of Venster in Rotterdam

and the video studio which was set up for the Sonsbeek exhibition in 1971

in Arnhem), and a couple of individuals such as the artists Miguel-Ángel

Cárdenas and Jack Moore in Amsterdam, who made their cameras available for

other artists. Many of the works which were made in this earliest period

of Dutch video art only surfaced from oblivion in the course of the 1990s.

Surprising discoveries among them are the works of Dennis Oppenheim, Terry Fox, Wim Gijzen, Nan Hoover and Tajiri.

With the arrival of the collection of De Appel an enormously rich collection of video records of performances was added. De Appel flourished in the 1970s as one of the most progressive international work sites for performance art. The collection of this institution contained unique works by Vito Acconci, Laurie Anderson, Gina Pane, Carolee Schneemann and others. But in addition to records of events in her own gallery, Wies Smalls, the founder of De Appel, also built up a collection of international video art in order to enable the Dutch public to become acquainted with what was happening internationally, including work by Douglas Davis, Ulinke Rosenbach, Joan Jonas and Alison Knowles.

In the early 1980s, with De Appel as its base, efforts were begun to establish an association for video artists, which later created the Time Based Arts Foundation. The collection of this artists' association, in addition to works by artists based in The Netherlands, such as Abramovic/Ulay, Hooykaas/Stansfield, Ben d'Armagnac, Christine Chiffron and Lydia Schouten, also included work by international artists like Mona Hatoum and General Idea.

Time Based Arts maintained an active collection policy, in which any artist who worked with video could try to have his or her work included in the collection. As it grew the collection became enormously diverse and afforded a good overview of the various ways that video could be employed in the visual arts. Through in to the 1990s Time Based Arts played an important role in the collection, distribution and support of video art until, in 1994, under pressure from the municipal authorities of Amsterdam, it entered into a merger with Monte Video.

René Coelho began his video gallery Monte Video in 1978, and in doing so laid the foundation for the present Institute. Monte Video was a gallery which specialized in electronic art and especially in video art that sought out the creative possibilities and qualities of the medium itself. An important impetus for establishing the institution was the work of the Dutch video pioneer Livinus van de Bundt. He was therefore the first artist to be shown in the gallery. Later the Vasulka's, Bert Schutter, Peter Bogers, Matthew Schlanger and many others followed. In addition to the works that were to be seen in the gallery, Monte Video began to be active in collecting and distributing work. Bill Viola, Gary Hill, Shelly Silver and Gabor Body were for instance artists who 'stabled' their work with Monte Video. The gallery owed its international success chiefly to this. When in the 1990s the conservation of video works became a pressing problem, the then merged Montevideo/Time Based Arts established itself as the goad and later as the center of technical expertise for carrying out the Conservation of Dutch Video Art project. As well as the collections described above, there was integral cooperation with museums that over the course of time had also collected video work. In addition to much technical research, the conservation efforts also prompted considerable recording work and research into content. Among questions dealt with were the status of the vehicle, the significance of the material chosen and establishing the boundary conditions for proper exhibition. Because of the differences in approach among the institutions from which they came, considerable time was spent integrating the collections with one another, and getting the possibilities for the use of the works coordinated with one another. But now, with the end of the conservation project in sight, the gaps between the collections appear to be closing ever more, and we can proudly present our multi-faceted collection to the public, as we do here.

>> [...] Arts

> what art

> True, art

In short: No money (as one of the forms of profit) without art, no art without politics. This is a simple formula and any Baudrillard would have secretly subscribed this, even in an epoch of ended (Hegel and followers) or never realized (Debord and followers) art. The fact is, we* don't need art as art, but -- and someone like jaromil shows this to us** -- we need other conditions, as painting, code or video or diy-cooking if you like. I don't care -- changing media is always good. But we are not able to produce the conditions' now' -- like someone like jaromil is may thinking -- because the conditions produce us, alienate us they will always produce us (products produce consumption and vice versa), but these conditions are (straightforward now) have to be uncaged from ruling modes of production, in the meat sector reproduced by national institutions (ZKM in Germany, Ex-Montevideo in NL, your personal MTV at home). The New Media Arts Crisis is not my crisis, It's just the crisis of the middle-class (Yuppie or not, fallen programmer or rising video-installer) in form of some arts with newer or older media, may it a t-shirt or an lcd. So there is no aftermath here but the effects of a mixed up (I love this status and condition) highbrow, baby! elite meshed with an alternative "green" and independent business party with no idea of real coding out there (forget networks, they are roped parties).

Hi Florian,

You point towards a classic issue, the relevance of context. What do different registers (fine art, media art, design, activism, popular culture etc.) give to a particular work and what does a categorization exclude, meaning what does it make *impossible*. Every register influences interpretation, (in)visibility, production and funding.

- > Since the 1990s, the so-called Fine Arts do provide no really
- > desirable environment either, likely they're even worse. It is
- > telling enough that the term "Fine Art" suddenly has become a
- > universally accepted standard while, not a long time ago, any

- > and cultural studies. The system consists of artists who have been
- > academically trained to produce works - along with non-understood
- > theory lingo - that fit the required curatorial buzz.

Can you speak more specifically about which curators, what art educational programs, which artists and what practices? For a constructive debate, it's important to avoid caricatures, otherwise there's a risk of creating false enemies, or missing out on how to best counter the real ones.

And as an aside, I have to admit when I read "not-even-half-baked knowledge" and "non-understood, I caught myself wondering who are the guardians of proper interpretation when it comes to theory. (not to mention, which theories) After all, couldn't theory be mutable in different contexts or even hackable? In other words, can it too be practiced, tested and changed once it hits the ground or encounters a specific situation or discipline?

- > Along with this development, the paradigm of the white cube and art
- > works as good-looking exhibition objects has become stronger than

- > ever before and rules out any art practice not fitting this format.

It's true the white cube is a dominant force to be reckoned with (or not, depending on what art world you dwell in :-), but interventionists/social/political practices have also continued.... (both of the digital and analog sort). You mention UBERMORGEN, and I would add The Temporary Travel Office, SubRosa, Mongrel, AUDC, Jorge Blasco's Cultures of the Archive, Marcelo Expósito's various projects, The Center for Land Use Interpretation, Beatriz da Costa and others... Maybe "tactical" is a red thread through these works?

- > All the while, the system thrives on the delusion that it still

- > like comic books, tattoos, fantasy figurines, t-shirt illustrations,
- > wildlife paintings... have long been excluded from its system.
- >

hmmmm....not sure about this, having worked as a hybrid artist/designer/curator/media artist/collaborator for some time now, again I reiterate that there are many different artworlds (and for that matter artists/inhabitants/vagrants). Sometimes they intersect, rub next to each other, come into agitation or simply run on parallel tracks. (Not too dissimilar from the so-called new media world.) Think of open source practitioners, the Max/Flash folk, and those that poach the web's detritus for their own purposes, they're all a part of new media arts, but each tend to dwell in different corners of the digital universe (or maybe not, if you're one of those cross-pollinators :-)

I haven't seen this particular work so hesitate to judge. I do however find it a little problematic to make sweeping statements about the Emperor's New Clothes and the "art world's" cluelessness based on one review and one artist.

- > culture etc.) give to a particular work and what does a categorization
- > exclude, meaning what does it make *impossible*. Every register
- > influences interpretation, (in)visibility, production and funding.

Yeah, and inevitably, these registers are not just different chosen perspectives we have on particular works, but also institutional and disciplinary contexts in which workers have to put their work and whose written and unwritten rules they can't avoid abiding.

> Can you speak more specifically about which curators, what art > educational programs, which artists and what practices?

I was really thinking of the contemporary art system as it has been described by its own protagonists, for example in Isabelle Graw's 2008 book "Der grosse Preis", or has been analyzed, with means that really deserve the term "artistic research", by Hans Haacke as early as in the 1970s in such pieces as "The Chocolate Master". And many people have criticized that system from within, from Henry Flynt in the 1960s to the writer and "Thing Hamburg"-blogger Michel Chevalier today. I think it is legitimate to make a sweepingly general critique of the contemporary art system just as it is legitimate to generally criticize and attack the music industry and contemporary popular music system for example. That doesn't mean that there would be absolutely no good music coming out of that system. But unlike other culture industries, the contemporary (Fine) Art system often falsely believes in its own autonomy. And it's my general experience and opinion that the art I'm more interested in is more often than not to be found in places outside that system. In the 1960s, this was true for Fluxus and Situationism, in the 1970s and 1980s for the Mail Art Network and postpunk, and in the 1990s for Net.art, the Luther Blissett project or the alternative pornography movement. Today, to speak in terms of our both hometown Rotterdam, I'm finding the interesting contemporary arts at places like WORM and De Player and only rarely at Witte de With, for example.

> For a constructive debate, it's important to avoid caricatures, > otherwise there's a risk of creating false enemies, or missing out > on how to best counter the real ones.

Well, this is true, and I admit that my posting was polemical - and emotional. My gripes with the contemporary art system are also based on bad personal experience and confrontations such as the one with the "Just Do It" exhibition <[http://www.mail-archive.com/nettime-1\[AT\]bbs.thing.net/msg02876.html](http://www.mail-archive.com/nettime-1[AT]bbs.thing.net/msg02876.html)>.

> hmmm....not sure about this, having worked as a hybrid artist/ > designer/curator/media artist/collaborator for some time now, again > I reiterate that there are many different artworlds (and for that > matter artists/inhabitants/vagrants).

Indeed. It's just that the particular art world I mentioned above - and which can be roughly described as the art world of the many biennials, the Documenta, contemporary art spaces like PS.1 and KW, contemporary art journals like October, Texte zur Kunst, Springerin and Metropolis M, too often monopolizes the term "art" for the art that it represents. Admittedly, its system can be permissive and include 'outside' practices, particularly when a curatorial subject requires it. However, it would be possible to map the institutions mentioned above just by the overlap of the people they involve, and come up with a fairly good representation of what makes up contemporary art.

The same is true, no doubt, if you take ars electronica, transmediale and ISEA, plus Leonardo, Neural, Rhizome and Nettime, ZKM and ICC Tokyo, and pin down the system "media art". But just as that latter system is now being - deservedly - questioned and undergoing a huge - if not terminal structural crisis, I think it is as legitimate to question the contemporary Fine Art system, and the Western concept of autonomous art. So, going back to Geert's initial report about the discussion about the crisis of "Media Art" at Montevideo Amsterdam, I think that it can't be a solution to integrate a very questionable "media art" system into an equally questionable contemporary art system. [As it is now happening, in education, too, for example in the Zurich art school media department where Felix Stalder teaches, and where the media programme has been rolled back into Fine Art on the Master level.]

> Sometimes they intersect, rub next to each other, come into > agitation or simply run on parallel tracks. (Not too dissimilar from > the so-called new media world.) Think of open source practitioners, > the Max/Flash folk, and those that poach the web's detritus for > their own purposes, they're all a part of new media arts, but each > tend to dwell in different corners of the digital notion universe > (or maybe not, if you're one of those cross-pollinators :-)

Yep, only that what you describe above is really declining and may not see much art funding or support in the future. The writing is on the wall.

>>> Director Heiner Holzapfel opened by noticing that new media art >>> is not easily accepted by fine art. Traditional art has become >>> eclecticism. According to Heiner, all art is technology based. >> >> This is true, yet contemporary art has mostly given up on >> reflecting its media. [I can almost hear an iPhone-wearing curator >> saying that reflecting one's media is outmoded modernism.] > > ouch, how stereotypes do prevail. I wonder if there would be a > paradigm shift if he/she had been envisioned with a pre-paid nokia. > :-)

I should have told that the above example was taken from a real life experience, although it's admittedly a deliberate caricature when I blew it out of proportion as above. I agree very much with Brian that artistic practices (to put it as broadly) are deeply intertwined in culture and communication. There's a good chance, and I really mean this, that I am getting old - in punk terms: a boring old fart - who's insisting on outmoded viewpoints. But I think that critiques of modernism, as legitimate as they are, become problematic when they're used to legitimize and maintain the status quo. [An extreme example is the contemporary art gallery scene and private collections in Berlin and their intrinsic links to the German discourse of "Neue Bürgerlichkeit" ("new bourgeoisie") <http://de.wikipedia.org/wiki/Neue_Bürgerlichkeit>.] The current economic, political and social developments should render all notions of posthistoire and non-rupture in the fabric of culture and communication, and hence also in the arts, all the more obsolete. They also question the bourgeois insistence on artistic practice as a product of individual subjectivity. And finally, the contemporary art field has been much ahead of the media art system in postcolonialism; however, if this reflection is serious, it should not exclude the notion and system of art itself.

Well, anyway, since the Geuzen collective of which you're a member operates in its own carefully chosen grey zone between art, activism, design, media, research and education, I actually think that our standpoints are quite similar, just that our points of departure regarding the usefulness of the contemporary art system might differ. For me, the projects of De Geuzen are a very good example for a post-autonomous artistic practice. Again, although I'm no friend of the media art system, I'm quite sure that it would be practices like those of the Geuzen that would suffer and struggle to find institutional support once the "media art" system will have vanished and been replaced with the existing contemporary art system (particularly the more cut-throat kind of the USA, Germany and England, with people who are anxious not to pollute Fine Art with applied or sociocultural practices they hate and detest as non-artistic [1]).

Florian

[1] a good example would be Berlin's Künstlerhaus Bethanien, a renowned contemporary arts space, whose director Christoph Tannert bitterly fights a group of squatters and their sociocultural center in his own building.

Re: <nettime> Political Work in the Aftermath of the New Media Arts Crisis

From: Renee Turner

To: nettime-1@kein.org

Date: Mon, 25 May 2009 13:37:41 +0200

Hi Florian,

My apologies for a slightly delayed response. I completely agree that there are aspects within the art world which need critical scrutiny. I

was simply asking for specificity, and I appreciate that you've taken the time to clarify.

> But unlike other culture industries, the contemporary (Fine) Art > system often falsely believes in its own autonomy.

I wonder if this is true. Feminist/post colonial practices have often argued the opposite and with much efficacy. Think of Jean Fisher's critical texts, Adrian Piper's work and Lucy Lippard's writing and curatorial projects and even the recent educational department at Goldsmiths of Irit Rogoff, all of these practices seem to point to an art world/system which is political, embodied and implicated.

> And it's my general experience and opinion that the art I'm > more interested in is more often than not to be found in places > outside that system. In the 1960s, this was true for Fluxus and > Situationism, in the 1970s and 1980s for the Mail Art Network and > postpunk, and in the 1990s for Net.art, the Luther Blissett project > or the alternative pornography movement.

I'm also interested these movements, practices, antics/prankties, but unlike you, I see them as a part of a complex and multifaceted art world (not outside of it). I find it problematic to define the system as only popular art mags, the market and large institutions when there's so much other interesting work going on. (not to mention, how would you classify those of us involved in art education?)

> Today, to speak in terms of our both hometown Rotterdam, I'm finding > the interesting contemporary arts at places like WORM and De Player > and only rarely at Witte de With, for example.

Yes, here we can look into specific curatorial approaches and talk about who these various institutions and orgs are addressing, (this takes more time than I have now... but I'm nonetheless interested in exploring this further at a later juncture) >>> Indeed. It's just that the particular art world I mentioned above > - and which can be roughly described as the art world of the many > biennials, the Documenta, contemporary art spaces like PS.1 and KW, > contemporary art journals like October, Texte zur Kunst, Springerin > and Metropolis M, too often monopolizes the term "art" for the art > that it represents. Admittedly, its system can be permissive and > include 'outside' practices, particularly when a curatorial subject > requires it. However, it would be possible to map the institutions > mentioned above just by the overlap of the people they involve, > and come up with a fairly good representation of what makes up > contemporary art.

I agree, this *is* truly the crux. It's crucial to map the overlap of people/institutions and ask ourselves who's setting the agenda, who's controlling the funding and whose *corner* of art world is being represented, and moreover, what do these representations make impossible, meaning what do they render invisible.

> They same is true, no doubt, if you take ars electronica, > transmediale and ISEA, plus Leonardo, Neural, Rhizome and Nettime, > ZKM and ICC Tokyo, and pin down the system "media art". But just > as that latter system is now being - deservedly - questioned and > undergoing a huge if not terminal structural crisis, I think it is > as legitimate to question the contemporary Fine Art system, and the > Western concept of autonomous art.

It's absolutely legitimate to question art's autonomy, and it's been happening for some time now. Besides the previous examples listed above, recently there has been much debate about the proliferation of biennials how art feeds into a neoliberal agenda.

> So, going back to Geert's initial report about the discussion about > the crisis of "Media Art" at Montevideo Amsterdam, I think that it > can't be a solution to integrate a very questionable "media art" > system into an equally questionable contemporary art system, [As it > is now happening, in education, too, for example in the Zurich art > school media department where Felix Stalder teaches, and where the > media programme has been rolled back into Fine Art on the Master > level.]

In many respects this cycle has happened to photography (remember when John Tagg wrote that no history of art photography could be written without taking into account, pornography, daguerreotypes, propaganda and family snapshots.) Or video's roots in activism, home videos, street journalism (Martha Rosler's essay: Shedding the Utopian Moment).... there's much to learn from these histories of assimilation. It's important to look at how institutionalization "tames" media...disciplines the discipline. But while questioning the systems of Fine Art, Media Art etc, I think as producers, viewers, educators and implicated accomplices, it's imperative to ask what do

we want to see happen or change.

As a graduate student in the eighties, I was taught by Harmony Hammond, a painter and co-founder of Heresies. In her painting class, she reserved time to present her personal collection of artists' works she felt were under-represented by the mainstream art world. It was a small but extremely powerful gesture. Eventually, in 2000 the collection was published under the title, Lesbian Art in America: A Contemporary History. I learned much from Harmony, but the most influential part of her teaching was watching her practice *otherwise*.

So in this context, I'm asking myself how can I/we practice *otherwise* and how might that *doing* nudge or broaden the scope of dominant discourses and visual regimes.

best,

Renee

Date: Sun, 17 May 2009 10:59:58 +0200

what i am always wondering about is why the media arts field is so concerned with its media, is dealing with "new media" or "old media" an excuse for making good or bad art? IMO defining art by its media is on the same level as defining art by its subject. not getting over these definitions will result in a ghetto-situation sooner or later. the problem -IMHO- is not that media art is not recognized by the fine art world but that the fine art world is dealing with other subjects. when was the last big exhibition dealing solely with 'painting' or 'sculpture' you've seen? ars electronica and the others are doing that every year: 'new media art' with changing subtitles.

the same problem persists when new media artists and theorists insist on "politicalness" and "radicality", those terms don't say anything about certain works either, no matter which media is used in it. they only say that they may be recognised as "political" in a certain time in a certain context. but that doesn't say anything about it's 'artness' either. 'art' doesn't become art by having specific characteristics but by a specific kind of processual reference to it." (J. Rebenitsch. Aesthetik der Installation)

and -please hit me hard if i'm wrong- the "fine art world" questions such things, this "eclecticism" and "cluelessness" some are claiming exist, but despite the ugly quest for the next blockbuster there is a lively scene developing things further without thinking about making "political art" or "painting", seen from this point of view i think that hans' claim "The aim should be Art, not Politics." is totally right, even if it is harshly criticized by geert. to put it bluntly: if i want to learn something about politics i would read a book with proper information about it and not go to see art that repeats the common sense that there are bad things existing in our world. i want to see art. neither new media nor politics.

Re: <nettime> Political Work in the Aftermath of the New Media Arts Crisis

From: Rama Hoetzlein
To: nettime-l@kein.org
Date: Sun, 17 May 2009 11:48:02 -0700

i agree.. i'm new to nettime, but following it silently until now, and have been doing research in this area.
here are a few earlier notes i've made on this topic:
<http://www.rchoetzlein.com/theory/>

in my view, the problem is that new media theory - the theory side anyway (not the art) - is largely defined by what we read from new media theorists, such as lev manovich and baudrillard. yet these philosophers do their primary work in "media theory" itself, that is the anthropological study of how media influences culture. thus, their central message is that media has meaning, and meaning changes culture:

"True, art is on the periphery for me. I don't really identify with it. I would even say that I have the same negative prejudice towards art that I do toward culture in general. My point of view is anthropological. From this perspective, art no longer seems to have a vital function; it is afflicted by the same fate that extinguishes value, by the same loss of transcendence." - Jean Baudrillard

i do not deny their contributions to media theory of course, but despite the fact that they may be open about their field of study (as this quote shows), the new media arts has not moved to define itself as an "art form", but rather defines itself in terms of media. of course, as an artist, i disagree about defining media art in such post-modernist terms (that is, purely as an outgrowth of culture). contrast the view of art above with this one:

"The activity of art is based on the fact that one, receiving through his or her sense of hearing or sight another's expression of feeling, is capable of experiencing the emotion which moved the one who expressed it." - Leo Tolstoy

New media art should be defined from an art-philosophical perspective. In this view, meaning is present in all works, to varying degrees, regardless of how they might be appropriated by culture. At what time in history was art not appropriated by culture? None the less, people continued to create art. The process of art-making is one of creating meaning, and this relation between the artist and the work is not changed despite how the object is ultimately appreciated, used, or abused by culture.

It's great to read such a fundamental comment. I shall add something. My viewpoint includes both Tolstoy's and Baudrillard's. I find that informatic art (my own off-the-cuff term, but surely better than new media) is compelling precisely when it places subjective expression within the most strongly coercive social arena of our time, namely the digital networks. Your idea that there is an art-philosophical perspective that could exclude or bypass social determinism seems, begging your pardon, somewhat naive. What is more, I think all the interest of art itself disappears when it is shorn from the contexts of power and held up as a pure conductor of subjectivity. Approached in that way, the art work tends to become no more than a mirror for our own emotions and fantasies -- far from any state of empathy, Einfühlung or whatever one chooses to call it. So I am not surprised that you move from Tolstoy's fascinating quote (reproduced below) to the "relation between the artist and the work." I guess I am more interested in, well, media: the way the work relates the artist to others.

However, your observation about new media theory (Kittler and McLuhan were recently mentioned here) is spot on. What we are given from the podium, over and over again, are lessons about the power of technoscientific systems. The predicament of the human singularity, caught within the net of determinisms yet resisting, creating another reality and expressing this rather fantastic adventure through whatever kind of material or semiotic medium has been chosen, is left out of the story, which thereby becomes a monument to the crushing regularity of the status quo. The same thing, of course, happens to resistant political action in the hands of the sociologists and the Heideggerian philosophers of an essential, "historial" alienation. Both ethics and aesthetics take it on the chin.

In my view, the great inspiration for new media theory has come from hackers themselves, who create alternative possibilities for existence within the overwhelmingly powerful networked environment. This is why, in essays which are inseparably about art and technics, I tend to use concepts like "reverse engineering" or "escaping the overcode." Expression, for me, is the rupture of code, an excess which does not abolish the labyrinth in which we are caught, but at least opens up a possible new path through it.

That's one approach. There could be many others. The problem, as you point out, is that usually there are not, because the theory very rarely meets any actual practice. The necessary discussion of technological power holds the center stage. Of course that is easier for the whole "new media" social circuit, because then you don't have to think very much, or feel very much, or try very hard to find out what might be at stake in a particular work.

This list, I guess, is about the best place to talk about how to approach media art. Thanks to all for starting the conversation. I'm ready for more. Let the thousand info-aesthetics bloom!

best, BH

Brian, thanks for your reply. In general, i'm glad to see that we're mostly in agreement. Based on my observations of nettime-l, disagreement is often the norm, so i'm glad to see that there is some consensus between us that the new media theorists are currently the only option we've been given, and that we really need some alternatives. Now, for some responses.

> Your idea that there is an art-philosophical perspective that could
> exclude or bypass social determinism seems, begging your pardon,
> somewhat naive.

I'm not suggesting that art-philosophy can bypass social determinism. I have no illusions about the difficulty the artist faces in creating any real social change, since my view of art does not negate any of the real research done by the media theorists. My own view is that the idea of art-for-social-change is long outdated. You suggest that hackers are the source of real inspiration in new media theory because they alone are able to transform the media itself, and thus undermine the system toward some possible escape path. Yet, there is no reason to believe that even if the media itself changes, that society will too. In my view, the only way we could overcome the current technoscientific system would be due to a deep, fundamental transformation in all individuals - and while I believe art is capable of doing this one person at a time, I don't think any one artwork, hacker or otherwise, is capable of really altering the technoscientific system we find ourselves in on a global level. Thus, all social change we talk about now is still part of that system. This is the media theorist perspective, of course - which I agree with - but as an artist, its incomplete.

The reason I advocate art-philosophy is for the sake of the individual, and the field of art itself. While I just said the artist is powerless to transform culture, perhaps to a degree greater than most would like, the artist is _not_ powerless to transform him or herself, and others which that person touches through the art.. Despite whatever the technoscientific system may do, to create art is an intentional act by an individual, and thus has an immutable meaning just by virtue of being "created". We get to choose what is created (this does not make it good art necessarily).

That meaning is present in all work "to varying degrees". By this, I mean that we each have a unique relationship to our artwork. For some, it is a mirror of personal emotions and fantasies (and probably my own work most of the time), while others may be able to communicate more. So, I'm not evaluating art. Some is good, some is not. However, having an art-philosophical does not automatically reduce our works to emotional fantasies. In fact, it is more likely to result in genuinely empathetic works since it creates a solid foundation for art based on a philosophy in which art is encouraged to be empathetic, rather than responsive to a system.

I'm simply stating -- which I think we perhaps both agree with here -- that so far we have not been given any other alternative view of new media art other than that proposed by the new media theorists. The way out of this problem is, I believe, through a philosophy of art whereby the artist has full awareness of the problems of society (hopefully), yet continues to create works of art despite this. It is possible to have no illusions about the inability of art to bring about explicit social change, but understand that it can bring implicit change through individual communication.

<...>

An interesting addition to this would be the emergence of 'New, new media arts'. I am thinking here, of practices in the field currently defining itself as bioart. Here the medium that is being manipulated is a form of living or semi-living matter, or tissue. Bioartist. Eduardo Kac and curator Jens Hauser have sought to specifically identify this new art practice, expressly on the basis of the medium itself. Bioarts, they argue, are most definitely not those works that take bios or a form of life, as a subject, but manipulate it as a medium. That said, the manipulation of living tissue can be executed through a number of divergent practices, specific technologies, and it is these that seem to be defined by some as the media, not the living tissue they manipulate. I guess a somewhat simplistic comparison would be between with identification of various 'digital media' in abstraction from the advances in computer technology on which they are based.

My current work in the field of bioart is increasingly pushing me towards a frustration at the distinction between art/science/media/technology/old/new that recurs in the majority of literature, and if I am not wrong seems to predicate this current discussion. In the light of these new practices I have been working towards re-imagining what art and media are in themselves, as technologies and processes not as distinct practices - the specific media or declared purpose seem less relevant from this perspective. So I wonder whether 'meaning' is present in all works, to varying degrees, regardless of how they might be appropriated by culture' could be extended beyond a simple valorisation of art.

It also seems that those new media theorists, such as Manovich and Baudrillard are somewhat restricted in their approach in that new media is perceived in a somewhat teleological sense, newness for the sake of newness, with new theories to match new media - without asking what is actually recurring in new media. IMO it seems that most new media, are really just old media anyway, particularly so in bioart. Is the creative growth of tissue not what we do continually as part of our natural bodily processes? Would it be facetious then to ask whether all media be considered from this original perspective, negating the discussions about relative newness or cultural categorization (ie it's art, it's science, it's technology, it's media).

but can "change" be a parameter for art? what is to be changed through art? I agree that a "change" in whatever direction is possible but IMO art mustn't be reduced to it. to me art is also something I can admire without thinking of having to change something, in fact even if I see some really good "political art" the first step is to admire it (wow, great work) and then to think about consequences. art is something autonomous. to me such an approach would free it from being a mere form of communication, a medium, or "new media art", but at the same time it can be all of that.

From: Rama Hoetzlein
To: nettime-l@kein.org
Date: Mon, 18 May 2009 10:11:25 -0700

exactly.. even if we are fully unconcerned with political art, when you say "wow, great work", thats just and only what i mean by implicit change (you are changed).. art is autonomous here because, while the work may or may not be political, this implicit change defines only the meaning-relation between the artist, the work, and the viewer. And that relationship is established independent of the impact of media on society, i.e. politics. A philosophy of art should provide a foundation for complete autonomy, and this is done by observing that the basis of art is creating and appreciating.. keeping in mind that theory only gets you so far as an artist.

What does one admire a piece of art? What is its autonomy? And what could be its consequences? I have asked myself these questions for years. Like most thinking people, I have come to a few conclusions. And since I like the idea that art can be "all of that" - a form of communication, a medium, new media art - I would like to share these conclusions with you.

Humans are excessively complex by nature, and inherently social. We are defined by the surfeit of symbolic activity that goes on in our brains and indeed, in our full sensorium, and that comes out not only from our mouths but in all sorts of gestures and postures and practices directed toward the senses and symbolizing activities of others. A long anthropological tradition running from Sapir through Levi-Strauss to Sahlins holds that so-called "primitive" societies are no less complex than modern ones: their languages show comparable range and variety, but are (according to Levi-Strauss) oriented differently, more concrete in one case, more abstracted in the other. There is so much going on in any human being and between any group of human beings that just ordering or harmonizing all this excessive symbolization - I mean, excessive over what the utilitarians think of as the simple quest for satisfaction or corporeal pleasure - becomes a problem in itself. Because madness always lurks on the edges of our reeling imaginations, and then there is also depression, or anger, or jealousy, or prejudice or extreme paranoia, indeed a great number of obscure problems that can disrupt the life of the one and of the many.

Religion has been the great social technique for bringing all this roiling thought, expression and sensation into some kind of predictable pattern and harmony, constituting entire narrative and figural universes, with their built environments, rituals, music, poetry, smells, tastes, etc, all associated and carefully correlated with orders of kinship, canons of

sexuality, responsibilities of care, expressions of tenderness, commandments, prohibitions and the like. What we now call art, as it gradually detached itself from religion and became a series of aesthetic traditions interpretable and modifiable by individuals - as it became autonomous in other words - seems to have taken on the role of being the sensuous and ideational mirror of the individual's proper "fit" with society; it became a way of continuing the vast and mostly imaginary conversation about the ways that the one relates to the many, and vice-versa. However, this conversation was no longer necessarily about harmony: because depending on the very particular context, the proper "fit" could have aspects of a "misfit," and the quest for an idealized harmony could involve extreme disruptions of the status quo, disruptions appearing both in art and in life itself. Just think about the Antigone of Sophocles and you will see that this kind of problematic was not invented with the romantics, it goes back quite a ways. Clearly it gets particularly intense in modern democracies, where we are all brought up to conceive ourselves as both legislators and revolutionaries.

Now, amusingly, one of the reasons I ever even bothered to think about such complex and excessive things, so far from "direct political action" and what have you, is that for many years I have found myself with a certain nagging problem of getting up in the morning. Perhaps others have experienced this! It so happens that on certain mornings I may spend as much as an hour just thinking about a certain constellation of things: a group of people, an artwork, a political issue, a line from a song, a concept, a phrase from a book, an image, a rhythm. Without showing any particular signs of anxiety, insanity, delirium, fever, swine flu or whatever, I still found it necessary to bring such constellations of ideas and sensations into some kind of dynamic pattern that would lend a spring to my step, a direction to my speech, an effectiveness to my gestures. Being a bit of a misfit - according to the aforementioned tradition in the democratic societies - I had to work on this question of how to fit all this in, nonetheless: how to fit into my own overflowing symbolic and sensate world, first of all, and how to fit that world into the multitude of others with whom daily activity brings me into contact. Thus I began to think that what is pleasing, satisfying, attractive, intriguing, inspiring, shocking, repellent, etc in the formal allure of artworks is also somehow the result of other people's struggles with the excess of symbolization in which they are embroiled, and that the "success" of the artwork (wow, great work) is always some variation on the "infinite theme of the artist(s) trying to break out of one universe and "fit into another - whether we're talking about a purely abstract universe "of chromatism or rhythm, or some Hegelian quandry of historical "dialectics, or the current discussion about cap and trade, or the latest "dispute over the coolest tattoos in the punk or heavy-metal circle that "encloses your secret passion. An aesthetic form doesn't directly solve any "of the weighty social problems - but it helps get a world together, it "helps structure a pattern and a dynamic and an enthusiasm, which is always "a good start.

So how 'bout the politics then? Well, according to my little theory, the personal is clearly both aesthetic and political, because if you can't get out of bed you are definitely not going to make it to the office, the march, the meeting, the voting booth, the library, or wherever your activity is going to have some consequences in terms of organizing social relations. What is more, this is not just my little theory, because going back to Plato's Republic or maybe the Rig Vedas, social thinkers have been very conscious of the influence of things like music on the order and harmony of the community, the city, state or whatever. Indeed, not long ago we saw with dazzled and almost disbelieving eyes that a great nation-state like China could put a significant fraction of its resources into organizing an aesthetic display which was not just supposed to knock everybody out, American style, with its overwhelming show of wealth, but also and above all to enact and celebrate an ideal of harmony and societal coordination which, from my anarcho-individualist viewpoint, was at once vastly impressive and also frankly terrifying, because here I could see an intensive use of all the latest, hypercomplex aesthetic techniques to knit together an order that could power a vast authoritarian economic machine and infuse it with the enthusiasm and belief of the many - which is a lot, when we're talking China. So you want new media? Replay your avi file of the opening ceremonies of the 2008 Olympics.

What I am trying to get at with all of this is that art is essentially media, it is not merely but essentially about communication, only what is communicated is not just a phrase or a slogan or a piece of information, but a problematic attempt to reconfigure a world on every level of sensate and imaginary experience. That can be an attempt to fit in or to stick out, to harmonize or to disrupt, to smash the current relation of self and society or to conserve it or to invent another one; but insofar as art is expression, it always projects this struggle over the shape and balance of a world towards the ears and eyes and excessive imaginations of others. When we say that art is autonomous, we situate it in the long democratic tradition where the self, autos, tries to help establish the law, nomos, accordingly which it can freely develop in the company of fellow human beings. Now, the problems of this attempt at autonomy are almost infinite,

they are sexual, technical, ecological, emotional, mystical, contractual, material, they involve philosophy, science, babies, great art and also the plumbing. And they always involve the relations of individuals and groups to others whose worlds they do not understand, whose rhythms they most not feel pulsing in their own veins, whose tacit concepts of harmony and disruption are not expressed by the same patterns and shapes and colors and combinations of tones. So when I say, Wow, great art - as I often do, just the way people in the new media arts circles have done for years at festivals sponsored by Philips and Microsoft and Sony and the like - the first consequence for me is to inquire into the world from which that art arises and to which it points, and eventually to see how I fit into or desire to break out of that world. This means that a deep and searching criticism can never just be criticism of the work, it always has to look further back, into the world from which it sprang, and ahead to the consequences of a potential change in the worlds we share, or at least to the consequences of a change in the way that *I* or *we* will relate to other worlds in the future.

Finally, it seems to me, in my anarcho-democratic world, that to say Wow, great art, without inquiring into the consequences, is one of the closest things one can do to never getting out of bed, i.e. it's close to sleepwalking. Because at best, you would then be just letting the great art fit into your own great dream, or letting it be the colorful and striking tattoo that will fit you into your small chosen circle. That's at best - because in the present world of biopower and noopoer, just admiring a work in itself and for itself can mean accepting without question the world that it mediates, which in the case of the networked technologies sold by Sony and Microsoft Philips and abused by a vast array of corporations and governments, can be an extremely predatory world, configured precisely in order to capture your consciousness and extract some value or utility out of your passions and dreams. Value that can ultimately be devastating for the collectivity (as in the debt-fueled consumption boom of this decade), utility that can make you into the most terrible of instruments (like the voters lured by nationalist rhetoric into supporting our proliferating wars).

It has been years since I read Lev Manovich, so what follows may be totally unjust to his work, but as I recall, what always irritated me in his writing was a kind of smug insistence that the new media were essentially defined by a certain kind of rhythm, a certain multiplication of screens, a certain connection to databases, etc. - in other words, that the new media were essentially defined by the dominant trends of contemporary capitalist society. For me this seemed like a total abdication of criticism itself, and it also seemed to be a sort of cheerful, "I'm on the winning side" version of the dark technological determinism and philosophical doomsmaying promoted by the post-Leftist thinkers in the wake of Baudrillard. What I missed was the very question of autonomy, and some recognition of its quasi-infinite complexities as they've been ceaselessly developing from the Neolithic to now, in the long and discontinuous series of messages passed from human world to human world. Imho, the poverty of new media art - its "crisis" - has intrinsically to do with the poverty of media critique tout court. It is the failure to see how the cultural politics of individuals and groups are mediated in the work, how they are expressed at every level of their ineluctable complexity and excess over the "mere communication" of what already exists.

best, Brian

Thanks for some beautiful and thought-provoking statements, especially Brian's and Carlos's. I would add that to me the real medium of all art is attention, attention the viewer or reader or listener must pay, feels consciously drawn to pay, in a deepening and all encompassing way. That attention amounts to a transformation of self — into the mind and body of the artist, as it were. The rest of the world falls away for that moment, and so does time — the moment might be a long one — and, as Brian suggests will recur later on, in recollection and

reflection.

If that is art, it is always political, because it always takes the attention payer out of the "system," whatever it might be and however much the managers of the system in fact solicited the artist - or the work to begin with. The huge abstract paintings of the 1950's cold only fit on the walls of the rich, but nonetheless, as long as they were there, they took over those walls, and made the space different from what the collector might have intended, and the same goes for Renaissance art and art of other periods.

The reason different media come in is that the artist has an on-going problem as to how to capture attention as distractions and competition multiply. In some way, to be really focussed on, art must avoid being too easy to experience, for then it can become just the background, just decoration or elevator music, or something that can always be attended to "later" — I.e., usually never. This is a serious and significant problem for new media as well, including much Internet art.

Expressly political art can only succeed, it seems to me, if it comes from the inner depths. For instance, I just finished reading Istvan Kertesz's "Fatelessness;" I don't think it is intentionally political but it certainly made me boil with anger at the human mistreatment and neglect of others. Such art brings what was already there inside us and adds to its centrality. But that doesn't happen often. In my experience most political art is superficial and therefore bad, just as likely to turn off sympathetic feelings in the viewer as the opposite.

Incidentally, I don't know that good art necessarily causes us to think "Wow! I admire that." But it doesn't easily let go of us.

Best,
Michael

Much of media studies is obsessed with witnessing an existence that is part of mediality, to borrow a term from the previous discussion, by placing great emphasis on inserting the observer into the equation. Nevertheless these studies formulate a distinction to preserve some authorship role. What this kind of representational relationship ignores is that it precludes any kind of intervention in favor of a conservation. If the art cannot be conserved because it is conceptual or a piece of code, the identity of the author is preserved and celebrated. This is because a piece of media arrives at its monetary value by being bundled with products that claim to correct the injustices, needs, or ailments being described in that piece of media. The media is monetized either for its value of showing a certain lack or showing the idealized completion that a product might fulfill. An authorship identity, it turns out, can fulfill this marketing function nicely for the lack of any particular object that might or might not exist or lacks monetary value, culminating it seems these days in a guarded wikipedia entry.

Turns out, while searching for a word to describe the process of entering into communication via media I looked up mediated. There is plenty of secondary literature on McLuhan using this word to capture the processes McLuhan describes, but he himself only uses the word mediated with the original definition to describe the arbitration that happens in a conflict. Using the term mediated in the sense that a form of communication is performed via media, still implies that there is an exchange occurring where each party must sacrifice some of their preconceptions in a productive process that is manufacturing representation. Otherwise this representation veers very quickly towards the ideological.

> later.

I am not so sure whether I agree. It all depends on your definition of "media". The problem is that the word "media" means quite different things in different contexts: In the arts, it traditionally refers to the material means of expression from which artworks are created [painting, sculpture, photography, video, performance - that were also the media meant with such terms as "intermedia", "mixed media" and "multimedia" since the 1960s]. In communication studies, "media" is practically synonymous with mass media and refers to an apparatus and system of communication, including newspapers, radio, TV, Internet. In other humanities, there is a notion of media as any symbolic or semiotic carrier.

For example, in the contemporary art (but not media art) world, there just has been a series of exhibitions on pornography, from "BodyPolitics" in Rotterdam to "The Porn Identity" in Vienna. One could call pornography a medium and thus say that these exhibitions were curated from a media perspective. After all, the ars electronica did almost the same thing with its "Next Sex" theme in 2000. Or, a random example taken from just having browsed the Tate Modern site and its blurb on the current exhibition "Stutter": "The onomatopoeic word 'Stutter' refers to an act of speech interrupted by agitated, spasmodic, or involuntary repetitions. As the title for this exhibition, it suggests a metaphor for questions of disruption and discontinuity in processes of thought, systems of communications or conceptions of knowledge." Again, this is pretty close if not identical to curatorship from a media and communications viewpoint.

> the problem -IMHO- is not that media art is not recognized by the
> fine art world but that the fine art world is dealing with other
> subjects.

If I take, for example, the subjects of the last nine transmediale festivals ("Do It Yourself", "Go Public", "Play Global", "Fly Utopia", "Basics", "Reality Addicts", "Unfinish", "Conspire", "Deep North"), they could just as well have been the names of contemporary art exhibitions at PS.1 in New York, KW in Berlin, Witte de With in Rotterdam, or any other contemporary art space.

> when was the last big exhibition dealing solely with "painting" or
> "sculpture" you've seen? ars electronica and the others are doing

One could just as well say that contemporary art deals with "white cube installation art" with changing subtitles.

> the same problem persists when new media artists and theorists
> insist on "politicalness" and "radicality".

The same terms abound in the contemporary art discourse if you read, for example, "October" or "Texte zur Kunst".

> those terms don't say anything about certain works either, no matter
> which media is used in it. they only say that they may be recognised
> as "political" in a certain time in a certain context.

IMO art is, like any public expression, always political. Art that claims not to be political being all the more political as a matter of fact (with symbolist l'art-pour-l'art being a prime example). What I would describe as the political-artistic quality in the art of, for example, ubermorgen is that unlike 'actual' politics, it can be willfully and even criminally irresponsible. One could admittedly dismiss this as a romanticist argument, but it has nevertheless a lot going for it, not just if we look at gothic aesthetics and Bataille's aesthetics of evil, but also at more recent artistic practices like Otto Muehl's commune and Eastern European art since the 1980s.

> but that doesn't say anything about it's "artness" either. "art"
> doesn't become art by having specific characteristics but by a
> specific kind of processual reference to it." (J. Rebentisch,
> Aesthetik der Installation)

Not knowing the full context of this quote, I nevertheless find such systemic definitions of art quite risky. If the basic quality of art - in the sense of 'Fine Art' - lies in its self-reference to its own system, then it would be something very narrow and ultimately boring, and something already exhausted by Duchamp in the 20th century. It would pay a high price for having, since the 19th century, rid itself from more popular forms of visual culture. Such a definition does not even apply to the arguably most elitist forms of other contemporary arts such as poetry and contemporary classical music, since poetry can still be defined outside its own system as highly condensed/conjugated language and new music as highly organized sound. - On top of that, it is an exclusively Western concept of art which blatantly contradicts the post-1990s efforts of integrating postcolonial considerations into contemporary art. Remarkable enough, these integrations never question the concept of "art" itself - although the concept of autonomous art only exists in Western cultures or as a Western cultural import in, for example, Asian countries (which traditionally do not separate art from craft).

> if i want to learn something about politics i would read a book with
> proper information about it and not go to see art that repeats the
> common sense that there are bad things existing in our world.

True. Only that exhibitions like Documenta XI have been haunted by this concept of art.

> I am not so sure whether I agree. It all depends on your definition of
> "media". The problem is that the word "media" means quite different things
> in different contexts:

i agree, but exactly this is the point: media theory is swallowing

everything, but where are its boundaries? what i am trying to find as artist (neither theorist nor philosopher) is a definition for art that goes beyond a mere definition as "media" in whatever sense. that is why i am aiming on the much-maligned term of "autonomy" (and i'm following here the previous mentioned philosophy of j. rebentisch), to me this doesn't mean art is somewhat apologetic or dealing solely with itself (l'art pour l'art - i guess you had this in mind when stating "[...] If the basic quality of art - in the sense of 'Fine Art' - lies in its self-reference to its own system, then it would be something very narrow and ultimately boring. [...]"). art is made to be seen/heard/whatever - to be experienced, and this experience is what defines art and not media. it can change in time - we quite surely don't experience cave paintings in the same way the ones did who made them- but i'm not sure if "the media" does, no matter if it's read as "painting/drawing" or as "hunting scene". what i am hoping to find by this is a possibility to think about "art" and neither media nor porn or politics. these are -let's say- "themes" that can be interpreted, but i hope that art goes beyond being a good designed set of political opinions. i mean, what political context is reflected in leonardo's "last supper"? we surely can speculate but do we know? these are things that are bound to their time and context but nevertheless we still perceive it as "art".

> If I take, for example, the subjects of the last nine transmediale

yeah, exactly, and this what the "art world" makes as boring as "new media art". what i had in mind when saying that the "fine art world is dealing with other subjects" was not the (i would like to call it nonexistent) contemporary discourse. what can be seen in the fine arts field (but not in the big biz -documenta, psi, kw, ...) is an inclusion of possibilities in expression and perception which i never saw in any media-art discourse (though i have to admit i am far from following everything in that area).

> Not knowing the full context of this quote, I nevertheless find such
> systemic definitions of art quite risky. If the basic quality of art
> - in the sense of "Fine Art" - lies in its self-reference to its own
> system,

i'm sorry if this comes through that way, i'm not the best in formulating things. i never wanted to present art as solely self-referential system. if autonomy is read as autonomy of the object (l'art pour l'art) i would agree totally with you. but seen from the viewpoint that "art" may not lie in an object but somewhere between the object and the observer (experience, perception) an autonomy of art is essential.

thank you all for your replies :-)

best,
carlos

>North"), they could just as well have been the names of contemporary
>art exhibitions at P.S.1 in New York, KW in Berlin, Witte de With in
>Rotterdam, or any other contemporary art space.

but it wasn't like that cause it was happening ONLY in a festival
<ghetto> situation

as I see it, many art people are not going to events like transmediale, cause its not seen as an important place for art. I don't go, besides when we are actively part of it.

looks like media art is not sexy enough, the exhibits, as part of festivals, are often too prudish. everything sensual seems forbidden,

too often it s needs written explanations to understand the (political) work.

I do not believe - and I say that as an artist- that the written word is necessary to <understand> a piece of art.it can help and make details transparent, but its not necessary in advance.

my own experience with Station Rose media art projects-like recently LogInCabin in MAK Vienna- is : they are recognized & seen in art spaces, museums by the art scene, but not as much in a so called media art context as festivals are.

basically my impression is that as long as a discussion like that one goes on, it makes clear that the art world is something and the media art scene is out of it.

exactly Carlos...

this revolves around the common (still, ongoing, & perhaps permanent!) problem of identifying creative impulses by their materialized remains (media, mediated forms). There are precisely identical histories of the rise of (materially) specialized festivals, research centers, art school departments, workshop venues, etc etc -- photography, for example. Where are all the institutions and organizations and events that swirled around that particular material result of creative impulse? They are gone, gone, gone. Abd the ones who remain -- does anyone think they are center for radical creative experimentation? Most people don't even remember them. the Rencontres Internationales de la Photographie and the Ecole Nationale de la Photographie in Arles, etc etc, huh, who cares?

when there is this material obsession, it is bound to be outmoded simply because things aren't IT, looking at the world as a bunch of things doesn't reveal the phenomenal nature of life: another words, focusing on

the detritus that is left, dead, after the creative forces have altered the local universe -- well it's simply a death cult and is a dead end. <>yawn>> why ponder on it? Better to skip the material categorization process altogether 'cause it IS a dead end...

<nettime> open letter to art critics

From: Geert Lovink

To: nettime-l@keiin.org

Date: Thu, 25 Oct 2012 15:03:18

+0200

(Written in response to the lack of debate during last weekend's Creative Time conference in NYC. I think art criticism is important source of inspiration and reference (or not) for net critique. The letter also refers to the ongoing, almost funny neglect by the 'art world' of 'new media'. /geert)

An open letter to critics writing about political art
- Stephen Duncombe & Steve Lambert

Last weekend Creative Time held their fourth annual summit on the current state of artistic activism. Over two days, scores of political artists from around the world gave short presentations and organized longer workshops. Hundreds of people participated.

The critical response, so far, has been underwhelming: few critics attended and those that did had little substantive to say. It would be easy to account for the overall silence and dismiss the surface commentary with some snarky criticism of our own about a bullshit art world with their head up their ass who can't recognize that something important is happening right in front of them. And while this may be self-righteously satisfying, it is not very helpful. We want to help.

How this event was -- and wasn't -- covered is indicative of the state of criticism when it comes to political art. The problem is not necessarily lazy criticism, but the fact that we don't have a developed vocabulary with which to understand, and criteria with which to evaluate, political art and activist artists. In an effort to develop a language and criteria with which artistic activism can be usefully criticized, we offer the following seven questions for the critic to consider:

1. Does it work?

Art about politics is not necessarily political art. The function of political art is to challenge and change the world. This should be obvious, but there is plenty of "political art" which uses social injustice and political struggle as mere subject matter: making these forces objects for contemplation and, perversely, appreciation. The point of political art is not to represent the world but to act within it.

Thus, the first question to ask of political art is: Does it Work? We don't mean: does it work aesthetically? but does it work politically. This entails asking more questions. Questions like: What does the artist want to achieve with their work? What change do they see happening through their work? How will this change happen? Who is affected, what affect will the work have on them, and what actions will these people take?

We're not suggesting that there's one criterion of efficacy for political art, nor is there one goal that all political arts should move towards. What we are saying is that political artists, if they want to change the world, need to think about what they want their work to do. And critics, if they want to seriously interrogate and evaluate this work, have to both examine those political aims and ask whether the artist has succeeded.

It is hard to truly succeed as a political artist. Many times, an artist aims short and sets out to "intervene" and "raise awareness" about a social problem or political issue. This is the low hanging fruit of political art. Other work sets out to have a direct impact in a discernible way. Using art to defeat a pending policy, or elect a politician. This is more ambitious on the part of the artist, and easier -- if not boring -- for the critic of political art to judge. Much harder, much more ambitious, and therefore much more difficult to evaluate, is art that intends to change the very way we see, act and make sense of our world -- including what we

understand to be politics itself. It is hard to measure the long term total victory of a shift in the culture.

2. Who is the audience?

The art critic is the audience for most art, and therefore it's quite valid for the critic to write from his or her own perspective. The audience for political art is quite different. Political art, by its very name, has the "polis" as its audience and this constitutes a much broader demographic -- one in which the art critic is confronted with readings of art radically different than their own. As diverse as we'd like to imagine the audience for most art to be it draws from a very narrow population, one in which the art critic is at home. But when the audience is a wider public, the tried and true perspective of the veteran art critic comes up short. The critic of political art needs to place themselves in the minds of very different people. This takes humility. It may even require taking the radical step of talking to the audience, asking them what they see, what they think. These are basic techniques of journalism and ethnography that an art critic may not be accustomed to.

3. What is the relevant tradition?

The tradition that serves conventional art criticism doesn't often work when it comes to political art. Drawing together art's historical and theoretical connections, while impressive to the writer's erudite readership, and possibly entertaining, is largely irrelevant. There are connections to be drawn, to be certain, but the valid ones here are more likely to be found in histories of social movements and textbooks in the fields of marketing, advertising, and public relations. Theories in human cognition and decision making, for example, are far more applicable, useful, and insightful into the work of the artistic activist than discussion of its relation to the newest aesthetic or Albers' color theory. The training most critics have is not sufficient for fully understanding this work. Indeed, knowledge of sociology, community organizing, or rhetoric lends crucial insight into what political artists are doing, and whether they are doing it well. You are not alone in your ignorance. We readily admit that many artists are in dire need of this knowledge as well.

4. What medium and why?

For art critics, medium is important. It situates the work within an historical canon, provides context and meaning, and a sense of continuity. For the artistic activist medium is important too, but as a means: the instrument through which one reaches the audience to effect change. Therefore, discussions about means are dependent on political considerations, such as who is the audience, how they are most effectively reached, and so on.

To privilege one medium over another in the absence of a discussion of efficacy is to miss the point. A good political artist's practice is promiscuous when it comes to medium. Critical Art Ensemble said it best with four words. The artistic activist works: "by any media necessary." A good critic, therefore, judges the political artist on the mastery of the medium they choose for the task at hand.

5. What kind of mastery is required?

Fine artists are often rewarded for the degree of control and mastery over their medium. We valorize artists who can transform materials to fully express their vision without compromise.

Political art, however, is engaged in the world. The world is messy. It has a lot of moving parts. This material is impossible to fully control or master -- and shouldn't be (unless you have fascist ambitions). Whereas compromise for the traditional artist means diluting their vision, compromise for the political artist is the very essence of democratic engagement.

The venue for the traditional artist is galleries and museums -- controlled spaces where the art itself does not need to speak very loudly because all attention is focused on it. Political art has a dauntingly large venue: the street, the marketplace, the mass media. This is an out-of-control space where one competes with the cacophony rather than retreating into silence and solitude. Political art, responding to this space, is often brash and loud. Subtlety is sometimes not its strong point. But we shouldn't fault a creative activist practice for what's inherently required of it. Indeed, it should be judged on how well it opens up a space, is read, and understood within this arena.

Some art lovers may be turned off by this focus on the practical and tactical, but for creative activists these concerns are essential. We are not, however, arguing that the informed art critic should simply be judging political art on how effective it is in communicating a message. Aesthetics matter -- but they needn't be seen in opposition to efficacy. If

one's goal is to affect change, form serves function. Art that succeeds aesthetically also has a better chance of succeeding politically. Beautiful art is art that people are drawn towards. The power of art lies in its ability to open up a space to ask questions rather than deliver answers. We think this makes for good politics too.

6. What am I missing?

The "art world" is truly a world all its own, with separate cultural spaces, communities, and languages. The detachment of fine arts from popular culture is the norm.

Alternatively, for creative activists, popular culture is their briar patch. Whereas in fine art, engaging in this terrain is read as pandering, ironic, "critical," and at all times, exceptional, for political artists it is the rule. In order to reach everyday people one must speak in a language they understand. This can be interpreted as dumbing things down. It is not. In order to convey complex radical ideas in a vernacular largely developed for and oriented toward consumer sales and crass manipulation requires a great deal of intelligence and skill. And the better you do it, the more likely it is to be overlooked.

Within the fine art world to stand out and be noticed is a clear sign of success. In the practice of artistic activism you are more successful the more your art weaves into the fabric of popular culture -- lost to the art world. The entire effort is shrouded in camouflage.

Critics are forgiven for passing over the best of this work in the past, but let's all begin to look more carefully, ok?

7. What's my role as a critic?

The relationship between artists and critics is often a fraught one. Critics can be lauded for how well they skillfully and cleverly demolish and denigrate artists' work. This aligns with the dominate competitive logic of the commercial art world. This is the paradigm, in part, that political art is trying to change. Despite this cannibalistic tendency, we all know that makers and critics live in symbiosis. This is especially true when the art operates in the broader society and the function of the work is not to be a unique and valuable object but to effect the world.

In this realm, the art critic is part of the team, with everyone working towards the big win of a better world. Being a good team member for artists means making powerful work. Being a good team member for the critic means offering insightful, relevant, and instructive criticism.

Art critics raise questions. Questions are good. But questions for what purpose? If you're a political artist, and you're primarily showing people how smart and clever you are, you're not producing good political work. The energy is misdirected. The same goes for critics. If you're writing primarily as a demonstration of how smart and clever you are, you have lost the soul of being a critic.

The critic might want to ask themselves, why am I writing this? Am I clarifying and illuminating the work? Am I instructing the artist and the audience so that better work is produced. Or am I "problematizing" as a demonstration of my prowess as a thinker. ("Problematizing" is too often used as a cheap substitute for understanding, analyzing and aiding.)

Being a critic, like being an artist, involves some degree of selflessness. There is a larger purpose. The critic, through their attention and analysis of the work, provides a helpful service.

Of course we all know this, but it's easy to get off track.

It's bigger than you and it's bigger than the art.

Modern art is rooted in the belief that the artists' individual expression is important. In turn, the individual critic's opinions about said artists and art are important. Think Pollock and Greenberg.

With political art a bigger game is being played. There are still individual artists and individual critics, but the stakes are not about the reputations of artists and critics. What's at stake is the transformation of the entire society. If this sounds grandiose, you may be in the wrong business.

We don't train people to be good political artists in our art schools. Most institutions are slow to adapt and are, at best, fighting the old myth of the lone genius artist expressing their vision in spite of society, rather than moving forward towards a world in which artists work collectively in an embedded engagement with society.

Call us optimists, but we assume anyone producing creative work to affect power is doing it from a sincere and passionate place. If it's not working,

it's not because they don't care enough or aren't committed. It's because we haven't developed a critical tradition that helps artistic activists strengthen their work. Political art needs help.

This is why we need you.

Because we're all in this together.

Date: Fri, 26 Oct 2012 07:44:07 -0700

When I read a sentence like this:

"Much harder, much more ambitious, and therefore much more difficult to evaluate, is art that intends to change the very way we see, act and make sense of our world -- including what we understand to be politics itself."

I see my life story unfolding in a single problem.

This kind of subtle, provocative or ontologically-challenging work means, for one thing, an audience limited to those interested in both art and politics simultaneously.

I would add, however, that the words "art" and "politics" could be swapped in that sentence, with equal truth.

When engaging with activists there is a demand for practical political art: agitprop, posters, propaganda, fundraising videos, etc. When the artist strays from dogma, they become useless, if not dangerous, to movements. Meanwhile, engaging the art world with politicized art brings the spectre of partisanship (with its threat to state funding & rich donors) if not simple disinterest or politically-motivated rejection.

Therefore at the same time as you call for more critical consideration of political art, I'd call for more political consideration of it as well.

I'm currently in a collective doing what's called here "publicly engaged" art; that is, artist residencies in community centres etc where the act of bringing people together to make art is seen as a positive political action. The content of the art is irrelevant to that - except insofar as

the content must emerge from the participants, rather than from above. It's important to push for high-quality final product, to create a dedicated team, etc, but the politics is contained in the form of the project rather than in the results.

Here's our website:

<http://somethingcollective.ca/>

Critical reception for this kind of art, as far as I can tell, is pretty slim. It's not considered "good enough" to warrant proper critical review, sort of like community theatre, and the political process contained in the work isn't relevant to art theory, or something.

Headlines Theatre is another group that does this kind of work in a different way - they do Boal-based Theatre of the Oppressed projects, i.e. interactive forum theatre with audience members getting on stage to try to work out the characters' problems. The theatre critics often don't really consider it proper theatre, though there is the occasional review.

This one is from Jerry Wasserman, who is the head of the UBC Theatre and Film Department, which I suppose is as legit as it gets, although UBC is more production- than theory-oriented:

http://www.vancouverplays.com/theatre/reviews/review_after_homelessness_09.shtml

In any case, my latest work is this video I created with an anonymous activist group in Newfoundland, who took advantage of my residency at Black Bag Media Collective to get me on board their anti-pesticide campaign. I'd love to hear any critical reaction to it.

<http://youtu.be/QEoZJWmcBjk>

-Flick

create a space and an audience with which we can engage and hone our abilities. I regret having had to put down my pencil for several years after co-convening a very successful conference on The Art of Collaboration held at UC Santa Cruz in 2008. Word did not get out about the conference contributions, to my regret.

All the best,
Margaret

Date: Sat, 27 Oct 2012 09:52:48 -0700

Dear Flick,

I agree with you and Geert that publicly engaged art is important and that it gets little critical attention. What struck me about the theater review from Vancouver--

http://www.vancouverplays.com/theatre/reviews/review_after_homelessness_09.shtml

-- is that it provided a valuable description of the remarkable performance as well as the reviewer's despair about the eventual prospects for success of this emerging form of theater in actually providing actionable ideas for social change. The Vancouver play offers the audience the delicious opportunity to see some audience members actually intervene in the performance and take the unfolding narrative in another direction again and again. Furthermore, we have a life/art connection of the actors and the audience who have experienced difficult and demoralizing life events and lived. What failed for the critic was the reception by the audience, particularly in the focus discussion afterwards.

However, the stakes here are far more fundamental. Why not think about this as a matter of practice and cultivation? Why should a public be good at this when they have so few opportunities to develop their critical capacities? For me, this genre takes off from Bertolt Brecht's ideas and pushes them further along. Brecht's performance practices aim at activating critical faculties that lead to action in the world--the audience should be able to see unfolding dramatic events in the life course as far from inevitable. That entails a number of performance practices typical of a Brecht play--for instance, the actors don't embody or identify with their roles; the narrative is constantly being interrupted with moments for reflection; dramatic events are put within a larger socio-political context and discourse. We critics of publicly engaged art also need more practice in writing on such performances. We also need to

Tactical Media

...

O.O

<nettime> The ABC of Tactical Media

From: Geert Lovink

To: nettime-l@desk.nl

Date: Fri, 16 May 1997 09:38:11

+0200 (MET DST)

(This manifest was written for the upcoming opening of the web site of the Tactical Media Network, hosted by the Waag, the Society for Old and New Media: <http://www.waag.org/tmn>). It will contain the archive of the web site and on-line journal of Next Five Minutes 2, a database of addresses, the archive of VPRO TV's "Worldreceiver" program and a new "broadcast site" with samples of new work, made by tactical media groups from all over the world. Contact: roos [AT] waag.org).

The ABC of Tactical Media

By David Garcia and Geert Lovink

Tactical Media are what happens when the cheap 'do it yourself' media, made possible by the revolution in consumer electronics and expanded forms of distribution (from public access cable to the internet) are exploited by groups and individuals who feel aggrieved by or excluded from the wider culture. Tactical media do not just report events, as they are never impartial they always participate and it is this that more than anything separates them from mainstream media.

A distinctive tactical ethic and aesthetic that has emerged, which is culturally influential from MTV through to recent video work made by artists. It began as a quick and dirty aesthetic although it is just another style it (at least in its camcorder form) has come to symbolize a verite for the 90's.

Tactical media are media of crisis, criticism and opposition. This is both the source their power, ('anger is an energy': John Lydon), and also their limitation, their typical heroes are: the activist, Nomadic media warriors, the prankster, the hacker, the street rapper, the camcorder kamikaze, they are the happy negatives, always in search of an enemy. But once the enemy has been named and vanquished it is the tactical practitioner whose turn it is to fall into crisis. Then (despite their achievements) its easy to mock them, with catch phrases of the right, "politically correct" "Victim culture" etc. More theoretically the identity politics, media critiques and theories of representation, that became the foundation of much western tactical media are themselves in crisis. These ways of thinking are widely seen as, carping and repressive remnants of an outmoded humanism.

To believe that issues of representation are now irrelevant is to believe that the very real life chances of groups and individuals are not still crucially affected by the available images circulating in any given society. And the fact that we no longer see the mass media as the sole and centralized source of our self definitions might make these issues more slippery but that does not make them redundant.

Tactical media a qualified form of humanism. A useful antidote to both, what Peter Lamborn Wilson described, as "the unopposed rule of money over human beings". But also as an antidote to newly emerging forms of technocratic scientism which under the banner of post-humanism tend to restrict discussions of human use and social reception.

What makes Our Media 'Tactical'? In 'The Practice of Every Day Life' De Certeau analyzed popular culture not as a domain of texts or artifacts but rather as a set of practices or operations performed on textual or text like structures'. He shifted the emphasis from representations in their own right to the 'uses' of representations. In other words how do

we as consumers use the texts and artifacts that surround us. And the answer, he suggested, was 'tactically'. That is in far more creative and rebellious ways than had previously been imagined. He described the process of consumption as a set of tactics by which the weak make use of the strong. He characterized the rebellious user (a term he preferred to consumer) as tactical and the presumptuous producer (in which he included authors, educators, curators and revolutionaries) as strategic. Setting up this dichotomy allowed him to produce a vocabulary of tactics rich and complex enough to amount to a distinctive and recognizable aesthetic. An existential aesthetic. An aesthetic of Poaching, tricking, reading, speaking, strolling, shopping, desiring. Clever tricks, the hunter's cunning, maneuvers, polymorphic situations, joyful discoveries, poetic as well as warlike.

Awareness of this tactical/strategic dichotomy helped us to name a class of producers of who seem uniquely aware of the value of these temporary reversals in the flow of power. And rather than resisting these rebellions do everything in their power to amplify them. And indeed make the creation of spaces, channels and platforms for these reversals central to their practice. We dubbed their (our) work tactical media.

Tactical Media are never perfect, always in becoming, performative and pragmatic, involved in a continual process of questioning the premises of the channels they work with. This requires the confidence that the content can survive intact as it travels from interface to interface. But we must never forget that hybrid media has its opposite its nemesis, the Medialien Gesamtkunstwerk. The final program for the electronic Bauhaus.

Of course it is much safer to stick to the classic rituals of the underground and alternative scene. But tactical media are based on a principal of flexible response, of working with different coalitions, being able to move between the different entities in the vast media landscape without betraying their original motivations. Tactical Media may be hedonistic, or zealously euphoric. Even fashion hypes have their uses. But it is above all mobility that most characterizes the tactical practitioner. The desire and capability to combine or jump from one media to another creating a continuous supply of mutants and hybrids. To cross borders, connecting and re-wiring a variety of disciplines and always taking full advantage of the free spaces in the media that are continually appearing because of the pace of technological change and regulatory uncertainty.

Although tactical media include alternative media, we are not restricted to that category. In fact we introduced the term tactical to disrupt and take us beyond the rigid dichotomies that have restricted thinking in this area, for so long, dichotomies such as amateur Vs professional, alternative Vs mainstream. Even private Vs public.

Our hybrid forms are always provisional. What counts are the temporary connections you are able to make. Here and now. Not some vaporware promised for the future. But what we can do on the spot with the media we have access to. Here in Amsterdam we have access to local TV, digital cities and fortresses of new and old media. In other places they might have theater, street demonstrations, experimental film, literature, photography.

Tactical media's mobility connects it to a wider movement of migrant culture. Espoused by the proponents of what Nie Ascherson described as the stimulating pseudo science of Nomadism. The human race say its exponents are entering a new epoch of movement and migration. The subjects of history once the settled farmers and citizens, have become the migrants, the refugees the gastarbeiders, the asylum seekers, the urban homeless.

An exemplary example of the tactical can be seen in the work of the Polish artist Krzysztof Wodiczko who 'perceives how the hordes of the displaced that now occupy the public space of cities squares, parks or railway station concourses which were once designed by a triumphant middle class to celebrate the conquest of its new political rights and economic liberties. Wodiczko thinks that these occupied spaces form new agoras, which should be used for statements. The artist', he says, 'needs to learn how to operate as a nomadic sophist in a migrant polis.'

Like other migrant media tactions Wodiczko has studied the techniques by which the weak become stronger than the oppressors by scattering, by becoming centreless, by moving fast across the physical or media and virtual landscapes. 'The hunted must discover the ways become the hunter.'

But capital is also radically deterritorialized. This is why we like being based in a building like De Waag, an old fortress in the center of Amsterdam. We happily accept the paradox of *centers* of tactical media.

As well as castles in the air, we need fortresses of bricks and mortar, to resist a world of unconstrained nomadic capital. Spaces to plan not just improvise and the possibility of capitalizing on acquired advantages, has always been the preserve of 'strategic' media. As flexible media tacticians, who are not afraid of power, we are happy to adopt this approach ourselves.

Every few years we do a Next 5 Minutes conference on tactical media from around the world. Finally we have a base (De Waag) from which we hope to consolidate and build for the longer term. We see this building as a place to plan regular events and meetings, including coming The Next 5 Minutes. We see the coming The Next 5 Minutes (in January 1999), and discussions leading up to it, as part of a movement to create an antidote to what Peter Lamborn Wilson described, as 'the unopposed rule of money over human beings'.

The DEF of Tactical Media
By David Garcia and Geert Lovink

[or part two of the ABC of Tactical Media, posted to nettime in the spring of 1997, <http://www.nettime.org> and the zkp4 reader, <http://www.desk.nl/~nettime>]

Campaigns and Movements

Although a global conference, the first Next 5 Minutes, held six years ago (1993), was dominated by the first large scale encounter between two distinctive cultural communities. On the one hand, Western European and North American campaigning media artists and activists and on the other hand their equivalent from the former communist countries of Central and Eastern Europe, dissident artists and samizdat activists, still basking in the after glow of the role they played in bringing down the communist dictatorships. In the excitement of discovering each other, these two communities tended to gloss over their ideological differences, understandably emphasising only the shared practice of exploiting consumer electronics (in those days mostly the video camcorder) as a means of organisation and social mobilisation. We referred to these practices, and the distinctive aesthetic to which it gave rise, tactical media.

Although the differences between these two groups were under-played at the time, they were nevertheless profound and illuminating. In the United States and Western Europe, tactical media, both then and now, are overwhelmingly the media of campaigns rather than of broadly based social movements. They are not a megaphone representing the voice of the oppressed or resistance as such. Once upon a time in the West, there were movements without one specific campaign. They were into questioning every single aspect of life, with 'the most radical gesture.' "We don't want a piece of the cake, we want the whole bloody bakery." But now there are a plethora of campaigns detached from any broadly based emancipatory movement. In contrast, central and eastern European media tacticians, or the 'samizdat media', had been very much part of broad social movement. A movement that resulted in the dismantling the Soviet Empire. They tended, in the early days, still to be if not exactly starry eyed, then uncritical, about their future under a market economy.

Six years later, the consequences of unaccountable global capital flows have bitten deep. And although less utopian about the emancipatory potential of new media there is a general convergence of many tactical groups around the principal of learning the lessons of global capitalism. While refusing to leave globalism to the investment houses and multinationals, these groups combated global capital with global campaigns. And present in these strategies is the faint hope that if a campaign generates enough velocity and resonates with enough people, it might just take on some of the qualities of a movement.

Simulation Vs Real Action

For many, the urgency of some of the questions we are facing generate an angry scepticism around any practice that raises art or media questions. For real actionists the equation is simple, discourse = spectacle. They insist on a distinction between real action and the merely symbolic. From

this perspective media tacticians are accused of merely talking not doing anything. By focusing on the media question we are accused of just creating more empty signs. And there is much in the current European political reality to support this critique. After all the expansion of the media realm has not automatically resulted in an equivalent growth in emancipatory movements and critical practice. It has merely resulted in an accumulation of self-referential topics. Media these days are accused of fragmenting rather than unifying and mobilising. Paradoxically, that is partly because of their discursive power to elaborate on differences and to question rather than just voice propaganda.

Although our favourite topic remains the end of media, the era of a total implosion of the whole spectacular media circus. This however remains the utopian option (which should not be mistaken for abandonment or surrender). Meanwhile at least for the Next 5 Minutes, we continue to languish in a world in which many struggles appear to have left the street and the factory floor and migrated into an ideological space of representation, constructed by and through the media. This is often characterised as a shift from public space towards virtuality or a shift from social action towards the mediated. In a time where we can see such growth in media channels where there is a tremendous expansion of various cyberspaces it is a nonsense to talk about "a return to the real". In fact one might even ask whether any meaningful politics can exist outside of the media sphere. The current debate about 'net activism' is the focus of the 'merely' symbolic Vs the 'real action' discussion, with critics voicing scepticism about whether you really can provoke a campaign by just sending out hostile commands via the internet or whether on your own, you can construct a movement via technical means or through mediation only.

Another level of critique addresses the problematic nature of self referential campaigns, that is campaigns that do not go beyond the media, such as the open source movement or the "WE WANT BANDWIDTH" campaign (<http://www.waag.org/bandwidth>). Although we believe that there can be no effective campaign if you have not tackled the media issue we are aware that this is just our assumption, perhaps our arrogance. We know how easy it is to lose oneself, to dive into an attractive and fatal media trap. Attractive because it is so vast, there is always more information, more channels, more software and the political issues within that sphere of contestation, the severe struggles within the media industry is a universe in and of itself. So yes we must be wary of the self-referential campaigns that are friction free, appropriating the glamour of activism without the sweat and tears... It is true we are vulnerable to the accusation of being trapped in the same old safe assumption that all power struggles are being fought out in the media space. However to believe this would be to believe that the campaigns to damage Shell, Nike or McDonalds have just been fought on the level of pure semiotics. It is a too easy and luxurious position to disdain the media question altogether. The point is to ask the right questions about what has more effect and what brings us nearer our goals! These questions imply analysis and in the end a judgement.

In part the trick is to emphasise topics which lie outside of the media realm whilst at the same time retaining sophisticated media tactics. The MacLibel campaign is a classic example of a campaign which would like to construct itself into a movement. Like every group it depends of the willingness of local groups to identify itself with it. The Macspotlight site is a collection of links to sites, bringing together this variety of local groups. The whole project makes a dialectical move whereby a single campaign organised from Oxford is translated into a translocal movement with broad appeal addressing billions of people.

Temporary Alliances and Hybridisation

Although a shared agenda may be emerging we should also be realistic about the differences. We have no unique overriding identity around which to organise. We create no positive models for anyone to identify with, let alone follow. Our alliances are still relatively loose with a tendency to fragment into an infinite number of gangs and subcultures. This why we still do not have this 'world federation of tactical media practitioners'. Perhaps we are just a diverse collection of weirdoes both men and women, who are off-topic by nature. Of course there is an element of pleasure in knowing that you are with your 20 dearest friends on your own "real audio" channel but this is swiftly accompanied by the realisation that it will be indefinitely confined to these twenty friends and what seemed like an opportunity has become a ghetto. We are then faced with the question of how to leave the safety of our own self created biosphere.

So we begin again, looking for new coalitions while trying to avoid falling into the traps and limits of institutionalised politics. Unfortunately, the Internet has not freed us from the necessity or perils of having to deal with institutional politics. Indeed there is no Internet without power, cable policy, money and access rights.

Beyond analysis and judgement the tactical is also about reclaiming imagination and fantasy. The classical rituals of resistance are no longer

reaching large parts of the population, this is the crisis of direct action, which is in part a failure of imagination. An exception is the epidemic of pie throwing. The ritualised humiliation of power with a pie in the face. A highly mediated practice, the pie does not exist without the image, its only meaning is as a media event. We could see it as a primal way of attacking power. You identify a locus of power and you pie him (<http://www.gloup.gloup.com>) A leap into perfect simulacra, creating the perfect sign, or rather the poisonous countersign. The pie is the perfect poisonous countersign. The secret wisdom of the tactics of radical alienation, in which the further you go, the more likely you are to implode into reality. Its time to intensify our semiotic guerrilla wars on corporate images.

Tactical media in the context of The Next 5 Minutes is a deliberately slippery term, a tool for creating "temporary consensus zones" based on unexpected alliances with people whom you might normally never meet based on a desire to be released from the tiredness of self satisfied groups and communities. But at the same retaining the right, when the time has come, to disconnect. Our aim is to retain our mobility, and our velocity, to avoid the paralysis induced by the essentialistic questioning of everything, in which everyone is an object of suspicion and nothing is any longer possible.

One of the most well trodden of tactical routes remains hybridisation, connecting old with new, the street and the virtual. We should be clear that hybridity is neither our ideology or our goal it is more like our dirty realism. Hybridisation is often seen as per se good, generative of infinite possibilities to switch between channels, mix up the signals, intentions and disciplines, naturally operating in accordance with the economic and technological shift towards synergy. Let us be clear, in our case hybridisation is about survival, it is not really our choice. For those who make the mistake of treating it as an ideology, there is simply no way back, there is no place for negativism. Taking this route we inevitably arrive at the dialectic free zone of Europe's new politics. Hybridity in this world is about connectivity in the sense of promiscuously connecting everything with everything, the neo-liberal idea of anything goes as long as its connects. In this world the critic is seen as a destructive trouble-maker, failing in their sacred duty to connect. This is where tactics end and choices will have to be made. Is this the end of the roaring media age? Not for the time being... But for sure a reconsideration what we are actually intending to transmit on all these channels.

<nettime> Garcia/Lovink: The GHI of Tactical Media

From: Andreas Broeckmann
To: nettime-1@bbs.thing.net
Date: Wed, 15 Aug 2001 15:50:44 +0200

[this text will be published in: transmediale.01.org: DIY Media, Berlin 2001 (forthcoming, autumn 2001); it is posted on the occasion of David's half-centennial birthday!]

David Garcia and Geert Lovink

The GHI of Tactical Media

An interview by Andreas Broeckmann, July 2001

ab: In 1997, you wrote The ABC of Tactical Media, and at that time the concept of 'tactical media' was already a few years old. It had grown out of the cooperation of media artists and activists in Amsterdam and has been closely identified with the Next 5 Minutes conferences, although important models of tactical media usage have also come from elsewhere. And then the concept was first related mainly to video and TV activism, which have been eclipsed in the last years by the Internet. A follow-up that you wrote in 1999, The DEF of Tactical Media, tried to sketch some of these changes. Do you think that it makes sense to speak of Tactical Media as a general attitude and practice that pervades different media, or is Tactical Media a summary term for a whole host of different media practices, each with their own culture and politics?

gl: Or even aesthetics? No, I don't think so. Tactical means tactical. It's a really open, short-term concept, born out of a disgust for ideology. It is pretty much a post-1989 phenomenon, surfing on the waves of events, enjoying the opening up of scenes and borders, on the look out

for new alliances. Curious, not afraid of differences. I am not sure if tactical media are bound to certain media or platforms. It is about a form of art meets activism with a positive attitude towards contemporary digital technology. It is more exploratory than confrontational. To some extent self-reflexive. There are a lot of rituals and phrases which have to be thrown out in order to be able to make new start and reach new audiences. Let's face it. This excitement has grown and resulted in a whole new generation of (net) activism, covered by the mainstream media. We are living in interesting times. This cannot be said of new media arts which was at its height in the early to mid nineties. Today's activism has profited from it, though. There is no fall-back noticeable towards a grey dogmatic non-aesthetics, which really surprises me.

ab: The 'grey dogmatic non-aesthetics' of earlier tactical media? Is this the result of a more 'pop'-oriented attitude in activism? A new generation that is less tied up in clean, fundamentalist ideologies? Java activists versus the telnet-generation?

gl: No, I think the distinction is a more primitive one: online versus offline (which, by the way, are not contradictory practices). It is not even punk versus techno. The DIY aesthetics I am referring to here is one which cares for the self (image), it has grown out of a curiosity, and is done with precision. It is against the sloppy attitudes which implicitly say that form doesn't matter anyway. I am talking about an activism with style. Not a particular style. Having, and maintaining, a style is quite something these days. It is hard. I am not sure if I would call it 'pop,' because that term, for me, is referring to 'popular.' That's not what I mean. Sophisticated and rich styles activists use often are unpopular. The aesthetic program does not even have to be about a certain 'look.' I am talking about a higher, critical awareness of style rather than the correct usage of this or that contemporary icon, software, color set, patterns or typography font.

ab: David, you have always strongly advocated a tight linking of media activism and art. This relationship has been very strong in a particular segment of media art practice, but it has sometimes fallen between the camps of established contemporary art and political activism. How would you describe the link between the two - or the complex in which they articulate each other?

dg: Yes, this is true and the reason for my position is not theoretical but the result of my first experience of seeing tactical media at close hand, in action in what I still believe to be one of the most important and effective campaigns of recent years. This was ACT UP a mobilisation against the AIDS policy of the Reagan administration of the time, which in choosing to ignore AIDS was a policy of silence. Artists played a critical role in both organising and giving shape and a kind of charismatic momentum to ACT UP. I believe it was the artist collective Gran Fury in their exhibition Let the Record Show who created the slogan (or equation) that became the symbol of the AIDS activist movement world wide:

SILENCE = DEATH

An activist carrying this statement on banners or wearing it on badges or sweat shirts were not delivering a simple polemical message from an earlier era of politics with its rigid command structures. They were developing a new language for the era of communicative networks. The activists were "wearing" a statement which required completion by others, to wear this logo was to draw people into conversation. Not a command but an invitation to discourse. Intimate media, a "user language" for both activism and the visual arts. This took the rhetorical tropes of the likes of Jenny Holzer and Barbara Kruger into a new and tactical dimension.

ab: Do you mean what Geert refers to as a 'style' - tactical media as an attitude more than a technical definition?

dg: Yes, rather than the use of any particular medium it is this quality of creating effective user languages (virtual or otherwise) that "engage" and "deploy" rather than "authorise" and "require" that characterise the tactical practitioner. The posters, videos, installations, murals graphics and television channels such as The Gay Men's Health Crisis were not only successful as art and as activism but were successful as art BECAUSE it was effective activism. The AIDS tactical practitioners, collectives like Gran Fury or individuals like Greg Bordowitz (who is still working) are true hybrids leaving behind the older categories to forge something else, something necessary, something which required a name. In N5M we chose to call it tactical media. Maybe the term itself is a tactical solution, an improvisation that has proved a curiously successful stop gap measure like the X in algebra. There is a text by the Critical Art Ensemble which encapsulates what I think is still the best take on tactical media: 'There has been a growing awareness that for many decades a cultural practice has existed that has avoided being named or fully categorized. Its roots are in the modern avant garde, to the extent that its participants place a high value on experimentation and on engaging the unbreakable link between representation and political and social change.'

Often not artists in any traditional sense refusing to be caught in the web of metaphysical, historical and romantic signage that accompanies that designation. Nor are they simply political activists because they refuse to take a solely reactive position and often act in defiance of efficiency and necessity ... For those of us who are involved in tactical media felt a kind of relief that we could be any kind of hybrid artist, scientist, technician, craftsperson, theorist, activist, could all be mixed together in combinations that had different weights and intensities. These many roles of becoming artist becoming activist, becoming scientist, etc., contained in each individual and group, could be acknowledged and valued. Many felt liberated from having to represent themselves to the public as a specialist and therefore valued. 'I can't put it any better so I won't try. But I will add that this model and its continued use makes it something more than simply a 'short term concept'.

ab: Geert, in a new text called *The New Aesthetics* which you wrote together with Florian Schneider, you describe the new possibilities of media activism that are emerging, but you also point to the potential dangers that people have to be aware of. The Internet as the master medium of the 1990s has, in the last two or three years, fallen into what looks like a depression. Some say that the party and the hype are simply over, others that we are entering into a more realistic stage where the importance of the Net as a medium will continue to grow, while the utopian hopes subside in the face of all sorts of critical reality checks. These reality checks are also closely tied to a crisis of the general belief in globalisation and the fast-aging 'new economy'. Does this crisis create room for tactical media practices, or does it make the life of media activists more difficult?

gl: It is indeed true that advanced net activism (not the adolescent 'hacktivism') is much closer to dotcom business than many would suspect. The new aesthetics is open for business, constantly searching for funds, just as tactical media no longer fully depend on state funding. For a good reason: there is a common interest in innovative net concepts, software, interfaces, usage of streaming media, free software and open source etc. This might mean that the current wave of net activism will face a setback in a little while because it's just behind the dotcom wave. The stagnation of bandwidth is a real concern, for example, also for activists. The same counts for the e-cash crisis and the absence of a functioning micro payment system. Activists, sitting on their explosive content, would really benefit from alternative e-commerce systems, not based on credit cards. It is of course good for social and political work on the Net that the cyberselfish robber mentality of the dotcoms has gone. But do not forget the flip side of this. With libertarianism losing its hegemony there is also the danger of throwing away the baby with the tub water and giving away the cyber freedom to corporations and the state. That should never happen. It is also up to activists to fight against censorship, lobby against the flood of disastrous legislations etc.

ab: The French theorist Felix Guattari has used the term 'post-media' to describe a potential system in which the mass media are pushed aside by a multiplicity of small, heterogeneous, digital media, a network or rhizome of practices that foster the emergence of more differentiated, less homogeneous subjectivities and group subjectivities. Howard Slater has taken this idea up and points out that the cheerful clutter of independent media activities on websites, music labels, in zines, at demonstrations, mailing lists, etc., are the kinds of post-media operations which Guattari saw the beginnings of in the Minut and free radio movements in France in the 1970s and 80s. However, rather than fulfilling Guattari's utopian hope, the mass-medialisation of digital media seems unstoppable and threatens to turn the Net, as well as the computer in general through the software door, into a one-way medium. Is the hope for 'DIY media', which we also tried to promote through the transmediale.01, futile?

gl: Not futile. It's a struggle. You don't get media freedom for free. And most of all you can't buy 'technological freedom.' It doesn't come with the equipment or even with the software. It is only a matter of time until we will see the first full-scale civil war, fought with Linux software on both sides, causing thousands of deaths. Why not? Is there something like inherently good software? No. The Internet is beyond good and evil and simply mirrors human nature with all its flaws. A radical and open, independent media infrastructure is produced by people and their ability to connect with each other and create a 'culture.' DIY media do not go anywhere if it just means Do It On Your Own. The trick is to create loose ties and provide a relative autonomy for separate units. The units can be individuals, groups, collectives, associations, circles of friends, from the same discipline and generation, in contact with the rest. The opposite of DIY is DBO, Done By Others. There is indeed a danger that Internet will become a professional medium, in the hands of others. But that's only the case at the macro level. On the micro level there is still so much possible, especially for those who wanna stay off the radar for a while.

ab: David, in how far can education play a role for this kind of post-media practices? You have been teaching at the art academy in Utrecht for several years now; has it been possible for you to translate

the attitudes of art and media activism into the curriculum?

dg: Actually where I have been teaching is the department of Interaction Design in a building far away from the main art school and devoted to Art, Media and Technology. To my surprise I have found key questions within interaction design highly applicable to the central problems of art and activism. These are the problems of action in relationship to observation. Historically there was a separation of observation and action in 17th century science and was mirrored in the same period by artists stepping out of the workshops of the artisan and into the isolation of their private studios. But in all areas of science and culture interest has again returned to the one area that was excluded namely action. This can be seen by analysing the discipline of interactive art and design as action or 'behaviour' lies at its core. Earlier forms of art could be perceived as constructed out of three primary components: appearance, content and structure. To this triangulation interactive artists and designers have added a fourth and defining component, 'behaviour'. Not simply the behaviour of the user but of the system as a whole which is made up of machine AND users. In this model, the work of art includes the whole system, the machines and the people. Success in these new forms of interactive art depend on being able to integrate a visualisation of the behaviour or action of the system into the work itself. It is in this context in both interaction design or tactical media that I apply the same maxim 'visibility is not achieved through prediction, but through support'. This summer at the Pompidou Centre in Paris, the artist George Legrady and the computer scientist from Helsinki Timo Honkela worked together (with others) to produce the installation, *Pockets Full of Memories* (www.pocketsfullofmemories.com) in which neural networks are used to create an artwork that evolves over time, refining its decisions in relationship to the different contributions that each museum visitor makes to the system. This is an artwork - and a supportive environment - that learns! Works like these are creating a new chapter in the history of culture. But we are confronted with the fact that along with this new chapter comes a new set of problems. As Gerard de Zeeuw, an important teacher and intellectual who recently retired from Amsterdam University wrote: 'Action remains the area of the unexpected, of the invisible, of that which changes without pattern. Stepping into the river still seems as unique as it was 2500 years ago!'

ab: For me, this conflation of interactivity in media art, action in a political sense, and behaviour - which seems to be a form of action that is non-subjective and driven by outside forces - is not unproblematic and I wonder whether it is possible to get all of this under the umbrella of 'tactical media.'

gl: No. For me tactical is the expression of a nineties temporality, in search of new alchemy, to break out of the high art versus raw activism of the outgoing eighties with its dogmatic infightings and institutionalized new social movements. For me the whole idea of tactical media geared up towards Seattle and the IMC phenomena. There's a phenomenal renaissance of media activism going on around the globe. I was just at the second Media Circus conference in Melbourne (www.antimedia.net/mediacircus). I also attended the first one, in September 1999, a one day event, during the East Timor crisis. Media Circus doubled in size. There were 350 mainly young people during the weekend. Last night, in Sydney, there was the first Active Sydney Fair (www.active.org.au/sydney/fair), with a crowd of at least 500. Naomi Klein spoke and she warned of summit tourism, the crackdown of authorities against the massive street protests. There is a gap between abstract topics of third world debt, world trade agreements, financial policies and the daily misery, with its concrete, local struggles. I don't think internet activism, or tactical media for that matter can fill that gap. What we can do exchange concepts. The rapid growth of anti-border groups, supporting illegalized migrants, is a good example there. A fight in which the tactical imagination plays a key role (see: www.deportation-alliance.com).

ab: David, when you started the Next 5 Minutes series 10 years ago, you were a free-lancing artist, whereas now you are teaching at an academy. Do you see areas where the academic system is opening up for more diverse and critical approaches to media in art and design?

dg: Recently my possibilities in the academic framework have been greatly expanded with the founding of the Ph.D. program Design for Digital Cultures which is a European doctorate sited at three very different European colleges, the Merz Akademie in Stuttgart, Utrecht and Portsmouth University. My objective over time is to make spaces for the people, theory and materials which have emerged from tactical media into an active component within the Digital Cultures program. This is not simply a question of curriculum it is a question of supporting and enabling the researchers who are part of the program to contribute to tactical campaigns, projects and conferences. For me this program will only be successful if we are involved in 'action orientated research'. The first stage of this will include explicitly linking the program to the development of the Next 5 Minutes edition 4. The ball started rolling in a

recent seminar in which I participated at New York University where they have launched a research program on tactical media, from this event came the notion of NjM4 as a loose alliance of rolling research groups. The aim is that these groups should form an active network of research nodes, each of which would be working on a specific synergy theme - ideally it should include groups such as NYU - Sarai - Critical Art Ensemble - Open Streaming Alliance - Technics (UK) - to name but a few. The process would involve a structure of regular "development meetings" and smaller planning meetings (on-line is fine but not enough - face to face is still the highest bandwidth -) to ensure that the nodes keep each other informed and are able to borrow freely from each other. In contrast to many previous tactical events I favor experimenting with an approach in which the meetings identify "objectives" and come to (fasten your seat belts) "conclusions". Under these circumstances The Next 5 Minutes Conference/tribal gathering would remain but be informed by less random approach. NjM would be the platform for presenting the results of our researches. The results could take many forms and be in many media but it would also include programming the conference itself which would obviously want to draw from beyond its own network. I envisage this process beginning November 2001 with research and meetings proceeding throughout 2002 and would culminate early in 2003 with The NjM4 event and conference in Amsterdam with possible related events in other locations.

ab: A final question. What David describes in relation to the development of the Next 5 Minutes as a research movement raises the question of the sites, institutional and informal, of tactical media practice. While institutions are no doubt necessary for creating a sustainable practice and infrastructures, the tactical always also seems to imply a 'hit-and-run' attitude which cannot be tied down in such structures. How would you see this tension and how do you think the field can be developed most fruitfully? Do we see the emergence of new, stronger alliances?

gl: I do not see it as a tension yet. Institutionalization is a problem which only comes in time. Let's say after five or ten years when an original scene has broken up into fragments. There are indeed people who dig in and do not know how to move on. They are the power brokers. They end up taking all the credits, taking the money from ministries, foundations and sponsors. But in most cases it's power over a dead territory. Creative individuals can't deal with the kind of bureaucracy that comes with today's institutions. I would love to see more hit and run companies taking off in the new media arts and activist sector. In that sense the dotcoms can be a good lesson. This is mainly because the arts and culture still depends on government resources. It hasn't found ways to generate its own income, nor does know how to negotiate with sponsors. The result is an incredible waste of time. I would love to see a fund where you could apply and get an answer in a few weeks time. We need art and activist ventures. The only way to do something quickly and initiate something new these days is to do it without any money, which sets off the well known self-exploitation cycles. There must be ways to break out of that logic.

dg: I want to emphasize that when I see NjM as a research process I mean "action orientated research" not research for its own sake. To Geert's emphasis on speed and mobility I would add (not substitute) a slowing down to analyze, reflect and evaluate; not so much digging in, as digging deep. Let me demonstrate with some local media archeology: I have been re-reading the proceedings of the first event where I met and worked alongside Geert. The Seropositive Ball, held in Amsterdam in 1990. The project arose out of a necessity for something beyond the perception of AIDS as an exclusively medical problem. It combined activism and all the arts with an embryonic culture of computer mediated communications. But at the time we were heavily and to a degree justifiably critiqued by New York activists. This is what Gregg Bordowitz said to us more than a decade ago: "the way the conference is organized is based on a utopian notion of a free exchange of information, instituted through technology. A use of technology that is unquestioned, uncriticized, unproblematised. The notion that a universal space can be established through phone links, faxes and modems. If there is one thing that is established through the kind of work we do is that there have never been such things as universal categories, principles or experiences. In future I would like to see conferences which reflected the interest of the people with the most at stake, in which there was some acceptance of difference that isn't evened out or erased through some notion of free exchange through some neutral means that remain unquestioned ... To me this destroys community ... collectivity." Next 5 Minutes 1 (1993), which followed The Sero Positive Ball at the Paradiso, was to a degree driven by a desire to answer this critique. But I am not sure whether any of the NjM conferences have yet been successful. Interestingly I recently re-met Gregg in the tactical media seminar in New York. He has remained a AIDS activist and video-maker and has been part of the successful campaign that fought the drugs companies who were trying to prevent the use of cloned drugs in South Africa (a case where the issue of intellectual property is a matter of life and death). Gregg is still committed to fight AIDS world wide. To me the continuity of this struggle, this 'digging in' with values other than 'hit and run' is inspiring. Personally I also found value in a closer scrutiny of the past of what

Geert described as our fragmented "scene" not for history's sake but for the sake of making us less likely to repeat mistakes and re-invent the wheel. Time has come to question the assumption that ephemerality must always be a virtue. Manifestos of the tactical (including our own) assume that we must reject the permanent, the monumental. Defacing public monuments is a knee jerk reaction of many street protests. I think there is something to be learned from the American Civil Rights movement and Martin Luther King when they appropriated the Lincoln Memorial as a means of tapping into a broadly based community memory. In Amsterdam we also have a great example, the Homo Monument which is a beautiful and effective public site for reflection and mobilisation. On the question of the tension between informal tactics and institutionalization, like Geert I also don't see tension, but for different reasons. The perceived tension is based on the misapprehension that tactical media is by definition always on the outside of institutional power. Power exists where it enacts itself and that may or may not be within institutions. I know plenty of "power brokers" who operate on the outside of institutions. Nor do I accept the romanticism of the statement "creative individuals can't deal with bureaucracy". An important reason for introducing the term tactical was to leave behind the rigid dichotomies of mainstream vs underground, amateur vs professional, or even "the creative individuals vs uncreative individuals". From Paper Tiger to the BBC's video diaries we discovered that the tactical cuts straight across the marginal vs mainstream dichotomy. It is the contexts in which tactical media are made that influence the tactics deployed, and these contexts (and their tactics) are multiple.

 Questioning the Frame
 Thoughts about maps and spatial logic in the global present
 By Coco Fusco December 16, 2004

Terms such as "mapping," "borders," "hacking," "trans-nationalism," "identity as spatial," and so on have been popularized in recent years by new media theories' celebration of "the networks" - a catch-all phrase for the modes of communication and exchange facilitated by the Internet.

We should proceed with caution in using this terminology because it accords strategic primacy to space and simultaneously downplays time - i.e., history. It also evades categories of embodied difference such as race, gender and class, and in doing so prevents us from understanding how the historical development of those differences has shaped our contemporary worldview.

Technocentric fantasy

The rhetoric of mapping and networks conflates the way technological systems operate with modern human communication. According to this mode of thought we are to believe that we live inside the world of William Gibson's *Neuromancer* and that salvation is only attainable via very specific technological expertise unleashed against the system - i.e., hacking. Consider the heroes of Hollywood sci-fi blockbusters such as *The Matrix* whose power lies in their knowledge of "the code." It is implied that we operate in networks because computers and the Internet have restructured "our" lives and because global economic systems have turned us into global citizens. Hacking then comes to stand for all forms of critical engagement with preexistent power structures.

I'm just a little too old to believe these new media mantras unquestioningly. This rhetoric implies two

possible explanations for the difference between the networked present and the non-networked past.

The first explanation suggests that no one on the left before the age of the Internet practiced subversive manipulation of existent media, tactical intervention, investigative reporting and infiltration of power structures. It also would seem that before the dawning of the networks, no one knew what being an organic intellectual was about, no one elaborated alternative communication systems and no one was aware of or sensed a connection to geographic regions other than Europe.

The second explanation would be that electronic communication has produced a form of networking that is so radically different as to imply a neat break with the past. In either case, these arguments conveniently situate their advocates outside history, since either way tactical media practitioners have nothing of value to inherit from the past.

While I can understand that there might be a dearth of knowledge about tactical interventions of previous centuries, I am perplexed by the apparent loss of short-term memory of many cultural theorists now in vogue, who were alive and active in the '70s.

Can we forget Daniel Ellsberg's publishing of the Pentagon Papers, the uncovering of the Watergate scandal, the break-in to an FBI office by an anonymous group that led to revelations of COINTELPRO and the Freedom of Information Act, the many Senate investigations of FBI corruption, the widespread solidarity with Third World independence movements, the plethora of underground and alternative presses and global mail art networks—all operated by radical activists, artists and intellectuals? Those of us who can at least recall the ways that these strategic interventions transformed political and cultural life in that decade necessarily cast a skeptical glance at the messianic claims of technocentrists.

The shift from Eurocentric internationalism to a more globally inclusive worldview came long before the age of the Internet. It was launched outside Europe and America, and emanated from the geopolitical margins. The process took place across a range of fields of knowledge, culture and politics. This revision of the world picture was catalyzed by postwar decolonization: the Non-Aligned Movement launched in 1961; and civil rights struggles in the developed world, including the Black Power and Chicano movements—all of which invariably affirmed their alliances with Third World revolutions. This political process was expanded upon by a postcolonial understanding that various diasporas shared transnational connections and that these diasporas were produced by the economics and politics of colonialism and imperialism. The historical bases of these movements are consistently obfuscated by the technocentric rhetoric of networks and mapping that emanate from Europe, North America and Australia.

Instead of dealing with these histories, contemporary discourses on globalism and new technology tend to dismiss postcolonial discourse as "mere identity politics." They tend to confuse bureaucratic efforts to institutionally separate the concerns of ethnic minorities with what always have been the much broader agendas of anti-racist political struggles and postcolonial cultural endeavors.

I am a great admirer of the practice of electronic civil disobedience and have used "hacktivist" software such as Floodnet to engage in online protest actions myself. But I find the willed historical amnesia of new media theory to be quite suspect, and even dangerous. One of the reasons I chose to make a/k/a Mrs. George Gilbert, a video art piece about the Angela Davis case, was because I wanted to reexamine crucial histories that are now being forgotten within the contemporary conversations on globalization. The alienation caused by multinational corporate domination (otherwise known as Empire) that many middle-class young adults in the Global North feel is

just the last chapter in a long history of reactions against imperial projects.
Mapping mistakes

Another issue of concern is the new media culture's fascination with mapping—a fascination that it shares with the military strategists. The news of the Iraq war frequently involves men in uniform pointing to or better yet walking across maps of various Middle Eastern countries—so when I then walk into galleries and cultural conferences in Europe and find more men (without uniforms) playing with maps, I start to wonder about the politics of those representations.

In the American media, maps dominate representations of warfare. While realistic depictions of the violence of war via photographs and film have been banned from American television news, maps are acceptable to those in power because they dehumanize the targets. Similarly, in the context of the art world, maps have come to abstract and thereby silence individual and group testimony.

New media culture uses maps to read the world in terms of extremes. Contemporary cultural theory is rife with renderings that celebrate macro views and micro views of the workings of the world, both social and biological—which is to say, maps of vast spaces and physical phenomena and maps of the most minuscule thing. We hear over and over again about global systems and panoptic vision on the one hand and genome chains and nano-entities on the other. When I first noticed this phenomenon I was struck by how it complements the resurgence of formalist art criticism's love affair with the grid. By this I am referring to the return in the '90s to the definition of art as a search for "perfect forms," and a celebration of the formal characteristics of objects and surfaces. What I have become more concerned about as time goes on, however, is how this fetishizing of spatial extremes enables the resurgence of Descartes' idea that humans are rational, autonomous individuals and that the human mind and mathematical principles are the source for all real knowledge.

However objective they may appear, maps do have a point of view, and that is one of privileged super-human sight, of safe distance and of omniscience. The mapmaker charts an entire field of vision, an entire world, and in doing so he (yes he) plays God. Whether you are beholding the map as a viewer or charting it as the cartographer, you rule the world before you, you control it, and, in putting everything in its place, you substitute a global whole established through pictorial arrangement for an actual dynamic engagement with individual elements and entities. The psychological motive behind assuming that position of power is not questioned, nor is the predominance of white male techno-elites in that discourse seen as anything more than incidental.

It is as if more than four decades of postmodern critique of the Cartesian subject had suddenly evaporated. Those critical discourses that unmasked the way universals suppress difference, which gave voice to the personal experience of women, the poor and disenfranchised minorities, are treated as inherently flawed by both the progressive and conservative discourses of globalism. Progressive media advocates dismiss these discourses of difference as "essentialist" while Republicans decry them as "the tyranny of special interests." But both provide ideological justification for the dismantling of legislation protecting civil rights.

Viewing the world as a map eliminates time, focuses disproportionately on space and dehumanizes life. In the name of a politics of global connectedness, artists and activists too often substitute an abstract "connectedness" for any real engagement with people in other places or even in their own locale.

What gets lost in this focus on mapping is the view of the world from the ground: lived experience. What is ignored is the pervasiveness of the well-orchestrated

and highly selective visual culture that the majority of Americans consume during most of their waking hours. Most people are not looking through microscopes and telescopes and digital mapping systems to find truth about the world. They are watching reality TV, sitcoms, the Super Bowl, MTV and Fox News, all of which also offer maps of a completely different kind: conspiracy theories that pit innocent Americans against the Axis of Evil, embedded journalists' hallucinatory misreadings of foreign conflicts, allegories of empowerment through consumption and endlessly recycled, biblically inspired narratives of sin and redemption.

Going off-grid

Finally we should consider what is being left off the maps and why? What has happened, for example, to institutional self-critique in the art world? Why has such examination become taboo in exhibitions or unpopular with artists who gravitate to political subjects? Why in the midst of myriad investigations of corporate control of politics and culture is there little or no attention paid to corporate control of the museums and of corporate influence in art collecting? Why is it acceptable to the art world for an artist to address the Israeli-Palestinian conflict, but not to address the pressure put on the organizers of global art exhibitions to showcase a disproportionate number of Israeli artists? Why is it fine for black artists to celebrate the construction of black style but not to make visible the virtual absence of black people as arbiters in the power structures of the art institutions, galleries, magazines and auction houses where black art is given economic and aesthetic value?

We live in a very dangerous time in which the right to express dissent and to raise questions about the workings of power is seriously imperiled by fundamentalisms of many kinds. Now more than ever we need to keep the lessons of history foremost in our minds and to defend the critical discourses and practices that enable differing experiences and perspectives to be heard and understood.

There are just too many important parallels to be drawn between COINTELPRO and the excesses of law enforcement brought about by the Patriot Act to be dismissive of history. Socially conscious artists and activists, rather than embracing tactics that rely on dreams of omniscience, would do well to examine the history of globalism, networks, dissent and collective actions in order to understand that they are rooted in the geopolitical and cultural margins.

to the tune of "REVOLUTION" by the Beatles:

"you say you want a revolution
well, you know,
somebody's got to pay..."

The foundations for the existence of free art and free media are threatened by the disappearance of funding and resources which have until now been the blood of existence of the culture scene as we _knew_ it.

Many within this scene have converged to discuss the concepts of "Tactical Media" and other progressive, democratic approaches of creating and distributing media which emphasize cultural diversity and respect for human rights.

Most, if not all these cultural gatherings, i.e. Next 5 Minutes, and others were funded by a variety of public and foundation money. There is no guarantee that this will be the case in the future.

The 1998 funding for MuuMediaBase in Helsinki is in doubt, for example. They are unsure if they can maintain their current level of operations in the future.

The question is, if there is the motivation to create an open space on the net for free art and media, how will it be achieved? How will it be funded?

During the early phases of name.space, known as "panet" (permanent autonomous net), it was stated that the only way to assure the uncensored presence of our media in the future, is to buy the bandwidth and server resources. In a sense, to make our own channel.

In order to create a place on the internet dedicated to the furtherance of free thought, free art and free media, an economic infrastructure must exist, or we must forever be at the mercy of whatever interests control the network you are on. The radical search engine at disinno.com was cut off because of the nature of its contents (Time Warner!--pulled the plug!).

The "Disneyfication of Media" threatens to censor or at least marginalize independent artistic content and free media.

(look back to "The Disappearance of Public Space on the Net"
<a href="http://mediafilter.org/ZK/Conf/Conf_Email/
March.30.1996.18.49.13">
Disappearance)

The idea of establishing an expanded domain name space seemed to be the perfect way of putting into practice many of the ideals often discussed around the topic of "Tactical Media". The idea of decentralization--of anonymity and privacy--the assertion of independence from the government legacy of the net--and, the establishment of decentralized, localized economy.

It is clear that the name.space initiative has enormous economic potential. This was known from the beginning and should be clear to anyone who even thought about the scale of the project. The question was, how to develop this economic potential?

*****HOW TO:

Setting up dns is technically a relatively simple operation. Creating new names in the toplevel namespace is as easy as typing in the name and address in the proper format in a classical BIND style file. Nothing special. A new tld is created. Getting people to recognize it is the next step.

Given that in order to be universally resolved, the new tld must be in the database of the current hosts recognized as root--10 machines run by military, government, university and private operators. The process for gaining inclusion into the current root database ranges from applying for a new toplevel via internic (you have to be a country, or prove why you should have it through a lengthy and tedious application procedure). Or, create a service that people can use on a "closed circuit" until such demand proves its viability (where name.space is today).

Under US Law, the current rootserver hosts must provide access to their facility by their competitors on a non discriminatory basis. (We just need to ask them for it!)
The U.S. Department of Justice, Anti-trust division has confirmed this to the name.space legal counsel.
"Your case is a carbon copy of MCI vs. ATT" they said.
If the Rootservers refuse, they are in violation of the law and subject to Anti-Trust violations. According to the USDOJ representative, There is no argument in this case. The law is clear in their opinion. (the case begins this month).

What name.space must prove is that it can provide a reliable service. At this stage, with only several thousand users, there have been no failures and users have been praising the name.space service. The number of servers is increasing, and the levels of connectivity are improving. By the time the name.space service is recognized by the current rootservers, it will have the capacity to handle the dns traffic of the net to its new toplevel names.

The size of a dns request is quite trivial compared to loading an average web page. 1 web page may equal 1000 (or more) dns lookups. Don't be deceived by visions of millions of dns requests. The specs for nameservers set out in RFC 2010 establish that a rootserver handle 1200 requests per second. Most of our servers can do that already. The ones which don't will be upgraded so they do. The load will not reach that level immediately. Most of the demand will come in the next year as the number of users in the new toplevel namespace increases.

Until then the current rootservers would handle most of the load. This time period should yield cash flow to pay for the network overhead, operations and upgrades.

***The operative is cash flow. Where does it go?

There are several networks and individuals who are directly involved with the implementation of name.space. Everyone so far has been working on a volunteer basis. As soon as the name.space database is universally resolvable, an annual fee of \$25 will be charged per name for registrations. Those charges will be waived for educational nets and discounts will be offered to non-profit organizations. Income will pay for the servers and connectivity and development of the name.space network:

```
desk.nl
dds.nl
v2.nl
muu.autono.net
ljudmila.autono.net
icf.de
thing.net
mediafilter.org
zero.tolerance.org
```

name.space has agreed to pay operating expenses to each of these networks, and also issue to each of them shares in the company.

Individuals who have contributed programming and development skills to the name.space project will be paid for their work and/or issued shares of the company.

[We still need someone with unix/perl/c and networking expertise to support the development of the dynamic dns updater that Andreas Troeger and Paul Garrin are currently developing on the ppc platform].

Technical personnel will be paid to operate the various facilities, as necessary.

The surplus network and server facilities are dedicated to keeping free media free--non commercial space of uncensored free content. The entire infrastructure of name.space is oriented toward cultural support at its foundation.

Should the revenue reach an appropriate level, it would sponsor full scale conferences, lectures, workshops, and other international cultural exchanges: (Next 5 Minutes in NYC 1998).

***On the question of registries sharing the toplevel namespace:

The dynamic update system now under development is a helper application to dns software which allows the dns registries to act as a travel agent would in booking an airline seat. This allows any registry, including interim and alternic, to register under all new and old tld's without conflict.

This registry package is being offered to the other nets in name.space who are interested in running registries in their area. The name.space website is a fully functional, fully automated name registry system. This system, together with the dynamic update system will enable the sharing of the toplevel namespace by the independent registries, thus creating opportunities for our affiliates to handle registrations, and therefore generate revenue for their nets.

Name.space is dedicated to keeping the toplevel namespace public. The decentralized registry model will allow for many local name registries to share all the toplevel names without conflict. It also includes multi layered authentication to prevent spoofing the database (today's dns doesn't have this feature).

This dynamically updated enhancement to dns brings us closer to the functionality of the future X.500 protocol which has a much larger database capacity than dns. By the time the dns database grows to 15,000-20,000 toplevel names, (the speculated upper limit of the current version of the BIND software), X.500 may already be in wide use.

(X.500 is a large scale sophisticated dynamically updated database with authentication and supports multiple encryption types--security is not available with dns).

Then there will be no issue as to the size or scale of the "directory of the net" in X.500 land.

Forget the concept of "DOMAIN".

DOMAIN = TERRITORY = DOMINATION

Abandon the nationalist/militarist paradigm of dns.

THINK VIRTUAL

The names used in dns are simple aliases to numbers.

Using a new mnemonic in the namespace to address content, or what has been discussed as "CONTENT ROUTING" combined with "VIRTUAL DOMAINS" and "SOFT VIRTUAL DOMAINS" (<virtual host> config in Apache server, Welcome Plugin for webstar 2.0) and eventually "DYNAMIC IP ADDRESSES" the idea of Heath Bunting's "WANDERING WEBSITES" or for "STEALTH NETS" become possible.

***The Question of the Business Model of name.space

In order to function legally in accordance with the laws of the State of New York, and the US Federal Laws, name.space has chosen to register as an S-corporation, privately owned, for profit entity.

This is not extraordinary or unusual. Many other nets surrounding us are also companies in accordance with their local laws: xs4all.nl, dds.nl, desk.nl, internationale stad, thing.net, Waag, and others exist as businesses. Some may receive support from corporate, foundation or state sponsors, but the future of that support is not guaranteed.

The question of wheather or not to operate name.space as a non-profit was simple to answer. No. Profit is ok if it is applied to good cause. The bureaucracy of non-profit is too stifling in the USA.

Name.space was started with private investment, from money earned by me from exhibiting my artworks, lectures, and other jobs including producing video for Nam June Paik. Others have volunteered their time on a limited basis, and contributed their server resources. Andreas Troeger has spent the past 6 months, full time, programming the registry and update system.

Many of us highly respect George Soros and his generous and vital support of culture and "open society"....all funded by profits made by one of the most dispicable acts of capitalism (next to real estate) --currency speculation.

But his money is eagerly sought after for arts and media in Europe... which is excellent. One capitalist has great ideas onn how to use his money to better society...or at least to enable others to try and make society more humane.

Name.space may never reach the scale of the Soros Foundation, but its agenda is the same. How can we use capitalism to fund our future existence in the face of growing abandonment of the public sector?

Response to the Tactical Media Manifesto:
A Network of Castles

Tactical media, then, would be a kind of filth--an organic process--as compared with the ideological cleanliness of strategic media (the "author").

Do we need a defense of filth, or a theory of filth--as fertility, as pleasure, as relaxation from the rigidities of "Civilization"? Not nostalgia for the mud, but the mud itself? Or would such theorizing simply become another kind of tidying-up process--an erasure of its own theoretical object?

The tactical problem consists of the need (or desire) to stay ahead of representation --not just to escape it, but to attain through mobilization a relative invulnerability from to representation. And the problematic aspect of the problem is that all media--even tactical media--deal in representation.

Thus one can follow the trajectory of a given tactical medium, through ever greater representation, towards the fate of being subsumed into some strategy. And the fatal black hole toward which so many of these trajectories vanish is Capital--of course.

Everything is a process of being cleaned up. To preserve its autonomy the tactical medium wants to remain dirty--it can never let itself be surrounded and cleared by strategy, by ideology. It must stay out ahead, drifting before all possible waves, uncertain even of its own trajectory.

By another paradox, this uncertainty itself becomes a "principle." It comes to occupy the space of a strategy--and thus to define a strategic space. No "authors" need to be implicated. A messy organic process--involving both reason and unreason--not imposed or categorical--emergent. Shape-shifting. Dangerous and plagued by failures. But not aimless or undirected. In effect--strategic.

Media as technologies ("machines") are perfect mirror-representations of the totality that produces them (or vice-versa). The internet, for example, mirrors not only its military origin but also its affinity with Capital. Like globalism, it breaks through borders--it is a "chaos," like Capital (which seeks the Strange Attractor of the numisphere, where the numinous and the numismatic are one and eternal). One might even speak of "nomadic" features ("migratory capital"). Like Capital, the Net is drawn toward virtuality, cognitive prosthesis, disembodiment. But (the "vice versa" process) media tend simultaneously toward the production of the totality--a complex multi-feedback relation.

In one sense, tactical media would then have to engage in the destruction and/or subversion ("substruction") of this complex--driving a wedge between the machine and the totality. Such action would imply that the totality is far from total, that there will be interruptions along the feedback lines, breaks in "service"--missing zones, and zones of resistance.

Ad-hoc, constantly mutating, determinedly empirical, at this point tactics begin to coalesce into a strategy ("spontaneous ordering"). Because this strategy has no "author" (and is not ideologically driven) each tactical medium--each tactician as medium--will be able to seek direction from it without losing autonomy to it. Thus the complex interplay between tactic and strategy is one of mutual validation or "co-emergence."

At this point, the metaphor of the castle--introduced by the Manifesto--takes on an added luster, or perhaps a baleful gleam. The Nizari Ismailis (the so-called "Assassins") structured their polity around a network of remote castles, most of which were inaccessible to every medieval military tactic--even prolonged siege, since they were supplied with their own gardens and water. Each high castle typically protected a fertile valley and was therefore self-sufficient--but full communication and even economic activity could take place within the network thanks to the "porosity" of medieval borders. And thanks to the policy of assassination or threatened assassinations, kings and religious authorities hesitated to interfere. This went on for centuries.

Some years ago I remarked that the Nizari model for utopia had been rendered impossible by modern technologies of war and communication. Perhaps it would be interesting as a thought-experiment to see if this negative judgment still holds true. From a military viewpoint of course it does--the "isolated castle" (or commune or the like) can still be eliminated by the push of a button. But "the military" must have a reason for such action. Since "assassination" is an absurdity (e.g. the Unabomber)--and even "militance" must be re-defined--there may be no immediately apparent reason for the military to suppress a given "autonomous zone."

The question of communication technology is trivial by comparison, but interesting. The Net as a "military" structure is "accessible to all," and even as Capital absorbs the Net these tactical areas of indeterminacy persist--the same holds true for all "intimate" or tactical media. Thus the "network of castles" becomes possible--but the real question is whether the castle itself is possible.

Like any institution the castle will exist in part as a representation of itself in media. The Assassins' castles were rooted partly in the imaginaire, in the image that pervaded medieval media (text, work-of-mouth, legend), in the image of mysterious inaccessibility and danger. The Mongols finally destroyed Alamut not by direct assault but by demoralizing it with an even more fearsome image (pyramids of skulls from China to Hungary, etc.). But at its height of power, Alamut could dispense even with assassination, since the image alone sufficed to ward off all military and political attention.

Under the regime of global neo-liberalization or pan-capitalism that triumphed in 1989, the nation-states of the world have begun to "privatize" all social functions for the collection of taxes for the support of military and police force, and the use of that force in the interests of Capital. The "natural law of the free market," however, clashes with the remnants of social ideology embedded in such structures as the UN, the EU, or even the "old" liberal or conservative regimes of certain states. Politics in such situations becomes a matter cognitive dissonance.

This is exacerbated by the appearance of "new media" which mirror the global totality but also enhance the cognitive dissonance (negative feedback, "noise") inherent in the representations of the totality. Capital seems to have a logic of its own--the tendency of money to define all human relations, if you will--but in truth neither capitalists nor politicians can really penetrate this logic or understand its direction--much less control it. Huge conceptual gaps open in the structure of the "totality." The question remains: are these gaps strategic?

The gaps cut across sedimentary layers of actuality, and the gaps themselves tend to shift position, change shape, open and close. Geography as well as the virtual space of the image, space as well as time constitute the mutating forms of these potential tactical regions. Some will be zones of depletion, in which all power has been shut off (there are rumors of strange tribes around Chernobyl...); others will be accidental autonomous zones which might involve classes, groups ("refugees") or specific areas. Some will be liberrad zones (Chiapas), others will be deliberate seams. Some will be "unseen," others will enter into representation. In the midst of such fluidity, there must emerge some islands or rocks. Castles will be occupied in the confusion, and later there will be no military advantage in destroying them. The castles will not be defensible, but they will be irrelevant, unassimilable--to "remote" (even in the middle of ancient cities)--apparently pointless. An air of shabby eccentricity might be useful here.

Another reason for Alamut's success was that any king who allowed it to exist could consider the possibility of a secret alliance, whereby money could be used to purchase immunity from the dagger--or perhaps even a contract on some other king--or most interesting of all, access to the secret sciences (astronomy, engineering and hydraulics, political philosophy, medicine, yogic techniques, etc.) of the Nizari observatories and libraries. In modern terms we might say that capitalists and politicians are so confused and ignorant about new media (far moreso than the average artist or 14-year-old) that large sums of money are currently being spent on "secret sciences." Out of the conflict between Capital and State over monopolies of representation, gaps can be produced--and made big enough to contain castles.

All this of course remains on the level of tactics. But the construction of a "network of castles" would constitute not only (in itself) a pleasurable act of autonomy and self-organization, but also a "strategic" structure, or rather an organic and embodied complexity out of which a strategic dimension might well emerge.

Tierra y libertad

Peter Lamborn Wilson

NYC April 1, 1997

Some notes on the document history of the manifesto of tactical media:

The official version of the manifesto was posted to nettime and is available as "The ABC of Tactical Media" at <http://www.waag.org/tmn>

Peter Lamborn Wilson obviously answers to a previous version of the document which was sent around earlier this year:
<http://www.desk.nl/~nettime/others/ABC.TXT>

and David Garcia one co-author wrote already a new and own version of it:
<http://www.desk.nl/~nettime/others/TACTICAL.TXT>

5.I

<nettime> On the tactic of tactics
From: McKenzie Wark
To: nettime-l@desk.nl
Date: Thu, 22 May 1997 18:16:43
+1000 (EST)

Whenever a term passes backwards and forwards a few times without much reflection, i'm inclined to look up its origins. And so: 'tactic' -- which seems to have a greek root, meaning to order or arrange. And 'stratagem', which Caxton took to mean 'artifice to surprise an enemy'. A device or trick. Its root is the word stratos, or army, modified with a suffix that means 'to lead'.

I find the idea of the device or trick more interesting than that of ordering or arranging. Trick media, ruse media, media stratagems -- that sounds more encouraging. The problem is not so much escaping or staying ahead of meaning, as camouflaging one kind of sense in another. How can media vectors connect subjectivities together in such a way that they can conduct a conversation that might pass unnoticed, or remain misread, in the midst of all the others? Such a conversation, such a subjective endeavour, wouldmost likely not be spatially or economically autonomous, but might nevertheless have an aspect of itself that remains free from capture by the prevailing vectors of capital and media.

But lets face it, talk of strategy and tactics is boys' talk, part of a retrograde fantasy we can all live without. The language of 'mobilisation' is itself part of the problem, and a hold over from the cold war. Intellectuals, artists, media people are supposed to join the ranks of this or that 'movement' to fight against this or that foe in this or that

'emergency'. Suspension of aesthetic, ethical and political freedom for all can then be legitimised in the name of a higher calling.

So its not a choice of tactics or strategy, but a choice of an authoritarian language for media practice or a democratic one. The mobilisation of 'forces' or escape from the grid of compliance, whether to the dominant power or its mirror image, the avante garde that would take its place.

Its more than a question of metaphors. Language doesn't represent anything. It connects things and people. It proliferates and reproduces itself in the process. The trick is to get the connecting and reproducing sides of language to work towards the production of plurality, difference, zones of liberty where meaning is neither led from the front nor punished at the margins.

Confrontation seems to me to usually involve the reproduction of the language of confrontation and authoritarian relations between people and things. Language becomes a matter of giving orders, announcing decrees, denouncing heretics, defining limits -- and pronouncing all of the above to be necessary in the name of this or that emergency.

Escape, on the other hand, is something else. It usually requires a ruse, a cover, a fold in the coding. It appears to be one thing, but it might also be something else.

A favourite example: 'burn baby burn' -- a slogan from the Watts riots, tucked in a fold in a disco song:
"I heard somebody shout
burn baby burn
disco inferno
burn the mother down!"

The virtual side of media is the ever present potential that some completely different subjective event will form out of what seemed like quite routine utterances. Its always threatening to veer towards flux. In the flow of media, as in the flow of water, order is always temporary. Its always on the verge of escaping towards pure difference.

Another example, from the endless riches of what Lester Bowie called the Great Black Music:
Aretha Franklin, singing gospel as a teenager. Conventional words of piety. Suddenly she shrieking,
'Never gonna die! Never gonna die!'
Her voice jumps straight into another realm, somewhere beyond meaning, into sense itself. Its as if the vibrations of her body transmit themselves, across space and time, across means of recording and distribution and reproduction, from her body to mine. An event outside meaning, or maybe inside it, hidden in the folds of it. Waiting to transmit.

There are any number of languages in which one might talk about media: aesthetic, ethical, political, but surely the military is the least necessary of them. And don't buy the old furphy about the 'military origins' of the internet. The internet has many origins. Its a hybrid of a whole bunch of technologies, pioneered in lots of different places and organisational contexts. There is no necessity embedded in its origins. The net is what it becomes. Do we know yet what the net can do? I don't think so. The collective experiments have only just started. We have some idea what you can do with a book or a song, they've been with us a long time. We've suffered from some pretty extreme experiments with the so-called mass media. We've had the telephone for years but nobody has bothered to think much about the democratic potential of this remarkably distributed kind of media. And the net... we're just starting, even though the technology goes back about 20 years now. That's nothing.

But the diversification of creativity on the net is still held back by a much older 'technology' -- language itself. Always the old terms! 'Tactical media', 'Net art' -- like calling a motor car a horseless carriage. It is waiting for a revolution in language to reveal what lies hidden in its virtual folds.

McKenzie Wark

<nettime> Workspace Manifesto

From: Geert Lovink (by way of Pit Schultz <pit {AT} contrib.de>)

To: nettime-l@desk.nl

Date: Sun, 17 Aug 1997 00:25:51 +0200

note: This text was written for the presentation of Workspace in the Documenta Halle in Kassel/Germany which took place on August 14, 1997 as a part of the 100 days program. We heard only two days in advance that the free slot would be available for us. The only text about Hybrid Workspace was written by a number of people, in a great hurry, just before the final deadline of the Documenta X shortguide, in May. For this improvised presentation, for the first time we looked into the growing audio, video and text archive of the Workspace project. We also thought it would be necessary to also have more theoretical text, a first attempt to reflect on the work we are doing here in Kassel. In the second part, the tactical media network presented their work. Special guest was the Colombian videomaker Silvia Mehuja. You can see the lecture in real video: http://www.mediaweb-tv.com/english/dx/gaeste_frame.html + more audio stuff: <http://www.icf.de/RIS>

First Analysis of the temporary WorkSpaces
By Pit Schultz and Geert Lovink

For the Hybrid Workspace presentation
100 days program, Documenta X, Kassel
'50 days, 120 guests', August 14, 1997

how to write a manifesto -- a document type description

Classical modernism brought us a new textual format for the multipurpose use in the alien environment of technical media. The manifesto was introduced by several avantgardist artist groups at the beginning of this century as a document type to mediate an emphatic moment of urgency, the utopia of the radical new.

Today, the manifesto returns as a useful form of electronic discourse that locates itself into the heart of cybernetic power. It does not just articulate a hierarchical voice from above, representing the wishes of others. It does not just promote the project of one predominant world model, it even cannot be taken seriously in every detailed claim it may make. In the main, the digital manifesto is a highly efficient form of communication which provides a frame of immediacy and presence for those formulating it.

The digital manifesto no longer makes the distinction between endless interpretations and the decisive logic of punctual statements, it articulates a profound, and often artificial subjectivity without reclaiming absolute power in the real world. It creates an ambiguous mode between visibility and virtuality which makes it useless to serious forms of executing power by virtue of its very absence. Paradoxically, only through the fact of its powerlessness and marginality the digital manifesto can claim to speak in the name of superhuman forces.

The digital manifesto, as found in countless instances on the electronic networks, is not rewriting the human command-line-interface as it is known from before the War. In the times of the Nets, after deconstruction is over, the manifesto is a node which attracts other texts, including audio and video, and plays with the viral potential of being able to get forwarded, redistributed, quoted and translated.

The digital manifesto functions as a media genre which speculates with maximum attention and possible media exposure. It mimics the gesture of broadcasting in the times of democratised xerox publicity. By definition the digital manifesto has a strong message. It claims an imaginative totality, a possible future, a virtual territory, knowing that it exists amongst a multiplicity of other manifestos, which all put into concrete practice the passion for polemics and rhetorics of public imagination: "I had a dream" (in Martin Luther King's famous opening words). You may find the digital manifesto all over the net referring to its outside, and referring to each other just by the fact that they express a will to be heard, to be heard about an extreme form to see the world.

The digital manifesto is the opposite of the self-referential contemplation from within the system. It breaks through the chains of

endless interpretation of existing textual material. It is stating the obvious, claiming the impossible, and deserving the full field of pragmatic possibilities to the limit where they become truly speculative. Next to the document types such as the pamphlet, the declaration, the statement, the sermon, the agenda, the charter or the petition, and in distinction to the essay, the article, the report, or other lengthy texts, the digital manifesto performs a compression which deals with the need for shortening, cutting and selecting from the media streams. From the very beginning it anticipates broadcasting and what it can do to a text. "Keep it short, my attention span is limited." (J. Sierstra) The typical form of the digital manifesto is a long list of paragraphs, which functions like as a crystal, where one paragraph can reflect all others. The potential character of this text type is not hidden or embedded in a set of characters and narrations like in a novel, or allegory. In a digital manifesto the need for far more possibilities meets the desire to touch the level of the real and serves a popular info-vehicle in the struggle for attention.

representation - media - image

Nowadays, if you are working in the field of the new media, you are very squarely confronted with the institutional power of the image. The multi media are out there, but apparently some media are more equal than others... Those which work with an interface of visual representation are also those which are the most appealing to consumers, advisors, media theorists, and museum curators. Optical media have traditionally a predominant role in the process of constructing the truth and representing the invisible. When it comes to reflexion about reality, our Western language is full of terms which privileges the visual above all other senses when speaking about the truth. The direct way of exercising power over people's dreams and visions is by controlling the sphere of images. This plays a crucial role not only in religion and advertisement but all fields which need the services of representation of power through visualisation as a form of celebrating and mediating its legitimacy. In the new media industry which is specialized in the development of "interfaces" most of the work goes into the production of demos (see Peter Lunenfeld in nettime). Finally it needs a surface to cover the emptiness of the final products with a shiny glamorous aura.

The aim being to produce media products that successfully suggest content, context, and communication. To produce a psycho-physical stimulus through visual information is a skill that has been learned from the various avant-gardes by putting their experiments into the commercial context - without taking the social, political and idealistic world models of modernism, of course. This format speculates with the investments made by the users, like their craze on the stock market, the investments into an 'economy of ideas', and the simulated empty products snatching away the peoples' attention/money without satisfying their desires. As long as a product is in demo mode it produces wishes by reiterating the promise of the tremendous potentials of the full version always to come.

The problems of media design have not yet been properly discussed. Some tend to see this 'artisan' practice more in its classical terms, where design is the final phase of the production process. In the information business, however, design plays the role of architecture, since it structures activities and organises knowledge and memory. Navigational design determines the modes of orientation and in the best case predicts all possible moves and interpretations by the users. The best interface is the one which becomes invisible. Electronic images are bringing you to the other sphere behind the screen, they are stimulating the imagination, they are trying to mediate between programmers and users, they are pretending to give technology a human face and are helping to reorganise business and workflows. Electronic images are fulfilling an initiative role in the first encounter with the realm of new media, they are mediating today the sphere of [to-morrow's] dream time, the mythological nomos, the realm of the uncounscious.

The aesthetics of total dispersion of the televised image do not break through the screen of the representational paradigm. The celebration of optical media exchanging the role of painting does not say much about the average media users which even probably wish they could see real paintings again. It is the play with the modes of visibility and invisibility, the aggregates of mediation between possible modes of representation expanded from the flat tableaux of the computer screen, to different frames of code and transformation, which can easily circumvent central authorities of quality control just by finding new combinations, or creating new hybrids and different intensities. On the carrier of digital media, such very private mixes introduce for a while the pure joy of doing it yourself. Before the old institutions or commercial enterprises move in, other fields for tactical use are already there.

hybrid

Hybridity has many names, many faces. One of these is the merger we are witnessing between video-technology and the Internet. But the much-vaunted wedding of TV and Web may well never happen. The cult of the interface culminates in its current brief to unify all media under one big

browser. The most recent manifestation of this idea is the 'setup box', the 'network computer' and the attempt to reinvent 'Television on the Internet' in the so called 'Push Media'. During the phase of the war of standards we see a diversity of interim media, a variety of sub-standards, incompatibilities and central giant media which try to include and swallow up small media.

On the technical level hybrid systems are very often the pragmatic way of resistance, and an attempt at finding the best possible solution aside from the one which consist of dominating the market by including different or older systems. This quite resembles the status quo prevailing in pop culture, where hybridity as cultural policy works against 'apartheid' and the sweet promises of a totality which is hidden behind the concept of the 'Gesamtkunstwerk'. Hybridity as postmodern condition is not a strategy but a starting point [- or a benchmark]. There is a certain threshold where the dirtyfication, mixing and opening of systems gets rejected. The double face of hybridisation needs both a critique in the context of the expansion of global capital and an analysis of its possibilities of emancipation at the micro-level. On the dangerous road which leads to becoming a Media-Gesamtkunstwerk the concept of hybridity looses contact to subjects and serves as a model of sophisticated organisation and domination.

work

"Networking is networking," (George Soros) Beyond the ideal of full employment and the scenario of a jobless economy there are many practical examples of inventing new forms of work. Whether this takes the form of a neo-liberal part-time McJob or some activity within state-run dole-for-work programmes, or some kind of occupation within the fast-expanding black money economy, or a slave job in a sweat shop in the "Little Asias" sprouting all over the place, or just a new, formalised way of neighborhood help, the traditional concept of work is changing rapidly. And very often it does so by applying information technology. Also, at the same time, a certain type of 'autonomous work' seems to persist. It drudges on at the limit of complete exhaustion, working with the bare achievement of the existential minimum as reward, within settings endowed with low resources and next-to-no budget. It must be the lure of some different gratification than money which motivates some people to work so hard in the non-profit-media. And yet this could become the model for many more people. Work is still the golden road to self-realisation. To detach it from the currcuits of capital begs the question on which economy it should rely. It is all too easy to state that through the rise of neoliberalism many sectors of the public sphere are being privatised as well as other resources are getting exploited in an irreversible way, which also means that there are no ways in turning back the clocks. While everybody seems to reluctantly agree on the fact that not much money has been made on the net to date, one keeps betting on a big boom triggered by the global information networks.

The main issues at stake here are the emergence of new types of jobs in the service sector and a need for more and lifelong education. Yet, in the same breath, one oversees the existence of a shadow economy of gifts, a do-it-yourself culture of producing public content without prospect of making the big buck. Apart from the small community of net experts which earn their keep with advisory or journalistic work, or the even smaller band which finds their little niches in the art world, the vast majority of small content producers are private individuals which like to publish what they like for the sake of it. This process of democratisation of the means of production, as sore and basic as it is, realises a big dream of many social utopians. The only drawback being that the glory and class consciousness of the new virtual working class does not seem to come very much into existence. While we have all possible tools for more media freedom still in front of us we are often unable to do anything, hypnotized as we are by the pronouncements about the rise of total marketization. Avoiding self-exploitation and burn-out on the one hand, sell-out and alienation on the other, the exploration of the possible modes of finding work in the new media is a challenging task indeed. While the trap of an ascetic ideal as well as the tragedy of a realised utopia makes you hyper-sensitive against false promises, you still have to work it out.

space

Different kind of spaces deserve different kinds of action. The media space is defined by its participants: there's no content without social context. And there is no way of defining a media space either without someone accessing it. The problem with spacial metaphors is that they do not normally include any time model. A combination of a time model with a social model, with a definition of the modes of access to a set of media equipment can already be enough to build a model of a small cyberspace. (You can do that at home, like the radio-amateurs in the 20ies did.) It could describe the ways a network can dynamically change, the multiplicity of layers of accessibility, and the diverse ways how to represent a set of data. It could emphasize the importance of relying on

mutually agreed-upon standards, not only in the definition of interfaces between the machines or parts of programs, the software and the hardware, or different pieces of hardware. These same standards also occur on the level of social associations, in form of jargons, marks for orientation, certain conventions of naming and addressing the yet unknown. In this way a cultural space could evolve, which is completely constructed by the definitions and interdependencies of the actors which create it through their actions and decisions. Cyberspace, besides its geographical extension, is a pure social construction. It has as many dimensions as there are nodes within it [male or female] it is more a vectorial space, or an imaginary one describable by fairly abstract mathematical models far beyond any three dimensional metaphors.

To bind a cyberspacial social environment to a physical space therefore may well render the need for a metaphorical architecture obsolete. Through social contacts (and the attention they bring with it) a more fuzzy process of forming a hybrid space which combines the real and the virtual becomes productive. But the connection between the real and the virtual realm will not go smoothly. It is a never ending story of disruptions, bugs in the human-to-human communication, conflicting standards and cultural glitches. The virtual should not become a quasi parallel world, nor should we return to the tactile solidity of the 'real' cities, the so-called nature or the social that might have existed once. The temporary workspaces and gatherings we are organizing do not intend to produce a consensus. No constructive solutions here. Our aim should be the design of problems and conflicts, free content, not the synergy of all technical media.

Strategies for media activism

By Geert Lovink

Presentation at the forum event of 'Code Red'

The Performance Space, Sydney, November 23, 1997

"Erkenne die Lage" (Gottfried Benn)

It is my personal commitment to combine cyber pragmatism and media activism with pleasurable forms of European nihilism. Not the apocalyptic, conservative culture of complaint which post modernism has left behind, but short heroic epics on the everyday life of the media, reporting from within the belly of the Beast, fully aware of its own futile existence, compared to the millennial powers to be. We ani's no salespeople, trying to sell the award winning model amongst the digital cities, some exotic Amsterdam blend of old and new media or yet another disastrous set of ideas, made in Europe. Instead, we are trying to exchange models, arguments and experiences on how to organise our cultural and political activities, finance media projects and create informal networks of trust that will make live in this Babylon bearable.

New media is a dirty business, full of traps and seductive offers to work for 'the other side'. There are no ways to keep your hands clean. The computer is a deadly machine when it comes to inclusion and exclusion. We, the workers on the conceptual forefront of cyberculture, have to admit that we are (not yet) politically correct and have failed so far to pass the PC-test. This is not because these criteria are deliberately neglected, but because the passions lie elsewhere. For the time being, the struggle is about the definition of the terms under which the 'information society' will become operational. The 'Short Summer of the Internet', now rushing to its close, is about the production of cultural and political concepts, which may, or may not, be implemented on a much larger scale. What network architecture will be used? Do we accept the dominant software and screen design or do we look for alternatives? Is there still space for theory and reflection, meaningless playing around? Is the production stress overruling creativity? Later on we will find current concepts back as 3D-animation, java scripts or human-machine interfaces. The terminal workers, producing one demo after another (as Peter Luenenfeld has recently described it) are determining future formats of the new media which will

shortly become standards, ready to be commodified. A further growth of new media products may need a phase of consolidation on the level of marketable products. The 'digital revolution' could therefore soon reach its counter-revolution, the Digital Thermidor (let us all hope that it will not turn violent against its Wired-visionaries that once so passionately preached their 'Californian ideologies'). There is less and less reason to make fun of 'Dinosaur behaviour' of the apparently outdated and 'tired' multinational corporations. Restructuring programs are in place now. The CEOs have listened carefully to the cyber-libertarian visionaries and have drawn their own conclusions. The network economy is well under way - and so is the 'Long Crisis'. Kevin Kelly's saga of the 'Long Boom' (in Wired magazine) turned out to be a hilarious mistake in the light of the current Asian (now global) currency crisis and its simultaneous environmental disaster. But sure he will keep on insisting that we simply have to route around the problems. Economics are benevolent if you are on a religious mission. As John Perry Barlow once said about the Internet, connecting every synapse with any other synapse on the world: 'It is not a good thing or bad thing, but it is a holy thing.' And believers can ignore any crisis, as long as it not theirs.

"Holding the Negative." (Andre Simon) The political economy of new media is not a favourite topic on conferences that deal with art and technology. Dry economic facts about the upcoming take-over of this emerging branch may spoil the celebration of the Computer-Aided-Renaissance. The belief that many small Davids can beat a few big Goliaths is still around. The ideology of economic liberalism has entered the rational of the creative part of the virtual class in a deep, unconscious way. The same can be said of state officials who still hold powerful positions in financing new media projects. But the fact is that the gold rush is over. Prices of web-design have fallen sharply. We can see the rise of the html-slaves, employed without contracts or health insurance, producing code for little or no money. Small businesses disappear, not only ISPs but also in the art and design sector. On the macro-economic level we have witnessed an unprecedented series of mergers in the telecommunication and media sector. This has led, for example, to the near monopoly position of WorldCom (which now owns 60% of the access business in the USA). Or take the Spanish telecom giant Telefonica and its Intranet, which will soon control the entire Spanish speaking world. We do not need to mention Microsoft here.

This may only be the return of the suppressed, after a period of post-modern comfort, in this case late monopoly capitalism. The undermining of the promising small and decentralised 'many-to-many' ideology also comes from within the IT-sector. The development of the ultimate multi-media device, web-TV, turns out to be a classical Trojan Horse. The much hated one-to-many television, news and entertainment industries have now found a way to neutralise a potential competitor. Soon the content of web and TV will be the same. In this respect, all these push media are claiming the available bandwidth. Older features of the Net, like the news groups, with their democratic and decentralised logic, are dying out and are being replaced by monitored and edited on-line magazines and chat rooms. Internal surveillance of net-use and private e-mail is on the rise due to the introduction of intranets of buildings, companies and entire countries. Another alarming tendency may be the withdrawal from the Internet of universities and research centres that are now working with much faster and secure computer networks. This dark picture results in the question -- 'What elements of the glory days of net hype, dating back to the period of 1989-1992, remain? Perhaps the answer is the phrase 'On the Internet no one knows you are a dog.' Indeed, and no one cares: a tragic end of the once so liberating politics of identity. What counts now are the commercial use of avatars, the number of hits on a site ('2 million a day'), the rise of webvertisement and the final putting into place of electronic commerce.

What form of organisation media activism could take? While some truly discouraging stories from the economic forefront are on the rise, it is good to keep returning to the old question: 'What is to be done?' A return of negative thinking could play an important role in the development of strategies for media activism. There is plenty of good will, and ruthless cynicism. What lacks is playful negativism, a nihilism on the run, never self-satisfied. Not just nomadic as a Lebensphilosophie, but rather tactical, an ever changing strategy of building infrastructures and leaving them, when the time has come to leave the self build castles and move onwards. The explorations into the fields of the negative not only imply the hampering the evil forces of global corporate capitalism, but also formulating a critique of the dominant alternative formula: the Non Governmental Organisation. The NGO is not just a model for aid organisations that have to correct the lack of government policies. It is today's one and only option to change society: open up an office, start fund-raising, lease a xerox-machine, send out faxes... and there you have your customised insurrection. "How to make to most of your rebellion." The professionalism inside the office culture of these networked organisations is the only model of media-related politics if we want to have a (positive) impact, or 'make a difference.' (as the ads use To call it). We will soon have to reject this bureaucratic and ritualised media model

altogether, with its hierarchies, management models, its so-called efficiency. "The Revolution will not be Organised." These are not the words of some chaotic anarcho-punkers or eco-ravers, calling for spontaneous revolt, right now, tonight. The crisis of the Organisation is our 'condition humane' in this outgoing media age. And it may as well be the starting point for a new, open conspiracy that is ready to anticipate on the very near cyber-future. Not anymore as a Party or Movement, nor as a network of offices (with or without headquarter), new forms of organisation may be highly invisible, not anymore focussed on institutionalization. These small and informal communities easily fall apart and regroup in order to prevent the group from being fixed to a certain identity.

"The site less visited." Media activism nowadays is not about the expression of truth or a higher goal. It is about the art of getting access (to buildings, networks, resources), hacking the power and withdrawal at the right moment. The current political and social conflicts are way too fluid and complex to be dealt with in such one-dimension models like propaganda, 'publicity' or 'edutainment.' It is not sufficient to just put your information out on a home-page, produce a video or pamphlet etc. and then just wait until something happens. The potential power of mass media has successfully been crippled. Today, reproduction alone is meaningless. Most likely, tactical data are replicating themselves as viruses. Programmed as highly resistant, long lasting memes, the new ideas are being constructed to weaken global capitalism in the long term. No apocalyptic or revolutionary expectations here, despite all rumours of an upcoming Big Crash of the financial markets. Unlike the Russian communist world empire, 'casino capitalism' (Robert Kurz) will not just disappear overnight. Heaps of deprivation and alienation is ahead of us. But this should not be the reason to lay back and become console socialists. We need organisations of our time, like the global labour union of digital artisans, networks of travellers, mailing list-movements, a gift economy of public content. These are all conceptual art pieces to start with, realised on the spot, somewhere, for no particular reason, lacking global ambition. These models will not be envisioned by this or that Hakim Bey. They are lived experiences, before they become myths, ready to be mediated and transformed on their journey through time.

Media activism constantly mediates between the real and the virtual, switches back and forth, unwilling to choose sides for the local or the global. Tactical media are creating temporary hybrids of old school political data and the aesthetics of new media, which deals with interactivity and interface design (see the article by David Garcia and me in *nettime/ZKP4*). As a next step, this is being implemented on both the level of the social personal level where our wearable bodies meet, and that of the 'non-located' technical network architecture. Activists are developing now 'negative software', (anti-)racism search engines, (temporary) public terminals, free groupware, anti-aesthetic browsers against both Microsoft and Netscape, electronic parasites that live on corporate software and content.
