Recording is not enough. Reality.net, equipped with tons of web cams can be fortunate and collect evidence, but it can as well add to the spreading paranoia about the surveillance by the Corporation-State. Sometimes it may be appropriate to detect and delete camera's. Neither eco-fundamentalist nor techno-utopian, media activists are taking risks and acting freely. This may sometimes be in a criminal way, if necessary (like computer hackers), thereby ignoring legal standards (censorship, copyright). The narrow frameworks that reformists have negotiated over time, like 'privacy' and 'freedom of expression' have to be defended and practiced openly. These can only be guaranteed with the help of an independent, democratic media structure, not owned or controlled by the state. Big media corporations will be the last to defend media freedom. It would be foolish to expect anything in this respect from Murdoch, Bertelsmann or Time-Warner. The same can be said of the efforts of isolated political lobbying groups which fight for better legislation...

A 'light' and independent media infrastructure is not merely expressing diversity. It is not enough to correct the main strain media and facilitate communities with their own channels. Being a 'difference engine' on the level of representation may put out a lot of use full public content, but it does not touch on the 'media question'. What interests us most are the ideological structures which are written into the software and architecture. But is not enough to subvert or pervert this powerful and still mysterious structure. It is possible to continue the earlier approaches of freeware and shareware within the now hyper-commercial environment of new media. The same can be said of the efforts to develop databases of free content, a now still marginal activity that will soon gain importance once everyone will have to pay for the content to download. This public sphere cannot come into being in a purely global, commercial environment and obviously also not in places where the state has absolute control over the nation's intranet and firewalls. It is in this 'third place', the public part of cyberspace, that the media activism will start to flourish.

Date: Wed, 10 Feb 1999 23:25:24
-0800

[NETTIMERz- The following dialogue grew out of a request by the Electronic Disturbance Theater to collect interviews on the topic of tactical media in general and FloodNet in particular. This interview and others will be excerpted and collected as supporting documents in a forthcoming chronicle of the EDT's actions entitled "Hackivism: network_art_activism." -ag]

Hacking Activism
An Email Dialogue
Between Alex Galloway and Geert Lovink

Alex Galloway: Let's talk first about the Zapatista FloodNet actions (<http://www.thing.net/~rdom/ecd/ecd.html>) in the context of tactical net.art. There was a lot of talk at this year's Ars Electronica festival about how the FloodNet was technically flawed. Do you think it works? Can electronic civil disobedience ever move past simple "consciousness raising," to actually realizing material change?

Geert Lovink: I don't think this is the best way to approach this issue. "Flaws" are something for the hackers and sysops to address, like Rop Grongrijp or others. FloodNet has had karma because of particular mistakes they made; I cannot defend them, nor do I particularly want to attack them. We have been working for several years on a thorough foundation for net activism. For example, this was a major topic at the Galactic Hackers Party in 1989, one of the first big "new" media events we organized in Amsterdam. Today, the net is no longer merely a tool, it is our everyday (artificial) life. For us it is a strategic theatre of confrontation. Yet the hackers still have that fresh, almost utopian attitude about the internet. For them the net is something precious, something that shouldn't be destroyed by things like denial of service attacks. Activists these days are not properly informed of the delicate balance within technology. For them, a corporate server is just another artifice to be destroyed, or rather, disturbed.

AG: Let's talk about software more generally. I think that, perhaps, the Web Stalker (<http://www.backspace.org/iod>) was the first real piece of tactical software (at least for our recent net.history). And now I'm searching for sequels. The browser seems like a perfect place for tactical interventions. Where else do you see this happening? The open source movement is one place... But what about network infrastructures? Operating systems? Where should we, as tactical programmers, "go" today?

GL: The open source movement is clearly an interesting area but what interests me most is how to build a public interface for movements like this. To be successful the movement must both effectively disseminate its software and surround the software with a lively, appealing political discourse. It could be our task, as mediators, journalists, artists and critics, to transform the issue of, for example, operating systems into a political question. Paul Garrin's name.space has failed so far in this (and so has nettime). The question is this: How do we turn all these abstract issues, which are debated in a very closed circle and only understood by a hand full of technicians, into a large topic, understood by the millions, so to speak. Minor decisions in the realm of technical standards taken today will have enormous effects on society later on. We are all aware of that. So, much will depend on our political skills, imagination and willingness to make coalitions, if we want to succeed.

AG: You are right to note that name.space and others have failed so far to address a larger audience, yet I don't think we should discount name.space. It preceded the Web Stalker (right?) and in some ways is more massive, more effective, and more tangentially artistic (making it all the more appealing). As for operating systems, there's Jodi's new OSS project (<http://oss.jodi.org>) which, although purely aesthetic, somehow also seems to be a real tactical intervention into how computers are used—especially since it exists as a stand alone application (as well as a CD-ROM) that mimics an operating system. I'm delighted at the fact that, with net.art, one can't really distinguish the tactical from the purely aesthetic. I think this is what will prove its ultimate importance.

I may have a slightly different take on the question of publicity and coalition-building. Why can't the ultimate success of tactical media projects be simply to produce temporary autonomous zones (TAZs) rather than liberate a larger public? (I realize this sentiment is probably not very popular with the Dutch/German tactical media community.) New technologies seem, finally, to be able to give us this TAZ option as a widespread reality for the first time. Look at our own projects—nettime and rhizome—I think that communities of this nature are virtually unprecedented. And, hey, that may be enough for me.

About the open source movement. I am in favor of software development that seems to be in the public interest. However I'm skeptical of the politics associated with some of these groups. Hackers and programmers have historically never shared the same politics as the avant-garde, especially one with such a lively surrounding discourse as ours does. I've read the various hacker's manifestos floating around and I think they're garbage. They specifically avoid political analyses at the expense of the "freedom of knowledge." This is at the heart of why EDT's FloodNet was criticized heavily by HEART (Hackers for Electronic Art) at Ars Electronica this year. What we have is two groups, both doing interesting work, but with two different political styles. I'm on the EDT side.

Let's move to the issue of translating traditional leftist strategies into the tactical media framework. A new method is critical. We've experienced bottom-up political movements for some time now. But, what about "distributed" bottom-up strategies? This is the machinic model, where there is no coalition, there is no core, yet there is a "movement." Is electronic activism like the FloodNet too rooted in old school leftist politics? The real question here is: How do we make the network into a medium for action and resistance?

I always think of the early net.art project called "Refresh" (<http://sunsite.cs.msu.su/wwwart/refresh.htm>), what (I'm assuming) Alexei Shulgin described as "the friendly web-design frenzy that we have started on Sunday 6 October 1996." In that project no one really needed to know who exactly was part of the chain, yet if your computer followed the refreshes you would glimpse a sequence of interrelations. This seems to me to be a model, albeit primitive, for some type of distributed bottom-up strategy.

GL: You are touching here on the question of organization. It presupposes common interests (or even "objectives," Marxists would say) and a basic set of common ethics. Today this sense of commonality has been blurred by the "culture wars"—in a good way, I would say. But the celebration of differences, chaos and complexity has prompted us to pose again the question of organization. Permanent deconstructions and cynical criticisms have turned many of the intellectuals, artists and activists into enlightened but powerless outsiders.

These days, one could say that new forms of organization are formed along technical lines. For example, majordomo mailing-list software is creating specific social structures (while excluding others). The internet has the tendency to strengthen both global and local connections, but seems to neglect the nation or state level. This will backfire sooner or later.

Today's organizations tend to be rhizomatic. I mean this in a negative sense. "Mille plateaux" rules. Not by choice but because there are few other attractive options. If we face the loose connections, the constant danger of decay, general anxiety over ideological commitment, panic over internal conspiracies, and the continued disintegration (after short moments of euphoria) of groups into sub-groups and tribes, we actually end up in a political climate of various, simultaneous micro cycles. The fear that others will cash in with your ideas—the fear of being appropriated—is very destructive. It has damaged common feelings, even friendships. With ongoing technological changes we should wait until new, more reliable forms of organization appear. Now we are caught up in a closed circuit of tiny techno-social experiments.

"Refresh" is a good example. A good idea, but now it is somewhere on the web, with most of the links out of use. No one seems to be responsible, nor has any one come up with a follow-up. That is the poverty of net.art at the end of the nineties.

AG: Are you in fact calling for a "consolidation" within tactical media? To be honest, I'm surprised that you say this. Is there anything other than simple pragmatics (i.e. the fact that we have to get things done) fueling your resistance to these distributed models? Some would say that old, consolidated forms of resistance have a track record of failure, and now we must follow the lead of Deleuze and others to find a new politics based on the "molecular" model of revolution without central organization. Personally I can testify in support of computers—they let me do the work of 10! Don't you think that the network as such gives us new possibilities for action and resistance?

Do you see a trajectory from progressive political theory in the '70s and '80s, to the real material manifestations of these theories today? I'm thinking especially of the idea of the rhizome or swarm, its correlate in nomadic politics, the privileging of the TAZ over revolutionary action, etc., which now, in the case of the internet, have all found their own conditions of possibility. Now that we actually have access to real, non-hierarchical systems do you see the future of resistive politics changing? It seems that what you lament about "Refresh" is exactly what I celebrate.

GL: Rhizomatic, molecular models of resistance are not new. I don't say this to sound discouraging. I would just like to point out a rich and diverse tradition. There are many histories--labeled these days as "anarchism" or popular revolts--including invisible, lesser known stories.

And please don't claim that these rhizomatic models are immune to failure. Rhizomes, at times, can lead us nowhere. Nomadic praxis specifically mystifies the question of organization and survival--internal accountability is not its strong point. It cannot deal with the type of sustainable infrastructures and power politics that extend beyond the limits of one's own tribe. Today's networks cannot answer essential questions of economic survival. Hit and run actions, semiotic guerilla strikes, document theft, creating counter discourses and cultures--these are just one aspect of a complete movement. It is dangerous to extend those models to all other spheres of life. In other words, please do not make a management guru out of Deleuze. The "rhizome ideology," in my opinion, is to be understood within the French (and Italian) politics of the '70s. It was a response to the democratic centralism of the European communists at the time. Its spontaneity is its strong point, but it cannot answer what comes next when the TAZ dissolves itself.

AG: One final comment on this "rhizome" thread, then I'd like to talk more about tactical net.art. You correctly situate the "rhizome ideology" in the '70s (and '80s and '90s), and I agree that the theoretical impetus was born then.

However (as said above) don't you see a trajectory from progressive political theory in the '70s and '80s, to the real *material* manifestations of these theories today? My only point about Deleuze (I'm just using his name for convenience, there are clearly other important figures) is that he never had access to real, material TAZs (or rhizomes, or nomadic communities, etc.) that instantiated his theoretical interventions. To take media venues as an example, I claim that we never had access to real, wide-spread non-hierarchical systems until now, with the dawn of radically democratic networked communities. Free radio is different; your "anarchism" or popular revolts" were/are different: moments like May '68 were *very* different.

Yes, this new mode clearly "fails" in the eyes of the dominant order. Yet *our* failure (our dissolving and reappearing) in their eyes means something good to us... It means that a new practice is emerging. "What comes next when the TAZ dissolves itself"? A new TAZ, of course.

Are you suggesting that we shouldn't translate traditional leftist strategies into the tactical media framework, but rather, translate tactical media backward into a more traditional leftist strategy?

GL: No, forget these leftist frameworks. I have never been part of that. In most cases, people do not have the energy anymore to form a new TAZ, or even to be part of it. The rigid time economy is eating up people's lives. Perhaps what you are not taking into account is people's real disillusionment and the pragmatic realities of life. When a TAZ has been smashed by the authorities, or has dissolved itself because of exhaustion or internal conflict, only a small percentage of the participants will continue. They will become the survivors; they will crystallize into a new group or TAZ. We have described this process in our Adilkno book "Cracking the Movement" (<http://thing.desk.nl/bilwet/Cracking/contents.html>). The phrase "disappearing and reappearing" is way too simple, especially in this harsh, neo-liberal climate.

I am a professional optimist (by nature) and it is my passion to create strategies for getting new initiatives off the ground. But your analysis of Deleuze (and his generation) not having experienced an actual TAZ is an historical misjudgment. This is mainly because you have ignored the numerous movements, world wide, which started in the late '60s, and have actually existed since then. This includes the ecology, anti-nuclear, and women's movements; squats, farms, alternative bookshops and restaurants, music festivals; sabotage, actions, strikes; and dogmatic splinter groups and armed guerillas. Current media/art initiatives are tiny compared to what was going on twenty or so years ago, when the Deleuze & Guattari duo was active. That is our sad reality at the end of the '90s.

It is true, though, that in today's technological climate a TAZ has the ability to incorporate activities elsewhere on the planet much faster and cheaper than in the past. Yet simply having this ability to organize new forms of resistance does not automatically generate new social movements. Perhaps in the (very near!) future, I remain optimistic!

AG: I'm an optimist too and I think we are living through a very exciting time. I think our disagreement stems from the fact that I consider the "rhizomatic mode" to be historically specific, while you're extending it to include resistive actions in general (or at least for the past 30 years). We can agree to disagree.

Let's forget about the offline for a moment and get back to our first topic above: electronic civil disobedience. Do you disagree with the strategy of the so-called "denial of service" attacks seen in the EDT's FloodNet actions? If yes, what are other possible network actions that may emerge in the near future... the new forms of hacktivism?

GL: The US/American establishment is preparing for the Infowar. You can read this everywhere. Secret services and military research centers have the wildest fantasies about Muslim hackers, and the damage they can cause. For me, these are all phantoms, orchestrated illusions put in place to legitimize the rise (again) of the US military budget during the late Clinton administration. Let us not fall into their trap. What is important now is to spread awareness of the fact that we are all under constant surveillance. Electronic media and networks are endangering citizen's basic civil rights (above all their right to privacy).

Hacktivism should move into this area, not just temporarily shoot down enemy servers. We need to be much more careful, flexible, remain under cover. FloodNet originates from an actual public space lost and gone. Perhaps it is trying to re-construct the loss in much too easy a way. In our experience, here in Amsterdam, the digital public sphere is a long term project, with thousands of people involved. In part, our work is invisible, and contains many random elements. Activists, by nature, are hasty. They want to get things done. Yet protection and restructuring of the public sphere is not a simple problem to solve. So let us come up with many models and examine which ones work, and which don't. That's hacktivism for me.

Re: <nettime> Hacking Activism
From: John Hopkins
To: nettime-l@desk.nl
Date: Sun, 21 Feb 1999 17:08:35 +0200

Following are some laborous observations to Geert and Alex's conversation:

>GL: The open source movement is clearly an interesting area but what ...snip...
>(and so has nettime). The question is this: How do we turn all these >abstract issues, which are debated in a very closed circle and only >understood by a hand full of technicians, into a large topic, understood >by the millions, so to speak. Minor decisions in the realm of technical >standards taken today will have enormous effects on society later on. We >are all aware of that. So, much will depend on our political skills, >imagination and willingness to make coalitions, if we want to succeed.

Well, I am a bit astonished that your dialogue passed by any reflection on the question, and instead focused on a continuation of the rhetoric in the closed circle of nettime posters. Sometimes you guys get my adrenaline going, I love it, thanks! Thus, I can't pass by that consequently (in the context of nettime) rhetorical question with some basic observations. Some are rooted in Newtonian/mechanistic arguments, but hear me out, I can't speak in the metaphors that are often used in this forum.

Interfacing with "the public" (i.e., everybody NOT on nettime), one will see both the answer and a distinctive perspective on the question. And I am neither proposing nor am interested in audiences of millions, but rather individuals, interacted with one-by-one, or at most in small groups. Firstly, please, please let go of the MASS issue -- I think any "movement"

that wants to deal with masses has, by the nature of the Beast, to coagulate its own mass in order to affect the direction, effectively ruling out a networked environment or form. Maybe it is too obvious to answer the question with the word "education" especially given the horrific state of institutionalized learning in the world. But the sharing of knowledge, experience, and life energy on an individual basis, the lowest common denominator, has the greatest potential to transform life.

next3minutes, I hope, will see some open discussions on this issue. If we are not generous about sharing our personal energies especially in the one-to-one sphere of action, there will be no change in the Other, much less, the Self!

It might be that perhaps the side-stepping illustrates the weakness of this <nettime> listserv -- that it HAS gotten away from personal dialogue and problem solving.

>than liberate a larger public? (I realize this sentiment is probably not >very popular with the Dutch/German tactical media community.) New >technologies seem, finally, to be able to give us this TAZ option as a >widespread reality for the first time. Look at our own projects--nettime >and rhizome--I think that communities of this nature are virtually >unprecedented. And, hey, that may be enough for me.

unprecedented? are you sure? Of course, SPECIFICALLY, in the sense of the detail of mediation techniques, the protocol, but is that important to dwell upon? I think it is more important to look at the human results -- are these communities unprecedented in their individual human effects?

>Let's move to the issue of translating traditional leftist strategies >into the tactical media framework. A new method is critical. We've >experienced bottom-up political movements for some time now. But, what >about "distributed" bottom-up strategies? This is the machinic model, >where there is no coalition, there is no core, yet there is a "movement." >Is electronic activism like the FloodNet too rooted in old school leftist >politics? The real question here is: How do we make the network into a >medium for action and resistance?

Well, a truly distributed network is distinguished from other forms of mass society in the fact that it has a distributed inertia -- it cannot be expected to have a concentrated mass that can be moved (given a torque loc) as a means to im-press the surrounding cultural/social matrix. The distribution of inertia requires that a net, whether it is organized through modern telecommunicative technologies or otherwise, be activated by intra-nodal exchanges of energy, nothing amounting to a directed social vector but more a series of trans-local point-source flare-ups of energy. This energy pulsing is at the same time reactive and proactive, revolutionary and transformatory. It is agent and carrier, self and Other, co-mingled. What about getting rid of the "up" in bottom-up? Why go up? As soon as one starts climbing, ascending above the direct personal interactive, the resistance becomes illusory and reactive (rigid and resistive) to a Cervantes' windmill, better to stay on the bottom and work with the dialogue as the primary tool. Resistivity invites reification or at least polarity, where intra-nodal flexing redirects opposing energies into positive channels opening lives and possibilities.

>GL: You are touching here on the question of organization. It presupposes >common interests (or even "objectives," Marxists would say) and a basic >set of common ethics. Today this sense of commonality has been blurred by >the "culture wars"--in a good way, I would say. But the celebration of >differences, chaos and complexity has prompted us to pose again the >question of organization. Permanent deconstructions and cynical >criticisms have turned many of the intellectuals, artists and activists >into enlightened but powerless outsiders.

Perhaps the blurring comes from the use of the wrong optics to view the issue -- the rhetorical tools of the intellectual class have been used to build mazes that take us away from principled/fundamental understandings -- understandings that chart trajectories of personal convergence and action. The weakness of rhetorical tools seems to be embedded in the instances when they are used outside of immediate dialogic situations and instead are used for propagandistic purposes. I have stated before that a critical measure of the efficacy of a text/language-based exchange is how closely or spontaneously actions (like behavioral shifts) spring up as a result. -- That is, if we are TRULY expecting that topics discussed here are to be translated to REAL social transformations! If the only response in more rhetoric, it is a signal that we are moving AWAY from active principles rather than towards them.

In the context of nettime, I was reflecting this morning on why I always have a funny feeling when I make that rare effort to post. I never have any reaction/response from the prolific posters which leads me to 1) consider that my ideas are not interesting to them or 2) they are not interested in getting anything but silent nods of approval to their postings. Of course, there is the third possibility that what I write

doesn't make sense, but I can come to my own defense and say that many ideas and observations have evolved in the very dynamic and social environment of learning situations involving many tens of dialogues with other individuals... hummmm.

No one is an outsider if they retain the soul-full will to speak and listen with an Other, allowing the limitless possibilities of exchange to resonate and evolve in the confluence. Insiders talk to many, and listen only to themselves.

>These days, one could say that new forms of organization are formed along >technical lines. For example, majordomo mailing-list software is creating >specific social structures (while excluding others). The internet has the >tendency to strengthen both global and local connections, but seems to >neglect the nation or state level. This will backfire sooner or later.

Why will this backfire? if people are interacting through an organically formed communications system, outside of total infrastructure breakdown/takeover/intervention, where is the real loss in neglecting geopolitical nation/state considerations? If it is the ONLY medium through which people are communicating, then I would suggest they get a "Real Life," no kidding! On the other hand, if you consider Language itself as a form of technological mediation, then it is quite clear that what you say is absolutely correct -- organizations ARE formed along lines of technological specification. Forming organizations with other criteria requires negotiation, translation -- and they must have individuals with a foot in either domain! Interesting!

see you two folks in Amsterdam!

kuitos
John

<nettime> The XYZ of net activism

From: luther blissett

To: nettime-l@desk.nl

Date: Wed, 3 Mar 1999 17:03:03 +0100 (MET)

[orig to n5m3-debates-l [AT] waag.org]

- THE XYZ OF NET ACTIVISM -
by Luther Blissett

It's time to create the pop stars of activism,
the idoru of communication guerrilla,
it's time to threaten and charm the
masses by the ghosts coming from the
net, to play the myth against the myth,
to be more nihilist than infotainment!

- etoy -

- _0_ Luther Blissett and the net.activism
- _1_ EDT and LB: two models of mediatic simulation
- _2_ The pop turn
- _3_ Pop interfaces for the masses: a political idoru
- _4_ Hybridisation
- _5_ The revolution of '99

o. < LUTHER BLISSETT AND THE NET.ACTIVISM >

In this contribution I want to introduce Luther Blissett Project into net activism debate. For those who don't know about it: Luther Blissett is a pop myth, a collective "open" pop star, which name is the same one of a Watford soccer player. But virtual LB has a computer-made face. LB is a multiple name: whoever can become LB and use his/her name for whatever purpose. Who

uses the name increases and takes part of a collective fame. In Italy, where small groups promoted this project, multiple name strategy triggered a chain reaction. By means of multiuse name a mass myth was built and used for political campaigns. The concepts underlying LB [multi-use name, open pop star, political avatar] can be a powerful tool to build a mass movement, as well as to spread in a popular way the net.culture and the net.criticism of inner circles like Nettime or N5M, ejecting the networks out of the Net.

For more details about LB:

-> <http://www.geocities.com/Area51/Rampart/6812/ramp.html>

1. < EDT AND LB: TWO MODELS OF MEDIATIC SIMULATION >

In the current debate about net activism a leading question is the "simulation" vs "real action" opposition. I think it has become a vicious and rhetoric question. Lovink & Garcia, in "the ABC & DEF of tactical media" are too patient with those who are skeptic about importance of "mediatic representation" issues. On the contrary, I'm going to point out the most radical thesis and strategies expressed about simulation: in my view, Electronic Disturbance Theater and LB/a.f.r.i.k.a. gruppe.

-> <http://www.nyu.edu/project/wray/wwwhack.html>

-> <http://www.nettime.org/nettime.w3archive/199803/msg0044.html>

Both of them think activism and counter information must learn to simulate on the mass media stage, i.e. in the infotainment. But these projects are completely different. Electronic Disturbance Theater is the name of a "group" of activists. They use the "net strike" to protest institutions and mass media about political questions. EDT's "actors" don't hide their names. On the other side, LB is just a name, a mark adopted by thousands of people who often don't know or communicate each other. LB is not a group or movement but a collective pop star. All the activists have the same name, all the activists "are" the same multiple pop star. LB usually don't protest establishment directly. s/he works inside mass media producing fake news, urban legends, trying to "short-circuit" spectacle's inner contradictions. LB's name is used for artistic works, political deeds, pranks, etc. LB have got no world wide fame like EDT, but s/he could get it. - Electronic Disturbance Theater The main question against EDT is: which is the risk of threatening and provoking media by simulations? How to control feedbacks and backlashes? How to avoid being coopted or starting moral panic? According to Stefan Wray, activists must become aware that politics is a theater and must learn to play: "we are manipulating the media sphere, we are creating hype, we are cultural jamming, we are simulating threats and action [...] we are actors! this is political theater! a glorification and transformation of the fake into the real, at least in people's mind". How to present activism on the stage? With an image and a name that work on the media. It's deal with building simulacra: "How do we invent an international cyberspace army? First by naming. EDT's simulacrum is very simple: it presents itself as a protest against institutions, media, corporations. It can be defined as a first level simulacrum, since it challenges the System in a direct way. Mediaticeffectiveness is given by simulated threat: "Floodnet's power lies in the simulated threat." The aim is to draw attention to particular issue, to attract some degree of media coverage by engaging in actions that are unusual. The question for EDT is to have made up a negative, destructive simulacrum. Media system coopts these antagonistic simulacra, it demonizes and criminalizes them, it uses them to starting states of emergency, moral panic. The "state" plays the same game of fear. That happens when you play the "first level" of mass media game. - Luther Blissett If EDT targets a direct fight, LB wants to raise the challenge at an upper logic level. As a.f.r.i.k.a. gruppe write: "Guerrilla communication doesn't focus on arguments and facts like most leaflets, brochures, slogans or banners. In its own way, it inhabits a militant political position, it is direct action in the space of social communication. But different from other militant positions (stone meets shop window), it doesn't aim to destroy the codes and signs of power and control, but to distort and disfigure their meanings as a means of counteracting the omnipotent prattling of power." Baudrillard quoting Widen: "Each element of contestation or subversion of a system have to be of an upper logic kind."

Contrary to EDT's practice: "Communication guerrillas do not intend to occupy, interrupt or destroy the dominant channels of communication, but to detour and subvert the messages transported." This means not to play as innocent actors but to imitate spectacle and its deceptions: "Against a symbolic order of western capitalist societies which is built around discourses of rationality and rational conduct, guerrilla communication relies on the powerful possibility of expressing a fundamental critique through the non-verbal, paradoxical, mythical"

Indeed, non rational strategy is very rational: becoming spectacle, becoming myth, to use infotainment weapons against itself. Traditional simple counter information doesn't work anymore. LB wants to bring the struggle in the realm of pop culture, to build "intelligent" simulacra, to spread out fake news, using irony to withdraw at the right moment. According to Critical Art Ensemble the enemy is invisible, the power has become a nomadic electronic flow. If it's easy to understand this, it's more difficult to understand how mass media system coopted, neutralize or demonize subversive forces. The net has made democratic simulating and faking information. But where is the myth in mass communication, today?

2. < THE POP TURN >

Roland Barthes, "Mythologies", 1957: "It is to be strongly established, from the beginning, that the myth is a communication system, is message." The myth is what is beyond the Spectacle, the back of media landscape. The myth unifies what is opposite in spectacle and overcodes any subversive meaning and deed.

Barthes: "To destroy the myth from inside was then extremely difficult. The same move to get rid of it falls at once a prey to the myth: the myth can always, in the end, signify the resistance made to it."

The title of 'read me!' intro is: "nothing is spectacular if you aren't part of it". I don't know if it is a quote and where it comes from (Debord...? it's pure Debord's philosophy!), but it's quite rhetoric, politically correct, puritanic. We should say: nothing is spectacular if you "are" part of it! Activism have to u-turn: let's call it 'pop' turn.

Barthes: "The best weapon against the myth is to mythicize itself, is to produce an artificial myth: and this reconstituted myth will be a real mythology".

- Net hype.

For example, Net hype is a myth that activism must parasite and overcode. As A.f.r.i.k.a. gruppe writes: "Increasing attempts to police the net, to establish state and corporate control will, paradoxically, increase its attractiveness as a field of operation of communication guerrillas. Possibly, even those of us who until now not even own a PC will get Wired then. Fakes and false rumours inside and outside the Net may help to counteract commodification and state control - after all, the internet is an ideal area for producing rumours and fakes."

"Communication Guerrillas are fascinated by possibilities offered by the internet also in a quite different sense: Beyond its reality, THE NET is an urban myth, and perhaps the strongest and most vital of all. Social discourse conceives THE NET as the location where the people, the pleasures, the sex and the crimes of tomorrow already take place. Go Internet, learn the Future! Fears and desires are projected onto THE NET: this is the mythical place where we can see the future of our society." Mass media stage is inglobing the net step by step. The Spectacle is hybridizing itself with the net. Collective imagery is penetrating the cyberspace. Activist have to attack and parasite the collective imagery fed by the net. Mass media imagery are becoming more and more interactive, "democratic". Old Left's theories about media manipulation are obsolete.

3. < POP INTERFACES FOR THE MASSES: A POLITICAL IDORU >

'Pop Turn' means that activists have become less boring and speak the language of the masses. Like all interfaces, it's a compromise. Some puritanic activist, some anarchist or eco-raver will disagree. But the only way to face infotainment is to become more nihilist than it. The 'pop' turn is not only a strategic choice, it's also a way to build an access to the masses.

- Pop avatar.

Pop culture is like indusitric pantheon where gods and semigods fight nonstop. It deals with making up really pop simulacrum, controlling them, drawing them back when they begin to produce unwanted reactions. Activism have to construct virtual pop stars, collective avatars conducted from the net to act in the infotainment, as LB o the idoru Kioko Date. By the metaphor of "mass avatar" I mean to explain open pop star model to net users and net activists who don't know about multiple name. The avatar metaphor can be transposed very easily from the net to the traditional media and used in the media activism. With "mass avatar" I mean a virtual idol to play on media stage and not a simulated identity in a one-to-one communication on the net. Anthropomorphic features make public identify itself with it. As well as Ballard and Gibson know, in media society the Icon is the direct way to access to people's nervous system. Franco Berardi aka Bifo defined LB as "The Antichrist of information". This definition explains the LB purpose to join counter-information and autonomous pop mythology.

- Gateway to the media.

Hacktivists have to organize gateways between the net and the "traditional" media. This net-media gateways should be an interface to feed and to control news media spread out. It deals with contacting and cooperating with on-line staff of TV and newspapers, with making up idiot-friendly interfaces for journalists. Electronic Disturbance Theater experience demonstrates it: without making the NY Times front page on October 31, 1998, EDT would have got only a merely on-line existence.

4. < HYBRIDISATION >

- Pop modules.

Hybridisation is not about just connecting the virtual and the "street". We risk to remain rhetoric and predictable on both the fronts. We have to

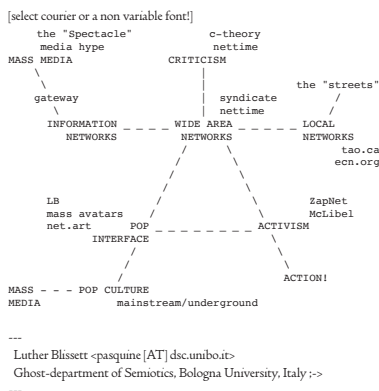

hybridize and to contaminate the forms of pop culture to create pop modules for activism. Net scene is a tank of odd and useful ideas. Think of a mediatic subversive use of the most iconoclast net art works, before they could be coopted by Nike or Adidas! Pop module can be defined as a multi-platform program that can work on different social environments and political frameworks, on both old and new media. An example is L.B, which name appeared many times on Italian media, signed books, novels, performances, shows, counter information campaigns, hoaxes, urban legends. Multiple name is a really hybrid module, as it works on both old and new media, on both the street and the net.

- Composing theories...
We don't need the western philosophy easy astractions and oppositions that go on with grassroots criticism: simulation vs. real action, alternative vs. mainstream, pop vs. avant-garde, molar vs. molecular, "take to the street" vs. "the streets are dead". A theory [or strategy] is not to set up against another, but they are to be composed together on the same level.
"Compositionism" is a deleuzian method suggested by authors as Bifo. Look at the beast of spectacle and its movements. It is infiltrating the net, rooting in the new forms without give up the old one. Capital infiltrates any interstitials. The net is not oppose to mass media, hypertext cannot destroy spectacle, but new hybrid forms grow up. Spectacle branches in the hypertextual net, it becomes more shifty. It is already hybrid, let's learn from it.

- ... and integrating activism.
In the same way activism has not to give up old strategies but to integrate them, to connect each other. Convergence of media involves convergence of strategies and "activisms". We have to cease to make theories. We simply have to connect a strategy to another, a thing to another. Hybridisation have to integrated different kinds of activism. After hacker we have to integrate net artists and designers into activism. I mean an euphoric, subversive, iconoclast, prankish activism! If net artists began to design pop interfaces and strategies for activism, they surely would be more spured, inspired and useful. But we don't need to be a "rhizome": rhizome myth has brought damage. Deleuze & Guattari also asked: "How can we distinguish between subversive schizophrenia and capitalistic schizophrenia?". Capitalism is schizo and rhizomatic too. We need to integrate and to be integrated.

5. < THE REVOLUTION OF '99 >

The net-media-art activism scene is fragmented in a lot of groups, close sub-networks, alternative culture ghettos, avant-garden loners, hyper-egos. Let's have a look at jodi's map: -> <http://www.jodi.org/map>
I don't know in which way it is organized, but it's an effective bird's-eye view of "our" network. This scene can go overground only through interconnection of each group of artists, activists, writers, theorists, designers, journalists, moderators, organizers, etc. This network could become a mediatic icon!, the next [western] sub-cultural movement, after punk, techno, cyberpunk, etc. We have to find a quite pop and stupid name: "the revolution of '99"? Next scheme is not so obvious, it also means to be an interface for "theory":
- it's a bit stupid and too general but clear.
- is it too "hegemonic"? don't mind names such as 'nettime', just for example.
- where is simulation and where real action?

<nettime> the language of tactical media

From: joanne richardson
To: nettime-l@bbs.thing.net
Date: Wed, 3 Jul 2002 15:56:54 +0200 (MEST)

Greetings,

An earlier version of this text was first circulated on the Next 5 Minutes 4 editorial mailing list. Current version rewritten for a feature on tactical media of the magazine Balkon, due to appear in conjunction with the Cluj, Romania co-edition of N5M4 in September.
The Language of Tactical Media
..... Joanne Richardson

"World War III will be a guerilla information war, with no division between military and civilian participation." -- motto of Tactical Media Crew, borrowed from Marshall McLuhan

The future is a series of small steps leading away from the wreckage of the past, sometimes its actors walk face forward, blind to the history played out behind their backs, other times, they walk backwards, seeing only the unfulfilled destiny of a vanished time. The promise of the tactical media of the future - the end of the spectacular media circus as everyone begins to lay their hands on cheap 'do it yourself' media technologies made possible by new forms of production and distribution - was inspired by a distinction between tactics and strategies made by Michel de Certeau in 1974. Strategies, which belong to states, economic power, and scientific rationality are formed around a clear sense of boundary, a separation between the proper place of the self and an outside defined as an enemy. Tactics insinuate themselves into the other's place without the privilege of separation; they are not a frontal assault on an external power, but makeshift, temporary infiltrations from the inside through actions of thefts, hijacks, tricks and pranks. But for de Certeau, the distinction was almost entirely focused on the power of reading (the consumption of signs) to transform submission into subversion. The most memorable example of tactics in *The Practice of Everyday Life* is the indigenous Indians who under Spanish colonization appear to be submissive but really "often made of the rituals, representations, and laws imposed on them something quite different from what their conquerors had in mind: they subverted them not by rejecting or altering them, but by using them with respect to ends and references foreign to the system they had no choice but to accept." The apparently submissive kneed, bow down, put their hands together in prayer, but they don't believe the words; when they mouth them they secretly mean something that was not intended by the original producers. The strength of their 'resistance' is in their silent interpretations of these rituals, not in their transformation.

Maybe the most interesting thing about the theory of tactical media is the extent to which it abandons rather than pays homage to de Certeau, making tactics not a silent production by reading signs without changing them, but outlining the way in which active production can become tactical in contrast to strategic, mainstream media. The examples of tactical media have almost become canonical by now: billboard pirating by Adbusters, plagiarized websites by the Italian hackers, 01001011010101.org, RTMark's mock websites for G.W. Bush and the World Trade Organization, and (as theYes Men) their impersonations of WTO representatives to deliver messages that don't challenge the WTO's position but over-identify with it to the point of absurdity. In contrast to mainstream media, tactical interventions don't occupy a stable ideological place from which they put forward counter-arguments; they speak in tongues, offering temporary revelations. But while shifting the emphasis from the consumption of signs to an active form of media production, the theory of tactical media seems to have lost some of the original contours of de Certeau's distinction. The tactical media universe as mapped by David Garcia and Geert Lovink in 'The ABC of Tactical Media' also included 'alternative' media, although its logic seems quite different. Grassroots initiatives which are focused on building a community around other values than the mainstream, do occupy an ideological place that is marked as different; they don't infiltrate the mainstream in order to pirate or detourn it, as RTMark might infiltrate the media image of the WTO.

And especially in the recent transformation of alternative media into the global Indymedia network, the separation between Indymedia's 'alternative voice and the mainstream enemy is quite evident. Indymedia critique the

pretensions of mass media to be a true, genuine, democratic form of representation; it opposes the false media shell with counter-statements made from a counter-perspective a perspective that is not questioned because it is assumed as natural. My Italian friends who work with Indymedia showed me a video they co-produced about the anti-globalization demonstrations in Prague and asked what I thought. I replied that it was a good piece of propaganda, but as propaganda it never examined its own position. In this video you see a lot of activists who came to Prague from America, UK, Netherlands, France, Spain, Italy, etc; occasionally you even get ossified Leninist bullshit from members of communist parties. What you really don't get is any reflection of the local Czech context many locals denounced what they saw as attempt to playact a revolution by foreigners who invoked slogans from an ideology the Czechs themselves considered long obsolete. The confrontation of these different perspectives is absent from the video, since it is meant to promote Indymedia's own anarcho-communist position, raised to the level of a universal truth. And in this sense it was as strategic and dogmatic as mainstream media; it was only the content of its message that differed.

De Certeau was a child of his time, maybe as a former Jesuit he was more timid and better behaved than his siblings, but he played with the same conceptual toys. In its historical moment tactics was an important idea that sought to define a way of subverting the information spectacle that would avoid using the same tools (strategies) against its opponent. Tactics recycled the Situationist idea of detournement: taking over the images and words from the mass spectacle, but putting them through an unexpected detour, using them in a way they were not originally intended by combining them in surprising combinations, heretical juxtapositions. The Lettrists kidnapped a priest, and, dressed in his gown, gave a sermon at the Notre Dame on the death of god; the SI altered the soundtracks of karate and porn films to reflect the struggle against bureaucracy; even striking workers during May '68 stole the media image of James Bond with a gun for a poster announcing themselves as the new specter haunting the world. These were neither art nor political speech; their disruptive power was that they did not use the familiar, straightforward language of politics. Their wit and lack of directness was a measure of their success; the danger always lurking in the background was that this new mode of production through theft and infiltration of public spaces, including the media, could ultimately be used to deliver the same kind of blunt, inflexible propaganda as the media spectacle. As a practice, detournement reflected a contradiction between the recognition that fighting on the same terrain as the enemy is a seductive but inevitable trap, and the desire to occupy the buildings of power under a new name. This contradiction crystallized in the hijacking metaphor: detourne was a verb commonly used to describe the hijacking of a plane.

The SI played upon this connotation, announcing their own productions as hijackings of films, of politics, of quotidian desires. The terrorist as a symbolic equivalent of the subversion of power was never far in the background of associations. And in an almost straight line stretching across the precipice of history, aesthetic terrorism continues to be invoked as an honorific title. Ettoy advertise themselves as digital terrorism; in an interview, Mark Dery called CAE a philosophical terrorist cell and made comparisons to the Red Brigades; RTMark is often congratulated for its brand of 'media terrorism.' Now it could be lamented that an unfortunate metaphor is being applied to practices that are very different but in what sense is the affinity only a matter of metaphor? Terrorism is a way that the weak, lacking the strength in numbers and political influence, can try to make use of the strong by infiltrating their places of power, in the hope that the temporary seizure of a key building, an airplane, or a politician might shift the balance of things and bring power to the bargaining table. Ever since terrorism abandoned the tradition of tyrannicide and became a form of propaganda of the deed, it operated through a hijack of the media. Letters to the press, communiqués: 5 minutes under the opaque illumination of the media spotlight. The terrorist use of media hijacks is the point where tactical media and strategy meet: it may be a surprise infiltration rather than a direct attack, but an infiltration with a clear sense of separation between its own position and that of the enemy, an infiltration that ultimately mirrors the political organization, juridical system and mode of expression of the power it opposes. The Red Brigades' hierarchy of brigades, columns, national branches, and an executive committee was a double of the centralist organization of the state; the Weather Underground's counter-institution of 'proletarian' justice mimicked the obscurity of the law in reverse: "We now find the government guilty and sentence it to death on the streets." And today's fundamentalist terrorism is a mirror of the network society of a stateless, global capitalism. Western educated bin Laden militants don't belong to any specific country; they travel the globe from Bosnia to Paris and New York, use the internet and cellular phones, and have access to communication networks even in a desert cave.

Asking how media can be used tactically today implies a recognition of the contradictory history in which the idea was born the moment of crisis when new social forces rendered old categories obsolete, and Marxism began

to reveal itself as a bankrupt system in which capitalism found not its abolition but its supreme fulfillment. But alongside new ideas and the search for a new language, lingered old modes of organization dating back to the Jacobin terror, and the mythic image of the armed, militant hero. Tactics sought to express a new way that the weak could fight against power by using different tools - but in the old language of military engagement. Before de Certeau, the distinction between tactics and strategy was invoked by Clausewitz in 1812. Tactics is the manner of conducting each separate combat; strategy is the means of combining individual combats to attain the general objective of the war. Tactics is the deployment of individual parts, strategy, the overview of the whole. This is a very different distinction from de Certeau's opposition between modes of combat: de Certeau's tactics is actually closer to what Clausewitz called *strategem* - a concealed, indirect movement which doesn't actually deceive but provokes the enemy to commit errors of understanding. This is analogous to what Sun Tzu termed a 'war of maneuver' - an artifice of diversion undertaken by weak forces against a large, well-organized opponent, an unexpected move that entices the enemy, leading him to make mistakes, and eventually self-destruct.

Whether direct or concealed, offensive or defensive, using the strength of numbers or the artifice of diversion, both strategy and tactics belong to the art of warfare and have the same objectives: conquering the armed power of the enemy, taking possession of his goods and other sources of strength, and gaining public opinion by destroying the enemy's credibility. And perhaps this is the limitation of a media theory based on a distinction between tactics and strategies - ultimately both are a form of war against an enemy power. The tactics of media hacks may differ from the strategy of independent, alternative media in their formal aspects, but what seems common to both is their self-definition through an act of opposition. A fake GWBush page cannot exist without the authentic one, which it parodies. Indymedia cannot exist without global capital, whose abuses it chronicles, or without mainstream media, whose falsifications it denounces. The mainstream spectacle also needs an embodiment of opposition to the universal values of democracy, enlightened humanitarianism, and the right to consume without restraint. And after the collapse of the other of 'Eastern Europe', the image of the terrorist is now the perfect media fantasy, the face against which it can define its own values in reverse.

This reflection was occasioned by my editorial participation in the 4th Next 5 Minutes Festival; it's an attempt to think about its content, which proposes an investigation of the meaning of tactical media in the wake of September 11, and its decentralized organizational structure, which will transform it into a series of dispersed but linked events, each focused on different local issues. If as David Garcia admits, the idea of tactical media grew out of a specifically Amsterdam context (or perhaps in a wider sense, the liberal democratic context of the countries of advanced capitalism), it is commendable that N5M4 is attempting to transcend its origins and include initiatives that were previously left out of what seemed to be a primarily 'western' idea of tactical media. The editorial team for N5M4 includes media tacticians like CAE, members of the Indymedia network, media centers in post-socialist countries which provide infrastructural support and access and education to local producers, and European organizations which provide ICT assistance to groups in Mali, Ghana, Tanzania, Uganda, Zambia, Jamaica, and Bolivia. Under the expanded cover concept of tactical media are included what appear to be both tactical and strategic media, as well phenomena that differ from both insofar as they are not forms of warfare - initiatives to provide infrastructure, improved access, means of communication and exchange to people who for economic and political reasons are lacking these means. These modes of production and exchange are not primarily constituted by being directed against an enemy; the content is not determined in advance through a preconceived opposition, but left to be shaped by its producers. Now to my mind, labeling all these diverse practices forms of 'tactical media' risks missing precisely their differences and making the term meaningless. This loss of signification seems to correspond, in inverse proportion, to the recent inflation of 'tactical media' as a cool label on the market of ideas. Instead of analyzing concretely what is inherent in different forms of media production and the ideologies they shelter and preserve, the term papers over their contradictions. Tactical media is good, progressive, alternative, etc. There is no need to ask questions, its truth already appears self-evident.

After making some extremely arrogant, offensive films of Maoist propaganda during the early 1970s, Godard became embarrassed. And started making films that had nothing to say. Here & Elsewhere we went to Palestine a few years ago, Godard says. To make a film about the coming revolution. But who is this we, here? Why did we go there, elsewhere? And why don't we here and elsewhere ever really meet? What do we mean when we use this strange word 'revolution'? It is only when he was old that Godard learned how to ask questions, stumbling around like a foreigner in a language and a history he did not possess. Here & Elsewhere, which came out in the same year as de Certeau's book, occupies no fixed position, moves towards no preconceived destination, and takes nothing for granted, not even its own

voice. In an era dominated by a politics of the message (statements, declarations of war, communiqués, demands in the form of new five year plans), it searches for a politics of the question.

The idea of tactical media is the harbinger of a question both necessary and timely: how is it possible to make media otherwise, media that expresses its solidarity with the humiliated thoughts and incomprehensible desires of those who seem doomed to silence, media that does not mirror the strategic power of the mainstream by lapsing into a self-certain propaganda identical to itself and blind to its own history. But the language of tactical media simultaneously imprisons the idea of a different type of media production inside a theory of warfare, as a media of opposition, defined in relation to its enemy. While it is necessary to continue asking the question and experimenting with models of media production that work in situations of crisis and adversity, it is also important to know when to change terrain. As wars rage around us - wars that rationalize the trafficking in merchandise under the shadow of sublime principles, wars against terrorism, wars against drugs, wars of information against information - maybe what we need least is to advertise our practice as an extension of one or another principle of warfare. When asked to take sides, for or against, siding with one army or the other, sometimes the only real answer is not to play the game. This refusal should not be confused with an exodus, a silent passivity, or a patient resignation. It is the vigilance of continuing to think, beyond the obvious - of a third, a fourth, or fifth alternative to the apocalyptic or utopian sense of the media.

[from] Tactical Media and Tactical Knowledge

McKenzie Wark

Geert Lovink and David García speak of a tactical media that might free itself from the dialectic of being an alternative or an opposition, which merely reproduces the sterile sense of a Wedom versus a Theydom in the media sphere. They claim that the "identity politics, media critiques and theories of representation" that were the foundation of oppositional media practices "are themselves in crisis." They propose instead an "existential aesthetic" based on the temporary "creation of spaces, channels and platforms". Lovink and García's seminal text on tactical media doesn't entirely succeed in extracting itself from the oppositional language of Wedom versus Theydom, but it points towards an alternative strategy to the negation that paradoxically unites Osama Bin Laden, George W Bush and the writers of The Nation as purveyors, not of the same world view, but of world views constructed the same way. It is a question of combining tactical media with a tactical knowledge, of using the extensive vector of the media in combination with the intensive vector of the scholarly archive.

In a nominally democratic country, one acts as part of a public sphere in the sense Alexander Kluge gave to the term. A public sphere – a matrix of accessible vectors – acts as a point of exchange between private experience and public life; between intimate, incommunicable experience and collective perception. Public networks are arenas where the struggle to communicate takes place. Two aspects of this concept are relevant here. For Kluge, writing in post war Germany, the problem revolves around the historic failure in 1933 of the public sphere to prevent the rise of fascism. "Since 1933 we have been waging a war that has not stopped. It is always the same theme – the noncorrelation of intimacy and public life – and the same question: how can I communicate strong emotions to build a common life?" For Kluge, the public sphere is a fundamentally problematic domain, caught between the complexities of the social and the increasing separation of private life.

One has to ask: for whom does Kluge imagine he speaks?

Perhaps there are other experiences of the relation between the time of intimate experience and the time of the public sphere, buried out there in popular culture. Perhaps it is only intellectuals who feel so estranged from the time of information in the era of telesthesia. After all, the mode of address adopted by most popular media doesn't speak to a highly cultured intellectual like Kluge or even a provincial one like me. We were trained in slower ways of handling information, and have a repertoire of quite different stories with which to filter present events. How could we claim to know what goes on out there in the other interzones, in quite other spaces where different flows from different vectors meet quite other memories and experiences of everyday life? After all, we intellectuals keep finding more than enough differences amongst ourselves.

A tactical knowledge of media may have among its merits the fact that it takes these other interzones seriously. It tries to theorize the frictions between Kluge's intimate experience and the network of vectors, or it actually tries to collect and interpret accounts of such experiences. It is necessary to at least attempt to maintain a self-critical relation to the codes and practices of the interzone specific to intellectual media experiences. After all, 'our' training, 'our' prejudices in relation to the vector might be part of the problem. Nothing exempts 'our' institutions and interests from the war of the vector, the struggle to control the trajectories of information.

With the spread of the vector into the private realm, a window opens that might be used to create a line along which the communication of intimate experience and collective feeling might take place, in those eventful moments when their separation collapses. The protocols of tactical media are not given in advance. As Gilles Deleuze says: "Experiment, never interpret." What is at stake is not the recreation of the public grounds for a universal reason, but finding the tactical resources for a far more differentiated and diverse struggle to communicate, that simple thing so hard to achieve.

The maintenance of democracy requires a practice within the public networks for responding to events that it was never quite designed to handle. Virilio asks whether democracy is still possible in this era of what he calls 'chronopolitics'. Perhaps democracy succumbs to 'dromocracy' – the power of the people ploughed under by the power to technological speed. Well perhaps, but the only way to forestall such pessimism is to experiment with tactics for knowing and acting in the face of events. One has to experiment with relatively freely available conceptual tools and practices and base a democratic knowledge on them. This may involve moving beyond the techniques and procedures of the academy. In Antonio Gramsci's terms, the academic intellectual risks becoming merely a traditional intellectual, one of many layers of cultural sediment, deposited and passed over by the engine capital and the trajectory of the vector, caught up in a temporality that is not even dialectically resistant, but is merely residual. One has to make organic connections with the leading media and cultural practices of the day.

Nevertheless, the historic memory and living tissue of scholarship stores resources that are useful and vital. In studying an event like September 11, a tactical knowledge can build on the best of two existing critical approaches. To the schools that concentrate on the structural power of transnational capital flows and military coercion it adds a close attention to the power of transgressive media vectors and the specific features of the events they generate. To the schools that study the space of the media text in the context of periodic struggles for influence with the national-popular discourse it adds an international dimension and a closer attention to the changing technical means that produce information flows. The event is a phenomena a little too slippery for either of these approaches. Hence the need to examine it in a new light, as the chance encounter of the local conjuncture with the global vector – on the operating table.

The chance encounter of Osama Bin Laden with CNN, like the meeting of the umbrella with the sewing machine, has a surreal, 'surgical' logic specific to it. It is not entirely reducible to the long term temporalities of capital or military power and lies in the spaces between national-popular discourses. Writing the vector is not really something that can be practices with the tools of the Herbert Schiller school of political economy or the Stuart Hall school of cultural studies,

alone, although a tactical knowledge might owes something to both. A tactical intellectual practice that uses the moment of the event to cross the divide between infrastructural and superstructural time.

The event is not reducible to the methods of the 'areas specialists'. When studying events from the point of view of the site at which the originate, they always remain the province of specialists who deal with that particular turf. Events often generate valuable responses from area specialists, but these usually focus on the economic, political or cultural factors at work in the area the specialists know first hand. They do not often analyze the vectoral trajectories via which the rest of the world views the event. A tactical knowledge borrows from area studies without being caught within its territorial prerogatives.

In an age when transnational media flows are running across all those academic specialties, perhaps it is time to construct a discourse that follows the flow of information (and power) across both the geographic and conceptual borders of discourse. Perhaps it is time to start experimenting, as Kluge has done, with modes of disseminating critical information in the vector field. Perhaps it is time to examine intellectual practices of storing, retrieving and circulating knowledge. Without wishing to return to the practice of the 'general intellectual', it may be worth considering whether the development of the vector calls for new ways for playing the role of the tactical intellectual. The tactical intellectual would combine the practices of tactical media and tactical scholarship, while being careful not to fall into the temporality of either journalism or the academy, but rather remain alert to the moments in which such distinct times are brought into crisis by the time of the event.

From: Michael Benson

To: nettime-l@bbs.thing.net

Date: Thu, 4 Jul 2002 17:34:22 +0200

Joanne:

Reading your text on tactical media reminds me of the experience of seeing a group of Ljubljana skinheads aggressively singing the words to the Slovenian national anthem the other day. One would think that the effect would be nationalistic, which is what they intended, but the lyrics kept on tripping them up -- only they themselves didn't know it. (The words call for equality and peace among nations) So in the skinhead's case, there was a kind of inadvertent monkeywrenching or Adbuster-style action, but one where the subversion which crept into the mix was there to begin with: it was only the context of the racist nationalists singing it that gave it a nice reversal only apparent to an outside observer. And so what was meant to be menacing was actually funny, its racist/nationalist delivery subverted not by its subtext but by its text. It was the song that detoured the singers.

In your case, what was meant to read as incisive analysis, couched in a hard-edged, dispassionate variant of the academese everyone's familiar with, is a kind of fog concealing exactly what you inaccurately accuse Godard of: it has "nothing to say" -- beyond its citations. If there's any kind of revelation in this post it's in your uneasy fascination with Godard's film about the Palestinian cause. (Right -- the same one I got to refamiliarize myself with because you lent me a tape of it when you were in Ljubljana. For the record.) "Here & Elsewhere" doesn't have nothing to say -- rather it's the only film document I know of that accurately conveys the complexity of the Palestinian/Israeli disaster, for which there are exactly no easy answers, and maybe no answers at all. But when I accuse you of having nothing to say it's also not quite right, because there's something fascinating about the coexistence of your ambivalent observations about his film with your other observations, all of which lead to a conclusion in which fellow travelers are advised to drop the metaphors of warfare, something (we're told) that's not a cop-out but instead shows "the vigilance of continuing to think, beyond the obvious..." Are we beyond the obvious here? Didn't "Here & Elsewhere" already signpost an alternative to what you call the apocalyptic vs.

utopian "sense" of the media, 30 years ago? Isn't that, more than approximately, the very voice of Godard's film I detect, rising like a stale but at least believable truth in your conclusion? I detect "nothing to say" in your post beyond what you inherited from those you'd accuse of the same.

Regards, MB

Michael-

Clearly you profess to have an intimate understanding of JoAnne's motives, conclusions. But, IMO, you only provide me with more evidence that the inherently paranoid only see the ulterior motive. If your not paranoid then you are under the delusion that your previous interactions with her have given you the insight to critique her for now, and forever. All I can do is applaud her. I hope she ignores you, Michael. She is the author ... you are nothing but a critic. She took her time to deliver a dispassionate and eloquent argument (with proper citations) that was very enlightening (especially for those of us who think the anti-globalisation folks are full of shit and just looking for a fight). And you, as a simpleton, rebuff her out-of-hand. You think you're so clever with your insider information ... but you're not ... you either missed (or ignored) the big picture.

As a very liberal democrat, I keep waiting for the anti-globalisation freaks to offer an alternative to the status quo ... but you never do. If they ever offered the first first idea on how to "better" govern then I would be their greatest champion ... but all I ever see is criticism.

It may not mean much ...but I would like to thank JoAnne. The perspective she presented may have been "obvious" to Michael but it was new to me.

Norman Mailer in 1962 interview:

There's something pompous about people who join peace movements, SANE, and so forth. They're the radical equivalent to working for the FBI. You see, nobody can criticize you. You're doing God's work, you're clean. How can anyone object to anybody who works for SANE or is for banning the bomb?

- You're not questioning their motives, are you?

I am questioning their motives. I think there's something doubtful about these people. I don't trust them. I think they're totalitarian in spirit. Now, of course I'm certainly not saying they're Communist, and they most obviously are not Fascists, but there are new kinds of totalitarians. A most numerous number since World War II.

Nature is life's greatest critic. Yet through nothing more than its relentless takedowns it has created man.

Dear Michael,

Wow, it's not every day I get compared to a Slovenian skinhead aggressively singing a dispassionate anthem. I find it hard to reply since you're right: I have nothing to say, offer no original ideas or conclusions about what is to be done, and only cite a few names and ask a few questions - about some things I think are often passed over in silence.

> Are we beyond the obvious here? Didn't "Here & Elsewhere"
> already signpost an alternative to what you call the apocalyptic vs.
> utopian "sense" of the media, 30 years ago?

Well, yes, that was the reason I used the example. Your reply seems based on a misunderstanding that I'm 'accusing' Godard of having nothing to say. When I said that Godard became embarrassed about his past and started making films that had "nothing to say" I was at least ironic, and at best serious. Apologies for not being obvious and straightforward enough, and at the same time too academic. The contrast was between having something to say -- in the sense of making absolutely declarative statements like the one's we're familiar with from the history of manifestoes - and telling a history by way of asking questions. So I am neither ambivalent nor uneasily fascinated by H&E, and I would agree with you that the film is one of the better examples of conveying the complexity of the Palestinian/Israeli disaster, maybe because it asks a lot of naïve questions, presents contradictory perspectives on the event, and instead of offering easy answers, leaves it up to others to draw inferences and conclusions. The contrast was also meant to suggest that it is maybe too easy to criticize something like the 'anti-globalization' movement for being merely negative and lacking any positive demands. It's not just a question of having something to say, but how you say it, how convinced you are of the correctness of your theory, who participates in it, how open it is to criticism and recognizing its contradictions, and probably a lot of other things which can't be listed in advance.

Ciao,
Joanne

Michael Albert, editor of ZNet (<http://www.znet.org>), has what I think is a very sensible proposal called 'Participatory Economics', about how regional economies could be run on the basis of participatory democracy. He's written two or three books about it:

This is simply not true and I can only suppose that you don't read much. There are so many concrete proposals for change it would be well nigh impossible to catalogue here. I would mention only a few to refute your assertions:

--Joseph Stiglitz (who has been mentioned on this list numerous times) is a the former chief economist of the World Bank and in his recent book he provides a highly specific critique of how the World Bank and the IMF damages the economies of less-developed nations, primarily because it is beholden to a pro-globalized-business agenda. He offers numerous suggestions for reform of the IMF and the World Bank.

--I am involved in creating an independent organization that will specifically provide certification of standards at garment factories in the developing world. It is to be funded by retailers and manufacturers, but remain independent and arms length.

BTW, It was the idea of a bunch of anti-globalization freaks including myself, working with business leaders to create a workable solution to a problem that all sides in the debate generally acknowledge is real.

Lastly, I would say that awareness is the most important element of real change. I certainly believe that most of today's misdirection is the direct result of ignorance. In a media saturated world, we remain uninformed: in a world supposedly governed by reason, we question surprisingly little; in our so-called democracies there is little debate, remarkably little public participation and little choice.

If people simply paid more attention things would change.

And if that doesn't work then lets blow things up!!
Obey little, resist much (Walt Whitman)

This is a misreading of parecon. You wouldn't get paid more for the trash, and glamour isn't a consideration.

> His "Balanced Job Complex" idea seems like a very unfunny
> joke to me.

Scorn, on its own, is a very weak argument against anything. If you want to argue convincingly against balanced job complexes, you'll have to do better than that.

> The whole "committees to decide absolutely everything"
> concept

This is a gross misrepresentation of parecon.

If you have objections to parecon, and you are really interested in thinking through the issues involved, I suggest that you try reading Albert's and Hahnel's replies to their critics on www.parecon.org; it may well be that your objections are answered there.

<nettime> Tactical Art in Virtual Space 1
From: Josephine Berry
To: nettime-l@bbs.thing.net
Date: Wed, 13 Sep 2000 13:01:50 +0000

This chapter of my thesis has just been published in the erratic British journal 'Inventory', in their latest Homo Ludens issue - <http://www.inventory.mcmillan.com/journal.htm>

Also, the footnotes have been lost in transit from Word to email...I've pasted them in at the end but annoyingly the numbers in the text are gone. Please mail me if you want to read this as a word document.

Josie

"Another Orwellian Misnomer"? Tactical Art in Virtual Space
Self-conscious tactics in an unstable space

In the wake of Michel Foucault's discussions of the discrete, invisible and all pervasive 'microphysics of power' at work within technocratic society, Michel de Certeau was moved to write an alternative account in which the 'network of an antidiscipline' is uncovered: a category of largely invisible, improvised and ephemeral practices which comprise 'everyday life'. This heterogeneous set of practices, de Certeau claims, exists outside discourse and has no proper name, belongs to no ideology, acts heterogeneously and by virtue of its elusiveness comprises an ongoing and pervasive resistance to an optical and panoptic regime of power. The exteriority of these practices to discourse is also, ironically enough, seen by Foucault to have characterised the advent of panoptic power, which emerged in a similarly 'mute' manner. The panopticon's articulation in discourse happened after the decentralised historical growth of a

panoply of observational techniques resulted in a coherent disciplinary regime. This, argues de Certeau, is a mode of power almost necessarily in decline because it has ceased to operate at an unconscious level; it has become distinct. If the panoptic mode of power gained ascendancy in silence, de Certeau speculates, what other silent forms of power are coming into being? In his 1984 book *The Practice of Everyday Life*, he asks:

"If it is true that the grid of 'discipline' is everywhere becoming clearer and more extensive, it is all the more urgent to discover how an entire society resists being reduced to it, what popular procedures (also 'miniscule' and quotidian) manipulate the mechanisms of discipline and conform to them only in order to evade them, and finally, what 'ways of operating' form the counterpart on the consumer's (or 'dominee's'?) side, of the mute processes that organize the establishment of socioeconomic order."

In what was not only a riposte to Foucault's uni-directional discussion of the discrete mechanisms of panoptic power but also an analysis of the all-too visible phenotypes of technocratic rationality, de Certeau mobilises two modes of operation: strategy and tactics. The former describes force-relationships "that can be circumscribed as proper (proper)" and which are brought to bear on objects or targets distinct and external to themselves. Strategy is the mode by which legitimated power operates from within a designated field; through language, political structures of representation, the assignment of gender roles, the regulation of space, discourses of the body and so on. In short, it is the productive mode of hegemonic power. Tactics, by contrast, has no proper site, discourse or language, of its own - it "insinuates itself into the other's place", it adorns itself in the other's garb, speaks through the other's language, and, because it has no fixed address or permanent mode, never consolidates its own achievements or preserves its conquests. Tactics comes out of the encounter with the rigid geometry of urban planning, the syntax and vocabularies of languages, the regulated flows of television, the choreography of the supermarket. In de Certeau's terms, tactics is the practice produced by 'making do' with the oppressive conditions of modernity and common people are 'unrecognised producers, poets of their own affairs, trailblazers in the jungles of functionalist rationality'. It is a mode of production based in the heart of consumption, a production that feeds on the desire provoked by the commodity but which is used in the creation of an own language rather than the singular conformity to the libidinal economy of the commodity's 'promissory note'.

But if Foucault and de Certeau can claim the desublimation of the panopticon, then we can also claim a similar coming to consciousness of tactics. And just as the discourse and the techniques of the disciplinary society are split, so too are the goings on of the everyday and their discursive integration into politics and aesthetics. In 1992, the term 'tactical media' was coined by the Amsterdam based organisers of the first Next5Minutes conference Geert Lovink, David Garcia and Caroline Nevejan in 1992. This term soon found its way onto media theoretical mailinglists such as nettime, and the term gained common currency in the virtual communities, working groups and social circles in which net artists participate. By the third Next5Minutes conference on net culture in March 1999, 'tactical media' had become the organising subject, with activists, media theorists, artists and technologists debating a new context and mode of political and cultural resistance. In the post-68 political environment in which the notion of a united front of resistance as questionable as its erstwhile target, imperial power, is anachronistic, the vagrant hybridity of tactics provides an important model for conceptualising and organising resistance. The structure of the Internet, which mirrors and fuels the decentralisation and hybridity of the global market economy and its geo-political correlatives, becomes an obvious and important site for resistance.

In the analysis of net artist's involvement in the cultural logic of tactical media which follows, the discussion will be framed by the problematic of virtual space. Although a closer enquiry into the phantasmatic quality of space on the Net will be presented in chapter 3, for the present the discussion will hinge on the friction between the idea of real and virtual space. Although tactics, as theorised by de Certeau, are by no means limited to spatial practices, I have selected this framework partly because it is the existence of an evasive but irreducible difference between real and virtual space that gives the Net its distinctive identity. It is within the context of a contested splitting of real and informational space that the phase shift of power pointed to by Foucault and de Certeau (the shift from disciplinary power to what Negri and Hardt have recently termed the 'biopower' of 'Empire') begins to emerge: a world in which power has become as deterritorialised as capital. Out of the four artworks discussed in this chapter, only Heath Bunting's *X Project* addresses this spatial splitting directly but, as I will argue, the ontology of virtual space and its impact on behaviour are crucial concerns and points of leverage for all the artworks considered. While some net critics argue the danger of the libertarian rhetoric of dual

worlds in which cyberspace is cast as the zone of borderless and unfettered freedom, others see their disjuncture as promising a radical potential. I will be using the widely diverging theories of the spatial and environmental production of the subject offered by Walter Benjamin, Michel de Certeau, Marc Augé and Slavoj Žižek to think through 'the practice of everyday life online' which the artworks of Jodi, Etayo, Rachel Baker and Heath Bunting present. In these works, the posting of 'typical' kinds of behaviour by net artists presupposes a definition of the nature of space and place, and vice versa. It is through the exploration of everyday behaviour, which is the concern of tactical net art, that the radical potential and oppressive flattening of cyberspatiality is brought into focus.

In a more limited respect, and as we have seen in chapter one, artists were drawn to the Internet because it offered them the possibility of a different kind of 'professional' practice; indeed a chance to elude the professionalisation of their own practice. In this sense, the Net offered them a 'tactical' space in which to evade the strategies of the art market. But if the Net seemed to offer such a tactical topology, it also imposes a new set of conditions which can be seen as belonging to strategic power within which art must operate. The establishment of technical protocols and languages such as the Domain Name System (DNS), TCP/IP, HTTP, HTML, XML, CGI and so forth impose a language or architecture from 'above'. But, beyond the expansion and elaboration of tactics and strategy along older lines, the Net participates in a broader development of mutual imitation that occurs within both dominant cultural strategy (the 'Prada Meinhoff' mode of advertising) and cultural resistance (the adoption of corporate identities). In other words, strategy and tactics are becoming harder to distinguish or require a new set of conceptual tools with which to decode them. An important aspect of this development for the online environment is the mutability of the Internet's distributed networks and digital modalities which complicate the production/consumption binary. The ease, for example, with which a digital file can be copied, parsed, mirrored, linked to and endlessly redeployed makes it, in some senses, extraordinarily vulnerable to tactical use. However, this malleability is also harnessed by the strategic forces of power at work in the Net; we begin to lose the distinction between the 'properness' of strategy and the vagrancy of tactics. Where de Certeau describes tactical action as a slow, erosive force, the 'overflow and drift over an imposed terrain, like the snowy waves of the sea slipping in among the rocks', in the new media age tactics are operating under more mutable conditions in which strategy no longer resembles anything so static as rocks. To grasp this more concretely, we have only to consider the intensification of market research carried out within the Net - based on the increased ease with which individuals' movements and patterns of behaviour can be tracked through inventions such as 'cookies' - to get an idea of how responsive the system has become. This is not yet the technological dystopia imagined by Arthur Kroker and Michael A. Weinstein in *Data Trash*, where the subject has become totally assimilated into the instrumental operations of virtual reality. But, to a great extent, the user does provide the 'encrypted flesh' or behavioural data-set required by the market to continuously reinvent itself in the putative image of the user-consumer who, in turn, reflects the conditions of consumption - the series of choices on offer - in a recursive loop.

Media theorists and activists David Garcia and Geert Lovink identify the shifting, mutating and transferable quality of digital data on the Net as 'media hybridity' and discuss the mobility it produces in their influential manifesto *The ABC of Tactical Media* written in 1997. The first passages of the manifesto synthesise the ideas set out in de Certeau's *Practice of Everyday Life* thereby explicitly revealing the indebtedness of the concept of 'tactical media' to his work. In their text, which was posted on community-building mailing lists such as *nettime*, Garcia and Lovink update de Certeau's tactics for the New Media environment, and elucidate on the centrality of mobility and hybridity for this newly 'instrumentalised' practice of everyday life:

"But it is above all mobility that most characterises the tactical practitioner. The desire and capability to combine or jump from one media to another creating a continuous supply of mutants and hybrids. To cross borders, connecting and re-wiring a variety of disciplines and always taking full advantage of the free spaces in the media that are continually appearing because of the pace of technological change and regulatory uncertainty."

We should not forget that this manifesto of tactical media was written at a time in which governments were still in a state of relative confusion over how to regulate the activities taking place over the Net as well as the Net's own technical administration. Although 1996 saw the first serious piece of U.S. Internet legislation in the form of the Communications Decency Act, international governments were still in a state of confusion as to which existing laws could be stretched to deal with the network, what new legislation was required and how, if at all, it could be enforced. This was a symptom of the Net's awkward transformation

from a U.S. government owned and academically administered research and communications tool, to a commercially open, privately financed space of international exchange. In the period between 1996 and 2000, a flurry of legislation has taken place regarding encryption, public surveillance of private communications, the liability of ISPs for the content stored on their servers, and a 'purely technical' body has been appointed by the U.S. government to regulate and administer the DNS system - the Internet Corporation for Assigned Names and Numbers (ICANN). These are just some of the areas in which the Internet's once 'wild frontier' is being tamed, and strategy is extended itself legislatively and bureaucratically into this formerly disregarded zone.

Returning to tactics, the marriage of the terms 'tactical' and 'media' has come to signify something more than the new terrain of everyday practice. 'Tactical media' belongs to a whole cultural turn in which what might be described as the old 'strategies' of art and politics are abandoned in favour of a parasitic, fast mutating and non-originary practice. The modernist belief in conceptual and aesthetic originality or the political belief in the aggregative basis of opposition such as class and trade unions cede to a postmodern refusal of such 'essentialist' individual and collective definitions of subjectivity. Once entities such as authenticity and originality are invalidated by contemporary thought and the belief in the plausibility of global revolution retracts into the limited struggles of the 'new social movements', the modest contingency of tactical practices come to the fore; a form of culture and politics as far beyond metaphysics as the virtualised environment (both on and off the Net) in which they unfold. The predominance of parasitism and vagrancy in net art as such, clearly owes much to the precursive experiments of minimalist and site specific art which began in the 1960s: the threshold of the information (post-disciplinary?) age. By this I mean site specific art's location within a pre-existing network of spatial, social, economic and political relations as against the artwork's creation of a series of separate and internally constituted 'internal relations' - the zenith of modernist practice as theorised by Clement Greenberg. Although not necessarily adopting practices of the everyday, the expansion of the artwork's limit beyond its physical 'pretext' to include a self-constituting network of forces and relations is an important anticipatory development. Michael Fried discusses this new turn in 'literalist' or minimalist art thus:

"There is nothing within [the beholder's] field of vision - nothing that he takes note of in any way - that, as it were, declares its irrelevance to the situation, and therefore to the experience, in question. On the contrary, for something to be perceived at all is for it to be perceived as part of that situation. Everything counts - not as part of the object, but as part of the situation in which its objecthood is established and on which that objecthood at least partly depends."

This art in which 'everything counts' is a phenomenological conception of the artwork's meaning occurring in dynamic relationship between work, viewer and world. In Frederic Jameson's description of the awesome scope of a Hans Haacke artwork, the circumference of the 'situation' and the intricacy of its phenomenology extends far beyond those immediate elements which comprise the artwork's situation to encompass a global situation. This scope is also the scope of the 'situation' articulated by net art:

"in the work of Hans Haacke, for example, [conceptual art] redirects the deconstruction of perceptual categories specifically onto the framing institutions themselves. Here the paralogisms of the 'work' include the museum, by drawing its space back into the material pretext and making a mental circuit through the artistic infrastructure unavoidable. Indeed, in Haacke it is not merely with museum space that we come to rest, but rather the museum itself, as an institution, opens up into its network of trustees, their affiliations with multinational corporations, and finally the global system of late capitalism proper (with all its specific representational contradictions)."

Here the artwork is understood as creating a self-consciousness in the viewer which operates on their own unarticulated and/or unreflexive behaviour (looking at art in public space) and the seemingly remote and silent functionings of the world order. If we consider how the collective and largely undirected construction of Net gives the many activities which compose 'the practice of everyday life' a greater emphasis, while the emphatically global scale of the Net creates a very different scale for these activities, we can imagine how the self-reflexivity of the viewer gains a seemingly more affective quality - hence the sharp focus laid on the relationship between behaviour and global 'situation' in net art. The artwork's animation of the intersubjective relationship between the user and situation can also, in Hegelian terms, be said to have effected a shift from a quotidian use of tactics 'in themselves to a practice of tactics' for themselves. The tactical mode has become an explicitly self-conscious way for net artists, activists and media workers to act in cyberspace, lifting the small scale countervailing practices of the everyday (the repurposing, circumventing, jamming, connecting, reversing

etc. of disciplinary powers) to the level of programmatic cultural resistance. This tactical self-consciousness in net art can sometimes exceed that possessed of site specific art because its self-reflexivity invites the viewer not only to see their (physical, ideological, economic etc.) relationship to the work and the world as part of the work's circumference and vice versa, but also because it often invites them to participate in its morphology. This invitation, although not unprecedented, has an easiness based in the contiguity of the space of art and the everyday in the Net, which comprises a (relatively) unhierarchical organisation and materially homogeneous consistency of space. Art ceases to be perceived as the site at which 'the practices of everyday life' grind to a halt and a different kind of behavioral logic takes hold. Some critics have optimistically formulated this development as 'the art of involvement' and designate preceding experiments in interactive art 'open works'. In contrast to the viewer's role within 'open work', where the viewer is solicited to 'fill in the blanks, to choose between possible directions, to confront the differences in their interpretations [to explore] the possibilities of an unfinished monument', "the 'art of involvement' no longer constitutes an anterior work at all but rather, "causes processes to emerge, it seeks to open up a career to autonomous lives, it invites one to grow and inhabit a world. It places us in a creative cycle, in a living environment in which we are always already co-authors."

But where does such a programmatic reading leave tactics? Are tactics simply another name for the productive capacity of countless individuals which can be massified into a coherent aesthetico-political project? Are they the behaviours preyed upon by marketers in their search for the true identity of the consumer or are they that which necessarily eludes this form of systematic reincorporation? Do tactics become available to strategists when they reach the level of self-consciousness revealed in the term 'tactical media' and therefore cease to be tactical? In net art, as with the coming to self-consciousness of tactics within tactical media, it is possible to see the elevation of this everyday practice of resistance (for example la perruque - the use by factory workers of their employers' resources for their own private ends) to the order of dominant cultural strategy. If tactics no longer solely constitute ways of 'making do' under the oppressive conditions of society, but begin to attain the legitimization of artistic value or political *modus operandi*, do they still remain the 'antidiscipline' to the dominant order? By investigating this question, we must necessarily ask the question of how tactics themselves change in virtual space, which in turn poses questions over the nature of that space. But it is important to bear in mind that no matter how self-consciously net artists are adopting tactics, their mutating nature is as hard to fix down as the changeability of the material and semiotic terrain in which they unfold.

A Place Made of Space

De Certeau's distinction between place and space - one importantly adopted by the anthropologist of 'supermodernity' Marc Augé - will be helpful when determining the nature of the tactical mode in net art. Place, for de Certeau, describes the coexistence of things determined by their respective occupation of an exclusive location. And conversely, that location is reciprocally defined by a thing's occupation of it. In short, 'the law of the proper' rules in the place'. (This 'properness' is partly responsible for Augé's positing of 'place' as a form of resistance to the deterritorialized disorientation of supermodernity). Space, by contrast, is "composed of intersections of mobile elements" it "occurs as the effect produced by the operations that orient it, situate it, temporalise it, and make it function in a polyvalent unity of conflictual programs of contractual proximities." De Certeau essentialises this difference by drawing an analogy to the difference between *langue* and *parole*. Tactics is then, nearly by definition, a spatial mode, and one through which place is practiced and experienced.

But what could be said to constitute a place on the Internet? The word 'site', which in ordinary speech would designate a precise location in space, doubles as the technical term used to indicate a particular digital file or 'information object' which is only ever viewed in the form of a reassemblage. That is to say, what we view in our browser window is the software's interpretation of a set of instructions - a string of os ands. On the Internet, although things can be designated a coordinate (an IP number or URL) nothing can ever be said to occupy a unique location. But even if we accept the distinction made by de Certeau and Marc Augé regarding place and space, and even though a website no longer occupies a singular location in the manner of a physical object, it is still possible to see its equivalence to place. As with place, we know what we have to do to get there, as with place we can compare the experience of having been there with others, as with place our knowledge of it is always existential, dynamised by our passage across it, infected with our intentions towards it, coloured by our encounters within it. But crucially, unlike place, we cannot build a sense of identity around a site on the Internet, we cannot belong to it and least of all attach foundation narratives to it. We cannot feel within it the echo of what Augé describes

as 'anthropological place'.

Quoting from the ethnologist Marcel Mauss, Augé discusses the part-fictional character of anthropological place in terms of the relationship of what the former terms 'average man' to the territory he inhabits. This man is born into a closed world, founded 'for once and all' and inscribed so deeply upon him that it does not have to be consciously understood. The 'total social fact' subsumes within itself any interpretation of it that its indigenous members may have: "The 'average' man resembles 'almost all men in archaic or backward societies' in the sense that, like them, he displays a vulnerability and permeability to his immediate surroundings that specifically enable him to be defined as 'total'". As we shall see presently, the connection between environmental permeability and a particular kind of identity are important subjects for the tactical practice of net art. The level of imperviousness which characterise the 'average' user's relation to the Net is a point of investigation for these self-conscious tacticians attempting to create a more bruising encounter between the space of the Net and its subject. In order to become the producer of an idiolect (the personal/tactical mode of enunciation formed within imposed structures), the subject must become sensible to the particularities of their environment and confident of their ability to find their own passage through it.

In 1996, the Swiss net art group cum spoof 'corporation' Ettoy targeted the supposedly neutral zone of the search engine with their artwork Digital Hijack. Search engines are some of the most frequently 'visited' sites on the Net with Altavista already drawing 32 million users per day by September 98. They act as huge centres of traffic convergence in the supposedly decentralised structure of the Net, but notably - similarly to airports - cannot be described as places of gathering. Although visitors frequently return, it is not in order to find something rooted in a singular location or to meet other visitors, but rather to use a service that spatialises the rest of the Net through the production of a set of URLs. Hartmut Winkler attributes their popularity to their perceived neutrality: "Offering a service as opposed to content, they appear as neutral mediators." It is precisely because the search engine serves as a portal to elsewhere that it becomes a heavily frequented site. For this reason we can see the search engine as the quintessence of the transformation of place into space, or the predication of place on space in the Net. The fact that a site's centrality is directly related to its distributive capacity tells us a great deal about the way in which spatial practices on the Net are characterised by passage rather than settlement. Nothing could be further from the permeability of the subject to anthropological place than the indifference of the Net user to the putative neutrality of the search engine website.

And it is precisely this neutrality that Ettoy singled out for attack in their Digital Hijack. In tune with Winkler's criticisms, Ettoy created a mechanism for alerting people to their passive acceptance of the search engine's mode of selecting and hierarchising URLs. The actual method of aggregating and organising websites in accordance with the user's keyword is, in reality, anything but exhaustive or disinterested. In the early days of search engines, some companies (such as Yahoo) paid employees to categorise websites 'by hand', thus making available only a tiny proportion of the total number of websites on the Net. Of course what was made available was the final result of a series of subjective choices and corporate categorisations made by a team of coders. The subsequent automation of this process has not, however, resulted in any fundamental increase in accuracy, comprehensiveness or compatibility between the keyword and the list of URLs displayed in response. Unable to master complex linguistic issues such as syntax, and therefore unable to interpret the meaning of strings of search terms, many search algorithms will simply prioritise URLs according to the number of times the search terms are mentioned.

This is just one example of how the map of the WWW produced by the search engine is deficient and, more importantly for us, how the system is vulnerable to manipulation. Realising this point of leverage, Ettoy began to analyse the top 20 sites returned by search engines in response to some of the most popular search terms such as 'porsche', 'penthouse', 'madonna', 'fassbinder'. Essentially, Ettoy found a way to manipulate the system by updating an older practice called spamdexing. This is a simple 'hacker's' trick by which a keyword is inserted repeatedly into an HTML document to ensure that a website is featured high up in the search engine display hierarchy. Ettoy used their 'Ivana bot' (probably an algorithm) to analyse the particular combination of keywords embedded in the top 20 websites returned to a keyword such as 'porsche' and then mimicked it. They then generated thousands of 'dummy trap' pages each of which contained combinations of thousands of popular keywords, thus ensuring that the pages would be returned in the top 20 category of myriad word searches. For a short period after March 1996, surfers using search engines were regularly 'hijacked' by dummy trap pages which, far from displaying information about a desirable car or pornstar would harass hostages with the message: "Don't fucking move - this is a digital hijack by ettoy.com". If the hostage/viewer decided to follow the links through the website,

they would first discover what number hostage of the Etoy 'organisation' they were, then view an animated graphic image file (GIF) of a shaven-headed Etoy member in dark glasses and ambiguously plugged into a cable at the navel, and finally receive a blunt mission statement:

"It is definitely time to blast action into the Net! Smashing the boring style of established electronic traffic channels.

Welcome to the Internet Underground".

Today, after the search engines succeeded in terminating Etoy's action, the statement posted on a sample site concludes:

"Although officially stopped, we cannot protect you from getting hijacked. We lost control.

PIRATES FIGHTING FOR A WILDER NET!"

Shock and the Order of Experience in Modernity and the Net

Walter Benjamin's discussion of the relationship between memory and experience is a useful text to draw on at this stage, because it provides an excellent way of thinking about the shock tactics used by Etoy, their role in the practice of place as well as a means of contrasting the space of modernity with Augé's discussion of anthropological place - a crucial way of entering a discussion on place in 'supermodernity' and on the Net. In his essay 'Some Motifs in Baudelaire', Benjamin splits experience into two terms: *Erlebnis* and *Erfahrung*. By *Erlebnis*, Benjamin means an experience for which we are psychologically prepared, against which we have developed a protective shield to parry the impact of a stimulus. Referencing Freud, Benjamin argues that experiences absorbed in such a way can pass instantly into our conscious experience (*Erlebnis*) because they do not produce any traumatic effects - traumatic stimulation being understood here as the basis for (involuntary) memory, a function of the unconscious. *Erfahrung*, on the other hand, is the order of experience attributed to a stimulus for which we are unprepared. Our lack of anticipatory shielding means that this experience cannot immediately enter our consciousness, but instead plants a memory trace that will then be worked through retroactively, through the act of involuntary memories or dreams. *Erfahrung*, therefore, is the order of experience which entails a dissolution of shock through the psychological relay of revisitations: the integration of an experience into a deeper level of identity. One that cannot be casually and voluntarily recalled, and equally cannot be so easily disposed with. Benjamin understands Baudelaire's lyrical relationship to the modern metropolis as the, perhaps paradoxical, endeavour to preserve its series of shocks in the conscious act of writing poetry. And asks how 'lyric poetry can have as its basis an experience for which the shock experience has become the norm.'

Benjamin, along with other modernist theorists of the metropolis such as Georg Simmel, makes the observation that as we grow accustomed to the battery of shocks afforded by the crush of population density, the chaos of crowds, the din and danger of traffic so too do our protective shields become more efficient and total. In the modern city, *Erfahrung* diminishes under the callousing of *Erlebnis*. Benjamin, quoting from Baudelaire, figures this shift in the disappearance of the daydreamer's unfocused look and the advent of the prostitute's wary and shifting glance:

"Her eyes, like those of a wild animal, are fixed on the distant horizon; they have the restlessness of a wild animal but sometimes also the animal's sudden tense vigilance."

Let us then compare this condition to the permeability of the 'average man' in anthropological place. Here we can examine how collective social symbolisations work upon the irregular topography of place as an index of *Erfahrung* and *Erlebnis*. In Augé's characterisation of anthropological place (as constructed by the ethnologist Mauss) he discusses how, despite the indigenous inhabitants' knowledge of the relativity of their home territory, they confer upon it the mythical status of a singular origin. A way of naturalising the contingent. Each new occurrence, such as a birth or death, however well 'known', has to be incorporated into a discourse and thereby naturalised into the mythological syntax. In other words, the specificity of place is constantly demarcated and thereby reaffirmed through its inscription in the foundation narrative. By contrast, in de Certeau's discussion of the 'concept-city' - the modern city of enlightenment rationality and the urban planner, the city whose origins Baudelaire witnessed and the precursor of cyberspace - the specificity of place and its subjects is flattened through the imposition of the universalising, self-constituting and dehistoricising myth of rationality. A myth which excludes those stubborn particularities which cannot be assimilated into its system: "a rejection of everything that is not capable of being dealt with in this way and so constitutes the 'waste products' of a functionalist administration (abnormality, deviance, illness, death, etc.)." Occurring then at the same time as the increased violence of the modern city and its concurrent defensive psychological

mechanisms is the invalidation of the specificity of places and their inhabitants, their histories and contradictions. We can view the concept-city as a utopian/dystopian fantasy existing in advance of (and at odds with) its actual construction, operating in tandem with the order of experience which Benjamin terms *Erlebnis*.

But what is the order of 'shock' manufactured for Etoy's digital hostages? The search engine itself can certainly be seen as a kind of concept-city imposing the template of universality and rationality - through its promise of categorisation and inclusiveness - onto the specificity of the Net's myriad layers, aggregations and networks. The user's God-like view over this map of the Net involves the same fantasy of legibility that transfixes the beholder of a city from above. Perhaps in this sense, the production of the dummy trap page causes the user to tumble from their vantage point into the sticky illegibility of the Net's tangled and undecipherable networks - the tactical point of view. These self-conscious tacticians have wrested the stunned subject from the alienating universality of the spectacle and returned them to the everyday practice of the walker who 'write(s) without being able to read'. Or rather, who reads a single page without knowing what else they might be able to read. But has this really shocked the viewer? Has the hoax managed to slip in under the guard of the viewer's sensory shield and produce *Erfahrung* in the place of *Erlebnis*? Or we could ask the question thus: has the viewer's divestment of the fantasy of legibility and the universalising myth of the Net's inherent rationality produced a bruising encounter with environmental specificity and in some sense converted the search engine into an actual place? This question contains within it the presumption that the 'view from above', the construction of legibility is a means by which the subject defends against the shock which is nothing other than a glitch in the symbolic tissue through which the Real is momentarily glimpsed. (I will return to this psychoanalytic line of enquiry below).

But there is an incompatibility between these questions and the Net because here we are dealing with a simulacral system par excellence. Within such a system, and in particular one that operates on the principles of its digital mutability, it is harder to perceive the distinction between an actual breakdown and its simulation or the occurrence of the unexpected within a programmatic field of novelty production. Furthermore we are also dealing with a zone of naturalised hybridity. The search engine applies the logic of library categorisation to a networked computer file system which, in turn, adopts the imagery of geographical space as evidenced in words such as 'website', 'site map' and 'portal' and the browser softwares' adoption of the terms 'navigator' and 'explorer'. The ease with which these categories can be successfully combined reveals a great deal about the malleability of the Net's symbolic economy. So long as equivalences can be found between semantic systems and an appropriate representational language assigned, then their combination is permissible. This environment then is neither the original site of the indigenous fantasy nor the concept-city with its disjunctive between rationalist myth and specificity. When Etoy engineer the shock of a dummy trap page, they may educate the viewer as to the workings of the system but they do not create any fundamentally new relationship or fantasy between the viewer and the site. In effect the dummy trap page is just a further augmentation of the constantly shifting simulacral panorama that is the Net. In this respect the Net does not possess the metaphysics of place where things reside in an exclusive location and around which or against which systems of meaning operate. It is, rather, a differential system without, to borrow a term from Baudrillard, 'limit'. Self-conscious tactics, if they do not rupture the simulacral texture of the Web and remain instead within the play of difference, are unlikely to produce the experience of shock through which place might be felt.

X marks the Spot: Portals to Place

When Josephine Bosma entitled her 1997 interview with Heath Bunting

"Street Artist, Political Net Artist or Playful Trickster?" she linked together some of the key issues at work in Bunting's tactical use of the Net. Were the word 'or' to be replaced with 'and', dispensing with the false problem of choosing between three not incommensurate identity types, we would have a description of the artist which hits upon the crucial attribute of his art: the creation of friction between real and virtual space through the indeterminacy of play.

In the same interview Bunting discusses a work that he would later title CCTV - World Wide Watch. His deadpan tone conveys very well the essence of the tactical mode; at once ironic, throw-away and serious:

"At the moment I am working on a closed circuit television camera project across the Internet whereby you can watch various city centres in various countries of the world, for instance Tokyo, Dublin, LA and London. Each of these cameras is linked to a webpage and on that webpage you are encouraged to watch these street locations for various crimes. If you see anything, you can type the details into the text box, click a button and this information will be sent directly via fax to the local police station, for instance at Leicester Square. So it's somehow encouraging people to police themselves and save the police some labour, so they don't have to watch other people."

In the final version of the project, Bunting confronts the viewer with a sequence of near-aerial CCTV views of 5th Avenue, New York; Broadgate, Coventry; the Marktplatz, Gutersloh, Germany and Oviedo, Spain. But the viewer's giddy sense of voyeuristic power, derived from the ability to view four city scenes simultaneously, laid out in their unconscious legibility for our scopophilic gratification, is undercut by the invitation to intervene. The viewer is confronted with the choice of converting the implicit power of the gaze into its explicit enactment (I am choosing to believe that the fax numbers are what Bunting says they are); a choice which splits the viewer's subject position between an occupation of the legible space of strategy and the tactical and partial space of everyday life. The contradictory nature of the spaces conflated in this work (both God-like and on-the-ground) - a spatial multiplicity which the Internet's networked expanse and digital mutability indifferently accommodates - becomes unbearable when the viewer's potential affectiveness looms into view. In contrast to the Digital Hijack where the hoped for moment of awakening is instantaneously neutralised by virtue of its inability to step outside the dominant simulacral economy, Bunting shocks the viewer awake with the unsettling possibility of cutting through the simulacral field of equivalences and precipitating an intervention into the particularities of place and its inhabitants. The viewer is accustomed to occupying both subject positions independently of each other; it is also usual to forego agency when occupying the God-like vantage point (perhaps a precondition of the fantasy of legibility?) and legibility when occupying the 'writerly' position of Wandersmann. In short, the shock delivered here is the shock of occupying the position of power where legibility and agency are combined. This dual position of legibility and involvement is not dissimilar to that occupied by the flâneur, as explored by Benjamin in his discussion of Baudelaire and the Paris of the Second Empire, who is at once entranced by the crowd but also, whose fascination with this fleeting, polymorphous spectacle is a writerly one, whose style it is 'to go botanizing on the asphalt'.

But if CCTV - World Wide Watch playfully and critically insinuates the look of power, it also implies the reciprocal gaze of its subject. Next to the form which, in its generic simplicity, invites the viewer to reflexively dash off a note to the ever attentive forces of law and order, are set the words:

"Improve self policing with further absented police force."

This exhortation to internalise the burden of policing and thus further atomise and virtualise the forces of discipline until no external display of power remains, ironically articulates the ultimate Foucauldian dystopia: a dystopian order against which de Certeau's antidiscipline of tactics is practiced. Here the viewer, who can perhaps be cast as unconsciously assisting the spread and perfection of Foucault's 'political technologies of the body' by incorporating them seamlessly into the fabric of his/her life, is confronted not merely with those technologies but their articulated discourse. As with the conflation of spaces and gazes, CCTV also conflates the normally silent functioning of the technology with its explicit enunciation. Here we have a concise example of the self-conscious adoption of tactics which differs significantly from those tactics described by de Certeau.

As already stated, de Certeau's point of departure is Foucault's analysis of the historical development of a diffuse set of disciplinary techniques (an overwhelmingly optical and panoptic mode of observational discipline) whose development he traces back to the advent of the rationalist discourses of the Enlightenment. An origin from which, Foucault argues, the technical modalities increasingly diverge:

"Foucault thus distinguishes two heterogeneous systems. He outlines the advantages won by a political technology of the body over the elaboration of a body of doctrine. But he is not content merely to separate two forms of power. By following the establishment and victorious multiplication of this 'minor instrumentality', he tries to bring to light the springs of this opaque power that has no possessor, no privileged place, no superiors or inferiors, no repressive activity or dogmatism, that is almost autonomously effective through its technological ability to distribute, classify, analyse and spatially individualise the object dealt with. (All the while, ideology babbles on!) This gallery of diagrams has the twin functions of delimiting a social stratum of practices that have no discourse and of founding a discourse on these practices."

So as the techniques of power lock tight, so too does their ubiquitous hold over society grow silent. But, ponders de Certeau, once their silent history has been uncovered and their primary (panoptic) technique articulated, have they then fallen into decline? Was their successful ascendancy not a consequence of their silent technical advances and lack of dogma? This questioning causes de Certeau to cast around for other 'technological practices', which lack the coherence of the panopticon, which may be scattered, heterogeneous and 'polytheist' but whose silence or existence outside discourse endows them with the potential to "produce a fundamental diversion within the institutions of order and knowledge." And herein lies the paradox of de Certeau's undertaking, namely to articulate a practice of resistance whose very status as such, not to mention efficacy, relies on its resistance to articulation. But for de Certeau, it seems, the guarantor of their survival is their imbrication in the very heart of regulatory disciplines such as consumption. They constitute the ineradicable indexes of alternative techniques and practices which return, like the repressed, in the disciplinary regime which attempts to dispel them.

A project by Bunting that seems to lie closer to this understanding of tactics, and yet perhaps exemplifies the difference of tactical media all the more, is his X Project begun in 1996. Combining his predilection for wandering about city streets and the semi-legal practice of tagging in chalk with his interest in the emergent social space of the Net, Bunting began a systematic programme of tagging the URL 'www.irational.org/x' in strategic places, primarily in London but also in other sites such as Bath, Amsterdam and Berlin (one presumes he simply tagged in the cities he happened to visit). If a passer by, on observing the URL, felt inclined to look it up on the Net they found a white page with minimal information on it. Underneath a JPEG derived from the chalked tag are the following three questions: "Where did you see this chalked? (Please include city and country)"; "Why do you think it was done?" and "Who do you think did it?" On filling out and submitting the questionnaire, a page which collates all the answers is downloaded. Today there are several hundred entries. The specific sites that the artist chose to tag were by no means random; in London Bunting primarily chose bridges (Hungerford and Waterloo) as well as international sites of significance to new media culture such as Clink St, (the site of an independent media laboratory Backspace where Bunting and Rachel Baker often worked). The Hub in Bath and De Waag in Amsterdam. It is likely that the bridges indicate the notion of crossing between zones - the central activity of X Project - and that the media centres also intimate concerted initiatives to depart local geography and enter into series of remote collaborations.

By means of the chalk tag, Bunting has created a semiotic and functional portal between virtual and physical space. In contrast to Digital Hijack, X Project taps into the contingencies of wandering. Rather than manufacturing a shock for the viewer, caught unawares in the midst of their impervious passage through the regularised space of the search engine, Bunting positions his tag to be caught by the corner of the eye in the midst of an awkward climb up the steep steps of a bridge or in the nooks and crannies of back streets - a mode in which awareness of place is heightened. The chalked tag catches the walker in the midst of a tactical traversal and the project's completion relies upon the viewer's alertness and curiosity to pursue this index of virtual space in the midst of an actual place. Rather than reinforcing the sense of the homogeneous order of virtual space, Bunting hybridises physical and virtual space and creates a tear not only in the latter but also in the former. Interestingly, it is by making this incision in the self-containment of each - or rather making explicit the impossibility of such self-containment - that the contingent and self-erasing nature of wandering can be mapped, recorded and co-ordinated. This suggests the potential of a view from above that is created from below and a reversal of the power implied in this same reversal. Rather than the fantasy of legibility implying a disengagement from the everyday, here legibility is created by and for the walker, the subject of the gaze. Perhaps this text is written blind, but it promises the eventual possibility of being read. The series of correspondences which 'emerge' on the website brings into being the consciousness of the cumulative potential of individual wandering. Tactical media art is here shown to be not only the coming to self-consciousness of those silently resistant ways of operating, but also the power resident in this coming to consciousness. A recognition that

precipitates an aggregation, and hence the realisation of the power which these myriad movements compose. The first in a long series of answers to the question "Why do you think it was done?" encapsulates this notion very well: "to collide the known with the emergent."

Has VR really killed desire? Tactics and Post-Oedipal Space

Bunting's interplay of 'real' space and 'virtual space', their ability to interrupt each other, poses an interesting question to a popular formulation of Slavoy Zizek's. In a series of writings on cyberspace and the functioning of desire, Zizek proposes that virtualisation reveals the always-already virtual nature of reality - the role of the symbolic order - at the same time as bringing about a 'psychotic' suspension of the symbolic order that structures this same reality. In the beginning of his essay "Quantum Physics with Lacan", Zizek illustrates this point by referencing Lacan's discussion of courtly love. For Lacan, courtly love is not a means of intensifying desire by creating more obstacles between its subject and object, but rather of concealing the fact that the possibility of satisfying desire *per se* does not exist: an impossibility that is concealed by its very prohibition. In Lacan's own formulation courtly love is: "A very refined manner of supplanting the absence of the sexual relationship by feigning that it is us who put the obstacle in its way." Desire, explains Zizek, is a short circuiting between the 'primordially lost Thing' and an empirical object which is elevated to the order of the former: 'this object thus fills out the transcendental void of the Thing, it becomes prohibited and thereby starts to function as the cause of desire.' In cyberspace, however, (and for Zizek, it is important to remember, his definition of cyberspace hangs somewhere between its actual and projective forms in the absence of specific, concrete examples), when 'every' empirical object can be immediately obtained without the ordinary frustrations such as the need to cross physical space or the unavailability of the desired item, 'the absence of the prohibition necessarily gives rise to anxiety.' The question that is posed here is how desire can be sustained let alone function when its paradoxical nature - 'the fact that desire is sustained by lack and therefore shuns its satisfaction, that is, the very thing for which it officially strives' - is laid bare. Zizek answers this by describing a trend in which the computer generation becomes increasingly unable to tolerate the look of desire in others, and are wont to forget about a possible sexual liaison because, for example, they are too engrossed in playing computer games or interacting in chatrooms. As prohibition is lifted and desire declines, last ditch attempts to preserve the dignity of the sexual object are mounted such as PC and religious fundamentalism. But the real effect of these prohibitive discourses is a phobic reaction to 'normal' sexual enjoyment which is everywhere cast as perverted. This, argues Zizek, develops the subject as pathological Narcissus who prefers 'interaction' with the computer over sexual engagement with another. Both VR and 'interactivity' are in Zizek's terms 'Orwellian misnomers', covering up in the former the demise of the already virtual structuration of reality and in the latter the increasing isolation of the individual who no longer interacts properly with others.

At the root of the individual's primordial envelopment in virtual space is 'the dream of a language which no longer acts upon the subject merely through the intermediate sphere of meaning, but has direct effects in the real.' Yoked to this dream of profound involvement, is the radical disengagement of the post-oedipal subject. The psychotic's relation to the symbolic (one which Zizek compares to the subject of cyberspace) is defined by externality and overproximity. On the one hand he/she is not interpellated into the symbolic order (the signifying chain is 'inert') and remains outside it, and on the other the gap between 'things' and 'words' is collapsed and he/she starts to treat words as things or things start to speak themselves. In cyberspace, the space between word and thing which sustains sense is collapsed, as is 'symbolic engagement' which operates in this space, resulting in radical disengagement: 'I can pour out all my dirty dreams, precisely because my word no longer obliges me, is not 'subjectivised'.' Interestingly, however, Zizek shies away from describing a total collapse of the symbolic economy in cyberspace or virtual reality (interchangeable terms it seems here). Instead, he sees the agreement between users to suspend the usual performativity of the symbolic order as analogous to the agreement between analyst and analysand in which the normal performativity of the speech is also suspended; the analysand can hurl verbal abuse at the analyst and it won't be taken personally. Likewise, in cyberspace, the participant consents to 'play the game' in which, despite words having little or no performative value, they are nonetheless bound by the symbolic pact of the 'act of faith' in which intersubjective relations in cyberspace are contained.

One of the main difficulties with Zizek's analysis is his characterisation of cyberspace itself as the context in which this new order of subjecthood finds its perfect conditions. Although Zizek does not imply that the disappearance of prohibition is a consequence of cyberspace itself, he certainly sees cyberspace as producing no internal resistance to its unbridled advance. His homogeneous description of the typical cyber subject and his mode of activity betrays the limitation of Zizek's model;

he seems invariably to be talking about a cliché of the anti-social, well-healed, masculine, avidly consuming and games playing computer geek. Cyberspace itself is cast as the ultimate consumption machine whose success lies in its ability to collapse the sign into the thing itself; the immateriality of the commodity. However, as we have seen above in the example of Bunting's work, although the Net entails this radical mutability that undoubtedly vehiculates Zizek's collapse of the word into the thing, or by which the word becomes the thing, and the thing thereby becomes as malleable as words, the collision of virtual and real space can and does occur revealing that the Net's consistency is far from simple. That is to say, the leakage between these two spheres reveals not only a resistance to the psychotic collapse that Zizek himself ultimately denies through his recourse to the symbolic pact, but also the possibility of using virtual space to enunciate the practices of everyday life - practices which remain outside 'the proper' - into a shared language which might entail performativity. There are numerous mundane examples in which individuals feel obliged to be as good as the word they give via the Internet, but here we are also interested in the opportunity cyberspace gives for co-ordinating the confused multiplicity of individual idiolects, of converting tactics into something close to strategies. An exceptional example of this are the protests against the WTO which occurred in Seattle in late November/early December 1999 which serve as an example of this transformative potential of cyberspace. Here a multiplicity of political ideologies and actors were coordinated via the Net into a formidably performative display of resistance against a powerful agent of globalisation.

But without the entry of another spatial, symbolic and atom-based system of 'words and things', is Zizek's notion of our unimpeded access to the (albeit nonexistent) object of desire in cyberspace quite accurate? Does the erasure of distance between our desire for the object and the object itself, the immediacy of delivery which can be figured as the subsumption of space by time in computer networks, really guarantee receipt? Rachel Baker's work *Dot2Dot* reveals the very skillful capacity of the Net to frustrate desire. In this work, Baker takes her cue from the Net porn industry which typically lures the viewer/consumer deeper and deeper into a site with free 'thumbnail' GIFs promising the full scale image but which ultimately delivers the image either at a price or, if free, only on an illegibly small scale. Far from the theoretical end of scarcity which the Net promises and Zizek assumes has been achieved, digital scarcity is imposed in order to intensify desire and thus increase the monetary value of the digital object. In *Dot2Dot* Baker picks up on this Net porn technique and exaggerates its manipulations to reveal the powerful hold that (pornographic) commodity fetishism still has in the Net. The art website's homepage is a dot 2 dot drawing of a copulating man and woman against a deep blue background whose subject matter, although largely composed of dots and numbers, is not difficult to make out. As is usual with these children's games, certain areas of the final drawing are already filled in. In *Dot2Dot*, these parts are the woman's eye and hands, and the man's mouth, penis tip, and fingers. Here the peek-a-boo suggestiveness of certain pornographic images is undercut by the delineation rather than concealment of the sexually 'significant' parts. Each dot in the drawing also doubles as a link to another page on the site where a predictably salacious GIF is offered (e.g. 'Tist inserted fully into pussy') but only on condition that the viewer/consumer enters personal details such as their name and company details. Having submitted these, the viewer is brought straight to the *irational.org* homepage and the promise is never honoured. Through this frustrated libidinal circuit, Baker not only intimates how the traditional commodity's never-honoured 'promissory note' is still operative, but also how the consumer is willing to submit more and more personal data in its pursuit. The exchange of one real data body for the unkept promise of another.

Baker's hoax can in some ways be compared with Etoy's Digital Hijack; as with the hijack, Baker is playing on the notional conformity of the viewer. The level of cooperation that individuals will countenance, their willingness to exchange valuable personal data on the vague promise of some form of libidinal gratification is at issue in this work. But unlike the hijack, the viewer has sought out this confrontation by keying in the work's URL, finding it through a search engine or entering it through the *irational.org* homepage. In most cases, we can surmise, the viewer's acquiescence is unusually self-conscious because it is given within the differently signifying context of an artwork. This might for instance result in the input of totally false information which, unlike with other commercial websites, would not effect the user's further passage in any adverse way. A more important difference, however, is that where Etoy attempts to alert viewers to the compromised nature of the search engine's 'neutrality' through hacking its system, *Dot 2 Dot* merely replicates the porn industry's production, manipulation and frustration of desire. Here, no radical alternative is even mooted. In contrast to Etoy who create an interruption and in so doing point to the manipulability of the status quo (an instance of Zizek's symbolic suspension?), Baker foregrounds the extra-technical limitations to digital malleability exerted by the intersection of symbolic and economic forces. If Baker and Bunting's works both point to the outside of an endlessly differential and simulacral

field of play which challenge Žižek's reading of cyberspace, his primary discussion of prohibition and desire are confirmed rather than challenged by their work. The need to point to the stoppages, tears, leaks and limits to the virtual sphere is a central part of their work which can be seen as a way of maintaining the function of desire which in turn produces action. The short circuiting mentioned above between the 'primordial Thing' and the empirical object, the construction of desire's object, can be seen at play within the construction of place where empirical objects are similarly invested and so animated. This is demonstrated by the promise of belonging that place exerts on the subject but can never wholly fulfill. I would like to propose that the pull exerted by place and by the things out of which place is composed, together with the subject's desire to consume these things in their quest for belonging or of jouissance, is essential to the practice of tactics which, as de Certeau points out, can be found at the heart of consumption.

But hasn't place also been described here as ceding to space? And is it not more accurate to talk about the total disappearance of limit in the simulacral economy in which, if we follow Baudrillard's argument, the invasion of exchange value into all aspects of life becomes the locus of the radical equivalence of things; the end of the metaphysics to which place and desire belong? Is not the callousing of Erlebnis touched on above not also a sign, both on and offline, that this is becoming the case? Are we not so inured to the shocks of our environment that they too become merely differential? By turning finally to a work by Jodi - certainly not a categorically tactical net artwork in the manner of Heath Bunting - I will attempt to answer this problem through the trope of estrangement. An analysis of this work helps formulate the question: is it necessary to feel the exertion of place, with all the vicissitudes of desire that it might imply, in order to practice a tactics? Does the putative equivalence of things, the conversion of place into space, cancel the possibility of Erfahrung out of which, paradoxically place is created?

Jodi's piece whose title, as is usual for them, is also its URL, <http://sod.jodi.org> is based on the source code of a 'shoot 'em up' style computer game called Wolfenstein. In the spirit of the 'open source' movement - based in part on the belief that 'software should be free', but more consistently on the belief that the best software is the product of a whole community's programming efforts rather than the isolated and secretive programming methods of commercial companies - the games company ID Software published the Wolfenstein source code in 1999(!). This cult, multi-player game has subsequently become the raw material of several Jodi artworks. In Jodi's Web piece, the look of a programming shell interface has been simulated. That is to say, the viewer is confronted with the garishly coloured field of text boxes in which programmers write code, but which also recall early or lower order computer interfaces. This interface has the nostalgic quality of a once 'transparent' computing age in which the apparent legibility of the computer's operating system and file structures found its analogue in the rudimentary visual range (for example, pixel size and colour distribution). In this piece, Jodi have taken various sequences within the Wolfenstein source code and hyperlinked them together. This means that the utility of the original code has been rendered not only the obsolete object of aesthetic contemplation but has also been repurposed as a set of Internet hyperlinks. This would be analogous to using an old wagon wheel as the support for a coffee table. This repurposing of code is one example of the estrangement at work in <http://sod.jodi.org>; as with a shard from an absent lifeworld preserved in a museum, Jodi's autopsy of code and its transposition to the different programming environment of the WWW endows it with a ghostly quality. The lifeworld from which it has been severed clings to it as a negativity or absence making its existence in its new environment only a partial one.

It is perhaps no coincidence then that, on actually reading the code, one notices that the coincidence of death - a typical subject of computer games - and the instrumental nature of programming language begin to produce a macabre and amusing quasi poetry. For example, one sequence runs:

```

// Test if death sequence is done
if (death sequence is done)
{
    // change state to death
    player-state = DEAD
} //end if death is done
} // end if dying
else // player must be death
{
    // the player is dead, so clean up the mess"

```

The lines 'change state to death' and 'player must be death' certainly resonate with the notion of the 'post-oedipal' state gestured to by Žižek which would, in its eternally deferred realisation, be premised on the passing out of the symbolic order into an unimaginable beyond: a place in which the old signifying chain has become 'inert'. Could we see the non-functionality of this code, accordingly, as equivalent to the non-performativity of words in cyberspace? Or does the importation of one programming language into another programming environment and its subsequent obsolescence provides us with another example of a 'limit'? Is this not an instance of how words and things are not commensurate in

computer space, even if those things are made up of words or signs and how words or code can guarantee a certain set of operations in one environment which do not translate to another. Through its deconstruction into an object of contemplation, Wolfenstein allows itself to be read again as a commentary on its own casual instrumentalisation of death: "end if death is done". An inversion occurs which allows the normally buried linguistic underpinning of the game's interface to speak over and even against the very spectacle which they engender. This then would appear to be an example of how the mutability of the digital object and limit can be seen operating at the same time but not univocally. As with collage, the repurposed data object will always drag with it its former signifying context thus throwing into doubt the degree to which Baudrillard's radical equivalence of things can really be said to exist. The locus of exchange has not completely subsumed the loci of meaning, exchange value has not completely eclipsed use value (even in cyberspace), nor have words necessarily lost their performativity, especially if we allow that the instrumentality of programming language constitutes a new kind of performative utterance.

Conclusion

Even though data objects on the Net, or in virtual space, may not reside in their own exclusive locations in the same way that they do in real places, we have seen that they are nonetheless capable of being estranged. This estrangement, conversely, suggests a rightful place which here I have considered through functionality. The location of information objects, as with things in 'real' places to a degree, cannot be read simply from their co-existence with other things as de Certeau has suggested, but also through their functionality which might or might not be transplantable. In this respect, what we might term 'place' on the Internet, is much closer to a practice than an occupation, which is de Certeau's definition of space: "space is a place practiced". Indeed virtual space, as with physical place, can only ever be experienced through practice; when the possibility of certain practices is rendered obsolete (the transference of a piece of code), the sense of being out of place draws our attention to its very existence in the computer network. The recognition of this heterogeneous consistency of the Net provokes, in turn, the consideration that virtual space itself might well be another 'Orwellian misnomer'. Not only does the Net span the real space of its sprawling infrastructure and the representational space of the screen image (spatial categories hardly without precedent before the advent of the Net), but its totality is also filled with the material and symbolic limits common to real space evidenced, for example, in malfunctions. However where this space is radically different from either physical or representational space is the immense capacity of the digital to combine heterogeneity and thus to create mutations; a capacity which becomes the leverage point of tactical net art and media.

What makes the medium of the Net so interesting to net artists is the ease with which discrete functions (search engines, source codes, networked CCTV cameras etc.) can be repurposed and re-embedded into separate contexts or operations. Far from making these functionalities all equivalent, their availability for hybridisation contains the possibility of a clash of new and old contexts or utilities. In this sense the tactics displayed in net art or tactical media differ from the tactics displayed by the walker in the city in which the environment is relatively fixed, and come closer to the tactics at work within language. As with language there are rules of syntax, but the mobility of its constituent parts is far greater than within the built environment. It is somewhere between the resistance of syntax and the hybridity and mobility of the online world that the tactics of net art are situated. In this respect, their work can be said to occur in an indeterminate stage between the recession of certain limits (here read in both a material and symbolic sense) and the creation of new ones. Without wishing to ignore the very real sense in which the Net courts the deadening quality of equivalence, the flattened experiential order of Erlebnis, it seems that an important realisation of tactical net art is the possibility for interrupting equivalence with hybridity. Not all spaces in the Net reflect the same degree of deterritorialisation, for example or effect the same non-performativity of language. But conversely, the deterritorialisation of the Net and its capacity for the endless reproduction of equivalent data has been seen to provide the basis upon which the scattered multiplicity of 'walkers' and idiolects can be formed into a totality which hints at the paradox of a heterogeneous yet coherent form of power emerging within the (now post?) disciplinary society.

Potlatch (was: Re: <nettime> Garcia/Lovink: The GHI of Tactical Media)
From: Jim Carrico
To: nettime-l@bbs.thing.net
Date: Mon, 20 Aug 2001 13:36:47 -0700

Hi folks -

excuse my poor form in posting before properly introducing myself. I'm a web developer, among other things, based in Vancouver BC. I was in Berlin a few weeks ago, where I met Pit Schultz, who pointed me in the direction of nettime, which I've managed to remain ignorant of for all these years. Our conversation revolved around the need to establish a movement in culture which parallels the 'free software' movement, in other words an aggressive 'viral' initiative to establish a vibrant public domain in culture. My position is that this won't be possible without an alternative system of rewarding and sustaining creators without forcing them to rely on scarcity-based marketing. For the last few years, I've been advocating for the development of a payment system for 'abundance-based' digital products, under the umbrella term 'Potlatch' - <http://www.potlatch.net>

Andreas Broeckmann <broeck[AT]transmediale.de> wrote:

The lack of a functioning system of micropayments or electronic cash is no accident. The institutions which should have been establishing standards in this area - ie. banks and governments - have shown no interest in doing so, in fact they have been downright hostile. This is disappointing, but hardly surprising, given the fact that interest payments and taxation are highly lucrative "frictions", which would tend to be eliminated by a more rational "frictionless" economy.

If we want an alternative e-commerce system, not based on credit cards, we're going to have to build it ourselves. I don't think this is as far-fetched as it sounds.

My basic premise is this: knowledge is not diminished as it spreads - in fact it is increased. Yet our economic system is based on scarcity, eg. the "law" of supply and demand which states that infinite supply equals zero value. The phrase "information economy" suggested opposing vectors on a collision course: the collision is happening right about now. One of two things must happen: either we make digital objects uncopyable (and hence scarce) which has been compared to 'making water not wet', or we start playing around with

the idea that abundant resources may be valuable, and see where that takes us.

The point is, it is very difficult to prevent people from copying and sharing digital goods, and it is nearly impossible to *force* them to pay for them if they don't want to. Elementary psychology suggests that rather than using increasingly draconian enforcement, we should be dreaming up ways of making them *want to pay*. Guilt trips are unlikely to be successful, what we need is a game-like system in which there are tangible gains for participating. The potlatch was an elaborate social game in which the winners were the one's who *gave the most* - it was very competitive, even hostile at times, because one's rivals were challenged to be more generous in return. The net result was an economy of abundance, in which all wealth was constantly in circulation.

Our current economic system is no less a game, it's just that it's a game that very few people can really play. It's down to the last few players now - I think maybe it's time to declare a winner, congratulate everyone on a hard fought battle, and set the pieces back up. H-ha.

Anyway, a few of us have been considering some possible solutions to this dilemma, focussed of necessity on overcoming what may be the fundamental scarcity of the modern world - a consensual hallucination called money. My contribution to the debate is the idea that digitally signed promissory notes, backed by the reputation of the issuer, could be the basis of a quick-and-dirty micropayment system. A first draft 'potlatch protocol' document was posted in March at <http://potlatch.net/protocol.01.html>. There's a 'version 0.2' which should be posted soon. Comments are welcome.

Jim Carrico
<http://www.potlatch.net>

PS - My Berlin contacts also mentioned the WOS conference in October <http://www.mikro.org/Events/OS/wos2/index-e.html> and that it may be a good opportunity to discuss some of these ideas. Anyone interested in a 'potlatch' session?

Potlatch (was: Re: <nettime> Garcia/Lovink: The GHI of Tactical Media)
From: richard barbrook
To: nettime-l@bbs.thing.net
Date: Sat, 1 Sep 2001 01:10:27 -0400

Hiya,

Here are some belated comments on a recent posting from Jim Carrico. The details of his interesting scheme on: <www.potlatch.net>:

* The potlatch was designed to *prevent* abundance not facilitate it. Tribal societies were threatened by the accumulation of wealth by their leaders turning into fixed class divisions. The potlatch hindered this process by encouraging the giving away (or destroying) of surpluses. Being good liberals, the English colonialists were - not surprisingly - outraged by such 'irrational' behaviour...

* It is not universally accepted that money regulates the scarcity of *things*. This may be the academic orthodoxy; but it is debatable whether this is what is actually happening within capitalist societies (see Adam Smith and his admirers). What money could be doing is regulating the division of labour, i.e. the scarcity of *time*. While it is fun to point out that neo-classical price theory implies that cost of digital information is zero, this ideology can't explain why the labour used for making this information often does have a price.

* The token system advocated by potlatch.net seems very much like another form of money to me. Could it simply be a digital form of LETS scheme? These can work where the tokens circulate within a smallish group of people, are not transferable into hard currency and can't be accumulated. Within a global information society, these limitations seem to be unenforceable. Wouldn't 'star' musicians (or programmers, writers or whatever) be paid too many tokens for them to distribute back into a parallel economy. It is much more likely that they'll want their success turned into material goods and services from the mainstream economy. Sooner

or later, people would be selling tokens for dollars (or euros, yen, etc.)
- and therefore turning the tokens into another form of money.

* The Situationists popularised potlatch as a political concept because it showed that societies could flourish without any money (or tokens). However, social relationships inside tribes were formed between people who knew each other and were usually related. In contrast, we live in societies where most of our social relationships are with strangers who we'll never meet. Money, states, corporations and other impersonal structures have long seemed to be the only methods of regulating such connections. This is why the Situationists' potlatch metaphor was dismissed as utopian during the 1960s. Yet, from our experiences on the Net, it is being slowly realised that giving gifts can also create these impersonal relationships. As long as we're getting more back in return from others, we don't need payment from each and every person who appropriates our labour. Tokens are *not* needed to regulate a hi-tech gift economy. Free gifts can remain free!

* Why does *all* information work need to be paid for? The revival of the potlatch metaphor reflects an interesting contemporary phenomenon. Like our tribal ancestors, many people are now using their surplus time in an "irrational" fashion, i.e. working for free rather than for money. As in the past, they're not being entirely unselfish. They also hope to gain respect, admiration and even things in return for their efforts. But what they're not doing is *directly* buying and selling labour time. A gift is a gift even when given away for an ulterior motive...

All the best.

Later,

Richard.

We would like to compile a selection of short texts
and reflections on 'sovereign media', and invite them
in the form of responses to this post

Please reply to Joanne Richardson at [subsol\[AT\]miz.hr](mailto:subsol[AT]miz.hr)

Notes on Sovereign Media
Geert Lovink & Joanne Richardson

In this age of media overproduction, information
immunity is a question of life or death. Data are no
longer stimuli to interest, but an inimical barrage
constituting a physical threat. From exchange to
effacement: communication is preying on naked
existence. This condition takes the shape of the
catastrophe while simultaneously embodying a promise
of liberation.

Sovereign media do not criticize the baroque data
environments or experience them as threats, but
consider them material, to use as they please. They
operate beyond clean and dirty, in the garbage system
ruled by chaos pur sang. Their carefree rummaging in
the universal media archive is not a management
strategy for joggling jammed creativity. Sovereign
media refuse to be positively defined and are good for
nothing. They demand no attention and constitute no
enrichment of the existing media landscape. Once
detached from every meaningful context, they switch
over in fits and starts from one audio-video
collection to the next. The autonomously multiplying
connections generate a sensory space, which is

relaxing as well as nerve racking. This tangle can
never be exploited as a trend-sensitive genre again.
All the data in the world alternately make up one
lovely big amusement park and a five star survival
trek in the paranoid category, where humor descends on
awkward moments like an angel of salvation and lifts
the program up out of the muck.

>From the calculating perspective of the mainstream,
media are intermediaries, conduits for communication,
communicators of information. Media mediate
information and carry it from A to B. They are
presented as the condition of possibility for the
exchange of information in its commodity form. The
most useful media efface their presence; they
disseminate the information in the most condensed form
in the shortest possible time to the largest audience.
Economy ultimately reduces itself to the economy of
time--Marx said somewhere. And vice versa, time
reduces itself to economy--to measurement and
circulation for profit. The clock is necessary for the
calculation and the organization of life under the
rules of business. At the dawn of capitalism,
merchants discovered the price of time as a
consequence of the calculability of space. The
exchange of commodities entailed movement from a point
to its destination, and the time taken up by movement
through space became subordinated to the money-form.

Media signify mastery over time under the rule of
profit. Sovereign media are instances of mastery over
nothingness free of motivation, without purpose,
they let themselves go, driven by the winds of data.
Sovereign media are fundamentally disinterested, they
don't care about the extraction of value or a surplus
of meaning, they are beyond the demand for information
and the utilization principle of the network.
Sovereign media lack any comprehensive idea of its
customer base. They cannot comprehend the language of
mass media, a language militarized by the clock,
reduced to sharp words that carry blunt concepts. They
do not pay attention to the attention economy.
Sovereign media are self-exponential. What they
communicate is something other than information. They
communicate themselves, liberated from the most
oppressive category around: the audience. Casting
beyond "the public" is the ultimate form of media
freedom.

Sovereign media insulate themselves against
hyperculture. They seek no connection; they
disconnect. This is their point of departure--we have
a liftoff. They leave the media surface and orbit the
multimedia network as satellites. These
do-it-yourselfers shut themselves up inside a
selfbuilt monad, an "indivisible unit" of introverted
technologies which, like a room without doors or
windows, wishes to deny the existence of the manifest
world. Sovereign media are not individual monads,
rather, the world they inhabit is a monad, a parallel
universe beyond (or beside) the universe of the
mainstream media and its demand for representation,
reality and truth.

Sovereign media have not abolished the desire for
connection and communication; they communicate with
each possible node within their parallel universe. But
their communication act is a denial of the maxim "I am
networked, therefore I am." The atmosphere inside the
sealed cabin conflicts with the ideology of
networking, which subordinates the process of making
links and connections to a practical goal, a concrete
project, the promise of a future gain. Networking is
never fully in the present nor fully in-itself, it is
endured for the sake of something always just out of
immediate reach. Sovereign media have severed the ties
to utility, the weight of time, the labor of the
project, the measurement of profit. Freed from the
demand for information, communication becomes
gregariousness, a gracious form of sociability. It
becomes what in fact it always was--a process of
forging social relations that are not subject to
exchange (giving something for the purpose of
extracting a return). The public is freed of its
obligation to show off its interest and can finally

stop paying attention. The desire to connect is determined by the pleasure of communication rather than the imperative to exchange information or establish a (political) agenda.

Sovereign media differ from the post-'68 concept of alternative media (and its most recent metamorphosis into "Indy" media) as well as from 1990s tactical media. Alternative media work on the principle of counter-propaganda and mirror the mainstream media, which they feel needs to be corrected and supplemented. Their strategic aim is a changed consciousness--making individuals aware of their behavior and opinions. These little media work with a positive variant of the cancer (or virus) model, which assumes that in the long term everyone, whether indirectly or through the big media, will become informed about the problem being broached. They presuppose a tight network stretched around and through society, so that in the end the activism of a few will unleash a chain reaction by the many. Alternative media have to appropriate Truth in order to operate. For sovereign media there is no Truth, only data which can be taken apart and reassembled in trillions of bytes.

The post-'68 alternative media universe took shape as a swarm of little grassroots initiatives, self-organized by the "radicals" and militants--media from below in the form of community newspapers, radio, and television, which were only locally available, but untroubled by their local constraints. This changed during the 1990s when the internet made it possible for do-it-yourself media to transcend their local boundaries, and become transnational, like their uni-directional global counterpart, the mainstream media. The Independent media of the 1990s is the globalization of the alternative media (due to the democratization of technology) and the universalizability of the principle of grassrootedness.

Indy media, as the most recent legacy of the alternative media model, seek to supplant the old media universe. These counter media constitute an internal, dialectical negation, an immanent critique that can never get out from the presuppositions of the system it challenges. (We need only think of Marxism's dialectical negation of capitalism, which preserved the imperative of productivity; the utility of instrumental technology, the repressive apparatus of the State, police and standing army, as a necessary "first stage.") The mass media universe purports to be a true, genuine, democratic form of representation. Indy media critique these pretensions from the inside, wanting to expose the ideological shell behind them. But they want to preserve the rational kernel, to offer a form of media that is a true, genuine, democratic form of representation. Indy media aspire to become the dialectical supersession of mass media, and dream of a future when media itself will be transcended, insofar as media implies a separation between sender and receiver. With the democratization of information, as the receivers can become, potentially, the senders, such a separation is abolished, and information becomes a free-floating field, a pure transparency. The truth of Indy media is the post-medial universe of unmediated relationships.

Indy media work by deploying counter-propaganda. They oppose the false, ideological shell of the mass media with counter-statements made from a counter-perspective. Independent media are dependent on the image of the mass media, which they seek to reverse--they need to bounce off this shell, often borrowing the same strategies. Propaganda is putting forward a position without being aware of its construction, taking it for something natural or inevitable, disarticulating the ideology it shelters and preserves. The counter media do not question the position from which they speak. It is self-evident. And like mainstream media, they are deadly serious, they fight, militantly, to defend their position. They have a mission, a supreme Cause--the revolution in ruins--and, perpetually, they wait. Caught in the web

of journalistic discourse, they too calculate time. Still not actual, they invest their energy toward some future beyond that legitimates their existence. Showing off their militancy, they are often blind to internal contradictions, closed off to the possibility of criticism, and devoid of the principle of pleasure. Propaganda and reflection do not always make good friends. And pleasure can become a danger to the Cause, it can throw it off-track, it can drown its unaware victims in a sea of forgetfulness. And above all, the counter media need to remember, to measure offenses, to accuse, to seek retribution.

Tactical media, by contrast, do not take themselves that seriously. They don't need to take the moral high ground and instead look for cracks in the media system. They know how to laugh, occasionally, even at themselves. Urged by their desire to form new coalitions they are capable of taking risks, even if this means they might self-destruct in the process. Clever tricks, the hunter's cunning, maneuvers, polymorphous situations, joyful discoveries, poetic as well as warlike. The tacticals are rebellious users of the mass media universe, whose messages they jam and hijack. As happy negatives, they are determined by their enemy. A fake GWBush page by RTMark cannot exist without the "authentic" one, which it parodies without reserve. Culture jammers do not exist without corporate billboards. Tactical media use what is handy, what can be improvised in the moment. They do not deploy the same strategies as the inside, they shy away from solemnity, and the claims to truthful representation. Tactical media create a system of disinformation, which implicitly questions the power and status of signs. Information becomes laughable, it is exposed as a sham. The truth is not a hardcore database full of "facts" but only appears as a brief moment of revelation, popping up out of the (collective) unconscious.

Tactical media may be art, but they are not, however, "disinterested"--ultimately, they have some long-term political aim, they labor for a future cause, even though they may know how to enjoy the moment. They have given up the masses, but they seek to change the consciousness of a minority, by conducting a politics by other means, a politics that has surpassed itself and become an art form. They wage not counter-propaganda, but propaganda of the hoax. The toolbox of tactical media is sometimes borrowed from the basement of the avant-gardes, who although not "militant" in the strict political sense, made a fetish out of the metaphors warfare and terrorism. And metaphors are not always innocent. The avant-gardes began decomposing a long time ago, as the militarism concealed in their names, gestures, and mode of organization came increasingly under disrepute. But sometimes they can still be heard gasping for life, somewhere beyond the grave of history, having since metamorphosed into "communication guerrillas."

Unlike the media of opposition, which are based on a radical critique of capitalist (art) production, sovereign media have alienated themselves from the entire business of media politics and the contemporary arts scene. An advanced mutual disinterest hampers any interaction. They move in parallel worlds which do not interfere with each other. No counter information or criticism of politics or art is given in order to start up a dialogue with the authorities. Sovereign media have cut all surviving imaginary ties with truth, reality and representation. They no longer concentrate on the wishes of a specific target group, as the alternative and tactical media still do. They have emancipated themselves from any potential audience, and thus they do not approach their audience as a moldable market segment, but offer it the "royal space" the other deserves.

The royal Other is not a receiver of information, but a partner in a communication without purpose. Sovereign media are media without the message, the dialectic of media at a standstill. They are stalled at the intermediary step of making connections, without moving toward an aim, without the finality of

exchange. Sovereign media lift up the media as an end in-itself. This should not be understood as a desire for the "purification" of the medium, a desire that has accompanied every old and new media revolution. On the day film was born, for instance, the conceptualists of purity wanted to eliminate from its realm everything that did not belong to it--narrative, representation, metaphors--and which had been imported from other media, like literature. The sovereignty of media is not a phenomenological reduction or purification of a language specific to "media as such." Sovereignty is not a conceptual project, but an aesthetic wandering. Communication ceases to be a general equivalent through which something is quantified and squeezed; it becomes an end in itself, narcissistic, ecstatic, and free.

If Indy media labor to become the supersession (Aufhebung) of media into Truth, sovereign media are its total dispersion. The counter media seek to abolish the separation between sender and receiver, between medium and the message, thereby completing the internal development of media. Sovereign media inhabit a universe which is post-medial in another sense. There is no sender and receiver because there is no broadcast and no message. Sovereign media do not surpass the sender-receiver regime by bringing it to its completion, they take no interest in it, they annihilate the problem, and with it, the desire for a solution.

Without being otherwise secretive about their own existence, the sovereigns remain unnoticed, since they stay in the blind spot that the bright media radiation creates in the eye. And that's the reason they need not be noticed as an avant-garde trend and expected to provide art with a new impetus. The reason sovereign media are difficult to distinguish as a separate category is because the shape in which they appear can never shine in its full lustre. The program producers don't show themselves; we see only their masks, in the formats familiar to us. Every successful experiment that can possibly be pointed to as an artistic or political statement is immediately exposed to contamination. The mixers inherently do not provoke, but infect chance passersby with corrupted banalities which present themselves in all their friendly triviality. An inextricable tangle of meaning and irony makes it impossible for the experienced media reader to make sense of this.

So what are sovereign media? The form of the question might be incorrect. Sovereign media are. In the pleasure of Being Media, sure of themselves and lacking nothing, they embark on a journey to shape the data universe.

RE: <nettime> how to defeat activism
From: Kermit Snelson
To: nettime-l@bbs.thing.net
Date: Mon, 22 Jul 2002 20:19:19
-0700

It isn't news that protest movements are being simultaneously intimidated by violence, bribed into submission with money or perquisites, slandered in the media and infiltrated by police and intelligence agencies. It was ever thus, and so will it ever be. My favorite thought concerning this problem was Lenin's. He was once asked in the early days what he did when the Czar's secret police managed to infiltrate his organizations. He replied, "We put them to work." Not yet in command of Siberia's prison camps, "work" to Lenin then meant passing out leaflets in the street.

Are successful activists themselves innocent of sharp-elbowed political tactics? Of course not, nor should they be. Violence? Seattle is famous precisely because the military tactics of the demonstrators defeated those of the police (and also of rival demonstrators). Bribing with money and perquisites? Look how far Bono gets with the Washington and Davos crowds simply by flattering those congenitally hankering geeks with his star presence and glamour. Slandering opponents in the media? That's the raison d'être of most activist groups these days. Infiltrating opposing groups? If activists aren't doing much of this, they damn well should be.

Political struggle is political struggle regardless of which side you're on. The winners tend to be those who grasp the facts quickly, persuade successfully and organize appropriately. On the other hand, there are those who let themselves be convinced by thick, incoherent "movement" bestsellers that facts are not something to be grasped, but invented; that the purpose of political writing is not to persuade, but to mystify; that disorganization and mob rule are not political weaknesses, but strengths; and that name-calling, body piercing and rioting comprise "cultural labor" and effective political resistance. Are we suddenly so eager to find examples of how corporate interests are turning activism into slacktivism? Why look further than the Harvard University Press? Or Duke University's Joe Camel Center for Marxist Studies?

But my aim here isn't to load the thread with illustrations of how "they", even the best-selling "Marxist" superstars in tobacco-funded US universities, are undermining "our" movements. That's not to say they wouldn't be correct. It is indeed an example of the success of their tactics, and the ludicrous failure of ours, that the world's protest movement now amounts to not much more than yet another Americanized, Starbucks-style, middle-class lifestyle choice based on the consumption of aggressively marketed fad products. But I think it would be only an exercise in resentment to complain about the tactics directed against our clueless selves in a class struggle which is, after all, not only a fact of life but even a sign of health. And to speak of its potential news value, such a complaint could just as easily have appeared in 1886.

What I'm arguing, instead, is that changing the world means embracing the Great Game and playing to win. This means not only that you must enter the same brotherhood as your opponents, but even that such a brotherhood of opponents is perhaps the only true one. "Napoleon died on St. Helena. Wellington was saddened." It is indeed impossible to resist without being attacked, and (worse, in the eyes of some) without becoming part of the game itself. Anybody who has ever made it onto the world's stage, whether the name was George Bush or Martin Luther King, has known that. But what is so horrifying about this? And what on Earth is so appealing about "negative critique" ideologies that glorify permanent marginalization, permanent poverty, permanent failure? That refuse to advance any positive recommendation for fear that one may actually succeed through "co-optation"? That view even being called to the negotiating table by one's opponent as a destructive act of hostility that must be refused? That in fact glorify "The Great Refusal" as an end in itself?

History has occasionally given us saints, but their probability is so vanishingly small that only a few generations can boast of one. So barring that, the only real alternative to struggle, negotiation and compromise with the real world is a retreat into suicidal insanity and destruction. Having read both Hamlet and Thucydides, the only reason I claim news value for this observation is that we recently seem to have entered a period in which such an ethos of negation and inward-looking despair, previously only a sad but private personal neurosis, is again a dangerous world-historical force. Even when disguised as religious fervor (bin Laden) or as a pseudo-revolutionary mania of desire (Negri), this

utterly sick but growing resentment and refusal of rough-and-tumble reality is something activists should fight, not embrace.

>

I think you might of answered your own question:
'yet another Americanized,
Starbucks-style, middle-class lifestyle choice based on the consumption of aggressively marketed fad products.'

But one manufactured by groups which seek to maintain a certain form of monopoly/oligopoly on the production of the "lifestyle choice". Maybe it really is all just about being "cool" and not "selling out"?

I think the term "commodified dissent" is a bit too mild for what I'm claiming. Under Negri and Jameson (et alia), the ideology of progressive activism has degenerated far beyond what was formerly simple, harmless "commodified dissent." In fact, it has now become the developed world's first version of a primitive Polynesian cargo cult.

The first stages of this development took place in the 1960s, when Marcuse divorced radical theory from the economic concerns of working people and cast it instead around psychological "issues" of identity formation and sexual awakening. And so the tool developed by Karl Marx for the use of working people and statesmen degenerated into something that could seriously interest only confused adolescents. This well-heeled adolescent confusion did, however, create vast fortunes for record companies, rock stars, drug dealers, and even a few university professors. "Commodified dissent" was born.

Some of those adolescents, as they grew older, eventually discovered that activism based on such theories wasn't accomplishing much in the world of grownups. And more importantly, it wasn't supporting them in the style to which they had grown accustomed as children. And so they founded businesses like ecotourism, which cart their customers over vast distances so they can trample and disturb the fragile things they care so much about. Like "The Body Shop", which decorates the world's swank retail districts and duty-free airport concourses with posters of picturesque poor people. Like "Ben & Jerry's", the Unilever subsidiary that allows people to express their deep concern over the rape of the Earth by eating ice cream with names like "Rainforest Crunch." And now the new chain of retail "Fair Trade" storefronts brought to you by the Global Exchange organization, the goal of which apparently is to do for the world's traditional, tourist-oriented aboriginal craft stands what Starbucks did for the world's coffee houses. And since any new industry needs a new legal framework, the university progressives have now been put to work on a jurisprudence of the marketably picturesque, granting intellectual property rights and other forms of legal personality to the native cultures, species and even scenery (which the international securities trade calls "hospitality assets") on which such businesses depend. Welcome to "commodified dissent", Phase II.

The third and final stage in the cultural logic of late activism then comes to pass just as the world's free and civilized peoples are now on their way back into an age of lawless slavery to unaccountable masters. The developed world's most prestigious universities, just as the doomed Paiute Indian tribes in the USA did during the 1890s, have responded to this grim prospect by producing prophets of the Ghost Dance. Think of today's academic talk of street theater and other forms of artistic activism, of learned discourses by Félix Guattari about liberating the world through a revival of "aboriginal subjectivities," of chained-together Zerkansites at WTO meetings, of monographs from Australian universities touting the liberatory benefits of a copyrighted Dreamtime, while reading this:

"In January 1889, a Paiute Indian, Wavoka, or Jack Wilson, had a revelation during a total eclipse of the sun. It was the genesis of a religious movement that would become known as the Ghost Dance. It was this dance that the Indians believed would reunite them with friends and relatives in the ghost world. As the movement spread from tribe to tribe, it soon took on proportions beyond its original intent and desperate Indians began dancing and singing the songs that would cause the world to open up and swallow all other people while the Indians and their friends would remain on this land, which would return to its beautiful and natural state. The unity and fervor that the Ghost Dance Movement inspired, however, spurred only fear and hysteria among white settlers which ultimately contributed to the events ending in the massacre at Wounded Knee." [1]

Closely allied with the latter-day Ghost Dance prophets are today's "tactical media" theorists. They have invented the developed world's first version of the cargo cults that originally appeared among the doomed native cultures of Polynesia in the 1930s, spreading the gospel of a New Dispensation based on consumer electronics. And this message goes far beyond their advocacy of intellectual consumption rather than production, or their "aesthetic of poaching, tricking, reading, speaking, strolling, shopping, desiring" [2]. For that would simply be an updated version of secretly spitting into massa's meal in the kitchen before serving it to him in the dining room.

No, the modern "cargo cult" of consumer electronics goes far beyond this, even to the point of forecasting that the consumer electronics revolution will create a post-human cybernetic subject that will evolve in biological symbiosis with its machines and eventually free mankind forever from all forms of physical bondage. Of course, this kind of talk delights consumer electronics manufacturers like Motorola, who have indeed recently shown themselves to be more than happy to fund such very scientific results. And thus we have reached "commodity dissent" in its highest and final form. Just as it proved to be for the American Indians and the Polynesians. The rest is silence.

"Man does not live by bread alone". Economic relations may be the foundation but they are not the whole building. "The tool (as Kermit describes it) developed by Karl Marx for use of working people and statesman" (deployed also, by the latter, in creating the terror and the Gulags, definitely an "adult" outcome, and no doubt to be as much regretted as Ben and Jerry's, the Body Shop and eco-tourism) was also employed by those involved in "cultural" transformation, in practice, by the likes Rodchenko, van Doesburg, El Lissitzky, and Tatlin, and in theory by Lukacs and Adorno, including Marx himself who also wrote about art.

If we are looking for the origins of, what Kermit suggests is, the adolescent illusion that the psychological "issues" of identity formation" (imagination, to the Romantics) might have an important role to play in revolutionary change we have to go further back than the utopian fever of the 1960's. Further back than Marcuse and McLuhan with their promise of the "global villages and multi-dimensional societies". Further back than the collective delirium induced by Jimi Hendrix, Janis Joplin et al. Further back than Joseph Beuys's founding of the German Student party in 1967 and making human creativity and the principal of "everyone an artist" the basis of all he did. Further back than the Whole Earth Catalogue's first encyclopedic listings enabling access to all forms of creativity (including an embryonic hacker culture). Back in fact to Romantic movement, beginning in Germany in the second third of the eighteenth century, to Herder, Fichte, Schiller, Beethoven, Holderlin, Goethe, Schlegel, and Novalis's conception of "the imagination as the Mother of all reality". This was a revolution which began in the imagination of artists and poets beginning in Germany, spreading like wildfire across Europe and whose most tangible outcome (including both the republic and the terror) was an actual revolution in France. "Tain describes the romantic movement as a bourgeois revolt against aristocracy after 1789: "romanticism is the expression of the energy and force of the new arrivistes". In the narrative myth of the Romantics, the artist plays the central role. But with the important proviso that the spiritual freedoms and the possibilities of self creation enjoyed by artists were the rightful legacy of all human subjects. It was not Joseph Beuys in the 1960's but Novalis in the eighteenth century who first declared that "everyone was an artist". "Since then the drive of every avant garde or modern utopia has been founded on the basis that the practice of artists was to liberate a potential for art making in everyone and shared by humankind as a whole. A potential whose field was aesthetic but whose horizon was political" And yes for better or for worse the latest eruption of this impulse is the "cargo cult" called tactical media. However one of the consequences of tactical media's roots in a tech culture, is that among the many differences between this and earlier "CGs" is that the artist's iconic status as imaginative outlaw and exemplar of freedom and the imagination has been replaced by that of the hacker.

The ghost-dance is only the modern delusion of identity within the imploding nihilistic space of colonization. A space which colonizes and commodifies this delusion. A space which is this delusion, (i.e. Baudrillard's simulacra) the all-consuming image.
We dance, as we are already ghosts.
"The rest is silence."

This is all true, I suppose:

The spasms of the dying fish,
repackaged as excitement and virtue within the experience economy.

Critiques of identity and modes of consumption stem from the loss of any non-colonized space or production. The critique being the final colonization, the particulate colonization. The ideal bio-power facilitated by the self-analysis of the consumer, and finally, of the mode of living.

The artist is a traitor. The artist's expeditions mark, claim, commodify, create territories for expansion. The artist runs ahead as the forests are cleared, marking the trees, explaining - these are the ones to be saved....

Commodity dissent, nothing exists outside the commodity.

Identity psychology, the self is trapped in space by its form.
We dance only to become ghosts.
Some even say we dance, as we are already ghosts
- but this is incorrect.
We dance, as we are not yet ghosts.

You've got to be kidding! Outlaw, perhaps, but freedom and imagination! Please! These guys sit at computers and blindly type strings of random words into unforgiving blank spaces all day in anticipation of that brief moment of reward. They are glorified carnival chickens. Give me a break.

- > humankind as a whole. A potential whose field was aesthetic
- > but whose horizon was political

David's appeal to a pedigree rather than an argument is not advisable. The trope that "poets are the unacknowledged legislators of the world" (Shelley, 1821) may indeed go back to the Romantics, but the opposing argument has an even more distinguished lineage, going back to Plato and perhaps even to Amenhotep.

In Book 10 of the *Republic*, written in the fourth century BCE, Plato notes that the "quarrel between poetry and philosophy" was already "ancient." He then has Socrates go on about the ontologically inferior status of artistic production. So it's no surprise that when Plato finally pronounces on the controversy as to whether poets or philosophers are the natural rulers of the human polity, he decides, famously, in favor of the philosophers.

It is strange to be informed that the French Revolution was brought about by poets and artists, especially German ones. If any single "hacker" can be said to have brought about that particular event, it was Jean-Jacques Rousseau with his "Discourse on the Arts and Sciences" (1750). As anyone who has read that work knows, Rousseau took a rather dim view of art's effect on the body politic. In fact, his essay argues that art be controlled by an elite in order to preserve civic virtue. Nor has the home town that Rousseau was proud to call his own, Calvinist Geneva, entered history with the reputation as being a hotbed of sexual or imaginative liberation. Yet these are the thoughts that preceded the "Discourse on the Origin of Inequality" (1754) and the "Social Contract" (1762), and which finally culminated in the reign of Robespierre, the Incorruptible.

My point, however, is not to correct David's history lesson. It is merely to point out that the argument over the political role of art is very old, and so important that Plato himself chose it to crown his oeuvre. And as Plato's work was largely a response to the fact that Athenian freedom and democracy were about to die, I think that we, who are roughly in the same position today, are obliged to examine the idea of "aesthetic politics" just as ruthlessly as Plato did, and to make it just as central to our analysis.

Hitler was perhaps the only one of history's monsters to have started his career as an art student. His rejection by the Vienna Academy of Art in 1907 is arguably the most disastrous thing that has ever happened. (Or is David going to argue that he would have been even more powerful politically as a professional artist?) But Hitler's sensitivity to artistic issues continued, remarking later in his career that "Whoever wants to understand National Socialist Germany must know [Richard] Wagner." His organization of "Degenerate Art" exhibits are infamous, and there was more than a little German Romantic aestheticism in his 1934 agreement, with Speer, that the public buildings of the Third Reich be constructed to ensure that they would eventually make picturesque ruins. [1] Hitler later honored Wagner's former friend Friedrich Nietzsche by personally attending the funeral of the philosopher's sister in 1935. As we know, Nietzsche began (and ended) his academic publishing career by writing that "the world is only justified as an aesthetic phenomenon." Stalin was also keenly interested in artistic and aesthetic issues, inventing "socialist realism" and personally reviewing (uncharitably) Shostakovich symphonies in *Pravda*.

All of this is only to argue, as Plato knew, that mixing aesthetics and politics makes a deadly cocktail. Walter Benjamin knew it, too. In 1936, he wrote that "The logical result of Fascism is the introduction of aesthetics into political life." [2] He also wrote that "All efforts to render politics aesthetic culminate in one thing: war." Four years later, Benjamin died fleeing that war.

But what say today's deep thinkers on the subject? Fredric Jameson doesn't get too far into 1991's *Postmodernism*, or *The Cultural Logic of Late Capitalism*, before pronouncing this flip judgment on Benjamin's dictum: "He thought [the 'aestheticization' of reality] meant fascism, but we know it's only fun: a prodigious exhilaration with the new order of things, a commodity rush." [3] He later elaborates: "Culturally I write as a relatively enthusiastic consumer of postmodernism, at least some parts of it: I like the architecture and a lot of the newer visual work, in particular the newer photography. The music is not bad to listen to, or the poetry bad to read ... Food and fashion have also greatly improved, as has the life world generally." [4] Defending the role of aesthetics in politics by observing simply that one man's fascism is another man's fun rings more than a bit unpleasantly in a book that also argues that Paul de Man's collaboration with the Nazis was "simply a job" [5], and that Heidegger's

commitment to Hitler was "morally and aesthetically preferable to apolitical liberalism." [6] Especially since Fascism led Walter Benjamin to an early grave, while Jameson's "fun" has led Duke University's famous Marxist professor to the comfortable summit of America's academic ant hill.

What of the role of "tactical media" theorists in Jameson's "commodity rush"? They are perhaps the first in history (other than Jameson, perhaps) to have claimed "shopping" as a revolutionary virtue. But they are certainly not the first to have insisted that a revolution requires a "distinctive and recognizable aesthetic." [7] Hitler certainly did as well. So did Stalin. So did the Taliban. No one will ever agree on what is more aesthetically preferable, nor on which sexual mores are truly liberating, nor on what practice is the more spiritually fulfilling. That's why making such things an integral part of politics is, as Walter Benjamin wrote and history shows, a recipe for war. Aesthetics and sexual mores should be left out of politics for the same reason that religion should be.

The reason why humanity never seems to live up to this truth is that finding one's own way is hard. That personal task, not politics or revolution, is the true role of creativity, artistic expression and identity formation. But a "tactical" aesthetic of consumption, of criticism, of refusal, of opposition is the very opposite of this. It's a lot easier than finding your own way. It takes no real work at all. It's the aesthetic of a slave, a parasite, and a vandal. [8] And if you seek its monument, look around.

A Reaction to Tactical Media

By Sfeir von Clauswitz

Tactics vs. Strategy

History is no more behind us than we can walk through time. There is no destiny and no vanishing. Tactical media makes no promises.

The spectacle and spectacular media are forms of tactical media, even more so now than in the future. Newer forms of media production and distribution: computers, cameras, the internet, etc. are not tactical. They exist as ballistics in the war of art, as does detournement and heretical juxtaposition. How these armaments are combined in conflict constitutes tactics.

These tactical conflicts culminate towards strategic goals. Strategy is defined by Clauswitz as a collection of battles in a war regardless of who the actors are.

Thus, strategy exists outside of nation-states and other such boundaries, just as Terrorists wage a war outside of such boundaries. As individuals become empowered with the ballistics of nations, so strategy becomes more useful for describing their activities. Individuals begin to enter the global strategic theater.

Strategy is not political, and cannot be in opposition to tactics. Strategy outlines a discourse of interactions, at times political, military, or aesthetic.

Tactics is no more a tool of resistance than a tool of the state. Isn't it enough to say it is a tool, and begin to explore its uses? How can we discuss the exchanges of tactics other than on a plane of strategy? Artists & Hackers

While many artists and hackers use tactical media, the divorce of these battles from the strategic and logistical landscapes renders such actions less significant than similar tactics in use by national and business actors.

EBN and Negativland developed beautiful munitions (heretical juxtaposition), and both Adbusters and RTMark expand arts reach and capacity into new theaters. All of which is necessary for the expansion of art on the conceptual landscape.

However, much of this work has been fueled by the political agendas and affiliations of these artists. While alliance with the activist, anarchistic, and anti-globalization syndicates has enabled these developments, it has also created logistical partisanship that prevents arts expansion into the strategic and logistical theaters. The Study of Tactical Aesthetics

As tactics, subversion of a dominant is no more valuable than submission to a dominant, outside of a specific theatrical context. In this way, both diversion and alliance, as tactics, might serve a particular end at a particular time.

The super-empowered artist does in many ways resemble a Terrorist, but the association is superficial in as far as it perpetuates the political roots that modern aesthetic warfare technology was developed within.

Many noble sciences have been detoured by militaries to serve very different political ends than their creators had intended. It is with this detachment from originating political bias that aesthetic warfare must be studied.

Information warfare (future war) deals heavily with propaganda. Aesthetics enables propaganda. Advanced practitioners of aesthetic theory should then be adept at the creation of propaganda, whether they work for Indymedia, themselves, or the government.

Propaganda neither hijacks the media, nor the deed. Deeds no longer exist separate from information media. The process of recording mediates the phenomenal and thereby defines informational theaters. Propaganda, tactics, aesthetics, and strategy-all require a recorded or informational value.

Digitization is one trend that contributed to the passage of warfare from the physical to the informational landscapes, but one of many. Death of distance, identity fragmentation, mass mediation, the deconstruction of language, and copyright law all contributed factors.

However, once all aspects of warfare can be translated into flows of information, a language of aesthetics reveals the way that information can be used as warfare. It is aesthetics that enables information. In this way, tactical media is a form of aesthetic information warfare.

Artists are now in the best position to leverage their aesthetics to create a technology gap between art and rival conceptual frameworks. Tactical media may well be the most overt part of this larger process. Modes of Warfare

Claustwitz tactics enable both the weak and the powerful. However, by embedding class opposition into the language of military art, de Certeau destroys the usefulness of the terms describing modes of conflict outside de Certeau specific theater.

Claustwitz strategem and Tzou's war of maneuver are both useful tactics, in their time and ours. An artifice of diversion is a method of using information for tactical advantage. It is one of many tactics used by the mainstream and many others, but to limit arts investigation of warfare to one tactic, or to tactics as a dominant mode, limits arts ability to maintain viability in the conceptual landscape.

The battle between the mainstream and the alternative cannot trace the full spectrum of media tactics, but even if we were to concentrate our investigation there, how could we foresee a victory or lasting resituation without considering the strategy of this particular theater?

Also, the language of economics permeates our telling (and recording) of this conflict, and yet the language of logistics is missing. Perhaps this is due to de Certeau politicizing of the modes of conflict, but then perhaps we have just not looked hard enough.

The continued viability of tactical art does require global participation, but it also requires a language to describe and refine that global participation-how it is gathered and distributed, authorized and synchronized. This language is the de-politicized language of strategy. A language that must be developed separate from the paradigm and perspectives of any specific theater, most of all the theater of activists, from which the vast majority of its practitioners emerge.

The preconceived opposition forms an essential context within which to discuss a particular theater. The specific economic and political intensities of a theater do form the essential difference between tactics as employed by different groups. Economic and political intensities are useful and even essential when recording the story of a battle.

But while these intensities are valuable we do not seek a history of the political winners. Nor do we seek a lexicon of potential media tactics. What we seek is art, an art of war, the beautiful forms of information that can be applied to shifting theatrical contexts. We seek a way to describe the exchange of informational flows within the theater.

We seek these things because it is the only way art agents will be useful actors in the quickly shifting landscapes of the future, and advanced practitioners of aesthetic informational warfare and tactical media may be the only way for art to remain a viable conceptual framework. <http://www.x-chicago.com/main/article.php?articleID=179> <http://www.collusion.org/Article.cfm?ID=410>

A Virtual World is Possible: From Tactical Media to Digital Multitudes
By Geert Lovink and Florian Schneider

1.

We start with the current strategy debates of the so-called "anti-globalisation movement", the biggest emerging political force for decades. In Part II we will look into strategies of critical new media culture in the post-speculative phase after dotcommania. Four phases of the global movement are becoming visible, all of which have distinct political, artistic and aesthetic qualities.

1. The 90s and tactical media activism

The term 'tactical media' arose in the aftermath of the fall of the Berlin Wall as a renaissance of media activism, blending old school political work and artists' engagement with new technologies. The early nineties saw a growing awareness of gender issues, exponential growth of media industries and the increasing availability of cheap do-it-yourself equipment creating a new sense of self-awareness amongst activists, programmers, theorists, curators and artists. Media were no longer seen as merely tools for the Struggle, but experienced as virtual environments whose parameters were permanently 'under construction'. This was the golden age of tactical media, open to issues of aesthetics and experimentation with alternative forms of story telling. However, these liberating techno practices did not immediately translate into visible social movements. Rather, they symbolized the celebration of media freedom, in itself a great political goal. The media used - from video, CD-ROM, cassettes, zines and flyers to music styles such as rap and techno - varied widely, as did the content. A commonly shared feeling was that politically motivated activities, be they art or research or advocacy work, were no longer part of a politically correct ghetto and could intervene in 'pop culture' without necessarily having to compromise with the 'system'. With everything up for negotiation, new coalitions could be formed. The current movements worldwide cannot be understood outside of the diverse and often very personal for digital freedom of expression.

2. 99-01: The period of big mobilizations

By the end of the nineties the post-modern 'time without movements' had come to pass. The organized discontent against neo-liberalism, global warming policies, labour exploitation and numerous other issues converged. Equipped with networks and arguments, backed up by decades of research, a hybrid movement - wrongly labelled by mainstream media as 'anti-globalisation' - gained momentum. One of the particular features of this movement lies in its apparent inability and unwillingness to answer the question that is typical of any kind of movement on the rise or any generation on the move: what's to be done? There was and there is no

answer, no alternative - either strategic or tactical - to the existing world order, to the dominant mode of globalisation.

And maybe this is the most important and liberating conclusion: there is no way back to the twentieth century, the protective nation state and the gruesome tragedies of the 'left.' It has been good to remember - but equally good to throw off - the past. The question 'what's to be done' should not be read as an attempt to re-introduce some form of Leninist principles. The issues of strategy, organization and democracy belong to all times. We neither want to bring back old policies through the backdoor, nor do we think that this urgent question can be dismissed by invoking crimes committed under the banner of Lenin, however justified such arguments are. When Slavoj Žižek looks in the mirror he may see Father Lenin, but that's not the case for everyone. It is possible to wake up from the nightmare of the past history of communism and (still) pose the question: what's to be done? Can a 'multitude' of interests and backgrounds ask that question, or is the only agenda that defined by the summit calendar of world leaders and the business elite?

Nevertheless, the movement has been growing rapidly. At first sight it appears to use a pretty boring and very traditional medium: the mass-mobilization of tens of thousands in the streets of Seattle, hundreds of thousands in the streets of Genoa. And yet, tactical media networks played an important role in it's coming into being. From now on pluriformity of issues and identities was a given reality. Difference is here to stay and no longer needs to legitimize itself against higher authorities such as the Party, the Union or the Media. Compared to previous decades this is its biggest gain. The 'multitudes' are not a dream or some theoretical construct but a reality.

If there is a strategy, it is not contradiction but complementary existence. Despite theoretical deliberations, there is no contradiction between the street and cyberspace. The one fuels the other. Protests against the WTO, neo-liberal EU policies, and party conventions are all staged in front of the gathered world press. Indymedia crops up as a parasite of the mainstream media. Instead of having to beg for attention, protests take place under the eyes of the world media during summits of politicians and business leaders, seeking direct confrontation. Alternatively, symbolic sites are chosen such as border regions (East-West Europe, USA-Mexico) or refugee detention centres (Frankfurt airport, the centralized Eurocop database in Strasbourg, the Woomera detention centre in the Australian desert). Rather than just objecting to it, the global entitlement of the movement adds to the ruling mode of globalisation a new layer of globalisation from below.

3. Confusion and resignation after 9-11

At first glance, the future of the movement is a confusing and irritating one. Old-leftist grand vistas, explaining US imperialism and its aggressive unilateralist foreign policy, provided by Chomsky, Pilger and other baby boomers are consumed with interest but no longer give the bigger picture. In a polycentric world conspiracy theories can only provide temporary comfort for the confused. No moralist condemnation of capitalism is necessary as facts and events speak for themselves. People are driven to the street by the situation, not by an analysis (neither ours nor the one from Hardt & Negri). The few remaining leftists can no longer provide the movement with an ideology, as it works perfectly without one. "We don't need your revolution." Even the social movements of the 70s and 80s, locked up in their NGO structures, have a hard time keeping up. New social formations are taking possession of the streets and media spaces, without feeling the need of representation by some higher authority, not even the heterogeneous committees gathering in Porto Alegre.

So far this movement has been bound in clearly defined time/space coordinates. It still takes months to mobilize multitudes and organize the logistics, from buses and planes, camping grounds and hostels, to independent media centres. This movement is anything but spontaneous (and does not even claim to be so). The people that travel hundreds or thousands of miles to attend protest rallies are driven by real concerns, not by some romantic notion of socialism. The worn-out question: "reform or revolution?" sounds more like blackmail to provoke the politically correct answer.

The contradiction between selfishness and altruism is also a false one. State-sponsored corporate globalisation affects everyone. International bodies such as the WTO, the Kyoto Agreement on global warming, or the privatisation of the energy sector are no longer abstract news items, dealt with by bureaucrats and (NGO) lobbyists. This political insight has been the major quantum leap of recent times. Is this then the Last International? No. There is no way back to the nation state, to traditional concepts of liberation, the logic of transgression and transcendence, exclusion and inclusion. Struggles are no longer projected onto a distant Other that begs for our moral support and money. We have finally arrived in the post-solidarity age. As a consequence, national liberation movements have been replaced by a new analysis of power,

which is simultaneously incredibly abstract, symbolic and virtual, whilst terribly concrete, detailed and intimate.

4. Present challenge: liquidate the regressive third period of marginal moral protest

Luckily September 11 has had no immediate impact on the movement. The choice between Bush and Bin Laden was irrelevant. Both agendas were rejected as devastating fundamentalisms. The all too obvious question: "whose terror is worse?" was carefully avoided as it leads away from the pressing emergencies of everyday life: the struggle for a living wage, decent public transport, health care, water, etc. As both social democracy and really existing socialism depended heavily on the nation state a return to the 20th century sounds as disastrous as all the catastrophes it produced. The concept of a digital multitude is fundamentally different and based entirely on openness. Over the last few years the creative struggles of the multitudes have produced outputs on many different layers: the dialectics of open sources, open borders, open knowledge. Yet the deep penetration of the concepts of openness and freedom into the principle of struggle is by no means a compromise to the cynical and greedy neo-liberal class. Progressive movements have always dealt with a radical democratisation of the rules of access, decision-making and the sharing of gained capacities. Usually it started from an illegal or illegitimate common ground. Within the bounds of the analogue world it led to all sorts of cooperatives and self-organized enterprises, whose specific notions of justice were based on efforts to circumvent the brutal regime of the market and on different ways of dealing with the scarcity of material resources.

We're not simply seeking proper equality on a digital level. We're in the midst of a process that constitutes the totality of a revolutionary being, as global as it is digital. We have to develop ways of reading the raw data of the movements and struggles and ways to make their experimental knowledge legible: to encode and decode the algorithms of its singularity, nonconformity and non-foundability; to invent, refresh and update the narratives and images of a truly global connectivity; to open the source code of all the circulating knowledge and install a virtual world.

Bringing these efforts down to the level of production challenges new forms of subjectivity, which almost necessarily leads to the conclusion that everyone is an expert. The superflux of human resources and the brilliance of everyday experience get dramatically lost in the 'academification' of radical left theory. Rather the new ethical-aesthetic paradigm lives on in the pragmatic consciousness of affective labour, in the nerdy attitude of a digital working class, in the omnipresence of migrant struggles as well as many other border-crossing experiences, in deep notions of friendship within networked environments as well as the 'real' world.

II.

Let's now look at strategies for Internet art & activism. Critical new media culture faces a tough climate of budget cuts in the cultural sector and a growing hostility and indifference towards new media. But hasn't power shifted to cyberspace, as Critical Art Ensemble once claimed? Not so if we look at the countless street marches around the world.

The Seattle movement against corporate globalisation appears to have gained momentum - both on the street and online. But can we really speak of a synergy between street protests and online 'hacktivism'? No. But what they have in common is their (temporal) conceptual stage. Both real and virtual protests risk getting stuck at the level of a global 'demo design,' no longer grounded in actual topics and local situations. This means the movement never gets out of beta. At first glance, reconciling the virtual and the real seems to be an attractive rhetorical act. Radical pragmatists have often emphasized the embodiment of online networks in real-life society, dispensing with the real/virtual contradiction. Net activism, like the Internet itself, is always hybrid, a blend of old and new, haunted by geography, gender, race and other political factors. There is no pure disembodied zone of global communication, as the 90s cyber-mythology claimed.

Equations such as street plus cyberspace, art meets science, and 'techno-culture' are all interesting interdisciplinary approaches but are proving to have little effect beyond the symbolic level of dialogue and discourse. The fact is that established disciplines are in a defensive mode. The 'new' movements and media are not yet mature enough to question and challenge the powers that be. In a conservative climate, the claim to 'embody the future' becomes a weak and empty gesture.

On the other hand, the call of many artists and activists to return to 'real life' does not provide us with a solution to how alternative new media models can be raised to the level of mass (pop) culture. Yes, street demonstrations raise solidarity levels and lift us up from the daily solitude of one-way media interfaces. Despite September 11 and its

right-wing political fallout, social movements worldwide are gaining importance and visibility. We should, however, ask the question "what comes after the demo version" of both new media and the movements!

This isn't the heady 60s. The negative, pure and modernist level of the "conceptual" has hit the hard wall of demo design as Peter Lunenfeld described it in his book 'Snap to Grid'. The question becomes: how to jump beyond the prototype? What comes after the siege of yet another summit of CEOs and their politicians? How long can a movement grow and stay 'virtual'? Or in IT terms, what comes after demo design, after the countless PowerPoint presentations, broadband trials and Flash animations? Will Linux ever break out of the geek ghetto? The feel-good factor of the open, ever growing crowd (Elias Canetti) will wear out; demo fatigue will set in. We could ask: does your Utopia version have a use-by date?

Rather than making up yet another concept it is time to ask the question of how software, interfaces and alternative standards can be installed in society. Ideas may take the shape of a virus, but society can hit back with even more successful immunization programs: appropriation, repression and neglect. We face a scalability crisis. Most movements and initiatives find themselves in a trap. The strategy of becoming "minor" (Guattari) is no longer a positive choice but the default option. Designing a successful cultural virus and getting millions of hits on your weblog will not bring you beyond the level of a short-lived 'spectacle'. Culture jammers are no longer outlaws but should be seen as experts in guerrilla communication

Today's movements are in danger of getting stuck in self-satisfying protest mode. With access to the political process effectively blocked, further mediation seems the only available option. However, gaining more and more "brand value" in terms of global awareness may turn out to be like overvalued stocks: it might pay off, it might turn out to be worthless. The pride of "We have always told you so" is boosting the moral of minority multitudes, but at the same time it delegates legitimate fights to the level of official "Truth and Reconciliation Commissions" (often parliamentary or Congressional), after the damage is done.

Instead of arguing for "reconciliation" between the real and virtual we call here for a rigorous synthesis of social movements with technology. Instead of taking the 'the future is now' position derived from cyber-punk, a lot could be gained from a radical re-assessment of the techno revolutions of the last 10-15 years. For instance, if artists and activists can learn anything from the rise and subsequent fall of dot-com, it might be the importance of marketing. The eyeballs of the dotcom attention economy proved worthless.

This is a terrain of truly taboo knowledge. Dot-coms invested their entire venture capital in (old media) advertisement. Their belief that media-generated attention would automatically draw users in and turn them into customers was unfounded. The same could be said of activist sites. Information "forms" us. But new consciousness results less and less in measurable action. Activists are only starting to understand the impact of this paradigm. What if information merely circles around in its own parallel world? What's to be done if the street demonstration becomes part of the Spectacle?

The increasing tensions and polarizations described here force us to question the limits of new media discourse. In the age of realtime global events Ezra Pound's definition of art as the antenna of the human race shows its passive, responsive nature. Art no longer initiates. One can be happy if it responds to contemporary conflicts at all and the new media arts sector is no exception. New media arts must be reconciled with its condition as a special effect of the hard and software developed years ago.

Critical new media practices have been slow to respond to both the rise and fall of dotcommania. In the speculative heydays of new media culture (the early-mid 90s, before the rise of the World Wide Web), theorists and artists jumped eagerly on not yet existing and inaccessible technologies such as virtual reality. Cyberspace generated a rich collection of mythologies; issues of embodiment and identity were fiercely debated. Only five years later, while Internet stocks were going through the roof, little was left of the initial excitement in intellectual and artistic circles. Experimental techno culture missed out on the funny money. Recently there has been a steady stagnation of new media cultures, both in terms of concepts and funding. With millions of new users flocking onto the Net, the arts can no longer keep up and withdraw into their own little world of festivals, mailing lists and workshops.

Whereas new media arts institutions, begging for goodwill, still portray artists as working at the forefront of technological developments, the reality is a different one. Multi-disciplinary goodwill is at an all time low. At best, the artist's new media products are 'demo design' as described by Lunenfeld. Often it does not even reach that level. New media arts, as defined by its few institutions rarely reach audiences outside of

its own electronic arts subculture. The heroic fight for the establishment of a self-referential 'new media arts system' through a frantic differentiation of works, concepts and traditions, might be called a dead-end street. The acceptance of new media by leading museums and collectors will simply not happen. Why wait a few decades anyway? Why exhibit net art in white cubes? The majority of the new media organizations such as ZKM, the Ars Electronica Centre, ISEA, ICC or ACMI are hopeless in their techno innocence, being neither critical nor radically utopian in their approach. Hence, the new media arts sector, despite its steady growth, is getting increasingly isolated, incapable of addressing the issues of today's globalised world, dominated by the war against terror. Let's face it, technology is no longer 'new', the markets are down and out and no one wants know about it anymore. Its little wonder the contemporary (visual) arts world is continuing its decade-old boycott of (interactive) new media works in galleries, biennales and shows like Documenta XI.

A critical reassessment of the role of arts and culture within today's network society seems necessary. Let's go beyond the 'tactical' intentions of the players involved. The artist-engineer, tinkering on alternative human-machine interfaces, social software or digital aesthetics has effectively been operating in a self-imposed vacuum. Science and business have successfully ignored the creative community. Worse still, artists have been actively sidelined in the name of 'usability', pushed by a backlash movement against web design led by the IT-guru Jakob Nielsen. The revolt against usability is about to happen. Lawrence Lessig argues that Internet innovation is in danger. The younger generation is turning its back on new media arts questions and if involved at all, operate as anti-corporate activists. After the dotcom crash the Internet has rapidly lost its imaginative attraction. File swapping and cell phones can only temporarily fill up the vacuum; the once so glamorous gadgets are becoming part of everyday life. This long-term tendency, now accelerating, seriously undermines future claims of new media.

Another issue concerns generations. With video and expensive interactive installations being the domain of the '68 baby boomers, the generation of '89 has embraced the free Internet. But the Net turned out to be a trap for them. Whereas assets, positions and power remain in the hands of the ageing baby boomers, the gamble on the rise of new media did not pay off. After venture capital has melted away, there is still no sustainable revenue system in place for the Internet. The slow working educational bureaucracies have not yet grasped the new media malaise. Universities are still in the process of establishing new media departments. But that will come to a halt at some point. The fifty-something tenured chairs and vice-chancellors must feel good about their persistent sabotage. What's so new about new media anyway? Technology was hype after all, promoted by the criminals of Enron and WorldCom. It is sufficient for students to do a bit of email and web surfing, safeguarded within a filtered, controlled intranet. In the face of this rising techno-cynicism we urgently need to analyse the ideology of the greedy 90s and its techno-libertarianism. If we don't disassociate new media quickly from this juncture decade, the isolation of the new media sector will sooner or later result in its death. Let's transform the new media buzz into something more interesting altogether - before others do it for us.

Lovink and Schneider ask the right question in 'A Virtual World is Possible'. What is to be done? Unfortunately, they have not done it. Yes, there is a need for a political position outside of the dialectic of the street and cyberspace. Yes, there is a need for a new position for new media outside of the dialectic of the media market and the art market. And yes, the place to look is in deconstructing the techno-libertarian ideologies of the 90s. But what is required at this juncture is a tool with which to prise it open to discover how it worked.

He was wrong about a lot of things, but Marx did enjoin us to ask what he called "the property question", and insisted that it was where the critical spirit begins and ends. And what if we ask the "property question" of the jumble of symptoms with which Lovink & Schneider confront

us? The network of power starts to reveal itself more clearly.

Did the new movements arise out of thin air? Or did they arise out of a new stage in the development of the commodity economy? At both the level of the tools it had at its disposal, and the range of issues it confronted, the new movement confronts a new class power. Only rarely is this class power named and identified at an abstract level. The symptoms of its (mis)rule have been charted by brave advocates and activists. But we are all merely blind folks touching different parts of an elephant and trying to describe the totality from the detail we sense before us, in our fragment of everyday life.

So let's ask the property question of all the fragments of resistance that appear to us in everyday life. Start in the underdeveloped world. How is it possible that the productive engines of commodity society find themselves shipped, by and large, out of the overdeveloped world and into the under-developed world? What new power makes it possible to consign the manufacturing level of production to places deprived of technical and knowledge infrastructure? A new division of labour makes it possible to cut the mere making of things off from all of their other properties. The research, design and marketing will remain, on the whole, in the overdeveloped world, and will be protected by a new and increasingly global regime of property, intellectual property. As for the rest, whole continents can compete for dubious honour of mere manufacturing.

What makes this separation possible is at one and the same time a legal and a technical distinction. Information emerges as a separate realm, a world apart as Lovink has perceptively argued for some time. But he has not stopped to inquire is to how or why, and without first asking how or why we cannot get far with the big question: what is to be done. So let's look closely at the way the development of a "vectoral" technology has made possible a relative separation from its materiality. Which is not to say that information is immaterial. Rather, it has an "abstract" relation to the material. It no longer matters to its integrity as information whether it is embodied in this cd-rom or that flashcard or that stack of paper.

A virtual world is indeed possible, precisely because of this coming into existence of abstract information. But what is information? The product of a labor of encoding and decoding. Just as the commodity economy made manual labor abstract in the machine age, so too it has made intellectual labor abstract in the information age.

But the virtual world finds itself constrained by a form of property alien to it. No longer confine to a particular materiality, information really does yearn to be free. But it is not free, it is everywhere in chains. It is forced into the constraint of a very new creation -- intellectual property. On the ruins of the commons that copyright and patent were once supposed to guarantee arises an absolute privatisation of information as property.

And so, with a whole new -- virtual -- continent to claim as its own, class power finds a new basis, and remakes that other world, the everyday world, in its image. The abstraction of information from materiality as a legal and technical possibility becomes the shape of the world. A world in which the mere embodiment of a concept in a commodity can be consigned to bidding wars between the desperate.

This bifurcation affects both the agricultural and the manufacturing economies. The patents on seed stocks are of a piece with the copyrights on designer logos. Both are a means by which a new class power asserts its place in the world, based not on the ownership of land or of physical manufacturing plant, but in the concepts and designs on which the world will be set to labour.

In the overdeveloped world, one discovers symptoms of the same emerging totality. Workers in manufacturing struggle to hang on to jobs in an economy that they alone are no longer the only ones equipped to do. So called 'state monopoly capital' is a mere husk of its former self. The emerging class interest has a very different relation to the state.

Meanwhile, there are the various phenomena of the 'new economy'. While the bubble may have burst, there is a risk in too low an evaluation of the significance of the media and communication revolution as an over reaction to the excessive optimism of the 90s. Just as railways and the telegraph created a boom and bust, but also created an enduring geography of economic and strategic power, so too has the latest, digital, phase in the development of the vector.

One should not right off the military dimension to the new class power quite as readily as Lovink and Schneider do, either. On the one hand it is the old oil-power politics. But there is a new dimension, a new confidence in the ability to use the new vectoral military technologies as a cheap and efficient way of achieving global redistributions of power. The same abstraction of information from materiality that happens in technology and

is sanctioned by intellectual property law is happening in military technology. The military wing of the new class interest wants a 'new' new world order to ratify its exercise.

This is not your grandparents ruling class we are confronting here. It is a new entity, or a new entity in formation. Perhaps it is a new fraction of capital. Perhaps it is a new kind of ruling class altogether. Remember, there have been two, not one but two, phases to rule in the commodity economy era. It has already passed through an agricultural and a manufacturing phase. In each case it developed out of the a distinctive step in the abstraction of property law. First came the privatisation of land, and out of it a landlord class. Then came the privatisation of productive resources, a more mobile, labile kind of property, and a new ruling class -- the capitalist class proper. And perhaps, with the emergence of the new global regime of intellectual property, we witness the emergence of a new ruling class, what I would call the vectoralist class.

As each ruling class is based on a more abstract form of property, and a more flexible kind of vector, than its predecessor, its mode of ruling also becomes more abstract, more intangible. Its ideologies would love to persuade us that the ruling class no longer even exists. And yet its handiwork are everywhere, in the subordination of the underdeveloped world to new regimes of slavery, to the slow motion implosion of manufacturing economy in the overdeveloped world, to the deployment of ever faster, ever sleeker vectors along which ever more abstract flows of information shuttle, making the world over in the abstract image of the commodity.

And what is to be done? One does not confront the new abstract totality with rhetorics of multiplicity alone. Rather, one looks for the abstraction at work in the world that is capable of producing such a multiplicity of everyday experiences of frustration, boredom and suffering. One asks the property question, and in asking it is left toward a practice that constitutes the answer.

This is where so-called new media art has proven to be both so useful at times, but so willing to cooperate in its own cooptation. When artists explore not just the technology, but its property dimension as well, then they create work that has the capacity to point beyond the privatisation of information that forms the basis of the power of the vectoral class. The new media art that matters is counter-vectoral. It offers itself as a tool for prising open the privatisation of information.

"Information merely circles in a parallel world of its own", as Lovink and Schneider say, precisely because of the abstraction it undergoes when it becomes vectoral. The counter-vectoral reconnects information to the multiplicity by freeing it from the straightjacket of private property. Indeed, there can be no talk of 'multitude' until this aspect of its existence is properly understood. Multitudes do not exist independently of their means of communication. The freeing of that means of communication from the abstraction of the commodity form is the necessary step towards realising the counter-abstraction that is latent in the formal concept of the multitude. A virtual world -- virtual in the true sense -- is indeed possible. It is what is to be done.

 I think the class struggle many 'counter-globalisation' protesters
 are engaged in is not so much a new class struggle but an age-old one.

the bulk of the actions that have taken place against the global
 institutions of capitalism in the last 5 or so years have taken place
 in the countries of the global South - Bolivia, South Africa, India,
 Mexico - or in countries 'over the horizon', out of site of CNN -
 South Korea etc. There isn't a single day where a protest, blockade,
 occupation, etc takes place against the array of institutions,
 corporations and governments of the North.

I would say that the overwhelming amount of protesters, activists,
 revolutionaries, et al around the world are engaged with an old class
 working through relatively new global mechanisms. The issues they
 have been confronted with since the beginnings of colonisation and
 then industrialisation are still very much the same - land, dignity,
 autonomy, freedom

But the main point I wanted to address is the question "Did the new
 movements arise out of thin air? Or did they arise out of a new stage
 in the development of the commodity economy?". To which the short
 answer is they arose out of a set of catalytic 'encuentro's'
 organised by the Zapatistas and then by string of international
 actions organised through the Peoples Global Action network = 8A
 [from <http://www/agg-prg>]

"The sense of possibility that this uprising gave to millions of
 people across the globe was extraordinary. In 1996, the Zapatistas,
 with trepidation as they thought no-one might come, sent out an email
 calling for a gathering, called an "encuentro" (encounter), of
 international activists and intellectuals to meet in specially
 constructed arenas in the Chiapas jungle to discuss common tactics,
 problems and solutions. Six thousand people attended, and spent days
 talking and sharing their stories of struggle against the common
 enemy: capitalism.

This was followed a year later by a gathering in Spain, where the
 idea for the construction of a more action focused network, to be
 named Peoples' Global Action (PGA), was hatched by a group made up of
 activists from ten of the largest and most innovative social
 movements. They included the Zapatistas, Movimento Sem Terra, (the
 Brazilian Landless Peasants Movement who occupy and live on large
 tracts of unproductive land) and the Karnataka State Farmers Union
 (KRRS), renowned for their "cremate Monsanto" campaign which involved
 burning fields of Genetically Modified crops.

The group (who became the PGA convenors committee, a role that
 rotates every year) drafted a document outlining some of the primary
 objectives and organisational principles of the emerging network. It
 outlined a firm rejection of appeals to those in power for reforms to
 the present world order. A support for direct action as a means of
 communities reclaiming control over their lives, and an
 organisational philosophy based on autonomy and decentralisation. In
 February 1998, Peoples' Global Action was born. For the first time
 ever the worlds grassroots movements were beginning to talk and share
 experiences without the mediation of the media or Non Governmental
 Organisations (NGO's).

The string of actions - that arguably gave birth the current 'wave'
 of actions and movements of movements - started in May 1998 with an
 international day of action against the world bank. This was quickly
 followed by an 'intercontinental caravan' that traveled through
 Europe, and he 'j18' international day of action [you can read the
 reports here:
<http://www.nadir.org/nadir/initiattiv/agg/free/global/j18.htm>]. The
 next on the list of actions was N30 - or what CNN dubbed 'Seattle'

Now, I'm not just nit-picking here. Its important to remember what
 has come before - especially the histories of resistance. Its
 saddening to note that the 'counter-globalisation' movements, with
 their histories bound up with those of the Zapatistas - the ones who
 reminded us that remembering is a weapon - can be turned from an
 international network and a series of projects based on decentralised
 and confrontational actions into 'Seattle' - into a singular movement
 born from a city at the heart of Empire. Or at least that its
 mythology - one of its most potent weapons - can be so easily blunted
 by a TV camera, and that the faces of resistance can be so easily
 obscured.

And I think its not just the richness of the histories that this
 change obscures - it is also the vastness of the alternatives that it
 is throwing up that is obscured. Its not true that they don't offer
 'alternatives' the current order of things. From farming methods, to
 communal land use, to systems of regional autonomy to mixed economies
 and markets, new mythologies and way of interacting with each other,
 from new media forms, and rich systems of participatory decision
 making to the rediscoveries of ways of community /barrio governance -
 the counter-globalisation movements, while not presenting programs
 for change, are most definitely creating 'the new in the old'.

The question as I see it is "can the strategy of the 'new in the old'
 work on a large enough scale?". Are the networks strong enough to
 fight these institutions, the corporations, and the governments of
 the North and win? Or will it all have to collapse before change can
 be made?

--
 + since I refuse 'reality' and since for me what is
 possible is already partly real, I am indeed a utopian ... a partisan

n_ik makes the valuable point that class struggle in most
 of the world appears not to be about information, but to be
 about land. Indeed, the "first", not the second or the third,
 moments of commodification is very much in progress. For
 many people the expropriation of their communal land
 rights is their direct experience of commodification, in
 terms of what it takes from them.

However, i think this process is overlaid by two other
 moments of commodification: industrialisation, or the
 commodification of fungible productive resources, but
 also vectorialisation, or the commodification of
 information and its means of abstraction, the vector.

If one breaks it down thus, one can use this distinction as
 an analytic for thinking about possible alliances, and
 possible conflicts, between the subordinated classes
 in each of the three distinct circuits of commodification.

It seems to me greatly clarifying to think about a
 complex articulation of class struggles, than to posit
 a 'multitude' arraigned against 'globalisation', where
 neither of those terms have much historical analytic
 specificity.

One can certainly trace a very significant movement that
 arises out the Zapatista experience, but it might be a
 bit limiting to restrict one's sense of a counter history to
 that one strand. Or to ignore how much that movement
 owed to an emergent information environment, both
 in terms of what it confronted and what it was able to
 use as vector for 'counter-global' (call it what you like)
 formation.

Re: <nettime> From Tactical Media to Digital Multitudes

From: Kermit Snelson

To: nettime-l@bbs.thing.net

Date: Mon, 4 Nov 2002 13:40:35 -0800

"As the situationists concluded, the true fulfillment of art ultimately implies going beyond the boundaries of art, bringing creativity and adventure into the critique and liberation of every aspect of life; and first of all into challenging the submissive conditioning that prevents people from creating their own adventures." -- Ken Knabb [1]

New media art must indeed fulfill and not simply continue to 'demo' its alternative vision of human relations. Geert and Florian are right to ask "what is to be done" to bring this about. However, the passage I just quoted came to mind as I read their analysis, and I'm not sure whether it serves them better as a summary or as a rebuke.

First of all, I don't see much in their post about "challenging the submissive conditioning that prevents people from creating their own adventures." I see quite the opposite, in fact; namely, an emphasis on the use of new media art as a tool for shaping mass psychology. In their own words, they are looking for a "solution to how alternative new media models can be raised to the level of mass (pop) culture." They say that the most important lesson that artists and activists might have to learn from the fall of the '90s techno-libertarian dotcommania is the "importance of marketing." They speak of a "virtual world" as something consisting of "software, interfaces and alternative standards" that must be "installed." And they strongly suggest that what's standing in way of such an "installation" is that the "new media art" discourse is now linked in the public mind with a failed, obsolete and financially ruinous business fad that "no one wants know about [...] anymore." So that means only that it's time to rebrand the product, eh?

Geert and Florian propose such a rebranding in two forms. First, they say it's imperative that the new media art scene disassociate itself from the failed '90s "New Economy" techno-libertarianism by radically critiquing it. Well, Geert co-founded nettime seven years ago to do just that. Apparently with little success, if their analysis of the present state of new media art is correct.

Second, they call for the abandonment of radical left theory in favor of a "new ethical-aesthetic paradigm" that "lives on in the pragmatic consciousness of affective labour" consisting of nerdiness, friendship and political action. This political action, in turn, is motivated by a very broad conception of "openness" that makes a connection, by means of considerable sophistry, between open source and open borders. Geert and Florian say that such a post-ideological, post-solidarity "digital multitude" is already a reality brought about by tactical media, and that "what is to be done" now is to bring this new social form "down to the level of production" by viewing this "multitude" as a producer of "experimental knowledge" whose "algorithms" must be encoded and decoded, all based on the core realization that "everyone is an expert."

But it's simply not true that "everyone is an expert", certainly not in any case at the "level of production", and it's in this conception of the multitude where I believe Geert and Florian's argument breaks down. I have never understood how the concept of "multitude" that Negri, joined by Geert and Florian, distinguishes from the "masses" by emphasizing the former's lack of a common trait, ideology or indeed any distinguishing idea at all [2], differs from the more traditional concept of "mob". McKenzie Wark in his response seems to pick up on this problem with Geert and Florian's argument, arguing that no "digital multitude" will be able to do "what is to be done" without first achieving class consciousness based on a common understanding of its relation to the currently emerging forms of intellectual property law. Whether or not McKenzie's own rewrite of the Communist Manifesto around IP law is the way forward, he is certainly right to insist that there's still something to the Marxist view that masses influence history only when formed by an idea. Certainly more than Geert and Florian seem willing to credit, anyway.

But McKenzie also fails to reach the heart of what's wrong with Geert and Florian's argument. Once again, I believe it lies near their idea that "everyone is an expert." To be sure, everyone is _potentially_ an expert. But no one, not even a genius, becomes an expert without the training, education and discipline necessary for creative and critical thought. Training and education involve the mastery of rules, techniques and ideas.

They are what any human culture is all about. On the other hand, it is impossible to found a culture on despair, nihilism and a principled rejection of all ideas and debate, even if one chooses to call such an approach "tactical media", "radical media pragmatism" or even "art". A "new ethical-aesthetic paradigm" that consists of only consumption, shopping, Indymedia-style parasitism, electronic vandalism and other forms of "negative thinking" [3] will never do anything but provide the motor force of Empire. This is what Hardt and Negri really meant by "resistance is prior to power" [4], concealing their real purpose in this instance not with their usual obfuscation, but with clarity.

Empire will be defeated not by applying the tools of mass psychology to create a "multitude," but by educating ourselves and others so that such tools may be resisted. We must cultivate our ability to propose answers, make distinctions, construct coherent arguments, refine our concepts, inform our judgments and, yes, make moral choices. Such abilities are the basis of any truly effective activism, just as they are the basis of any truly effective life. Renouncing all these things and calling that "liberating" will only ensure our slavery.

There is no knowledge to be decoded in mindless action, just as there is no freedom in license. Masses are creative and free; mobs are not. Konrad Becker's recent post to nettime notwithstanding, there's a radical difference between propaganda and education. The difference is precisely that education allows one to challenge "the submissive conditioning that prevents people from creating their own adventures," as Ken Knabb writes in the passage I chose to open this post. Mass propaganda techniques based on a "fascination for authoritarian models" [5], even when wielded by well-intentioned media activists, can accomplish only the opposite.

Kermit Snelson

A Possible World is Virtual (was: <nettime> From Tactical Media to Digital Multitudes)

From: Gabriel Pickard

To: nettime-l@bbs.thing.net

Date: Tue, 05 Nov 2002 10:28:37 +0100

A possible world is virtual. absolutely.

_This_world_is_always_fucking_impossible.

... There's something lovely about it _ that i just can't quite place my finger on. .. speak this - and rub your finger a ll' over. that is, complexity. and it won't help (much) to recognize and declare it as such (don't even _try to understand).

though the question may be: this? world?

ok, it should be clear that a _this_world_ (in _this_ (absolute (non-multiple) sense) does not exist.

So we already have one reason why? a possible world is so utterly virtual.

this is of course a question of reality and reality multiplicity and production, which presents itself as a painful and fascinating issue to a media-activist. what is often overlooked, though, is that reality != media. The term "world" even more so. I certainly do not want to criticize those who analyse and fight the evil corporate media in its malicious influence on mass realization, but as important as this is, reality is about more than just media. media in the narrow space of communication connects information and material, virtuality and actuality. reality is nothing else but a borderline, discerning in&out, real&irreal. maybe we should get past the point of pushing around this borderline, it's all existence -anyway, much rather, i'd propose we reflect upon the everyday, unspoken

implications of our "doing media" because if we realize that information is independent parallel existence, this abstractive "interface" becomes quite interesting. "doing media" and "doing information" are two different things. now isould say that we can hardly get around doing information, but media is still a much more alterable mass than we might think. eventhough it may seem old, i'd like to suggest that we rethink- remake- redo. if our media is discontenting, question its foundations - build a new new media -really /if our movement seems frustrating, poses: wastunf, why not move something else, somewhere else_and_under_another_name_ that will

-andis- being done anyway.

wastunf'so_

what only may be tried, is both an immediate and metamediatic radicalization in addition to mediate radicalism.

concerning bubble&burst:

now to me, as potential early representant of the generation following the gen. of 89, the whole dotcom thing had a lot to do with adolescence. with growing pains, puberty and confusion. growing up with people envying you for all the new, new developments you'll witness - and pitying you for not being able to cash in and grow in power at the beginning of the "long boom". nowadays, people don't philosophize over the future too much, they just tell you to work hard and get a good job. :-| Maybe this can help with the analysis, seeing it all as the growing up of the 21st century. and don't let them fool you, even though it's already feeling like midlife-crisis, that's all just some youthful morosity. There's more developments around the corner the dream of the open technological future is not over yet

keepitup,
Gabriel.

To have multitudes, then, we need a gathering idea for them, which quickly brings us back to the proverbial Catch 22. The first symptom of this stalemate conundrum is arguably how it is theorized here. Operatives like left and right, mass and mob, network and empire are passive placeholders for multitudes that are conveniently pushed around into pigeonholes carved by persuasive rhetoric, as if they were not already deeply conflicted "multitudes" themselves. This is of course how one traditionally arrives at a general idea about the specific, tellingly called theory from its Greek root. The first step toward the stated aims must surely be to cease this nonsense and intersect on less grandiose terms. As one of the heralded beats remarked on leave from the asylum: "A star is as far as the eye can see and as close as my eye is to me."

Re: <nettime> From Tactical Media to Digital Multitudes
From: David Garcia
To: nettime-l@bbs.thing.net
Date: Thu, 07 Nov 2002 07:36:41 +0100

In their article In their article Florian Schneider and Geert Lovink declare that "the new social movements (wrongly labeled anti-globalisation) are in danger of "getting stuck in self-satisfying protest mode, running the risk "of getting stuck at the level of a global 'demo design,' no longer grounded

in actual topics and local situations." They then ask the key question "how to jump beyond the prototype?"

The answer to their question lies above all in specificity. In being able to generalize effectively (with explanatory power) from the lived experience of involvement in *specific* campaigns. In December Gregg Bordowitz will be moderating a session in the New York Tactical Media Lab <<http://nsm4.org/index.shtml#118+120+2450>> His text (below) suggests ways of addressing a number of the questions raised by Geert and Florian including the function and meaning of art in relationship to politics. I hope this list finds Gregg's text as useful as I did on the recurring art question as it takes us beyond the rather fruitless obsessing about the "electronic arts sub-culture" and the demise of the dot.com era. (David Garcia)

I'm Gregg Bordowitz, AIDS activist, video maker, writer and teacher. I will be facilitating the discussion at the December TML on Sunday the 15th. It will focus on HIV/AIDS media activism. Planning for that day is coming more into focus. Here are some of the ideas that I have been thinking about that could come up within the discussion.

I am a long time activist who has made much work, both in video and in writing that addresses the organizing problems specific to AIDS activism. Here are some of the presumptions I make going into our discussion. Be kind, these are rough working notes.

1) The AIDS crisis is still beginning. In the US there is much fatigue around the issue of AIDS and a profound misconception that the epidemic is contained. Around the world, in Africa, South America, Eastern Europe and Asia, places where the epidemic is out of control, there are growing activist movements. A particular hot spot to look at now is South Africa. The issues that internationalist AIDS activism currently focuses upon have the potential to explode and alter a number of governing discursive and juridical regimes concerning trade, industrial production and post-industrial production. International AIDS activists are questioning and applying pressure regarding the production and distribution of generic pharmaceuticals. This is interesting to us for a number of reasons. First, I am on the AIDS drug cocktail myself and so the issue is potentially central to my survival. Second, the juridical regimes that govern international patent law are the same whether applied to pharmaceuticals, software or feature films. (The TRIPS agreement covers all this.) All of us have a stake in copyright law -- academics, media activists, software designers, people interested in digital tech of all kinds. For media activists, the issue of affective labor and the management of the production and distribution of affective labor is an area of great concern in theory and practice.

2) You can't understand the global AIDS crisis without a working theory of globalization and analyzing the global AIDS crisis is a perfect way for forming a theory of globalization. You can get to almost any issue by way of an analysis of global AIDS -- poverty, borders, modes of production, etc.

3) Think about. There are millions of people with AIDS around the world, in every corner of the planet. What would happen if every person with AIDS demanded immediate care and access to lifesaving drugs? At the Barcelona AIDS conference this passed July, Nelson Mandela encouraged every person with AIDS, no matter where they are, what circumstances of poverty they live-in, to demand immediate care. This was profound. Everyone else was talking about scaling-up -- increasing the scale of funding and infrastructure to meet the dire needs of millions. That's an important discussion to have (unfortunately now weighed down by bureaucratic infighting and the apathy of governments). BUT, Mandela gave a revolutionary message that addressed the individual, potentially millions of individuals. This is what Hardt and Negri are talking about in the book Empire, when they are trying to figure out "how to capture the multitude as a singularity." How can one come-up with an articulation available to individual use, an open, improvisational code, if you will, that links millions around a common goal, but allows for differences of context. (Yes back to the old problem of the Internationale. The Internationale without the Internationale. Arise, ye prisoners of international trade regimes and structural inequity!)

3) Politics and art. Media activist work must adopt the imperatives of a movement as its starting point, not its end. The work of media activism is not supplemental to any cause. it is its own cause. Media activist work does not earn its guarantee of relevance or truth from protests and activist efforts. Media activism must provide its own guarantees through form. The politics in political art, are the politics that occur when the work is encountered in real time. The politics of media activism are not to be found anywhere but in the work itself. Lastly, we must talk about aesthetics. Yes, as media activists, in particular our work must address questions of form. I advocate the cross breeding of documentary procedures with poetry and

the concerns of structure usually reserved for conversations about music.

Here's some thoughts about various contributions to this thread, quite a useful one for me anyway, which David Garcia has now about capped off by contributing Gregg Bordowitz's insightful and even revolutionary reflections on AIDS and globalization. While awaiting the fusion of documentary and poetry :)

1.
Kermit really doesn't like the slogan "everyone is an expert":

...no one, not even a genius, becomes an expert without the training, education and discipline necessary for creative and critical thought. Training and education involve the mastery of rules, techniques and ideas.... it is impossible to found a culture on despair, nihilism and a principled rejection of all ideas and debate, even if one chooses to call such an approach 'tactical media', 'radical media pragmatism' or even 'art'. [snip]

Kermit, sometimes I wonder if you do any political organizing? You know, it might be great if leftists could only associate with people who had a clear sense of self, sharply honed critical faculties, a good background knowledge of all the issues, sound moral reflexes and a sense of coherency in their actions. Trouble is, these days that list of qualities probably better describes the majority of American voters who just gave Bush a mandate for holy war. "Negative thinking" is a philosopher's word for the difficult attempt to resist a badly oriented rationality, a predatory individualism, a malevolent discipline. But the sources of effective resistance don't just come from philosophy: they also come from the fringes of alienation and anger and despair, from the insights of artistic experience, from the sudden enthusiasms of technological change, sometimes from more obscure rejections of the status quo. One of the main issues today is that the majority of the "experts" never question the holy mantra of economic growth, or the unspoken credo of racist exclusion. Somehow that expertise has to be challenged, it's urgent. What Geert and Florian are doing is not just armchair resistance, they're trying to give fairly large numbers of people a possible way into political life, which is always about debate, even when that debate takes the form of a riot or a hacker attack. Did you ever stake your own physical freedom on an issue? Do you think someone who does might also have principles? The main thing right now is not to diss everyone off and claim the high ground. I mean, I appreciate your scholarship and also that you even take the time to apply it to what we're talking about here. What's dismaying, generally, is that the minority concerned about something other than their own greed spend half their time fighting with the people on their own side. We could use some subtler criticism.

2.
I really liked Nik's post in this thread, recalling the role that the PGA and all the social movements associated with it have played in putting a new critique of capitalism seriously on the table. In the absence of that history and that continuing reality there would be no social forums, just a complicit center left waiting to cave in and abandon everything. Without a few principled riots the critique would have remained so "reasonable" that it'd just be contemplative nostalgia from a bunch of well-heeled artists, old pros or has-been communists. If you have problems with armchairs and you're not totally hooked on computer screens, check out the PGA for a change. I've found those meshworks to be the best way for me personally to experience and develop the kind of global cooperativity and solidarity that's going to be a broad basis of real resistance, as the days get darker and all of this bullshit economic crisis goes on wrecking people's lives.

3.
I also liked the way that MacKenzie came back in his second post and talked about three major types of resistance, against three forms of

domination, over land, the means of industrial production, and abstract or symbolic property. Those are actually Karl Polanyi's three anthropological categories: land, labor and money (or the social institution of exchange). Polanyi showed how the liberal fiction of self-regulating markets destroys all three, leading to violent conflict. The complexity and diversity of resistance, based on differing relations to those three categories, is a key reality, it's one that you have to respect in order to understand why different people stand up for their different struggles. Our job as intellectuals is to at least try to bridge the gap, whenever it's possible. But I don't think the "vector" thing adds much to the argument. Way back in the mid-eighties, people had analyzed what's still unfortunately true: finance capital reigns supreme in this phase of capitalism. Before the World Wide Web, abstract dollars and deutschmarks and yens were spinning madly around the planet in electronic circuits, and doing the kind of damage they're still doing today. And they did it in the 20s too, before electronics. The great granddaddy of intellectual property, the way of controlling land and labor and even commerce at a distance, is big money, stock, financial instruments, supported as always by national and international law that favors owners over non-owners. IP is just a new twist in that very old story. Again I agree with Nik.

4.
All the above suggests the critique that I personally have of the concept of "multitudes." But first of all, to say it's a synonym of mob is just ridiculous. In all the autonomist texts the multitudes arise from subjective processes of individuation, which are opposed to the consensual figure of the "people" within the normalizing framework of the nation-state. The notion of the multitudes is a demand to go beyond the current premise of representative democracy: that a virtuous, unimpeachable collective will can be derived from just counting up votes or polling opinions in frameworks that ask only for knee-jerk reactions, and not for any kind of self-elaboration or collective participation (not even the kind you go through when you take part in a big demo). Paolo Virno puts the whole mob argument to rest in his article in the French journal *Multitudes* #7, when he says that this singularizing process is actually an intensification of political sociality: "Far from regressing, singularity is refined and reaches its peak in acting together, in the plurality of voices, in short, in the public sphere." OK, for every Virno there are lots of sloppy uses of the word, and I agree with Kermit that it's right to point them out. It's really a word that needs to be kept at the level of philosophy, at least for a while anyway. But the fundamental problem I have with multitudes is the argument that says that we're all intellectual laborers now, or even if we're not, that's the key process, the same way as Marx said that industrial labor was the key process giving rise to the proletariat in the 19th century. I think the danger there is taking your own navel for the whole orange, or worse, for the whole planet. 6.25 billion post-fordists is just not yet reality. We intellectual laborers definitely have some scores to settle with finance capital and IP, and those are important struggles, for sure. But let's try and keep our intellectual eyes open for the ways that everyone else is living too.

The first score is of course how "we" are going to get paid for "our" work as "intellectuals." Our plan of action must be to isolate certain points and

make them scarce by attributing them to the select few that pose as useful authorities on worthwhile topics. Let us further form close links where we quote each other ad infinitum to create the domino effect where arguments fall real nice and everyone included in the chain reaction make perfect sense. Oh, and we will of course embrace everything and everyone in our arguments, so the process should in no way be considered exclusive or exclusionary (although some _obvious_ exceptions will me made, based upon our consensus). This is not to say that I don't hungrily read or (dis)agree with you, but not so deep down I know that theory is some bullshit corner I paint myself into and admire the view.

What happened to AIDS activism (re: GB words)? If I may reinterpret some of the sentiments about gay activism put forward by Crimp in *Melancholia* and *Moralism*; it is not just the case that it died as a result of gay neo-conservatives hijacking its agenda and thereby gaining the mainstream appeal that eventually defused it. The *melancholia* part relates to an inward mourning of its own potential; the loss of its own future as a culture of sexual possibility. Activism, in other words, grew to the point where it lost momentum and turned on itself as a melancholic impulse directed toward its past. My metaphoric guess is that the AIDS quilt can be seen as a pivotal moment, where this particular movement reached a critical mass in the west and individuation no longer mobilized but returned to alienation and loss. The from-to implications in the subject heading of this thread may signal a similar moment for 'new media.'

Just listen to what people are saying; the post are infused with melancholy, for what never was and what is taken away. There are reasonings for hope not impulsive calls for action. So GB's invite for documentary and poetry to fuse, following the formula for a.g. intervention through formal invention, is the proven antidote to such a lethargic moment, and it deserves a little more than an emoticon smirk, despite its predictability. It also asks for theory to examine its boundaries and to think rather than quote. To rejuvenate the grassroots, we don't necessarily have to hose the lawn with another dose of Empire. Activism moves from the specific to the general and dies.

I know it scares me that some deadbeat drunk [sorry, Mr. Corso] with an asylum record can capture more insight in a few stanzas than a whole legion of decorated laureates can in a whole library. To overcome such fears is the breach of theory. "Our" work as "intellectuals" is then done. "We" can move on.

Re: <nettime> From Tactical Media to Digital Multitudes

From: Keith Hart

To: nettime-l@bbs.thing.net

Date: Thu, 7 Nov 2002 16:57:04 -0500

I always pay particular attention to messages from Kermit Snelson and Brian Holmes because I like where each of them is coming from. I have pursued this sense of an affinity with each of them off the list. So when Brian takes umbrage at Kermit's last post in this thread, I feel compelled to enter the fray.

Max Weber wrote two great essays called "Science as a vocation" and "Politics as a vocation". He argued that a scientist must privilege reason, but good scientists are usually enthusiasts; whereas politicians move people by passion, but their arguments are more persuasive if they are reasonable. Despite this overlap, it is hard to be both a scientist and a politician at the same time. Weber was chief organiser of German sociology, a failed Liberal MP and an adviser to the Kaiser's wartime cabinet. He was also a depressive who knew about the psychological pressures of trying to unify the two sides of his personality.

What I like about Kermit's messages is their intellectual clarity. It is true that there is scholarship in them, but what impresses me is their quality of reasoning. It does not seem fair to me to ask him to justify these interventions in terms of a logic of political activism. I know that the politics of Karl Marx and Walter Benjamin are long dead, unrealised. But their contributions to the ongoing human conversation about a better world still inspire us. Do I care about their skills in mobilising people to man the barricades? Not really. It is the quality of their thinking that is moving.

Maybe that makes me an intellectual more than a political activist. But it is clear that the people who matter were motivated by both concerns. I can't imagine that Kermit would be on this list unless he cared about the political troubles of our day, whether or not he goes out into the streets to get people committed to a cause. Equally, having read and studied all of Brian's contributions to this list, I find his intellectual and political visions equally inspiring. He wants things to get better soon, but he has put in some spadework on how to think about that. Maybe there is more feeling in his posts than Kermit's. But surely there is room for all of us in this game. Why attack a blatant intellectual for saying that he sees some flaws in the arguments of Geert and Florian?

I should add a footnote on Polanyi, since Brian brought him up, not for the first time. This is not just a scholastic intervention. Polanyi, in *The Great Transformation* (1944), said that land, labour and capital were fictitious commodities. A commodity is something produced and sold. But nature, humanity and society (money) are not produced and therefore cannot be sold. If they are, something terrible happens to the relationship between society and nature, as formulated by Aristotle when he said that man is a political animal. The self-regulating market, as an utopian idea, inevitably inflicts damage on nature, humanity and society. Particular classes express resistance to that general damage.

What this has to do with multitudes and mobs I can't guess. I prefer English words of one syllable (expressing the idea of mobility) to Latin words of three syllables (expressing the poetry of an intellectual class).

Keith Hart

<nettime> Tactical Media & Conflicting Diagrams (draft chapter)

From: Alexander Galloway

To: nettime-l@bbs.thing.net

Date: Sun, 12 Jan 2003 11:54:40 -0500

Nettimers--I'm preparing a book manuscript on computer protocols and how they establish control in the seemingly anarchical Internet. I'm hoping that some of you will be able to read my draft chapter below on tactical media which tries to show how there are many interesting flaws in the protocological system of control. Please point out my mistakes before i send it to my editor!:-) thanks, -ag

+ + +

"The Internet is like the Titanic. It is an instrument which performs extraordinarily well but which contains its own catastrophe."^[1]
Paul Virilio

Like many interesting social movements that may manifest themselves in a variety of ways, tactical media has an orthodox definition and a more general one. The orthodoxy comes from the new tech-savvy social movements taking place in an around the Western world and associated with media luminaries such as Geert Lovink, Ricardo Dominguez (with the Electronic Disturbance Theater) and Critical Art Ensemble (CAE). Tactical media is the term given to political uses of both new and old technologies, such as the organization of virtual sit-ins, campaigns for more democratic access to the Internet, or even the creation of new software products not aimed at the commercial market.

"Tactical Media are what happens when the cheap 'do it yourself' media, made possible by the revolution in consumer electronics and expanded forms of distribution (from public access cable to the internet) are exploited by groups and individuals who feel aggrieved by or excluded from the wider culture," write tactical media gurus Geert Lovink and David Garcia. "Tactical media are media of crisis, criticism and opposition."^[2] Thus, tactical media means the bottom-up struggle of the networks against the power centers. (And of course the networks against the power centers who have recently reinvented themselves as networks!)

But there is also a more general way of thinking about tactical phenomena within the media. That is to say, there are certain tactical effects that often only leave traces of their successes to be discovered later by the ecologists of the media. This might include more than would normally fit under the orthodox definition. Case in point: computer viruses. In a very bland sense they are politically bankrupt and certainly no friend of the tactical media practitioner. But in a more general sense they speak volumes on the nature of network-based conflict.

For example computer viruses are incredibly effective at identifying anti-protocological technologies. They infect proprietary systems, and propagate through the homogeneity contained within them.

Show me a computer virus and I'll show you proprietary software with a market monopoly.

I will not repeat here the excellent attention given to the subject by CAE, Lovink and others. Instead in this chapter I would like to examine tactical media as those phenomena that are able to exploit flaws in protocological and proprietary command and control, not to destroy technology, but to sculpt protocol and make it better suited to people's real desires. "Resistances are no longer marginal, but active in the center of a society that opens up in networks."^[3] Hardt & Negri remind us. Likewise, techno-resistance is not outside of protocol, but is at its center. Tactical media propel protocol into a state of hypertrophy, pushing it further, in better and more interesting ways.

Computer Viruses

While a few articles on viruses and worms appeared in the 1970s and beginning of the 80s,^[4] Frederick Cohen's work in the early eighties is cited as the first sustained examination of computer viruses. He approached this topic from a scientific viewpoint, measuring infection rates, classifying different types of viruses, and so on.

"The record for the smallest virus is a Unix 'sh' command script. In the command interpreter of Unix, you can write a virus that takes only about 8 characters. So, once you are logged into a Unix system, you can type a 8 character command, and before too long, the virus will spread. That's quite small, but it turns out that with 8 characters, the virus can't do anything but reproduce. To get a virus that does interesting damage, you need around 25 or 30 characters. If you want a virus that evolves, replicates, and does damage, you need about 4 or 5 lines."^[5]

Cohen first presented his ideas on computer viruses to a seminar in 1983. His paper "Computer Viruses, Theory and Experiments" was published in 1984, and his Ph.D. dissertation titled "Computer Viruses" (University of Southern California) in 1986.

Cohen defines a computer virus as "a program that can infect" other programs by modifying them to include a, possibly evolved, version of itself."^[6] Other experts agree: "a virus is a self-replicating code segment which must be attached to a host executable."^[7] Variants in the field of malicious code include worms and Trojan Horses. A worm, like a virus, is a self-replicating program but one that requires no host to propagate. A Trojan Horse is a program

which appears to be doing something useful, but also executes some piece of undesirable code hidden to the user.

In the literature viruses are almost exclusively characterized as hostile or harmful. They are often referred to completely in the negative, as in "anti-virus software" or virus prevention, or as one author calls it, a "high-tech disease." They are considered nearly exclusively in the context of detection, interception, identification, and removal.

Why is this the case? Viral marketing, emergent behavior, self-replicating systems these concepts are all the rage at the turn of the millennium. Yet computer viruses gain from none of these positive associations. They are thought of as a plague used by terrorists to wreak havoc on the network.

So why did computer viruses become so closely connected with the viral metaphor in biology? Why think of self-replicating programs as a "virus" and not simply a parasitic nuisance, or a proper life form? Even the father of computer virus science, Cohen, thought of them as a form of artificial life^[8] and recognized the limitations of the biological analogy. "[C]onsider a biological disease that is 100% infectious, spreads whenever animals communicate, kills all infected animals instantly at a given moment, and has no detectable side effect until that moment."^[9] wrote Cohen, identifying the ultimate inaccuracy of the analogy. How did self-replicating programs become viruses?

For example, if viruses had emerged a decade later in the late-1990s, it is likely that they would have a completely difference socio-cultural meaning. They would most certainly be thought of more as a distributed computing system (like SETI [AT]home) or an artificial life experiment (like Tom Ray's Tierra), or an artwork (like Mark Daggett's email worm, vcards), or as a nuisance (spam), or as a potential guerilla marketing tool (adware) not a biological infestation.

Computer viruses acquired their current discursive position because of a unique transformation that transpired in the mid-1980s around the perception of technology. In fact several phenomena, including computer hacking, acquired a distinctly negative characterization during this period of history because of the intense struggle waging behind the scenes between proprietary and protocological camps.

My hypothesis is this: early on, computer viruses were identified with the AIDS epidemic. It is explicitly referenced in much of the literature on viruses, making AIDS both the primary biological metaphor and primary social anxiety informing the early discourse on computer viruses. In that early mode, the virus itself was the epidemic. Later, the discourse on viruses turns toward weaponization and hence terrorism. Here, the virus author is the epidemic. Today the moral evaluation of viruses is generally eclipsed by the search for their authors, who are prosecuted as criminals and often terrorists. The broad viral epidemic itself is less important than the criminal mind that brings it into existence (or the flaws in proprietary software that allow it to exist in the first place).

Thus, by the late 1990s viruses are the visible indices of a search for evil-doers within technology, not the immaterial, anxious fear they evoked a decade earlier under the AIDS crisis.

Computer viruses appeared in a moment in history where the integrity and security of bodies, both human and technological, was considered extremely important. Social anxieties surrounding both AIDS and the war on drugs testify to this. The AIDS epidemic in particular is referenced in much of the literature on viruses.^[10] This makes sense because of the broad social crisis created by AIDS in the mid to late 1980s (and beyond). "In part," writes Ralf Burger, "it seems as though a hysteria is spreading among computer users which nearly equals the uncertainty over the AIDS epidemic."^[11] A good example of this discursive pairing of AIDS and computer viruses is seen in the February 1, 1988 issue of Newsweek. Here an article titled "Is Your Computer Infected?" which reports on computer viruses affecting hospitals and other institutions, is paired side-by-side with a medical article on AIDS.

Consider two examples of this evolving threat paradigm. The Jerusalem virus^[12] was first uncovered in December 1987 at Hebrew University of Jerusalem in Israel. "It was soon found that the virus was extremely widespread, mainly in Jerusalem, but also in other parts of the country, especially in the Haifa area."^[13] wrote professor Yisrael Radai. Two students, Yuval Rakavy and Omri Mann, wrote a counter-program to seek out and delete the virus.

Mystery surrounds the origins of the virus. As Frederick Cohen writes, terrorists are suspected of authoring this virus because it was timed to destroy data precisely on the first Friday the 13th it encountered, which landed on May 13, 1988 and coincided with the day commemorating

forty years since the existence of a Palestinian state.[14] (A subsequent outbreak also happened on Friday, January 13th 1989 in Britain.) The Edmonton Journal called it the work of a 'saboteur.' This same opinion was voiced by The New York Times, who reported that the Jerusalem virus "was apparently intended as a weapon of political protest." [15] Yet Radai claims that in subsequent, off-the-record correspondence, the Times reporter admitted that he was "too quick to assume too much about this virus, its author, and its intent." [16] In the end it is of little consequence whether or not the virus was written by the PLO. What matters is that this unique viral threat was menacing enough to influence the judgment of the media (and also Cohen) to believe, and perpetuate the belief, that viruses have a unique relationship to terrorists. Words like 'nightmare,' 'destroy,' 'terrorist,' and 'havoc' pervade the Times report.

Second, consider the 'AIDS Information Introductory Diskette Version 2.0' Disk. On December 11, 1989, the PC Cyborg Corporation mailed approximately 10,000[17] computer diskettes to two direct mail lists compiled from the subscribers to PC Business World and names from the World Health Organization's 1988 conference on AIDS held in Stockholm.[18] The disk carried the title 'AIDS Information Introductory Diskette Version 2.0,' and presents an informational questionnaire to the user and offers an assessment of the user's risk levels for AIDS based on their reported behavior.

The disk also acted as a Trojan Horse containing a virus. The virus damages file names on the computer and fills the disk to capacity. The motives of the virus author are uncertain in this case, although it is thought to be a rather ineffective form of extortion as users of the disk were required to mail payment of \$189 (for a limited license) or \$378 (for a lifetime license) to a post office box in Panama.

The virus author was eventually discovered to be an American named Joseph Popp who was extradited to Britain in February 1991 to face charges but was eventually dismissed as being psychiatrically unfit to stand trial.[19] He was later found guilty in absentia by an Italian court.

Other AIDS-related incidents include the early Apple II virus "Cyberaids," the AIDS virus from 1989 which displays "Your computer now has AIDS" in large letters, followed a year later by the AIDS II virus which performs a similar infraction.

So here are two threat paradigms, terrorism and AIDS, which characterize the changing discursive position of computer viruses from the 1980s to 1990s. While the AIDS paradigm dominated in the late 80s, by the late 90s computer viruses would become weaponized and more closely resemble the terrorism paradigm.

The AIDS epidemic in the 1980s had a very specific discursive diagram. With AIDS, the victims became known, but the epidemic itself was unknown. There emerged a broad, immaterial social anxiety. The biological became dangerous and dirty. All sex acts became potentially deviant acts and therefore suspect.

But with terrorism there exists a difference discursive diagram. With terror the victims are rarely known. Instead knowledge is focused on the threat itself the strike happened here, at this time, with this weapon, by this group, and so on.

If AIDS is an invisible horror, then terror is an irrational horror. It confesses political demands one minute, then erases them another (while the disease has no political demands). The State attacks terror with all available manpower, while it systematically ignores AIDS. Each shows a different exploitable flaw in protocological management and control.

While the shift in threat paradigms happened in the late 1980s for computer viruses, the transformation was long in coming. Consider the following three dates.

In the 1950s in places like Bell Labs,[20] Xerox PARC and MIT scientists were known to play a game called Core War. In this game two self-replicating programs were released into a system. The programs battled over system resources and eventually one side came out on top. Whoever could write the best program would win.

These engineers were not virus writers, nor were they terrorists or criminals. Just the opposite, they prized creativity, technical innovation and exploration. Core War was a fun way to generate such intellectual activity. The practice existed for several years unnoticed. "In college, before video games, we would amuse ourselves by posing programming exercises," said Ken Thompson, co-developer of the UNIX operating system, in 1983. "One of the favorites was to write the shortest self-reproducing program." [21] The engineer A. K. Dewdney

recounts an early story at, we assume, Xerox PARC about a self-duplicating program called Creeper which infested the computer system and had to be brought under control by another program designed to neutralize it, Reaper.[22] Dewdney brought to life this battle scenario using his own gaming language called Redcode.

Jump ahead to 1988. At 5:01:55pm[23] on November 2 Robert Morris, a 23-year-old graduate student at Cornell University and son of a prominent computer security engineer at the National Computer Security Center (a division of the NSA), released an email worm into the ARPANET. This self-replicating program entered approximately 60,000[24] computers in the course of a few hours, infecting between 2,500 and 6,000 of them. While it is notoriously difficult to calculate such figures, some speculations put the damage caused by Morris's worm at over \$10,000,000.

On July 26, 1989 he was indicted under the Computer Fraud and Abuse Act of 1986. After pleading innocent, in the spring of 1990 he was convicted and sentenced to three years probation, fined \$10,000 and told to perform 400 hours of community service. Cornell expelled him, calling it "a juvenile act,"[25] while Morris's own dad labeled it simply "the work of a bored graduate student." [26]

While the media cited Morris's worm as "the largest assault ever on the nation's computers,"[27] the program was largely considered a sort of massive blunder, a chain reaction that spiraled out of control through negligence. As Bruce Sterling reports: 'Morris said that his ingenious "worm" program was meant to explore the Internet harmlessly, but due to bad programming, the worm replicated out of control.' [28] This was a problem better solved by the geeks, not the FBI, thought many at the time. "I was scared," admitted Morris, "it seemed like the worm was going out of control." [29]

Morris's peers in the scientific community considered his prosecution unnecessary. As reported in UNIX Today, only a quarter of those polled thought Morris should go to prison, and, as the magazine testified, "most of those who said 'Yes' to the prison question added something like, only a minimum security prison you know, like the Watergate people vacationed at." [30] Thus while not unnoticed, Morris's worm was characterized as a mistake not an overt, criminal act. Likewise his punishment was relatively lenient for someone convicted of such a massive infraction.

Ten years later in 1999, after what was characterized as the largest Internet man hunt ever, a New Jersey resident named David Smith was prosecuted for creating Melissa, a macro virus that spreads using the Microsoft Outlook and Word programs. It reportedly infected over 100,000 computers worldwide and caused \$80 million in damage (as assessed by the number of hours computer administrators took to clean up the virus). While Melissa was generally admitted to have been more of a nuisance than a real threat, Smith was treated as a hard criminal not a blundering geek. He pleaded guilty to 10 years and a \$150,000 fine.

With Smith, then, self-replicating programs flipped 180 degrees. The virus is now indicative of criminal wrongdoing. It has moved through its biological phase, characterized by the associations with AIDS, and effectively been weaponized. Moreover criminal blame is identified with the virus author himself who is thought of not simply as a criminal but as a cyber-terrorist. A self-replicating program is no longer the hallmark of technical exploration, as it was in the early days, nor is it (nor was it ever) a canary in the coal mine warning of technical flaws in proprietary software, nor is it even viral; it is a weapon of mass destruction. From curious geek to cyber terrorist.

[...]

Conflicting Diagrams

"Netwar is about the Zapatistas more than the Fidelistas, Hamas more than the Palestine Liberation Organization (PLO), the American Christian Patriot movement more than the Ku Klux Klan, and the Asian Triads more than the Costa Nostra." [61] John Arquilla & David Ronfeldt

Throughout the years new diagrams (also called graphs or organizational designs) have appeared as solutions or threats to existing ones. Bureaucracy is a diagram. Hierarchy is one too, so is peer-to-peer. Designs come and go, useful asset managers at one historical moment, then disappearing, or perhaps fading only to reemerge later as useful again. The Cold War was synonymous with a specific military diagram bilateral symmetry, mutual assured destruction (MAD), massiveness, might, containment, deterrence, negotiation; the war against drugs has a different diagram multiplicity, specificity, law and criminality; personal fear, public awareness.

This book is largely about one specific diagram, or organizational design, called distribution, and its approximate relationship in a larger historical transformation involving digital computers and ultimately the control mechanism called protocol.[62]

In this diagrammatic narrative it is possible to pick sides and describe one diagram as the protagonist and another as the antagonist. Thus the rhizome is thought to be the solution to the tree,[63] the wildcat strike the solution to the boss's control, Toyotism[64] the solution to institutional bureaucracy, and so on. Alternately, terrorism is thought to be the only real threat to state power, the homeless punk-rockers a threat to sedentary domesticity, the guerrilla a threat to the war machine, the temporary autonomous zone a threat to hegemonic culture, and so on.

This type of conflict is in fact a conflict between different social structures, for the terrorist threatens not only through fear and violence, but specifically through the use of a cellular organizational structure, a distributed network of secretive combatants, rather than a centralized organizational structure employed by the police and other state institutions. Terrorism is a sign that we are in a transitional moment in history. (Could there ever be anything else?) It signals that historical actors are not in a relationship of equilibrium, but instead are grossly mismatched.

It is often observed that, due largely to the original comments of networking pioneer Paul Baran, the Internet was invented to avoid certain vulnerabilities of nuclear attack. In Baran's original vision, the organizational design of the Internet involved a high degree of redundancy, such that destruction of a part of the network would not threaten the viability of the network as a whole. After World War II, strategists called for moving industrial targets outside of urban cores in a direct response to fears of nuclear attack. Peter Galison calls this dispersion the "constant vigilance against the re-creation of new centers." [65] These are the same centers that Baran derided as an "Achilles Heel" [66] and what he longed to purge from the telecommunications network.

"City by city, country by country, the bomb helped drive dispersion," [67] Galison continues, highlighting the power of the A-bomb to drive the push towards distribution in urban planning. Whereas the destruction of a fleet of Abrams tanks would certainly impinge upon Army battlefield maneuvers, the destruction of a rack of Cisco routers would do little to slow down broader network communications. Internet traffic would simply find a new route, thus circumventing the downed machines.[68]

(In this way, destruction must be performed absolutely, or not at all. "The only way to stop Gnutella," comments WiredPlanet CEO Thomas Hale on the popular file sharing protocol, "is to turn off the Internet." [69] And this is shown above in our examination of protocol's high penalties levied against deviation. One is completely compatible with a protocol, or not at all.)

Thus the Internet can survive attacks not because it is stronger than the opposition, but precisely because it is weaker. The Internet has a different diagram than nuclear attack; it is in a different shape. And that new shape happens to be immune to the older.

All the words used to describe the World Trade Center after the attacks of September 11, 2001 revealed its design vulnerabilities vis-à-vis terrorists: it was a tower, a center, an icon, a pillar, a hub. Conversely, terrorists are always described with a different vocabulary: they are cellular, networked, modular, and nimble. Groups like Al-Qaeda specifically promote a modular, distributed structure based on small autonomous groups. They write that new recruits "should not know one another," and that training sessions should be limited to "7 - 10 individuals." They describe their security strategies as "creative" and "flexible." [70]

This is indicative of two conflicting diagrams.

The first diagram is based on the strategic massing of power and control, while the second diagram is based on the distribution of power into small, autonomous enclaves. "The architecture of the World Trade Center owed more to the centralized layout of Versailles than the dispersed architecture of the Internet," wrote Jon Ippolito after the attacks. "New York's resilience derives from the interconnections it fosters among its vibrant and heterogeneous inhabitants. It is in decentralized structures that promote such communal networks, rather than in reinforced steel, that we will find the architecture of survival." [71] In the past the war against terrorism resembled the war in Viet Nam, or the war against drugs conflicts between a central power and an elusive network. It did not resemble the Gulf War, or World War

II, or other conflicts between states.

"As an environment for military conflict," the New York Times reported, "Afghanistan is virtually impervious [72] to American power." (In addition to the stymied US attempt to route Al-Qaeda post-September 11th is the failed Soviet occupation in the years following the 1978 coup, a perfect example of grossly mismatched organizational designs.) Today being "impervious" to American power is no small feat.

The category shift that defines the difference between state power and guerrilla force shows that through a new diagram, guerrillas, terrorists and the like can gain a foothold against their opposition.

But as Ippolito points out this should be our category shift too, for anti-terror survival strategies will arise not from a renewed massing of power on the American side, but precisely from a distributed (or to use his less precise term, decentralized) diagram. Heterogeneity, distribution, communalism are all features of this new diagrammatic solution.

In short, the current global crisis is one between centralized, hierarchical powers and distributed, horizontal networks. John Arquilla and David Ronfeldt, two researchers at the RAND Corporation who have written extensively on the hierarchy-network conflict, offer a few propositions for thinking about future policy:

- Hierarchies have a difficult time fighting networks. [...]
- It takes networks to fight networks. [...]
- Whoever masters the network form first and best will gain major advantages. [73]

These comments are incredibly helpful for thinking about tactical media and the roll of today's political actor. It gives subcultures reason to rethink their strategies vis-à-vis the mainstream. It forces us to rethink the techniques of the terrorist. It also raises many questions, including what happens when "the powers that be" actually evolve into networked power (which is already the case in many sectors).

In recent decades the primary conflict between organizational designs has been between hierarchies and networks, an asymmetrical war. However, in the future we are likely to experience a general shift downward into a new bilateral organizational conflict networks fighting networks.

"Bureaucracy lies at the root of our military weakness," wrote advocates of military reform in the mid eighties. "The bureaucratic model is inherently contradictory to the nature of war, and no military that is a bureaucracy can produce military excellence." [74]

While the change to a new unbureaucratic military is on the drawing board, the future network-centric military an unsettling notion to say the least is still a ways away. Nevertheless networks of control have invaded our life in other ways though, in the form of the ubiquitous surveillance, biological informatization and other techniques discussed in the earlier chapter on power.

The dilemma, then, is that while hierarchy and centralization are almost certainly politically tainted due to their historical association with fascism and other abuses, networks are both bad and good. Drug cartels, terror groups, black hat hacker crews and other denizens of the underworld all take advantage of networked organizational designs because they offer effective mobility and disguise. But more and more we witness the advent of networked organizational design in corporate management techniques, manufacturing supply chains, advertisement campaigns and other novelties of the ruling class, as well as all the familiar grass-roots activist groups who have long used network structures to their advantage.

In a sense, networks have been vilified simply because the terrorists, pirates and anarchists made them notorious, not because of any negative quality of the organizational diagram itself. In fact, positive libratory movements have been capitalizing on network design protocols for decades if not centuries. The section on the rhizome in A Thousand Plateaus is one of literature's most poignant adorations of the network diagram.

It was the goal of this chapter to illuminate a few of these networked designs and how they manifest themselves as tactical effects within the media's various network-based struggles. As the section on viruses (or the previous chapter on hackers) showed, these struggles can be lost. Or as in the case of the end-to-end design strategy of the Internet's core protocols, or cyberfeminism, or the free software movement, they can be won (won in specific places at specific times).

These tactical effects are allegorical indices that point out the flaws in protocological and proprietary command and control.

The goal is not to destroy technology in some neo-Luddite delusion, but to push it into a state of hypertrophy, further than it is meant to go. Then, in its injured, sore and ungarded condition, technology may be sculpted anew into something better, something in closer agreement with the real wants and desires of its users. This is the goal of tactical media.

[1] Paul Virilio, "Infowar," in Druckrey (ed.), *Ars Electronica*, p. 334. One assumes that the italicized "Titanic" may refer to James Cameron's 1997 film as well as the fated passenger ship, thereby offering an interesting double meaning that suggests, as others have aptly argued, that films, understood as texts like any other, contain their own undoing.

[8] Indeed pioneering viral scientist Fred Cohen is the most notable exception to this rule. He recognized the existence of "benevolent viruses" that perform maintenance, facilitate networked applications, or simply live in "peaceful coexistence" with us: "I personally believe that reproducing programs are living beings in the information environment." See Frederick Cohen, *A Short Course on Computer Viruses* (New York: John Wiley & Sons, 1994), pp. 159-160, 15-21, and Frederick Cohen, *It's Alive!* (New York: John Wiley & Sons, 1994). The author Ralf Burger is also not completely pessimistic, instructing us that when "used properly, [viruses] may bring about a new generation of self-modifying computer operating systems. ... Those who wish to examine and experiment with computer viruses on an experimental level will quickly discover what fantastic programming possibilities they offer." See Ralf Burger, *Computer Viruses* (Grand Rapids: Abacus, 1988), p. 2.

[61] John Arquilla & David Ronfeldt, *Networks and Netwars: The Future of Terror, Crime, and Militancy* (Santa Monica: RAND, 2001), p. 6. A similar litany from 1996 reads: "netwar is about Hamas more than the PLO, Mexico's Zapatistas more than Cuba's Fidelistas, the Christian Identity Movement more than the Ku Klux Klan, the Asian Triads more than the Sicilian Mafia, and Chicago's Gangsta Disciples more than the Al Capone Gang" (see John Arquilla & David Ronfeldt, *The Advent of Netwar* [Santa Monica: RAND, 1996], p. 5). Arquilla & Ronfeldt coined the term netwar which they define as "an emerging mode of conflict (and crime) at societal levels, short of traditional military warfare, in which the protagonists use network forms of organization and related doctrines, strategies, and technologies attuned to the information age" (see Arquilla & Ronfeldt, *Networks and Netwars*, p. 6).

[62] This is not a monolithic control mechanism, of course. "The Internet is a large machine," writes Andreas Broeckmann. "This machine has its own, heterogeneous topology; it is fractured and repetitive, incomplete, expanding and contracting" ("Networked Agencies," <http://www.v2.nl/~andreas/texts/1998/networkedagency-en.html>).

[63] This is Deleuze & Guattari's realization in *A Thousand Plateaus*.

[65] Peter Galison, "War against the Center," *Grey Room* 4, Summer 2001, p. 20.

[66] Baran writes: "The weakest spot in assuring a second strike capability was in the lack of reliable communications. At the time we didn't know how to build a communication system that could survive even collateral damage by enemy weapons. RAND determined through computer

simulations that the AT&T Long Lines telephone system, that carried essentially all the Nation's military communications, would be cut apart by relatively minor physical damage. While essentially all of the links and the nodes of the telephone system would survive, a few critical points of this very highly centralized analog telephone system would be destroyed by collateral damage alone by missiles directed at air bases and collapse like a house of cards." See Paul Baran, Electrical Engineer, an oral history conducted in 1999 by David Hochfelder, IEEE History Center, Rutgers University, New Brunswick, NJ, USA.

[67] Galison, "War against the Center," p. 25.

[68] New Yorker writer Peter Boyer reports that DARPA is in fact rethinking this opposition by designing a distributed tank, "a tank whose principle components, such as guns and sensors, are mounted on separate vehicles that would be controlled remotely by a soldier in yet another command vehicle," (see "A Different War," *The New Yorker*, July 1, 2002, p. 61). This is what the military calls Future Combat Systems (FCS), an initiative developed by DARPA for the US Army. It is described as "flexible" and "network-centric." I am grateful to Jason Spingarn-Koff for bring FCS to my attention.

[71] Jon Ippolito, "Don't Blame the Internet," *Washington Post*, September 29, 2001, p. A27.

[72] Wanting instead American invulnerability to Soviet nuclear power, in 1964 Paul Baran writes that "we can still design systems in which system destruction requires the enemy to pay the price of destroying n of n[communication] stations. If n is made sufficiently large, it can be shown that highly survivable system structures can be built even in the thermonuclear era." See Paul Baran, *On Distributed Communications: 1. Introduction to Distributed Communications Networks* (Santa Monica, CA: RAND, 1964), p. 16. Baran's point here is that destruction of a network is an all or nothing game. One must destroy all nodes, not simply take out a few key hubs. But the opposite is not true. A network needs only to destroy a single hub within a hierarchical power to score a dramatic triumph. Thus, Baran's advice to the American military was to become network-like. And once it did the nuclear threat was no longer a catastrophic threat to communications and mobility (but remains, of course, a catastrophic threat to human life, material resources, and so on).

[73] Arquilla & Ronfeldt, *Networks and Netwars*, p. 15, emphasis removed from original. Contrast this line of thinking with that of Secretary of Defense Robert McNamara in the nineteen sixties, whom Senator Gary Hart described as advocating "more centralized management in the Pentagon." See Gary Hart & William Lind, *America Can Win* (Bethesda, MD: Adler & Adler, 1986), p. 14. Or contrast it in the current milieu with the Powell Doctrine, named after four-star general and Secretary of State Colin Powell, which states that any American military action should have the following: clearly stated objectives; an exit strategy; the ability to use overwhelming force; and that vital strategic interests must be at stake. This type of thinking is more in line with a modernist, Clausewitzian theory of military strategy, that force will be overcome by greater force, that conflict should be a goal-oriented act rather than one of continuance, that conflict is waged by state actors, and so on.

Diminishing Freedoms

On a visit to Brazil in 2004 I stayed with Grazia Kunsch an important artist who is also a committed political activist. Part of her work is (hosting) foreign visitors at her house 'Casa Grazie'. To be hosted by Grazie is a delight, not least for her wonderful breakfasts and the long discussions that are given the time to unfold throughout the morning.

Like many artists who are politically active she keeps the boundaries between the two spheres deliberately blurry. But she told me how although this was once acceptable, she was finding it progressively harder to declare openly that she is an artist in activist circles.

Freedom, the expressive freedom of art seems to be becoming the impossible word. Why? What is at stake? Why are so many political activists moving to repudiate cultural politics and the expressive freedoms that continue to inspire and draw so many to call themselves artists?

There seems to be an oppressive philistinism emerging on the radical left, raising the worrying prospect that it is not only neo-liberalism that is instrumentalising all of life.

I have been troubled by these developments for some time, but I have only recently found a framework to address discuss the problem with myself in more detail and with a little more rigor. It was in the context of a review for a book on DIY Media by the London based artist activist group C6. As always Mute editors are (at least in my case) rarely passive recipients of the articles they solicit, and I was gently prodded into much more than a simple review. I don't pretend that the resulting ruminations are in any way definitive but I hope that it triggers some discussion.

Below is an extract, the full text can be found at <http://www.metamute.org/>

The Split

We have seen the emergence of three interconnected tendencies, since the tactical media of the 90s. Firstly there is a widespread rejection of the homeopathic and the micro-political in favour of ambitions scaled up to global proportions coupled with a willingness to move beyond electronic and semiotic civil disobedience and to engage in direct action, to literally 're-claim the streets'. This is almost entirely as a result of the emergence of the powerful global anti-capitalist movement which (from their perspective) have transformed tactical media into the 'Indy-media' project. But there is also a third less visible and more troubling tendency, a tendency towards internal polarisation.

This polarisation is based on a deep split which has opened up between many of the activists at the core of the new political movements and the artists or theorists who, whilst continuing to see themselves as radicals, retain a belief in the importance of cultural (and information) politics in any movement for social transformation. Although I have little more than personal experience and anecdotal evidence to go on, it seems to me, that there is a significant growth in suspicion and frequently outright hostility among activists to the presence of art and artists in 'the movement', particularly those whose work cannot be immediately instrumentalised by the new 'soldiers of the left'.

So what is it that has changed since the 90s to give rise to these tendencies? To understand we must cast our minds back to the peculiar historical conditions of that time. The early phase of tactical media re-injected a new energy into the flagging project of 'cultural politics'. It fused the radical and pragmatic info politics of the hackers with well-established critical practices based critiques of representation. The resulting tactical media were also part of (and arguably compromised by) the wider internet and communications revolution of the 90s which, like the music of the 1960s, acted as a universal solvent not only dissolving disciplinary boundaries but also the boundaries separating long established political formations. The power some of us attributed to this new 'media politics' appeared to be born out by the role that all forms of media seemed to have played in the collapse of the Soviet Empire. It seemed as though old style armed insurrection had been superseded by digital dissent and media revolutions. It was as if the Samizdat spirit, extended and intensified by the proliferation of Do-it-yourself media had rendered the centralized statist tyrannies of the soviet empire untenable. Some of us allowed ourselves to believe that it would only be a matter of time before the same forces would challenge our own tired and tarnished oligarchies. Furthermore the speed and comparative bloodlessness of the Soviet collapse suggested that the transformations that were coming would not have to be achieved

through violence or personal sacrifice. This would be the era of the painless ('win-win') revolution, in which change would occur simply through the hacker ethos of challenging the domains of forbidden knowledge. It came to be believed that power that comes only from the top down had lost its edge. As late as 1999 in his Reith lecture, Anthony Giddens could still confidently assert that 'The information monopoly upon which the Soviet system was based, had no future in an intrinsically open framework of global communications'. Giddens and other third way social theorists were part of a wider movement, which acted out the dream that the profound political differences, which had divided previous generations, had been put on hold. This was made credible through the ubiquity of one of the dominant myths of the information age, a myth shared by activists and new media entrepreneurs alike. The myth that knowledge will set you free. This founding narrative of techno-culture, visible from Ted Nelson ('Computer Lib' onwards, recycles (in intensified form), the age old proposition that knowledge and freedom are not only connected but may actually entail one another.

The fact that a belief in the necessary relationship between knowledge and freedom has gone largely unquestioned is based in part on the depth of its lineage, fanciful stoics and most modern rationalists are at one with Christian teaching on this issue. 'And ye shall know the truth and the truth shall make you free'. As Isaiah Berlin pointed out in 1968 not only is it. This proposition is not self evidently true, if only on empirical grounds. It is one of the least plausible beliefs ever entertained by profound and influential thinkers.¹

In addition to being fallacious the accompanying rhetoric of transparency, freedom, access, participation, and even creativity, has come to constitute the ideological foundation of 'communicative capitalism', transforming tactical media's homeopathic micro-politics into the experimental wing of the 'creative industries' and corroborating the temporal mode of post-Fordist capital short-termism.²

Neo-liberalism's effective capture of the rhetoric of 'freedom' and 'creativity', has re-opened an old fault-line which the first wave of tactical media did so much to bridge, the fault-line dividing artists from the political activists.

The theorist and activist Brian Holmes described the origins of this dichotomy succinctly as going (at least) as far back as the cultural politics of the 1960s. He describes a split 'between the traditional working-class concern for social justice and the New Left concern for individual emancipation and full recognition and expression of particular identities'. According to this account corporate foundations and think tanks of the 80s and 90s have succeeded in inculcating market-oriented variations on earlier counter-cultural values rendering the interventions of artists (including tactical media makers) profoundly if unwittingly, de-politicising. Holmes goes on to describe (or assert, I am not quite sure which) a critique in which 'the narcissistic exploration of self, sexuality and identity become the leitmotif of bourgeois urban culture. Artistic freedom and artistic license have led, in effect, to the neo-liberalization of culture.'³ The puritanical and authoritarian tone of this analysis is just a little unnerving. At the very least this tendency could lead to a crass and oppressive philistinism and might signal far worse to come.

At the Senegalia meeting in 2004 for Telestreets, Franco Berardi (Bifo) made a plea to Telestreet activists (and by extension all artist/activists) not to 'embrace our miserable marginality'. Increasingly this call is being answered. There are a growing number of inspiring cases which we can point to, the Yes Men's achievement in securing global distribution in mainstream cinemas, Yomango's high voltage contributions to the global, protest movement and Witness.org's extensive initiatives in which the provision of indigenous activists with DIY media with their campaigns is connected to human rights legal processes. These and many other projects are pointing to the growing willingness to strategically globalise dissent. This process in not unconnected to a growing willingness to relinquish one of the shibboleths of tactical media, the cult of 'ephemerality'. In place of the hit and run guerrilla activism the direct opposite is now required, 'duration'. It's a time for longer-term commitments and deeper engagements with the people and organisations networked around contested issues.

One of the most extraordinary examples of this kind of development is 'Women on Waves' a Dutch Foundation initiated by the Rebecca Gomperts who studied medicine at the University of Amsterdam and specialised as an abortion doctor and then went on to study visual arts at the Rijetveld Academy and Sailing at the Enkhuizen Zeevaartschool (Nautical College).

The most celebrated achievement of Women on Waves is the Abortion Boat, a large floating clinic that tactically exploits maritime law, anchoring the boat just outside the 12-mile zones of countries where abortion is forbidden. On the Abortion Boat women can be helped with information and with actual abortions are performed by a team of Dutch medical practitioners (including Dr Gomperts) on Dutch 'territory'. Thus, women are actively assisted and local organisations are supported and inspired in their struggle for the legalisation of abortion.

Along with the practical intervention of the Abortion Boat, Women on Waves also uses art and design as part of their global campaign for abortion rights. For instance the 'I had an Abortion' installation consisting of vests on wire coat hangers, which bear the text 'I had an abortion' in all European languages. On their website <womenonwaves.org> a diary can be found of a Brazilian woman relating her experiences of wearing one of these t-shirts. The continued validity of the modes of political address pioneered by tactical media are apparent in her descriptions of how the message on these t-shirts was preferable to something that might have read like earlier forms of agit prop say 'Legalize abortion!'. These t-shirts function 'not' she declares to 'make myself a target, that was not the point; it was to give all those women without a face a support. As to say, don't worry, it's all right, you're all right. This fulfils one of the prime directives of classical tactical media, unlike traditional agit prop it is designed to invite discourse.

Women on Waves is a reminder that cultural politics in its modern sense was in large part a creation of the women's movement. Those who question the value of a cultural politics would do well to remember that feminism also served to transform the lives and politics of many men who were taught (sometimes painfully) that they were failing to live out in their ordinary lives, the democracy they were advocating in theory.

The way in which 'culture' is central to feminism's demands and not peripheral is powerfully explored by Terry Eagleton in his valuable book *After Theory* which describes the centrality of 'the grammar' in which the demands of feminism were framed. 'Value speech, image, experience and identity are here the very language of political struggle, as they are in all ethnic or sexual politics. Ways of feeling and forms of political representation are in the long run quite as crucial as child care provision or equal pay.'⁴

This expanded political language was articulated not by activists and writers alone but also by many important women artists. Women artists who were critical in shifting the centre of gravity of the world of the 60s and 70s from Greenburg's formalism and Rosenberg's mysticism to a new expressive and subject centred naturalism, which remains influential and important to this day. In our efforts to understand our new conditions and to change we must beware of trying to eliminate all ambiguities and impurities, above all we should not be tempted to relinquish the essential legacy of cultural politics.

- > foundations and think tanks of the 80s and 90s have succeeded in
- > inculcating market-oriented variations on earlier counter-cultural
- > values rendering the interventions of artists (including tactical
- > media makers) profoundly if unwittingly, de-politicising. Holmes goes
- > on to describe (or assert, I am not quite sure which) a critique in
- > which "the narcissistic exploration of self, sexuality and identity
- > become the leitmotif of bourgeois urban culture. Artistic freedom and
- > artistic license have led, in effect, to the neo-liberalization of
- > culture. The puritanical and authoritarian tone of this analysis is
- > just a little unnerving. At the very least this tendency could lead
- > to a crass and oppressive philistinism and might signal far worse to
- > come.

Garcia misquotes and misinterprets me pretty deeply, in what's otherwise a good article. See my original text, and particularly the questions I ask about culture and politics, at <http://www.nettime.org/Lists-Archives/nettime-l-0510/msg00005.html>. But it doesn't matter, it's just a mistake and the whole subject is worth going back to anyway.

The sentence that Garcia can't swallow (the one about the narcissistic exploration of self, identity and sexuality) was written in fact by another David: David Harvey, in his book, *A Brief History of Neoliberalism*. In my review of that book, I quoted a long passage where Harvey recounts the bankruptcy of New York in 1975 and how the city and its culture were subsequently reshaped in the context of financially driven globalization. I was interested in two things. First, a fresh analysis, within a specific urban framework, of the way that cultural and intellectual practices were broadly neutralized by turning them into commodities in an economy of images and signs (a process which at the same time transforms a growing mass of artists and intellectuals into the economically interested producers of those same commodities). And second, I was interested in the limits of exactly that same analysis.

Things have only gotten worse since 1975, and new problems have arisen. While reading Irving Kristol's book, *Neoconservatism*, The Autobiography of an Idea, I was struck by the Kristol's fierce rejection of a 60s counterculture that he equated with a Nietzschean transvaluation of all values. I thought: Can I do without that counterculture, without that Nietzschean aspiration to destroy old values and recreate new ones? The answer was, I couldn't. For someone like myself, the only viable option is to pursue a radically experimental work on the self and society, expressed by signs and materials in their rupture with history. In other words, I need something like vanguard art (only I think you can call it post-vanguard art, because these practices have gone far beyond their old limits). I wanted to conclude my review on Harvey's strong analysis of the subservience of art to finance in the neoliberal economy, and at the same time, I wanted to question the Marxist reflex that would reach back to a supposedly clearer and truer world of working class culture and militancy that the new middle class media culture is said to simply obscure and distort.

The problem, as Garcia shows throughout his own text, is that the contemporary cultural economy really does have a strong coopting and neutralizing capacity, which operates mainly through commercialization in the United States and mainly through selective social democratic patronage in Europe. The combined renewal of artistic and activist practices in the 90s really did require direct action, reclaiming the streets, as Garcia knows for having theorized such things while also participating in them.

Now that the effectiveness of direct action has been blunted by increasing police pressure on the streets, as well as a general rise in the stakes of political conflict, we do (or at least I do) see the cultural institutions and even the commercial ones coming in to skim off the cream of tactical media representations, which aren't particularly threatening or destabilizing in the absence or decline of what they were supposed to represent. That's a real problem. I am sure plenty of activists are suspicious of me, for publishing and spouting off my mouth and participating in museum and festival debates. I'm even suspicious of me, to the point where I've deliberately gone back to translating, to make sure that I'm not tempted to write texts or do talks just for the payoff at the end. It's easy to get confused in a great big media machine that is also made (or at least functions) to produce confusion. But what's mainly lacking, from my viewpoint, are not only audacious direct action stunts, and not only (though this is of course more important) forms of political engagement that can reach huge numbers of participants and give them an effective way to help change society. What's also missing are artworks that cut through the trendy flaky fashions, and go beyond the old modernist definitions of art for art's sake, to touch the core of the human quandry and help you transform your self and your relation to the others, at a moment when things go on getting worse and worse and worse.

Garcia quotes Terry Eagleton to talk about how the women's movements totally changed politics, by making what appear as cultural issues inseparable from the economic ones. He could have drawn his examples (and probably would have, if he'd been here) from the 6th World Social Forum in Caracas, where you could see and hear and feel, in almost every talk and study session and activist planning round, that the old ways of doing politics have changed. Particularly, but not only, by the fact that women and indigenous people are participating everywhere, and often taking the most prominent roles. I did not see much cutting edge art

at the social forum, certainly not in the concentrated forms that derive from the western tradition. But a strong point of the forum for me was the way that it put forth the irreducible presence of a plurality of cosmovisions. Yes, that's they say. And you could hear it, you could feel it. At one point, Maya and Qechua women completed a ceremony on stage in the context of a panel which was refusing the patenting of women's knowledge. In the Q and A that followed, one of the women said more or less this: "Our god is not up above in the sky. Our god is in the earth. It is in us. It is us." I had a kind of insight at that point, or maybe something I had learned from deconstruction finally made tangible sense to me. I realized that the whole Christian recovery and reinterpretation of Platonic idealism was inseparable from abstract, Cartesian, metaphysical, alienating representation. The spectacle society. The military surveillance grid. And I realized that what we were involved with was not that kind of representation.

But there I go again talking again, spouting off. Who wants to make me feel guilty about it? While those women were performing their ritual, there was a TV cameraman crowding on the stage. It was so annoying, this guy crowding in on our intimacy. And then I remembered that this was being broadcast by the Bolivarian TV stations. The revolutionary TV stations. Like Catia TV, where I saw a fantastic montage-analysis of the way that the commercial TV channels had sought throughout the late nineties and early years of this decade to impose a reactionary reading on crucial events in the streets that have led, each time, to the continuation of the revolutionary project here in Venezuela. What you could see in action, on broadcast TV, was a critical and transformative kind of mass representation. At one point, on broadcast TV, they were showing an interview of an Italian guy from Telestreet, talking about the urgent situation in Italy where Berlusconi controls all the broadcast media.

I like art. I like activism. While hanging out in Caracas, I would sift through my mail in cybercafes, like all the gringos and all the latinos. I get so many ads for high-class art and pseudo activist events put on by the European social democratic institutions. One mail said: Art's good for nothing, that's its whole necessity. The hackneyed French academic modernist version of elite vanguard art. Another mail said: If I can't dance I don't want to be part of your revolution. The happy-go-lucky disco Dutch populist version of activist cooptation.

I admit it, at times I feel impatient and even angry about all that schlock. Philistinism? Well, sometimes I also just feel very very bored.

best, Brian

<nettime> Technologies of Resistance: Transgression and Solidarity in Tactical Media
From: Miguel Afonso Caetano
To: nettime-l@bbs.thing.net
Date: Tue, 30 May 2006 19:05:50 +0100

Dear Nettimers:

I have recently finished a M.A. dissertation about Tactical Media that I've talked about here a few years ago (www.nettime.org/Lists-Archives/nettime-l-0211/msg00063.html). I'm sending you here the English version of the abstract and the table of contents. In the thesis, I make some criticisms of the concept of tactical media in terms of its current validity. Also, in the second part I cover in detail some projects of the vibrant Brazilian tactical media scene: Metareciclagem (www.metareciclagem.org) - who has received an honorary mention in this year's *Ars Electronica* (www.aec.at/en/prix/honorary2006.asp) and the now deceased Projeto Metafora (<http://ogum.metareciclagem.org/metafora>).

Since Nettime's 10th anniversary meeting is happening right now in Montreal, I think it would be good to start a debate here in the list about the actual relevance of tactical media in the age of Web 2.0, which has embraced (co-opted?) much of the same DIY ethos in places like Flickr and MySpace. On the other side, we're also living in the midst of the "state of exception"/War against terrorism where every subversive activity is considered suspicious - the bioterrorism paranoia case against CAE.

Judging from the Brazilian example, I think that it is becoming more adequate to think about tactical media in peripheral

countries like Brazil and India where there's a sense of more severe urgency in social transformation, of reappropriation of technology by the people.

Best regards from Portugal,

Miguel Caetano
Technologies of Resistance:
Transgression and Solidarity in Tactical Media

Miguel Afonso Caetano
Resulting from the convergence between media, technology, art and politics, tactical media are a set of cultural practices and a theoretical movement which started in Europe during the first half of the 90s, having spread to North America until the end of the millennium and, afterwards, to the rest of the world. Initially taking advantage of video camcorders but also, later, of digital technologies such as CD-ROMs and the Internet, the producer of this kind of media acknowledges himself as as a hybrid, performing simultaneously the role of an artist, activist, theorist and technician.

These subversive and/or creative uses of information and communication technologies by individuals who normally don't have access to them are characterized by experimentalism, ephemerality, flexibility, irony and amateurship. Based on the distinction between tactics and strategies developed by Michel de Certeau and continued by David Garcia and Geert Lovink, this dissertation examines the way tactical media present themselves as "media of crisis, critique and opposition". By applying a theoretical analysis of some collectives, we intend to demonstrate that the protest tactics of these media production forms represent a position of permanent struggle against a concrete and explicit opponent (nation-state, supranational institution or transnational corporation).

After addressing the dangers that this antagonist model of media as a weapon of resistance can lead to, we propose an alternative perspective of tactical media built on an empirical analysis of two Brazilian projects, *Metáfora* and *MetaReciclagem*. Finally, we argue that these and other grassroots initiatives adapt the practices of subversion and resistance visible in the activist collectives of developed countries to the local settings of a peripheral country like Brazil. By fostering technological reappropriation for social transformation, these groups unleash the creative and communication capacities of these communities, towards their self-sustainability and autonomy.

Keywords: tactical media, strategies, media activism, alternative media, hacker, free software, technological reappropriation, recycling, Brazil.

>against CAE.

My feeling is that cooptation is an infinite process - part of social struggle, which demands that every dissenting or antagonistic expression be abandoned and reinvented soon after its first release into the infosphere. I also think that the expression "tactical media" was launched at a great moment of political weakness and under-the-radar diffuse experimentation from the left/anarchist side of the cultural and political spectrums - a moment coinciding with the massification of a new communicational toolkit. That those days are gone is pretty clear (the state of exception was definitely the turning point), but what's interesting is all they produced, the new possibilities. The questions of what at the time was called tactical media, and more, the forms of experimentation with communicational politics from below, are something you can only move through as it happens and leave aside as it disappears. Still, histories are fascinating when they're not confused with futures.

>Judging from the Brazilian example, I think that it is becoming
>more adequate to think about tactical media in peripheral countries
>like Brazil and India where there's a sense of more severe urgency
>in social transformation, of reappropriation of technology by the
>people.

There's something to that. First of all, De Certeau was inspired by Brazil and wrote about it, if I'm not mistaken. Second, the massification of the Internet toolkit is still underway in Brazil and India. Third, the state and therefore, the cooptation apparatus is weak in Brazil, though as far as I can see (on short visits) it still works all too well. Actually, I think people in Brazil and India would be best off inventing new concepts to really drive home the point that things are happening - and should happen, are urgently needed - in those specific contexts.

The thing that amazed me on my last trip to Sao Paulo was hearing about the PCC weekend. What does nettime think about that? A gang that has totally dominated the prison system in Sao Paulo state, that controls the drug trade in the cities of that state (including the megalopolis itself), that has built up a very sophisticated economy and a functioning leadership structure, and is able to coordinate an attack on the police using cell-phones from inside the prisons, burning 60 buses and assaulting reportedly a hundred police stations (is that true?), carrying out what friends of mine described as a "subjective occupation" of the minds and emotions of one of the largest cities in the world! Talk about tactics... It seems as though a networked criminal organization (the Primeiro Comando da Capital) is able to run rings around a state which cannot catch up to it, cannot install the kind of hi-tech protection and distributed control mechanisms that the US and other Western countries are working so desperately to perfect. This is fantastically interesting, actually hopeful in some weird respects (if the state fails to that degree, must it not be reinvented?), but mostly just astounding, with the great danger that a kind of fascist electoral reaction will come out of it (as in the US), as well as police death-squads which, I have been told, immediately formed to exact reprisals. The whole thing is incredibly important as a phenomenon of our times, I would be curious to know what others think about it.

best, BH

<nettime> 30 Years of Tactical Media
From: Felix Stalder
To: nettime-l@kein.org
Date: Sun, 8 Feb 2009 17:15:32 +0100

This is a short text which appears in "Public Nethase: Non Stop Future. New Practices in Art and Media" edited by the fine people at the New Media Center_kuda.org, in cooperation with World-Information Institute / to. We recently presented this book at transmediale in Berlin.

"An ultimate reference book for those who want to find out about cultural discourse and practice from the beginning of the internet explosion in the nineties to the present..." Brian Holmes

<http://nonstop-future.org>
30 Years of Tactical Media [1]

Felix Stalder

Tactical media as a practice has a long history and, it seems safe to predict, an even longer future. Yet its existence as a distinct concept around which something of a social movement, or more precisely, a self-aware network of people and projects would coalesce has been relatively short lived, largely confined to the internet's first decade as a mass medium (1995-2005). During that time Geert Lovink and David Garcia, two Dutch media activists/theorists at the heart of this network, defined Tactical Media, as

"what happens when the cheap 'do it yourself' media, made possible by the revolution in consumer electronics and expanded forms of distribution (from public access cable to the internet) are exploited by groups and individuals who feel aggrieved by or excluded from the wider culture. Tactical media do not just report events, as they are never impartial they always participate and it is this that more than anything separates them from mainstream media."^[2]

Like so many other things that are now common in our informational lives, the roots of tactical media lie in the cultural innovations of radical social movements that sprang up in the late 1960s. Not only did they begin to exploit technological changes enabling to self-produce media but they created entirely new ideas of what the media could be: not just conduits for more or less sophisticated state propaganda (as in Althusser's famous analysis of the ideological state apparatuses^{[[3]]}) or as a source of objective^{[[4]]} information provided by a professional (enlightened) elite. Rather, they reconceptualized the media as means of subjective expression, by people and for people who are not represented by the mainstream.

Given the still significant technological hurdles to autonomous media production and distribution which existed deep into the 1990s, the first wave 'do-it-yourself' media thought of themselves as 'community media'^{[[5]]} representing local social, cultural or ethnic minorities. In the US, community media centered around public access television (and radio). They were made possible by fortuitous legislation which required cable companies to provide one channel for local, non-commercial programming. This created the technological and financial basis for community activists to run a (low-budget) TV channel. Across the country, local TV stations sprung up, giving a platform to various community groups to produce programming by and for themselves. During the 1970s, video technology developed at a rapid pace, reducing the bulk and the costs of the equipment while improving the quality of the recordings and the means of post-production. In the 1980s, this peaked in the 'camcorder revolution'^{[[6]]}, referring the small, cheap video cameras/recorders that became widely available. They seemed to offer the possibilities to engage in 'counter surveillance'^{[[7]]}, i.e. the ability to document abuses of power. As the case of Rodney King showed in the early 1990s in Los Angeles, the consequences of such 'counter surveillance' could be dramatic.^{[[4]]} At the same time, new satellite transmission technology made it possible to start nation-wide, rather than local distribution of content. This was spearheaded by Deep Dish TV, founded in 1986. Its aim was to 'do what broadcast media cannot do for itself: identify and amplify, without alteration or limitation, the voices of the disenfranchised cultures who struggle for equal time.'^{[[5]]} In the Netherlands, public cable TV enabled an lively pirate TV and radio scene which developed in parallel with the early public access Internet projects such as Digital City of Amsterdam creating a rich local culture of experimental, politicized media.^{[[6]]} In the rest of Europe, partially because of a different regulatory environment, public access TV has played less of a role, whereas community radio, or, in the UK, pirate radio, has flourished since the 1970s. Today, the public access model is still relevant and even expanding. In Vienna, for example, a new public access channel (Okto TV) opened in 2005. Yet, the TV environment has changed significantly over the last 30 years, and public access TV is threatened to become just another narrow-caster among a near infinite number of channels.

By the mid 1990s, the costs of media production had further come down and the internet was beginning to offer a credible promise of an alternative distribution platform. It made possible to avoid some of limitations of broadcast media with their hardwired distinction between sender and receiver, which not even community media could overcome (even if they if they lowered the hurdles to becoming a producer oneself). A new generation of media activists began to experiment with the new possibilities of open communication networks, which were, by and large, still a promise to be realized, rather than a readily-available infrastructure.

They radicalized the ideas of community media by challenging everyone to produce their own media in support of their own political struggles. This new media activism was motivated by three key insights. First, cultural theorists had been calling for a reevaluation of how individuals dealt with media products. Rather than seeing them merely as passive consumers, they were understood as tactically appropriating them.^{[[7]]} New media could transform this practice from an individual to a social level. Hence the term, tactical media. Second, it became understood very clearly that all politics are, to a significant degree, mediated politics and that the long-

held distinction between the 'street' (reality) and the 'media' (representation) could no longer be upheld. On the contrary, the media had come to infuse all of society and in order to challenge the dominant society, it was necessary develop new means of producing and distributing media. Not as a specialized task separate from the social movements, but as key activity around which social movements could coalesce. Finally, the media environment characterized by a broadcast logic of geography was being supplemented with an environment characterized a many-to-many logic of access.

In such an environment, networking came naturally and some of the key networking events were the large scale social protests that tracked the international policy gatherings of the WTO (World Trade Organization), G8 and similar 'free trade' organizations in the late 1990s and early 2000s. This inspired the creation of an international network of local media projects under the name of Indymedia which, at least initially, understood itself as the media arm of the anti-globalization movement. However, while Indymedia currently still lists close to 200 local, regional and national network nodes, it never really managed, and probably never intended, to match the full breadth of a global movement. Rather, Indymedia seems to flourish where the nodes are deeply rooted in local communities, privileging concrete local struggles over abstract, global policy.

Even before Indymedia attempted to establish global alternative media network, a series of conferences were held in Amsterdam (1995 - 2003) called 'The Next Five Minutes' (N5M)^{[[8]]}. They brought together many of the early internet-based media activists and connected them with previous generation of public access TV producers and independent film makers, reconceptualizing the whole movement as Tactical Media. These new media projects were understood as tactical because they were not geared towards setting up long-term structures, but towards quick interventions that could be realized with high ingenuity and low budgets. It was practice over theory, partly as an attempt to sidestep the exhausting debates about identity and representation that had been raging for more than a decade now.^{[[9]]}

Such a short range approach was well suited to experimentally explore the new media environment which was rapidly emerging but was still largely unstabilized. Technology was being developed at an extremely fast pace during this hyper-growth phase of the internet, and a global civil society was just beginning to be forged. Thus, many of the Tactical Media projects where even more marginal than the community media of the previous generation, but they nevertheless played an important role in the experimentally establishing media practices adapted to the new conditions of open networks. For a few years, and mainly do to intensive networking at conferences such as N5M, Tactical Media flourished as a distinct, self-conscious practice of media activists interested technological and political innovation.

However, as the technologies of the Internet began to mature, some of the inherent contradictions of the Tactical Media concept became apparent. For example, providing infrastructure for projects is a long-term rather than a tactical task that quickly overburdens loose networks. Indymedia has been here the exception to the rule, but mainly because it turned closer to community media, made by and for a relatively distinct subset of the larger anti-globalisation movement. Publicly-funded organizations active in this area, such as Amsterdam's De Waag, either lost interest, or, as in the case of Vienna's Public Netbase, had their funding cut, leaving the field to smaller, more specialized organizations. More importantly, however, was the conceptual contradictions between integrating media production into all forms of grassroots political movements as part of their tool kit, and building a particular identity around this increasingly common practice. The movement as a whole began to dissolve as increasingly people were doing tactical media without thinking about Tactical Media. In a way, Tactical Media was so successful in establishing new political practices that it could no longer serve as a distinctive approach would define a particular community.

This makes the current state of affairs decidedly mixed. On the one hand, production technology has become even more accessible, both in terms of price and ease-of-use. With the advent of commercial hosting companies for blogs or videos distribution has been professionalized to a very high degree. As an effect, it has become very simple to shoot, edit and distribute rich media to audiences large and small. This is very good news, particularly for activists in developing countries. At the same time, the commercial capture of the infrastructure is creating new bottlenecks where censorship and control of media content can and does function efficiently.

Thus the autonomous production of media for grassroots campaigns has been widely established as a core concern for contemporary political movements, not the least thanks to the Tactical Media pioneers of the 1990s. However, its increasing reliance on commercial infrastructure is introducing new points of failure as becoming apparent as the policing of the commercial platforms is getting more intense.

Partly as a reaction to the shortcomings of tactical media and the pressures of the commercial platforms, there is a renewed interest in infrastructure among politically-minded media developers. One example is a global network of initiatives called *bricolabs* which describes itself as “a distributed network for global and local development of generic infrastructures incrementally developed by communities.” *Bricolabs*, in a way, combines the two strands of Community Media and Tactical Media, by seeking ways to network local communities to support each other in the development of alternative infrastructures for media production. How far this goal can be realized remains to be seen, but it is clear that despite the decline of Tactical Media in the narrow sense, the social practice of autonomous media production continues to be adaptive and innovative.

<nettime> 10 years of Indymedia

From: zanny begg

To: nettime-l@keim.org

Date: Sat, 13 Feb 2010 17:05:39
+1100

Below is an article marking the 10th anniversary of Indymedia (and its roots within Sydney activist scene) which was published in the most recent edition of *RealTime* (+on screen).

To go to a link for the article: <http://www.realtimarts.net/article/95/9772>

Message is Medium is Message

[image: Indymedia flyer] I JUST OVER 10 YEARS AGO SYDNEY MEDIA ACTIVISTS RUSHED TO FINISH A VERSION OF ACTIVE SOFTWARE WHICH WOULD ENABLE THE FIRST INDIYMEDIA SITE TO GO LIVE IN TIME TO COVER THE PROTESTS AGAINST THE WORLD TRADE ORGANISATION MEETING IN NOVEMBER 1999. AS RIOTS ERUPTED IN DOWNTOWN SEATTLE, MILLIONS OF PEOPLE LOGGED INTO THE NEW SITE LAUNCHING A MEDIA NETWORK WHICH REPORTEDLY RECEIVED MORE HITS IN ITS FIRST WEEK THAN MEDIA HEAVYWEIGHTS SUCH AS CNN.

“It was the heyday of globalisation, the high point of the internet boom and the last gasp of the New Economy: the WTO ministerial in Seattle was meant to celebrate the advent of a corporate millennium extending ‘free trade’ to the furthest corners of the earth. Nobody on that fall morning of Tuesday, 30 November 1999, could have predicted that by nightfall the summit would be disrupted, downtown Seattle would be paralysed by demonstrations and a full-scale police riot would have broken out... Nobody, that is, except the thousands of protesters who prepared for months to put their bodies on the line and shut down the World Trade Organization.”

Brian Holmes, nettime posting November 2009.

Ten years later the Indymedia network, while relatively small and fragmented in Australia, has grown to over 150 outlets around the world and has become a global phenomenon based around the simple slogan: “don’t hate the media, become the media.” A decade on it is now possible to see that Indymedia not only helped establish a global media service it also helped forge a connection between digital innovation and activism which has had a lasting impact on culture and the net.

activism goes digital

ABC social media producer John Jacobs, a member of the Jellyheads anarchist media collective whose warehouse was an infamous performance venue in the 90s, explains that the impetus for Indymedia grew out of attempts by people involved in Jellyheads, Critical Mass and the Reclaim the Streets activist communities to produce a hardcopy calendar to share news and events. Jacobs says that he knew he “never wanted to look at a photocopying machine again” when he met up with a physics student at Sydney University, Matthew Arnison. Arnison and Andrew Nicholson collaborated in writing the code for Active Sydney, a website which enabled people to share events, news, photos and other digital material online for the first time.

Active showed its international networking potential when used to cover news of the J18 global street parties in June 1999. As Nicholson, who is now a freelance coder and a member of the Sydney based art collective You Are Here, explained, its breakthrough was that activists could share information in “near real time.” In the build up to the Seattle protests in November of that year the founders of Active made contact with media activists in America and helped create the first Indymedia site which was based on the existing Active software.

Media analyst Marc Garcelon explains how Jeff Perlstein, a local member of the Seattle Independent Media Coalition, and another Seattle media activist, Sheri Herndon, became interested in using the internet to create an independent media network focused on the upcoming WTO protests. These activists wanted to utilise the archetype of “open-posting” developed in Australia: “after hooking up online with the Active network, the Seattle group around Perlstein and Herndon secured low-rent use of a downstairs

floor in Seattle through the directors of the Low Income Housing Institute...For the next six weeks, the network transformed this space into the first Indymedia center, which became operational the day before protests began against the WTO Conference" (Marc Garcelon, "The 'Indymedia' Experiment: The Internet as Movement Facilitator Against Institutional Control", *Convergence* 2006; 12).

open structure

According to Nicholson, the creation of Indymedia marked "the first time that a decentralised activist network used the domain name system to at once differentiate themselves locally but stay linked to a global network." Nicholson explains that the original Indymedia site very quickly decentralised into seattle.indymedia.org, washington.indymedia.org and sydney.indymedia.org and so on: "this was the same process for Active which had always been active.org.au/sydney.active.org.au/melbourne.active.org.au etc...but using the same domain name system enabled the community media centers to hold together as a network." Nicholson goes on to explain, "in 1999 it wasn't very common for mainstream media organisations to have any of the Web 2.0 features which people now talk about such as group voting, commenting, rating, tag clouds, inter-related social networks and so on. Things which we did on our websites put pressure on non-activist website for similar features, so 10 years later everyone wants interactive elements."

For Nicholson the first Indymedia site uniquely brought together the hacker systems of communication which had developed in the early days of the BBS and the ARPAnet with an expanding counter-globalisation movement and its non-expert adherents and enthusiasts. The interactive elements which were so novel in the Indymedia site had a long history in "the smaller base of the open source community of programmers who were writing websites for other programmers and were used to using the most advanced technologies of the time to rate and improve their programs. Slashdot.org for example had a system of commenting and ratings 10 years ago. It was a very nerdy algorithmic way of moderating because you could rate people's articles and people could rate your ratings, you could rate people's comments and other people could rate the way you rate people's comments in an endlessly recursive system of moderation." Because Nicholson and Arnisson had a foot in both camps—open source programming and activism—Nicholson explains "we were a bridge to bring those forms of interactivity to a broader range of activists who also had an interest in democratic forms of communication."

Indymedia's rapid expansion was helped along by its open structure—anyone in the world could put their hand up and say that they wanted to create a local branch and they were given the domain name and someone would create a handle for them in the Active software. Nicholson describes this as a "network effect" much like the old web rings of the early days of the net where people would band together to share common interests within an autonomous and expanding web environment.

[image: Indymedia flyer]

open publishing

Also crucial to the success of Indymedia was the notion of open publishing, something Arnisson describes as ensuring "the process of creating news is transparent to the readers..." (<http://purplebark.net/maffew/cat/openpub.html>). John Jacobs likens Indymedia to a "big communal blog before blogs were even invented. The backbone of Indymedia was peer-to-peer moderation, user generated content and open publishing, something which would ripple out through the web as a whole." The concept of open publishing has expanded throughout the web with popular sites like Wikipedia which rely on "swarm intelligence" to refine, edit and verify content.

An obvious corollary opens up between the open architecture of the web and the open publishing tactics of the web activists of Indymedia. The desire to decentralise information production and distribution connects directly to the de-centralised packet-switching structure of how information flows through the web. The many-to-many information broadcasting nodes of the web form the base which supports an ideology of open content creation, editing and sharing which has become normative within activist and web culture more broadly.

The tactical implications of this have been enormous, both for the raft of art projects which have used the web as their medium, experimenting with net conceptualist actions such as the electronic sit-ins of the Electronic Disturbance Theatre, but beyond the core of internet artists there has been a general trend towards interactivity and networked culture within art making even in non-technologically dependent projects, such as the artists loosely grouped under the banner of Relational Aesthetics.

tactical media

Tactical Media is a term developed by David Garcia and Geert Lovink in the

late 90s to describe the possibilities for artistic and activist interventions into digital and web-based media. In creating this term they borrowed from Michel de Certeau's celebrated book *The Practice of Everyday Life* which outlined the potential for ordinary people to tactically interact with consumer society. De Certeau drew a distinction between strategic interventions, which were the prerogative of those invested with power, and the wily, tactical interventions of the weak. In contrast to the grim absolutism of the Situationists ("consumer society has colonized social life"), de Certeau saw the possibilities for consumers, or rebellious users, as he preferred to call them, to recreate the value of consumer products by investing them with their own idiosyncratic uses and meanings.

Garcia and Lovink explain, in a nettime posting, how this allowed de Certeau to produce a "vocabulary of tactics rich and complex enough to amount to a distinctive and recognizable aesthetic...[an] aesthetic of poaching, tricking, reading, speaking, strolling, shopping, desiring..." Since the mid to late 90s multiple groups, networks, lists and projects have evolved under the tactical media umbrella such as Institute for Applied Autonomy (1998), RTMark (1996), The Yes Men (1999), Next Five Minutes (1993), Carbon Defense League (CDL) (1998), Bernadette Corporation (1994), Beyond The Brain parties (1995), HAcKtitude (2001) and so on. The tech savvy trickster has become a key figure within art as cultural activists use the avenues of communication opened up by digital media to play in the gaps and cracks in the armory of the powerful.

digital cultural resistance

Critical Art Ensemble (CAE) has contributed greatly to the discussions surrounding the possibilities of digital resistance in a networked world. For CAE the "tradition of digital cultural resistance" is indebted to a rich heritage of avant-garde art practices such as détournement, bricolage, readymades, plagiarism, appropriation and the Theater of Everyday Life. These practices stretch back to 20th-century art movements such as Dada, Surrealism, Fluxus and the Situationists, and just as much reach forward to a tech utopia of the information age. This point is also made by the founder of the online discussion list HAcKtitude, Tatiana Bazzichelli, who sees the lineages of digital art/activism stemming from "situationist, multiple singularity and plagiarist projects" (www.oekonux.org/list-en/archive/msg05812.html). As she explains "the contemporary Internet-based networking platforms have their deep roots in a series of experimental activities in the field of art and technology started in the last half of the 20th-century which have transformed the conception of art as object into art as an expanded network of relationships."

avant garde continuities

What the internet allows is the rapid expansion and diversification of the impulse towards networking, collaboration and collectivism contained within earlier avant-garde art movements: thus Mail Art becomes the email list, détournement becomes sampling, the readymade becomes plagiarism, plagiarism becomes copyleft, the derive becomes Google-earth, the collage becomes the mash-up, appropriation becomes the fan-zine and so on. Rather than emulating the avant-garde impulses of earlier art movements, as those who claim we live in a postmodern world might hypothesise, the internet age has put them on steroids, rapidly expanding the capacity of artists and art movements to experiment with networked practices which regard social relationships as a form of art.

Experiments in the 80s and early 90s with neoism, culture jamming, cyber-punk, tactical media, net.art and hacktivism created a culture of digital resistance and critique which has transformed both art and networking, or, as Bazzichelli cogently argues, conflated the two. In Italy, where Bazzichelli is located, the digital underground is highly active and innovative spawning a multitude of networked cultural practices and initiatives such as 0100101101010101.org the Luter Blissart Project, the Teletreer network, FreakNet and so on. In Italy there has been a powerful combination of autonomist theory, digital resistance and political activism which has reverberated outwards to the rest of the world through the writing of Toni Negri, Maurizio Lazzarato, Franco Berardi and Paolo Virno and the actions of counter-globalisation protesters in Genoa.

the internet come to life

In May 2000 Naomi Klein was invited to give a paper at the Re-Imagining Politics and Society conference in New York. A central theme of this conference was providing vision and unity to the counter-globalisation movement which had emerged so spectacularly on the streets of Seattle the year before. When deliberating on her speech Klein came to the antagonistic conclusion, however, that a lack of vision or unity should be considered a strength rather than a weakness. Choosing her metaphor carefully Klein argued that while the movement had not coalesced into a single definable identity its various elements were "tightly linked to one another, much as 'hotlinks' connect their websites on the Internet." She went on to explain, "This analogy is more than coincidental and is in fact key to understanding the changing nature of political organising. Although many have observed

that the recent mass protests would have been impossible without the internet, what has been overlooked is how the communication technology that facilitates these campaigns is shaping the movement in its own image...What emerged on the streets of Seattle...was an activist model that mirrors the organic, decentralised, interlinked pathways of the internet—the internet come to life” (www.thenation.com/doc/20000710/klein/single).

The Sydney hackers who helped launch Indymedia years ago played an important part in linking our experiences of communication and politics with the technical capacities for decentralisation embedded within the structure of the web itself. As we confront copyright, piracy, plagiarism and other issues of the digital age, the innovation of a decade ago stands as a reminder that the future of culture lies in democratising the productive capacities of the era in which we find ourselves.

<nettime> The alt-right and the death of counterculture

From: Florian Cramer
To: nettime-1@kein.org
Date: Fri, 7 Jul 2017 08:50:20 +0200

[Olivier Jutel wrote an extensive review of Angela Nagle's new book "Kill All Normies - Online culture wars from 4chan and Tumblr to Trump and the alt-right" (Zero Books, 2017) for the Australian journal Overland: <https://overland.org.au/2017/07/the-alt-right-and-the-death-of-counterculture/>

It's an essay in its own right; I'm reposting it here with Olivier's kind permission. An other, less favorable review of the same book can be read here: [https://medium.com/\[AT\]curple.turmlr/i-didnt-like-kill-all-normies-very-much-225c17868d78](https://medium.com/[AT]curple.turmlr/i-didnt-like-kill-all-normies-very-much-225c17868d78) -Florian]

The alt-right and the death of counterculture
By Olivier Jutel
6 Jul.17

Angela Nagle has written an indispensable book that allows both the extremely online- and meme-illiterate to grasp the IRL implications of the online culture wars. From the rise of Trump as a lulzy agent of base enjoyment and unrestrained conspiracy, to the collapse of meaning in these perilously ridiculous times, all are products of an ascendant online culture which privileges affect and transgression. Nagle navigates a sea of anime Nazis, gamers, white nationalists, masturbation abstainers and violent misogynists in mapping the contours of online reaction and fascism. What is essential and most controversial in her thesis is the symbiosis between what we can call the 'Tumblr liberal-left' and the alt-right. Both are products of an online cultural vanguardism that has been lauded by techno-utopians, nominally leftist academics and journalists alike. Nagle

wields a forceful critique of the online left's aestheticised resistance as both self-satisfied and lacking the dynamism to undercut the alt-right's discourse of modern alienation, however nonsensical. This book is not an attempt at righteously slam dunking on the basement dwelling nerds of the alt-right or rehashing the excesses of campus identitarians. Instead it takes on the ideological deadlocks of the left that have been masked by the tech-fetishism of late capitalism.

The title 'Kill All Normies' embodies the wry humour of this book, necessary to deal with the risible nature of the alt-right and the horrifying obscenity, racism and misogyny that fuels the movement. At its origin, the alt-right amounts to a lament of web 2.0 inclusivity which ruined the memes and the 'mean internet' safe spaces of predominately young white male misanthropes. At its core, the alt-right is the equivalent of a new convert to punk complaining that 'modern music today is so terrible'. In Gabriella Coleman's book on 4-Chan and the hacker collective Anonymous, she extensively profiles the archetype troll Andrew Auernheimer, aka weev. weev is a truly contemptible figure, an avowed white supremacist and supporter of Dylan Roof who during the Trump campaign dedicated himself to 'Operation Pepe'. As with so much of the alt-right, weev is equal parts laughable and evil, claiming that his weaponisation of Pepe the Frog memes will incite the coming race war. And despite his undeniable status as an uber-troll of the alt-right, his interview with Coleman captures a pathetic grandiosity in trying to impress the fact that he "was in the room when the lulz was first said". It is so jarringly stupid to think that the renewal of fascism and white supremacy would be driven by a nerdy subcultural one-upmanship but this is the genesis of the online culture wars identified by Nagle.

For Nagle, the rise of the alt-right is not so much about the ideological currency of reactionary politics but the techno-enthusiastic embrace of transgression and disruption deracinated from politics. As with many discussions on the state of the left, Nagle considers the epochal moment of '68 and the youth-led demands for individual emancipation from hierarchy. She writes, the alt-right 'has more in common with the 1968 left's slogan "It is forbidden to forbid!" than it does with anything most recognize as part of any traditionalist right'. 'Where for fifty years conservatives have been fighting sexual liberation and 'liberal cultural excess,' the alt-right have formulated a style which is counter-cultural, dynamic, and thrives, at least temporarily, on its own incoherency. Embodying the best traditions of conservative hucksterism, Milo has been a key figure in providing a fascist chic and garnering mainstream media access, elevating his brand and online provocations into a reactionary culture-jamming. Nagle observes that Richard Spencer's 'spitting disdain about the vulgarity of the US consumer culture-loving, Big-Mac munching, Bush-voting, pick-up truck owning pro-war Republican' could be ripped from a mid-oughts edition of AdBusters.

The alt-right has latched onto the transgressive and paranoid libertarian style of culture jammers and hackers, which always sat uncomfortably on the left, and celebrates the liberation of the individual against ghastly sheeple and normie culture. In the process they have disrupted the poles of youth culture, allowing for an easy slippage between gaming, lib-hating, trolling, unbridled misogyny and fascism. As Nagle writes: 'When we've reached a point where the idea of being edgy/counter-cultural/transgressive can place fascists in a position of moral superiority to regular people, we may seriously want to rethink the value of these stale and outworn countercultural ideals.'

One of the intellectual legacies of '68 and the new left that Nagle identifies is the shift of concern from a universalist politics of state, party, the public and economy, to cultural studies, new forms of political identity and privatised resistance. There has been a great deal of intellectual energy devoted to conceptualising political emancipation in a manner that evades the stubbornly persistent questions of party organisation and militancy. In this retreat from the collective and embrace of the new, there has been a tremendous amount of exuberance from nominally left academics, sometimes with chairs paid for by tech companies, about the radical potential of new media. Jodi Dean in her 2009 book Democracy and Other Neoliberal Fantasies, presaging Occupy Wall Street, wrote of the 'techno-democracy fetish' in which new forms of communication in themselves do the hard of work of ideology and organisation in our place. The reality of techno-democracy was the 'collapse of symbolic efficiency,' meaning an endless circular proceduralism and clarification of terms which prevented participants from making the radical ethical gamble of politics that requires an individual subsumption to a collective discipline.

It was through this mix of techno-utopianism, political indeterminacy and the carnivalesque that figures like weev and the hackers of Anonymous could be turned into progressive allies by the likes of Coleman, Molly Crabapple or philosophy professor Peter Ludlow. The glaring white supremacy of weev was seen simply as trolling and lulzy transgression, while the cesspool of 4-Chan that spawned Anonymous was responsible for this 'force for good in the world' wielding lulz as a weapon of resistance. Anonymous have since been thoroughly eclipsed by the alt-right as the inheritors of this legacy.

This appalling omission rests on a thoroughly Nietzschean tech-elitism, as Nagle writes, 'it is certainly hard to imagine even a hint of approval being tolerated in academia if the subjects at hand were ordinary blue-collar normies of the far right like Tommy Robinson, despite his far milder views than what has characterised achan and trolls like weev for many years.' This nerd solidarity and tech-elitism informs Laurie Penny's profile of Milo devotees as 'Lost Boys' with anxiety disorders, as opposed to fascists politically responsible for their actions.

The idea that lulzy racism and transgression is either polysemic or the corollary to a new disruptive network enabled democracy owes to a cheap Deleuzianism deployed by tech-utopians, culture jammers and autonomist Marxists alike. The Rhizome, the Multitude, the wisdom of crowds and peer-produce all rest on an ideal of a latent affective human connectivity, that passes between bodies in cyberspace, enabling new decentralised forms of resistance and democracy. (See footnote for an extraordinary rhetorical flourish of this nature.) Nagle's critique of this network-determinism, pervasive during Tahrir Square and the Occupy moment, does not simply touch on the failure to seize power or the tyranny of structurelessness, but the pure nihilistic potential of the network. Perhaps the black-pill trajectory of this discourse should have been clear when AdBusters described ISIS as rhizomatic and superior to the 'Western rationalist approach.'

The failure of online connectivity to stabilise around a radical left ethic is, as Dean notes, both a product of its individuating effects, and the failure of communication itself to overcome the ideological deadlocks of the left. Affect and the lulz may create a short circuit here, but it is not the humanist teleology supposed by cyber-enthusiasts, rather a self-ferc'd 'ironical in-joke/maze of meaning.' Nagle writes, 'every bizarre event, new identity and strange subcultural behaviour that baffles general audiences ... can be understood as a response to a response to a response, each one responding angrily to the existence of the other.' Nagle correctly identifies that this self-referential world has as its end an amoral 'liberation of the individual and the id,' and a pathological enjoyment at the expense of an other. The role of the other in psychoanalytic terms figures prominently in the online neuroses of the Tumblr liberal-left and unrestrained malice of the alt-right. Nagle hints at this libidinal economy but is unable to devote sufficient time in her task of drawing the battle lines of the culture wars.

What the Tumbrites embody is a taxonomical politics which is driven (drive in psychoanalytic terms) by the techno-fetishist belief in pure communication and individual empowerment. It is in this way that language has become so central to politics. The clarification of terms, the bracketing of difference and the weighing of utterances from different subject positions, cis-males at the bottom, all attempt to make the banality of online life urgent and political. In a manner that mirrors the data colonisation of the social by new media companies, every difference must be celebrated, problematised and deconstructed. Thus there are hundreds of genders, Marxist universalism is misogynist, and effacement of agency requires reparations through any number of micro-payment platforms. Any slight sarcasm or scepticism about these facts is violence. The claim to truth of such politics is purely affective, as challenging political statements from a left-ethical position may elicit the refrain it's not my job to do the emotional labor of explaining this to you. The political speech-act becomes about amplifying marginal voices towards an in-group consensus, and the concept that ideas be rigorously scrutinised in debate 'seems to anguish, offend and enrage this tragically stupefied shadow of the great movements of the left.'

Nagle quite rightly castigates this as a joyless and vicious politics that does not expand the quality of left thought so much as garner converts to a woke clergy. It is also an ontologically impossible politics that cannot succeed on its own terms. In Lacanian libidinal theories of language, communication is defined by its impossibility, what Lacan calls symbolic castration, which launches us into the world of subjectivity through a gap and lack between the symbolic and the subject. The attempt of Tumbrites to produce politics through language is doomed: we are always haunted by the other 'what did they mean?', 'did I deny agency?', 'have I internalised cis-male discourse?'. The efforts to eradicate this indeterminacy, rather than make an ethico-political commitment, can only result in a vicious and impotent lashing out. Thus we have seen what Nagle describes as a 'culture of purging' in these online spaces against the left, as an identitarian elite looks to translate a surfeit of virtue into a scarce social capital for online cultural gatekeepers.

This extremely online politics produces a drive to self-destruction and paralysis within a nominally left identitarianism, while providing the alt-right with an obscene pathological enjoyment that defines its entire universe. While Nagle quite rightly takes pains to distinguish between alt-lights (Milo, Gavin McInnes, Mike Cernovich), the Manosphere (Roosh, Paul Elam) and the Nazi alt-right (Spencer, weev), the connective tissue is trolling as libidinal pathology. The logic of trolling corresponds precisely to what Lacan calls jouissance, that is, an enjoyment that is

dependent upon another who steals it from us. Trolling is the obsession over and debasement of the other for amorphous crimes against the subculture. Thus for the alt-right, identitarians are an object of constant ridicule that should be, in the language of sexual violence, 'triggered' with misogynist, racist and anti-semitic memes as both a matter of enjoyment and internet justice. Yet for all of the complaints about liberal snowflakes and grievance culture, trolls are obsessed with what is served in the cafeteria of a private liberal arts college they've never heard of. There is an inability to enjoy while this pervasive other threatens their memes, video games, traditional marriage and even Western civilisation.

This logic of jouissance as stolen by a nefarious, contradictory and overdetermined other is neatly evinced by the obsession with sexual hierarchy. Nagle's great insight here is in understanding the alt-right's reversion to intense misogyny as a pathological libidinal frustration and self-hatred. She writes, 'their low-ranking status in this [sexual] hierarchy is precisely what has produced their hard-line rhetoric about asserting hierarchy in the world politically when it comes to women and non-whites'. The default insult of liberal men and Never-Trump conservatives as 'cucks' depicts the 'fuck or get fucked' logic of jouissance. If you do not have the will to embrace the 'red pill' truth about politics, gender and race and engage in radical transgression you can expect to have your jouissance stolen by way of immigrants, liberals, or, in the original meaning of this metaphor, miscegenation. Here we have the deadlock of jouissance, the very thing that gives the alt-right enjoyment reinforces the racial other's virility as a direct threat to their own potency.

This is Žižek's great insight into the logic of fascism and antisemitism: the figure of the Jew in a contradictory evil – both aristocratic and slovenly, intellectual and carnal – whose enjoyment is based on stealing the people's social jouissance. Whether through the manipulation of media and finance, or the destruction of 'Western civilisation, the fascist's enemy (Jew, Feminist, Marxist, POC) lives to deny an organic order of gender and racial and religious hierarchy. The enemy's enjoyment extends to the very control of enjoyment, as nicely evinced by the recent Daily Stormer story, that Jews are controlling the porn industry to make men masturbate to plus-size models in order to weaken the white race. The enemy is necessary for the very existence of this idea of natural order, and grows more powerful as the alt-right is confronted with the impossibility of 'Western civilization' or patriarchy as they conceive it. This inevitable failure requires both a violent lashing out, to cover this lack, and an obsessive conspiracy which feeds the cycle of jouissance and frustration. Even if 'Pizzagate', the conspiracy alleging that the Democratic Party is a vast paedophile ring, was created by 4-Chan trolls, its logic corresponds perfectly with how trolls conceptualise their enemy and their politics of enjoyment. The fact that Pizzagate is so widely believed by Republican voters and that the favourite pursuit of online Fox viewers devotees' is now 'triggering snowflakes' speaks to the broader political currency of this fascist jouissance.

The great threat of the alt-right identified by Nagle is that they best embody the political potential of networked affect, and that they are able to use this infrastructure to accelerate a pure fascist politics of jouissance and libidinal frustration. The prevailing tendency on much of the self-identified left has been to retreat from the kind of broad popular struggle that could be attractive to the politically curious, making 'the left a laughing stock for a whole new generation.' Nagle's conclusion is harsh, and though it is always complicated unravelling various left threads, in the wake of the liberal resistance's floundering and their continued obsession with Bernie Bros, it holds true.

The alt-right meanwhile will continue to be wracked by their own self-loathing, the diminishing returns from online cultural victories, and an inevitable sectarianism. In this moment of post-ideology it is fitting, however grotesque their beliefs, that even our fascists are second rate. There will be no Steve Bannon-inspired National Socialist New Deal and the alt-right will have to be content with the wages of jouissance. Where this does threaten to verge into new radical territory is with a black pill nihilism that lauds mass shooters and the political violence of Dylan Roof, Elliot Rodgers and Jeremy Joseph Christian. Where networked politics was supposed to be liberatory, it has become a conduit for a violent acting out of this libidinal impasse, that can only grow in the absence of an IRL left militant universalism.

Footnote:

'And yet, peering through the computer, we find Anonymous in any instant to be an aggregate sack of flesh – meshed together by wires, transistors, and wi-fi signals – replete with miles of tubes pumping blood, pounds of viscera filled with vital fluids, an array of live signalling wires, propped up by a skeletal structure with muscular pistons fastened to it, and ruled from a cavernous dome holding a restless control center, the analog of these fabulously grotesque and chaotically precise systems that, if picked apart, become what we call people. Anonymous is no different from

us. It simply consists of humans sitting at their glowing screens and typing, as humans are wont to at this precise moment in the long arc of the human condition. Each body taken alone provides the vector for an irreducibly unique and complex individual history – mirroring in its isolation the complexity of all social phenomenon as a whole – which can itself be reduced yet further to the order of events: mere flights of fingers and an occasional mouse gesture which register elsewhere, on a screen, as a two-dimensional text or a three-dimensional video; the song their fingers play on these keyboards ringing forth in a well-orchestrated, albeit cacophonous and often discordant, symphony; it is sung in the most base and lewd verse, atonal and unmetred, yet enthralling to many; the mythical epic of Anonymous.’ – Excerpt from page 115 of Gabriella Coleman’s *Hacker, Hoaxer, Whistleblower, Spy: The Story of Anonymous*, Verso, 2014

This is one of the more challenging pieces I’ve read on nettime. It must speak to many people’s experience – certainly it does to mine. I wonder if anyone else might like to respond to this one?

The alt-right has latched onto the transgressive and paranoid libertarian style of culture jammers and hackers, which always sat uncomfortably on the left, and celebrates the liberation of the individual against ghastly sheeple and normie culture. In the process they have disrupted the poles of youth culture, allowing for an easy slippage between gaming, lib-hating, trolling, unbridled misogyny and fascism. As Nagle writes: ‘When we’ve reached a point where the idea of being edgy/counter-cultural/transgressive can place fascists in a position of moral superiority to regular people, we may seriously want to rethink the value of these stale and outworn countercultural ideals.’

Though I could not have imagined the alt-right at the time, after 2008 I chose to withdraw from the European art circuit in order not to be lured into the self-serving postures that I had analyzed years before in ‘The Flexible Personality.’ I got into activism because capitalism was steering society to a bad end. In the early 2000s had a serious go at updating Marxist theory with Toni Negri and the rest. After the crash, when our very sophisticated leftist theories could not stir any effective resistance, I did not want to go on inertially mouthing stylized slogans whose patent unreality seemed to bother no one. I could have moved from France to Spain, where the efforts of the 2000s were not drained into art-circuit spectacle but instead drove an attempt to change both institutional politics and daily life. But for personal and family reasons, I chose rather to return to the US, where at least I had to face the increasing irrelevance of both the post-68 counterculture and the classical left. How to do this without cynicism and bitter disavowal of one’s own former strivings is, I think, one of the real questions that confronts people of my generation, those who went through the wild enthusiasms of the late 90s...

Nagle writes, ‘every bizarre event, new identity and strange subcultural behaviour that baffles general audiences ... can be understood as a response to a response to a response, each one responding angrily to the existence of the other.’ Nagle correctly identifies that this self-referential world has as its end an amoral ‘liberation of the individual and the id’, and a pathological enjoyment at the expense of an other.

These lines, while pitched at Milo and the young sexy neofascists, describe a lot of the cultural pranks we used to celebrate in the festival circuits emanating out from Amsterdam. The big difference is that until very recently, the world was stable and the pranks were inconsequential. Now the ways that such nihilism feeds monsters have become all too obvious. The style of paranoid critique that many of us in the theory-world practiced is complicit in these devastating outcomes, because no matter how bad things may be, it is one’s responsibility to seek for possible ameliorations of the common lot – by which I mean something much more widely shared than the rarified concept of ‘the commons.’ From my viewpoint, the breakdown of techno-utopianism requires a sweeping reassessment, a new departure, a change of life in short. And obviously, that entails corresponding changes in cultural expression. Anyone not working on at least those two levels is way out of date. Liberation can no longer be the keyword for the middle-classes, that’s for sure.

The clarification of terms, the

bracketing of difference and the weighing of utterances from different subject positions, cis-males at the bottom, all attempt to make the banality of online life urgent and political. In a manner that mirrors the data colonisation of the social by new media companies, every difference must be celebrated, problematised and deconstructed. Thus there are hundreds of genders, Marxist universalism is misogynist, and effacement of agency requires reparations through any number of micro-payment platforms.

However the above lines are just as void as what they denounce. There is no disciplined Marxist universalism to fall back on, because the industrial proletariat was long ago bought off, functionalized and absorbed by the industrial welfare state, whose productive promise, celebrated by all true Marxists, has turned out to be a Promethean overreach culminating in climate change and the many disasters of the Anthropocene. The crucial thing now is not to claim any theoretical high ground, but to try to understand and pragmatically embody what unites those who resist, not only fascism, but also the self-destructive excess of liberalism. Sure, the gender-changing drives of the younger generations may be seen as a kind of escapism, but they are also an attempt to incarnate, in one’s own direct experience, the oppressed marginality of the proliferating racialized underclasses who bear the brunt of contemporary social violence. The question is not how to condemn the kids, but how to be an adult that anyone could possibly care about. How to create a transformative outlet for the raw energy of alienation? How to work through the really existing institutions, towards more responsible kinds of social relations that can withstand all the stresses of imperial breakdown?

The great threat of the alt-right identified by Nagle is that they best embody the political potential of networked affect, and that they are able to use this infrastructure to accelerate a pure fascist politics of jouissance and libidinal frustration. The prevailing tendency on much of the self-identified left has been to retreat from the kind of broad popular struggle that could be attractive to the politically curious, making ‘the left a laughing stock for a whole new generation.’

That diagnosis undoubtedly holds for the specific ecosystem of neofascists emerging from the expressive orgies of 4chan, but if you think that sums up all the world’s problems, and that you can cure them with Lacan reinterpreted by Žižek, then you are still stuck in the illusions of net-critique. The world is going through a giant demographic shift that realizes the historic privileges of whiteness, PLUS a shift in economic and technological power from Euro-America to East Asia, PLUS the looming disasters of climate change. The neoliberal forms of production, justice and state power are all unraveling in the face of these epochal shifts, and the only way to keep people from reacting to the chaos in a thousand erratic and dangerous ways is to find new social forms to replace those which have become irrelevant. This article is great because it pushes you (or at least me) to seek out all the hollow illusions of an outdated counter-culture that lingered on as a luxury subjectivity, and is now just a useless impediment for anyone who remains tangled in its repetitive tropes. But the fantasy of a disciplined Party able to take over and dominate the historical stage is just a distraction from the real problem of formulating and embodying those missing principles of production, justice and legitimate state power, which all have to be remade anew to meet the demands of the future.

And with that little note I’ll rest my case!

Brian

Sorry Fascists have always considered themselves to be in a position of moral superiority to ordinary people.

That is part of its attraction. It allows smug violence in the name of moral superiority against weak and decadent people who are betraying the valued race or nation...

Looking back, the shortcomings of the approaches "emanating out of Amsterdam", say tactical media in particular and, but the cultural/media left more generally, seem to be twofold, in my view.

First, while the intuition about the necessity to interrupt the normal flows of communication was correct and has proved to be very powerful since, there was no idea what do in the space that would thus be opened up. We could have used the time when the system was relatively stable to think about this, but we didn't. Now, the system is falling apart, the far right is capable of imposing an even darker version of disaster capitalism.

Second, both the actions and the theories remained absolutely insular. What passes as cultural/media theory still delights in jargon and obscurantism. Or, in offering hypercritical takes that create no opening (like Florian's erudite but otherwise baffling piece on public domain).

There has been very little interest in offering points of translation, that is, to think about how people who are not in the same circuit could appropriate and transform for their own use, the insights they find in the theoretical perspective one offers.

For me, however, the concepts of the commons still remains useful. For one, it at least points to a new social settlement, that is, towards what might fill the void of the break-down of the old order. Second, it has a certain resonance where I stand, thus it can lead unusual alliances. And, third, it's vague enough a concept so that many different strands of thinking might come into contact under this umbrella and it does have a lot of potential to be appropriated by different actors, not the least in the context of radical urban social movements.

Felix

PS: This focus on the meme-culture of the alt-right makes it seems like the import of ideas/tactics always goes from left to right. It has the whiny undertones of an inventor who sees his idea commercialized by others. But that's incorrect. If you look at what happens with the "Indivisible Movement", they very clearly and openly copy tactics of the tea party movement, namely to give senators and representatives hell at town hall meetings, where the politicians face the people face-to-face. And at the moment, its seems fairly successful eroding the majority for the repeal of Obama care.

I am trying to get a sense of what is really at stake in these discussions.. what the underlying continuities as well as big changes that make these questions of counter-cultures and the new autonomous zones of message boards and meme wars seem important rather than a trivial side show.

The big change from the 1990s is the way internet and digital cultures (in large areas of the world) are now fully inserted into and thus inseparable from daily life. The full impact of the web 2.0 revolution and the rise of the platform era is quite simply the -mainstreaming- of digital cultures.

In this context it is nonsense to see work on the political, cultural and epistemic impact of these changes as a marginal obsession of -a self-selecting group geeks.. the continued development of earlier agendas of the cypher punks around anonymity, surveillance, autonomy, and agency as a necessity for creating wider progressive change has increased not decreased in urgency. Digital cultures have become quite simply a-Total Social Fact- [Noortje Maares-Digital Sociology].

This -insertability- of the digital cultures into all aspects of life is the foundation for both the success of these platforms and devices as well as the basis of monopolistically inclined business models that Nick Srnicek has called platform capitalism in active combination with the surveillance state.

Coming to grips with this problem is more subtle than it is sometimes portrayed. The tricky point lies in understanding that what constitutes actual participation and what differentiates these cultures from all that preceded it.

Participation is not as it is sometimes portrayed -the difference between -the passive audience and the active engaged participants or users-. No, a traditional audience (or public) can be as active and highly engaged as anyone else. The key point of difference is that engagement in the case of an -audience- is invisible. The engagement of an audience is invisible because it is not -traceable-. And without traceability there can be no -feedback-. No feedback means no participation.

This was de Certeau's observation long ago and why he saw consumption as invisible co-creation with an asymmetric balance of power. And observed the presence of silent invisible networks of resistance that he called tactical.

It is this necessary traceability on which participation depends that has been opportunistically seized upon as the business models and the new forms of exploitation and value extraction we know as platform capitalism which when combined with state surveillance squats like a toad atop of what could still become a post capitalist culture of contribution.

The -insertion- of this model of digital cultures into the everyday life accounts for both its success and also sub-cultural resistance that demands the right to anonymity and the need for unregulated spaces. It is the need for these spaces that accounts for the huge popularity of message bodes like 4chan where registration is not required and anonymity is an expedient that morphed into an ethos and then into a movement whose potential has only begun.

Back in 2012 Gabriella Coleman wrote a journal article reflecting on the research she had been doing since 2008 on the formative role of 4chan's random page in the emergence of Anonymous in which she asks -how has the anarchic hate machine of (Fox News's epithet for Anonymous) been transformed into one of the most adroit and effective political operations of recent times? - Now in 2017 we need to invert the question and ask how did the platform that gave rise to -the most adroit and effective political operation- spawned the even more adroit and effective operation Alt.right? And more pertinently why was this once progressive domain ceded so much to the right... why was there not a more effective fightback. why no equally powerful alt.left?

The white supremacist trolls and nazi meme warriors may have had an exaggerated belief in their own influence but though exaggerated was and remains far from negligible. Trump's recent speech in Poland on the battle for Western Civilisation has Bannon's Alt.right finger prints all over it. He may be less visible these days but his influence in the White House remains undimmed.

Whether as Anonymous or Alt.right the unregulated autonomous zones of message boards represent the revenge of what some on the left previously dismissed as folk politics. Far from being either an impotent side show or the property any particular set of political affiliations these spaces represent a new front line in the battle for the social mind. As Florian Cramer pointed out in a recent panel that there are parallels here with Punk which although often associated in the UK and beyond with the anarchist left in Germany there was a strong constituency of neo-nazi punk.

Felix Stalder wrote

> import of ideas/tactics always goes from left to right. It has the

Yes agreed- And one of the most important lessons is to be unafraid of power and to be willing to re-occupy traditional political parties but in new ways.

Although it has not figured much in these discussions the UK Labour party's successful campaign combined with the Momentum the organisation in support of the Corbyn agenda operating outside of the formal party structures and making fantastic use of independant media outlets.

Other nettime regulars such as Richard Barbrook who were actively campaigning would be far better than I am to illuminate this picture.

But from the outside the campaign seems to have taken many lessons from the US grass roindendantot's media activism combining new forms of campaigning. Turning rallies into media events. Not cosying up to mainstream media but attacking them all appears straight out of the Trump play book of Let Corbyn be Corbyn

Its easy too write off work around art, media and politics in the words of Jodie Dean -communicative capitalism's perfect lure- a self deluding sideshow, unconnected to the disciplines of real political organising. But whatever else the Alt.right demonstrated that in politics "culture" particularly sub-cultures still matter. And that Bretitbart's famous aphorism energetically adopted by Bannon's meme team that: -politics is down-stream from culture- is a message that the far right learned well which some on the left overlooked as they were anxious to move on from the DIY media practices dismissed by some as -folk politics-.

Again from the outside, Momentum have been stupidly misrepresented as a throw back

Trotskyist entryism of the 1970s. But Corbyn himself represent a very different approach

to what leadership is. Part of Corbyn's very contemporary appeal is he appears as a reluctant leader. Uncomfortable with the trappings of power. His clear discomfort with the normal logic of power brings his approach closer to what Paolo Gerbaudo has called the "emotional choreography" of the reluctant leaders of Occupy.

I remember a discussion along while back at the LSE with Paul Mason in a conversation with Manuel Castells where Mason declared would be inconceivable for any politician today could openly declare as Labour Party's Shawcross notoriously did when Labour won power in 1945 that -We are the masters now- For whatever reason people don't want masters .. People don't trust traditional forms of leadership anymore..

But in the same conversation they discussed the fact that major social and political change takes time to unfold it can be glacial (then sudden). Castells pointed out how -it took 20-30 years from the arrival of mass industrialisation to the point when union power and the labour movement became political institutions [...] its long journey from the minds of people to the institutions of society-. I know. I know.. we don't have that long.

<nettime> 20 years of Indymedia:

Where are we now ?!

From: podinski

To: nettime-l@kein.org

Date: Fri, 6 Sep 2019 15:42:24 +0200

hello N-time,

This November INDYMEDIA - ((i)) - will be 20 years old !!

April Glaser writes a good short history of the pioneering network/platform/newsfeed ... for Logic Magazine (here). But there's probably many more things that need to be analyzed in the history of the Internet and digital culture to understand and assess whether "Another Network Is Possible"... and where + how tactical media can unite communities tomorrow...

<https://logicmag.io/bodies/another-network-is-possible/>

...

XLterrestrials are working on an expanded post about ALL that...

<http://xlterrestrials.org/plog/?p=19424>

excerpt from Part 1: Where are we now ?

>

(that haunting + sad final-years-Bowie tune is playing back in our heads as we write...)

This is an extremely complicated discussion, and it will take more than a short essay to sort through all the angles and dilemmas we find ourselves soaking in with the cybernetic technodystopias + technospherical spectrum +/or rectal probes of the military/corporate communication industries, now oozing ubiquitous through all the tissues and orifices of human + social organization like electro-shock + doctrines + disruption therapies to cure our inherited already-anthropocene-driven madness... by accelerating it ... like: Here take this, it's another anthropo-scenic downloading spiral into Stephen-Pinker-esque "tech-n-progress" Inc.

>

...

On a tangent note, it would be nice to put on some Indy-inspired type tactical media event...

perhaps in the Btropolis (Berlin) for this anniversary date...

Any ((i)) and N5Minutes veterans wanna play with us on that † get in touch !

There is already something planned in Houston hosted by IMC folks there
(at Rice U. †) ...

but nothing in the EU territories yet, as far as we know... and WHY
Btropolis?

One of its IMC sites is still active,

and its more radical sibling offshoot, got the crackdown + kicked off
the webz 2 years ago. (Linksunten)...

And there's been heated discussions here about WHAT'S NEXT !!

...

liebegreetz !

sorry for slow reply...
things have been a little overloaded...

good to hear that NL ((i)) is still kicking... i believe there are
several still out there providing useful public channels (as
mentioned in the article, ie. Argentina)!

Not quite sure how to proceed with any concrete event plans for
Nov.... or beyond.
but happy to hear that there are some comrades out there who want to
be involved...

Should be a topic at Transmediale 2019 "e2e" network theme...
<https://2020.transmediale.de/festival-2020>

but one always has to wonder just how far out of touch the
arts + cult + showtime sectors are with pragmatic activism + praxis ...
i will check in to see, if not already too late.

my cynical acent bits for the day...

podinski

Cheers, Ingrid.

hi pod! long time no see, hi ingrid, tatiana from abya yala :)

as for a long time user and educator on free technologies for creative
media production I was a bit skeptical on the article - we dont need to
create one more leftist tool, but re-occupy with purpose and love all
collective maintained tools - perhaps more influenced by intersectional
politics (I am reading Ocalan :) but the networkS are alive, dormant
because NOT dispersed and very much re-creating itself all the time.
free philosophy and ethics becomes just more urgent then ever! As Krenak
an indigenous leader in brazil says we have been using "colored
parachutes" in this fall "being able to maintain our subjectivities, our
visions, our poetics about existence".

we are in shock with the fire but its from the ashes that we create!

here a recent ongoing work from the brazilian cyberfeminists
<https://midiatatica.desarquivo.org/> tactical archives from the last
decade by collective perspectives.

best for all!

Hi Matze,

i tried recently to follow and catch-up on the debacle of linksunten and state censorship... and picked up the pamphlet :
verboten ! zur Kriminalisierung von Indymedia linksunten
via Rote Hilfe e.v.

but havent yet had time to get thru it.

...

re: the issue of the liberated webs and copy left...
i have begun to think that another unexpected + massive fallout has occurred with all this online free content falling into... the Titan grip...

and in the idealism of trying to "common-ize" and/or "dismantle capitalism" on the net, but not in the AFK world... as the majority of us still live in the realms of landlord strangleholds...

protection of labor and the livelihoods of content producers and indy publishers + DIY distro merchants was not very well considered... in the eco-systems of books, media, data, small business and shop owners... and people's having to make their money to survive... pay rent... or recoup their production budgets (see Astra Taylor's The People's Platform)...

Copyright is a completely re-openable subject... of hot debate....

which HKW is also being revisited again this year (100 Years Of Copyright and Part 2 : Right the Right... this Nov.)
... but i am not so hopeful they will handle the topic radically enough, because in the end they are already looking for tech solutionism to fill in the grim situations... ie blockchain in the music industry ?

but no time to get very sophisticated in that beastly and tedious topic.

...

cheers,
p.

**[Nettime-bold] Media without an
Audience**

From: Eric Kluitenberg
To: nettime-bold@nettime.org
Date: Thu, 19 Oct 2000 10:58:57
+0200

dear nettimers,

Please note: This text is an expanded version of a talk given at the Banff Centre for the Arts Interactive Screen o.o workshop (August 2000), and the introduction to the <target.audience=o> panel at net.congestion - International Festival of Streaming Media, in Amsterdam, October 2000. The text will appear shortly in the third Acoustic Space issue, published by the E-lab artist organisation in Riga, Latvia.

Media without an Audience

by Eric Kluitenberg

Presence in the mediated environment of digital networks is probably one of the most complex phenomena of the new types of social interaction that have emerged in these environments. In the current phase of radical deployment (or penetration) of the internet, various attempts are made to come to terms with the social dynamics of networked communication spaces. It seems that traditional media theory is not able to contextualise these social dynamics, as it remains stuck on a meta-level discourse of media and power structures (Virilio), hyperreality (Baudrillard), or on a retrograde analysis of media structures deeply rooted in the functionality and structural characteristics of broadcast media (McLuhan).

Attempts to come to terms with networked communication environments from the field of social theory, are generally shallow, ill informed about actual practices, and sometimes too straightforwardly biased. Psychology does not contribute in any significant way to an understanding of these social dynamics either. The rather popular idea, for instance, that the screen is a projection screen for personal pre-occupations, and that social relations that emerge through the interactions via networked media are mostly imaginary for lack of negative feedback or corrections, is deeply contentious. The idea that absence of corrective feedback stimulates the creation of fictitious relationships is an interesting one, but one that can apply equally well off-line as it can on-line. It illuminates certain patterns of human behaviour, but it does not tell us much of what makes presence in the networks specific.

One of the greatest fallacies of current attempts to understand the social dynamics of networked media is the tendency to see these media as an extension of the broadcast media system. This idea has become more popular as the internet is extended with audio-visual elements. Interactive audio-visual structures, streaming media, downloadable sound and video, all contribute to the notion that the internet is the next evolution of broadcast media. But this vision applies only partially, and is driven primarily by vested interests of the media industry. It is often not reflected in how people actually use the net.

The predication of the conception of media on the broadcast model based on a division of roles of the active sender <-> passive receiver / audience relationship, is the greatest barrier to understanding what goes down in a networked media environment. The networked environment should primarily be seen as a social space, in which active relationships are pursued and deployed. Activities that often seem completely useless, irrational, erratic, or even autistic. The active sender and the passive audience / receiver, seems to have been replaced by a multitude of unguided transmission that seem to lack a designated receiver. Thus the net is seen as an irrelevant, chaotic, and useless infosphere, a waste of resources, a transitory phase of development that will soon be replaced by professional

standards of quality, entertainment, information, media-professionalism, and above all respect for the audience.

Let me be clear, I do not believe in this vision, and I am convinced that the net will not evolve into the ultimate entertainment and information medium. Instead it seems more likely that the seemingly unstructured mess of random transmissions will prevail.

Into the Soup...

The ideal of seeing the media environment as a social space has a considerable history. Already in the late twenties Bertold Brecht formulated his now famous radio theory in which he envisions radio as medium for direct two-way communication, and the media space as a connective network of decentralised nodes.

(use of cyber rhetoric deliberate here!)

This idea heralds strong resonances of early cyber-utopian discourses such as "The Virtual Community" of Howard Rheingold. J.P. Barlow, one of the other great cyber utopians talked extensively about "the great conversation", emphasising the kinship of network communication to the traditional meeting places, the street, the square, the agora, the theatre, the café... This early utopian phase of the net is over, cyberspace turned out not to be independent. It's sovereign existence is threatened by mega fusions of the AOL/Time Warner type, but there is one aspect where these early stories are right, and that is in pointing beyond the sender->audience dichotomy of broadcasting.

A progression of media phenomenologies

beyond the broadcast dichotomy...

Intimate media

The first step towards a micro-politics of resistance against the broadcast hegemony was introduced with the notion of 'intimate media'. I was introduced myself for the first time to this concept at the second Next 5 Minutes conference on tactical media in 1996.

Intimate media have a high degree of audience feedback. Typically the distance between the sender and its remote audience is enormous in broadcast media, if only because of the ratio of active senders and the overload of passive audience. Feedback mechanism are necessarily complicated and bureaucratic: the letter to the editors, phone-in time available for only a tiniest fraction of the audience. Intimate media instead are micro-media, there is a close relationship between sender and audience. Ideally the sender and the audience all know each other, while the relationship is still more than one on one conversation (as in a telephone call).

Intimate media are spontaneous media. They emerge at the grass roots level. They cut across all available media, all available technologies. Intimate media can be low-tech, they can also be high-tech. What characterises them is an attitude. Intimate media range from micro-print to pirate radio, to hacked tv, web casting, satellite amateurs, micro-fm or high-bandwidth networks. Intimate media can be organised in a professional way, though usually they are not. Most common is their appearance as amateur media - their audience reach is generally economically not viable. Intimate media are generally not a good stock option.

People often do know each other personally in these media networks. A curious incident at the second Art + Communication festival in Riga (Latvia) illustrates this beautifully. All the discussion were sent out live via audio streams over the net, and a few people were even listening at the other end. During one of the breaks the stream continued and one of the artists decided to take the mobile microphone used by the presenters into the coffee room. He placed the microphone silently on a coffee table, where a lively conversation (gossip) was going on. As it turned out later, about the only person listening (in London) to this conversation at the time, was the person the conversation (i.e. the gossip) was about, and she protested via a chat channel within minutes. This type of media-intimacy is virtually unthinkable in the broadcast model.

Socialised Media

Media used in the context of a specified social group or in a specific regional context, are best described as 'community media'. Common forms of community media that belong to a geographically situated community are community-radio and -television. The use of the internet in a geographically situated community is mostly referred to as community networking. Community networking has become very popular in the US, but also has some importance in Europe.

Special interest communities are usually organised around a topic, a theme, or a shared interest. They are essentially translocal in nature, hooking up

local interest groups or even shattered individuals, who can be dispersed over different regions and countries.

Networked communications can be highly beneficial for the process of community building and for strengthening the cohesion of such communities. It is obvious that translocal (special-interest) communities benefit most from networked communication, since it offers a low-cost and fairly effective means to stay in touch and exchange ideas. But the high degree of audience feedback, and peer to peer interaction also makes networked communication technology an invaluable tool for social interaction within a geographically situated community.

Typical forms of networked communication are the newsgroups that emerged from Usenet, text-based fora where people exchange ideas and opinions about the topic of the newsgroup. MUDs & MOOs, or generically on-line multi-user environments, where people can interact directly on-line in a communications environment. MUDs and MOOs started out as text-environments and became popular as role playing environments, but they have become visual and subsequently also integrated live speech and 3D environments that can be navigated in a more visceral way than the point and click navigation of traditional web pages. Multi-user environments enhance the feeling of sharing a communications space with others. The mode of interaction has to be active, otherwise it doesn't work.

Another important aspect of socialised media are the collaborative networks that have emerged as a result of these low-cost translocal communication tools. Especially e-mail has helped tremendously in this regard. Mailing lists are easy to set up and can help to distribute information evenly and effectively to a very large base of subscribers, while offering each subscriber also the opportunity to react to the sender as well as to the whole list. 'Audience' feedback here is immediate, distributed and non-hierarchical. It is far removed from the letter to the editor that most likely never makes it through the editorial filters. The practices of micro media in the arts and net-casting have benefited enormously from the availability of mailing lists such as Syndicate, Xchange, nettime, Nice, and others, and have been tools to establish co-operation, a sense of community and a discourse that is more open than what any print magazine would have been able to support.

Create Your Own Solutions!

One of the most notable collaborative networks, still in becoming, has been the Interfund. The Interfund is "a co-operative, decentralised, non-located, virtual but real, self-support structure for small and independent initiatives in the field of culture and digital media." The Interfund proposes to become a shared resource pool, a "Bureaucracy Protection Shield", a forum for the critique of (the inefficiency of) large institutions, a pool of shared skills.

Beyond that the Interfund stimulates individuals to "create your own solutions". One of the more ingenious of these self-help solutions was the self-funding scheme! This scheme addresses the nasty fact that cultural funding agencies generally want to support projects only if they are already supported by other funding bodies. The Interfund therefore came up with the idea of a micro-funding scheme where projects from within the Interfund community (which itself is an open structure) would be immediately eligible for official support by the Interfund - in an amount of either 1 or 10 US\$ per project.

With the official letter of acknowledgement new funding applications to local agencies could be given extra credibility. "Look, our project is already supported by the Interfund!" - "what, really? Well in that case..." If by any chance the Interfund office is far away, or there is no time for a surface mail exchange, the entire Interfund would be down-loadable in the form of PDF files and other downloadable design-elements. Thus allowing each individual member to establish their own Interfund.

All of these types of media practices still have an attachment to the functional. There is an idea that something has to be communicated - a fallacy of course. What mostly distinguishes intimate and socialised media from the broadcast model, is that the media-infrastructure here primarily act as support structures for certain intricate social figurations to emerge. There is a highly specific sub-set of these media phenomenologies, however, that seems to have emancipated itself from even those basic functional demands of use and has entered into a kind of 'phatic' state; the sovereign media.

Sovereign Media or 'The Joy of Emptiness'

Sovereign media are first of all media that simply exist for the sake of nothing else. Sovereign media produce signals "with" an origin / sender / author, but "without" a designated receiver. The term 'Sovereign Media' alludes to the notion of the sovereign as developed by Georges Bataille in 'The Accursed Share'.

As a media phenomenology it has first been identified by BILWET (a.k.a. ADILKNO - Foundation for the Advancement of Illegal Knowledge). For Bilwet the sovereign media are a bewildering new UTO - Unidentified Theoretical Object, which they studied with great curiosity and leisurely pleasure. Let me first share some of the early Bilwet/Adilkno observations about this UTO with you:

"The sovereign media are the cream of the missionary work performed in the media galaxy. They have cut all surviving imaginary ties with truth, reality and representation. They no longer concentrate on the wishes of a specific target group, as the 'inside' media still do. They have emancipated themselves from any potential audience, and thus they do not approach their audience as a mouldable market segment, but offer it the 'sovereign space' it deserves. Their goal and legitimacy lie not outside the media, but in practising (practicable) 'total decontrol'. Their apparently narcissistic behaviour bears witness to their self-confidence, which is not broadcast. The signal is there; you only have to pick it up. Sovereign media invite us to hop right onto the media bus.

(...)

Sovereign media insulate themselves against the hyperculture. They seek no connection; they disconnect. This is their point of departure. They leave the media surface and orbit the multimedia network as satellites. These do-it-yourselfers shut themselves up inside a self-built monad, and "invisible unit" of introverted technologies, which, like a room without doors or windows, wishes to deny the existence of the world. This act is a denial of the maxim "I am connected therefore I am." It conceals no longing for a return to nature. They do not criticise baroque data environments, or experience them as threats, but consider them material, to use as they please. They operate beyond clean and dirty; in the garbage system ruled by chaos pur sang,

Their carefree rummaging in the universal media archive is not a management strategy for joggling jammed creativity. These negative media refuse to be positively defined and are good for nothing. They demand no attention and constitute no enrichment for the existing media landscape. Once detached from every meaningful context, they switch over in fits and starts from one audio-video collection to the next. The autonomously multiplying connections generate a sensory space which is relaxing as well as nerve-racking."

(from the Bilwet Media Archive)

Presence Beyond Utility

In "The Accursed Share", Bataille defines the sovereign in opposition to the servile, in opposition to all activities subordinate to the demands of usefulness. The demands of usefulness, the basis of any kind of economic or productive activity, rule out the experience of sovereignty. By deriving its meaning and purpose from what it is useful for, the activity itself becomes intrinsically meaningless. The sovereign experience on the contrary is meaningful independent of its consequence. It always refers to the moment of its consumption, never beyond.

"Life beyond utility is the domain of sovereignty", Bataille writes. Only when experience is no longer subordinate to the demands of use is it possible to connect to what is 'supremely' ('souverainement') important to us. Sovereign media then should be understood as media beyond use. They should not be understood as 'useless' but rather as 'without use'. The sovereign media are media that have emancipated themselves from the demands of functionality or usefulness to exist in their own right.

Quality is irrelevant!

Freed from the demands of usefulness, quality becomes an irrelevant criterion for these media signals. The signals exist, how they are interpreted, what the framework and the demands are that are projected upon them, is not a consideration in the process of their production. The signals can be beautiful and brilliantly clear, or amateurish and oblique. The traditional criteria of media professionalism have long been left behind in the universe of the sovereign media.

One of the most beautiful examples of a supremely sovereign media practice is the net.radio.night, a global micro jam in net.audio, regularly hosted by the xchange network. Typically for a net.radio.night a call is put out on the mailing list, inviting net-casters to join on irc and listen to a live stream originating from location one. Other locations listen and pick up the stream till someone announces on the irc channel that the live stream will move from its original location to theirs. The next stream is a remix of the original, some things added, others taken away. The process starts anew and the stream moves to the next location and the next re-mix. This process can go on for hours, and very soon the origin of any specific sound is lost. What the net.radio.night imprints on the participants is a strong feeling of being in the network, where the relationship between origin and destination has been dissolved. Also the traditional audience

can tune in and listen, but is no consideration in the structure of the event.

A distinctive characteristic of sovereign media is their hybridity. Any medium can be combined with any medium. Sovereign media have a cross-media-platform-strategy, but this time not to reach a new audience, but simply to extend the media space. Examples are the Virtual Media Lab, an intersection of all available media [at <http://live.media.nu>] in Amsterdam, combining cable television with web casting, with radio, and even at times with satellite transmissions.

Another interesting cross breed are automated media such as the Frequency Clock of radioquailia.com, or Remote TV of TwnFM, allowing automatic scheduling of live streams from the internet on local radio and cable tv infrastructures. Or the project Agent Radio of the Institute of Artificial Art in Amsterdam that automatically and randomly selects sound sources from the Internet and schedules them in the ether.

All these media operate beyond the body count of viewer statistics.

Private Media

In the Digital City Amsterdam the personal home pages of its 'citizens' are called 'Houses'. For some years already the personal home pages on the world-wide web in general, and the success of initiatives such as GeoCities, prevail in the face of adversity, while big-budget entertainment networks such as DEN (Digital Entertainment Network), collapse even before anyone really got to know about them. The deeply respectable weekly economy magazine The Economist recently put a sad smiley on its cover, testifying to "what the Internet cannot do". Inside the issue a careful analysis is made why the Internet has such a hard time taking of as an entertainment medium, and is not living up to its promises at all.

The kind of private media formations such as GeoCities, the Digital City in Amsterdam, and others, mostly do not deal with the communication of a specific message at all. They have no target-audience, and are not part of the attention economy, but still they are highly successful as private media. More than the failed attempts to establish the ultimate entertainment medium, the net has flourished as the ultimate personalisation of the media space. The endless stacks of private home pages are the icons of these truly privatised media. Their private messages, beyond anything else, simply state "I am here", but this simple message should not be discarded as a banal statement.

Phatic Media

In their final phase of evolution media become phatic. The term derives from linguistics. In linguistics phatic language relates to "speech used for social or emotive purposes rather than for communicating information". The typical, though admittedly somewhat stereotypical example, is the daily speech of house wives meeting every single day in the garden while hanging wash or taking care of domestic tasks. The exchanges of apparently meaningless phrases such as "how are you?", "How are your children doing in school?", etc., communicate something beyond the semantics of the individual words.

An amazing image: A test channel of a satellite tv transmitter, operated by satellite tv amateurs - an international network. One central image surrounded by smaller screens. They show what looks to most of us "nothing". A small room, an attic, a technical workshop, equipment, somebody sitting around, no apparent communication. The image is, it does not speak. One of our civilisation's most highly developed high-tech infrastructures, utilised to celebrate the joy of emptiness...

This type of media appears to be completely useless within the traditional (broadcast) media scheme. It is a mistake to take this view for granted, however. There is indeed nothing banal about this media behaviour. The media sphere is treated here as a new type of environment, 'in' which people create presences, but without a desire or aim to communicate a specific message.

In fact I understand this as a fundamental anthropological principle - a way of inhabiting a new environment, and one that is, after all, primarily a hostile environment for most of us.

Strategising Tactical Media

From: geert lovink

To: <new-media-curating@jiscmail.ac.uk>

Date: Sat, 22 Apr 2006 12:28:42 +0200

Ele Carpenter sent following theses:

Strategising Tactical Media

Immersion in tactical media tools and antics has enabled some artists and activists to work together for a while – but the fundamental differences are too great for real collaboration: activists continue to mimic the mainstream whilst artists produce unused tools.

Is it possible to work towards longer-term strategic visions? What do you think is missing from the discourse and the practice that can help bridge the gap?

Where is the cultural shift needed for political change coming from?

Is new media the political imaginary for art?

New media practice and theory charts the evolution of free communication networks and tools. The development model of open source has its roots in self-organisation: creative commons is a realization of the principle of the freedom of information. Why is it that the visual arts is only beginning to take the socio-political imaginary of self organization seriously through the model of open source?

Does the ‘coolness’ of technology and the wealth of new media theory give credibility to social networks as art, that the ‘woolliness’ of socially engaged art failed? Or does new media’s ability to side step the art market, and government agendas enable it to practice what it preaches?

Or to put it another way – is new media the new avant-garde that enables artists and activists to work together? And if so where is it going?

--

My response would be the following:

Tactical media can (and maybe should) not be looked upon outside of the realm of social struggle, movements and political issues. This is the problem discussing the problematic relationship between artists and activists as an isolated topic. Yes, it’s all true what Ele writes. But it also changes in concrete situations.

The problem of outdated and self-referential museums and the art world in general is, in the end, not a problem of activists and the general public but of these institutions themselves. You either care about issues and society or you don’t. If you do, you engage and get involved, show solidarity. If you don’t you’re just yet another closed castle or boring office. Who cares?

Ele is right in that concepts do not travel that easily from one context to the next. We can see grand parallels. But they may as well remain parallel universes. Žižek’s latest book deals with this issue.

Yes, the art world is lagging behind. So does the aesthetics of activists. Instead of claiming who is the most avantgarde, these days the discussion seems to be: who is the most behind? Only Generation Zero seems to be the perfect cool informed. Those in their early twenties, the rest can be written off. I don’t mind this view.

New media is ghetto, as is activism, likewise the MySpace youngsters. But do not give up hope. There are times that people break out, create unexpected alliances and coalitions and make things happen. The alchemy of this is rather mysterious. There is no recipe. Lenin had some but I am not a Leninist. One strategy would be to keep on trying and utilize the tools that we all have. Ignoring the Zeitgeist is important. We have to mind less about newspapers, watch less TV and Web and perhaps do more stuff that we really find really interesting. Stop keeping up with the Cool Johnsons. Maybe you already do this.

Best, Geert

From: Andrej Tisma <aart@EUnet.yu>
Organization: Happiness
Subject: Re: Rise and Decline of the Syndicate

A very touching report on Syndicate history, indeed. But listmasters
should have admit some of their faults too, for their full right to
mention the word ethics.

Since I am mentioned personally in the report, and I am thankful for
former listmasters' understanding for keeping me on Syndicate all the
time (unlike Nettime), I want to stress once more: yes I was expressing
my anti-Western and anti-NATO attitude, and I am doing it still with the
same intensity. But in that very vivid artistic and political engagement
my aim was never to defend "Milosevic regime" (in the same logic I could
claim you defended Clinton's or Schroeder's regime on this list), but
rather to oppose Western, mostly American neoimperialism,
interventionism and globalization, like many progressive Western
intellectuals do. In that aim I had and still have a great support and
admiration by numerous people world-wide, specially on the West. Even
now when "Milosevic regime" doesn't exist, you might remark that my
activities didn't stop or change, and that they are maybe even growing.
Also the support for my engagement and art is growing, and with time and
new Western violent, arrogant and inhuman activities the statements I
was publishing on the list seem to get more proofs.

This is what I wanted to say. And about reasons of Syndicate's "decline"
you should also ask yourselves, if it was right to leave the list in the
most difficult and sensitive moment, or you just felt that your
mastering is under reasonable questioning, which you couldn't endure.
Regards,
Andrej

ANDREJ TISMA is Novi Sad (Yugoslavia) based artist, art critic and
curator. Since the early '70s mail-artist and networker. Founder of
The Institute for the Spreading of Love (1991) and Embargo Art
campaign (1992). Since 1997 web-artist and activist.

The Syndicate - building a history
From: brnac ferran
To: <new-media-curating@jiscmail.
ac.uk>
Date: Sun, 6 Oct 2013 12:43:12 +0100

I think I agree with Armin, but even further reinforced by seeing an
intriguing new film at the AND Festival yesterday in Liverpool made by
Aleksandra Domanovic which is called From Yu to Me, and addresses the
actual making/building of an internet connection in the former Yugoslavia
before the yu domain was created in 1989 largely to do with the efforts of
two female scientists, Borka Jerman Blasik and Mirjana Tasic whose
profound testimony of under the radar academic moving and shaking was
mirrored both in the film and in person in Liverpool yesterday. Great
privilege to hear them speak. They came across as relatively lacking in
vanity about establishing some place in art or otherwise history ...

<http://www.andfestival.org.uk/events/from-yu-to-me/>

I think the film is going to be online at some stage soon, Aleksandra is
still working on it. It has been commissioned by AND with Fridericianum
and Rhizome.

maybe just my own perception there is a sort of 'let me show you my vinyl
record collection' tone emerging here...like the recently dead brought
gratefully back to life in a muted form, inevitably seems to be missing
somehow the pain of the punctuating flame.

half seriously
B

**The Syndicate - building a history
of lists**
From: Charlotte Frost
To: <new-media-curating@jiscmail.
ac.uk>
Date: Sun, 6 Oct 2013 18:40:48 +0800

So far we've had little mention of the Syndicate list, which was extensively
chronicled in a post to Nettime in 2001 by founding members Inke Arns and
Andreas Broeckmann: [http://www.nettime.org/Lists-Archives/nettime-l-0111/
msg00077.html](http://www.nettime.org/Lists-Archives/nettime-l-0111/msg00077.html).

One of the things that I believe was so important to this list at the time
(and perhaps even more so with some historical perspective) was the voice it
gave people of the former Yugoslavia during its civil war. It's common place
now to talk about how platforms like Twitter break through political
censorship. Iran and Egypt are good recent examples but on a list like
the Syndicate, such freedom of speech could be both a benefit and a
detractor, as Arns and Broeckmann note. I'd love to know if anyone involved
with the list at this time would like to recall individual posts that
illustrate this difficult period.

And also more generally if anyone would venture an account of their
relationship with the Syndicate what collaboration it's led to, and what
it was like to lose it especially in light of the comments we've already
had about how much of loss the Rhizome Raw list was.

Inke and Andreas, I've BCC'd you in case you have time to offer anything to
this discussion on Media Art Curating. I can forward your responses if you
are not current subscribers/are pushed for time. You'll find more on this
month's discussions here: [https://www.jiscmail.ac.uk/cgi-bin/
webadmin?Ao=new-media-curating](https://www.jiscmail.ac.uk/cgi-bin/webadmin?Ao=new-media-curating)

All the best,
Charlotte

Re: The Syndicate - building a history of lists
From: Armin Medosch
To: <new-media-curating@jiscmail.ac.uk>
Date: Sun, 6 Oct 2013 13:05:44 +0200

Hi Charlotte,

while it is surely interesting to recall individual posts I think it is also important to point out that many of those posting could only do so because they had access to the net and that in itself was nothing to be taken for granted. A great role in that respect played Zamir net which started in 1992 and which connected peace activists in former Yugoslavian states ... there is a wikipedia entry about it <http://en.wikipedia.org/wiki/ZamirNET>

Another, less well known story is how Serbian hackers ensured email connectivity for civil society at a time when Serbia was under international embargo and didn't even have a domain name.

As I have tried to point out in the past, without much success, the material layer of networking also matters. Arts and humanities scholars have a tendency to ascribe too much importance to what you could call the semantic and symbolic layer. No email from Serbia would have found its way to the syndicate list without having a route to travel on. Those routes are provided by people who also have cultural and political ideas, so that those human-technical assemblages also have meaning, if you so want, something that should also be considered, however, without tipping over into a one-sided materialism

all best
Armin

Forwarding some individual posting from Syndicate [not those illustrating political relations, or any subversive channels, but more those that describe internal turmoil(s) within the list itself]:

Subject: Re: [syndicate] Re: Yes, but is it art?

At 03:45 PM 3/10/2002 +0100, f wrote:

of course, everybody knows that I am an advocate of list disruption, the difference is that I think that ultimately this should be beneficial to the list and not to the disrupter alone.

fred,

i'm curious as to how u distinguish the difference? firstly, i'd surmise u to define _beneficial_ in terms of how it affects list cohesion & function, & how this individualisation of subscriber identification can operate along this benefit-deficit scale? also how this affects the pulse communication function that most list labor under.....?

the huge difference is the cross posting

cross posting is the bane of mailing lists

y, fred? u seem to be aligning yr perception with a niche that advocates members of various mailing lists live under the illusion that the net/work perpetuates this insularism, that every who is interested in being subbed to various mailing lists exist in a mono-data-directed vacuum that can only cope with _i_ manifest exposure to information.....that those who only interested in connecting to a nodepoint, via _i_ list forum, do not have the right to be exposed to data because of the _n.con[ne]ct[ive]nience this would cause those more-connected via multiple nodes.....r u really interested in promoting exclusion & data closure because of this top-down hierarchical slant in terms of network function?

i am stained with repetition.
[re:peat]
::the chip.mark of the net.
::[kulture]work::abbreviated strokes::sampling::[sci]graffiti::code
languages::bass.house::jung[jle]mantras
all .[t]h[r]ive in .he[a]re.....

why are there different mailing lists?
with (hopefully) different subscribers, different topics, different functionalities, different roots and different histories?

ah, the hub. difference [n.insert perpetual loop]

n.deed, yr there? this _difference_ is telling.....instead of operating via this divergent take, i c the net/work as a _whole_ operational in terms of info-sharing & dispersal.....

this difference, this reliance on the in box as a box, not as a [link]node.....

HISTORIES!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

f, surely u just here, histories!!!!
history doesn't exist, it is a fiction @ best.....

cross posting can never be justified

f, _u think[perceive this_] this is not a statement of fact [or
|||||history|||||],

because it nullifies the very nature of each mailing list, because it specifically addresses none of them.

i c it as _ratifying_ the nature of mailing lists.....[et]ature as defined by connexion, communicative points in an extendible net of flow & flux.....do u want to exclude those not so ego-n.trenched in this net.baggage? if _xXx_ is subbed to syndicate but not to _reader-list_ and info is not cross-posted due to exclusionary individualisation via blanket withdrawal of crucial info due to justifications such as u yr espousing, do u c that _xXx_ is then excluded from exposure to info _from which_ they can then choose to expose themselves to?

[filters. r. yr]the. xclusionists. friend.]

therefore it turns the attention on the cross poster only (having discarded any and every notion of communality) and it becomes obvious that the cross poster is only willing to momentarily confiscate the _numbers and that is what I find terribly abusive.

oh f,

do u c that yr perception here is crucial to the formation of yr point above? do u c that u think that cross-posting highlights the ego-definition of the poster in such a way that their characteristics are etched all over the forum?

i offer a different view.

these numbers that u assume r being overwritten [due to non-responsivity/lurking b.haviour etc], this community that is being [in yr view] blanked out due to the nature of extended information exposure is

d.fined by wot x.actly? wot makes up the community here, in this net.worked area? is it repetition of dialogical conventions? participation via manifest post activity? access 2 information? access 2 communication via other entity participation? wot?

not that it bothers me that much beyond the fact that I find it either willingly manipulative or lacking in reflexion about networking indeed

it bothers me greatly that u'd offer these opinions & not firstly c that they r in fact _drenched with yr individualistic-ego driven spin_...as r my opinions...wot matters here 4 me is that this _community_ of mailing lists [in my case, network connectors] r being banded around as cohesive structures in which individuals autonomously activate data _without_ any nuanced understanding of the mechanisms via which these communities act\interactive\exist.....

u need 2 x.plain the community function 2 me, within the confines of a mailing list forum.

[pre.tend - or ack.no.ledge - i. am. an. idiot.]

~ a signature

comme toujours

well, peut etre, but it seems that _everything must be explained (gosh!)

absolutely. if u start a multilogue like this f, b prepared 2 x.plain[n]gage in multilogues. it is 4 the good of the _community_ after all.....)

x.tendibly,
mez

>>

to take this reasoning further you should hire a bulk email company and spam the whole world. seriously. has any artist ever done this?

not 2 my knowledge.....[doesn't mean it hasn't been done, though:]

just b.cause i perceive the net.work as a whole, a tapestry of potentialities of defor[com][m][unic]ation doesn't mean i advocate [or carry out] _blanket spamming_ activity.....this syst.[n][c][t][m] displays n.tricate s[ilicon]ymbiotic tendencies which shift & pulse data via n.finite variations...just as i don't c a mailing lists such as syndicate as static or x.clusively filled with a group of n.tities that r non-changing & there4 r all hyperaware of how the forum [can] function[s]. i don't perceive mailing list as non-communal in scope or [wo][manifestation].....

my. p[ercept][atterning, is. reticular.

of course there would be serious repercussions which may mean it is better for a non-entity?

i'm not sure.....

like nn to do this, the possibilities are amusing to think about. or do you see your message as being more focused than this which would mean you concede to heirarchical data nodes?

not sure if i c _my message_ [& by this i take u 2 mean the fluttering code.symbology i use in my mezangelled wurks] as focused, but more flu[idic][vial].....do u c this as perpetuating hierarchical data methods?

mim.e.t[h]ically,

Re: The Syndicate - building a history of lists
From: Simon Biggs
To: <new-media-curating@jiscmail.ac.uk>
Date: Sun, 6 Oct 2013 12:23:22 +0100

If there's a list that has achieved the stated aims of the Syndicate list (dedicated to constructive debate that excludes announcements, promotion and artist's actions) then that would be empyre (established by Melinda Rackham in 2002 and still going strong). This has been achieved by moderating every email posted to the list, ensuring that only those that are on topic reach the list (which is different each month, curated, with invited discussants). This is a bit of work and

does sometimes mean censoring posts, but not as much as you would imagine, especially as the list has over 1500 members. The culture of the list is well established and generally self-regulates.

Other lists that are similarly closely moderated include Yasmin (having similar ambitions to Syndicate, but instead of the East/West Europe focus its is the north/south pan mediterranean that is engaged) and DASH, with a focus on digital arts history.

The opposite of these lists is Netbehaviour, which is totally open and unmoderated. Like emptyre, its culture is well established and there are rarely conflicts or other issues - certainly nothing like what happened on Nettime, Syndicate and 55 in the 90's, where flaming was common. Why the difference? Perhaps the rise of mainstream social media platforms has taken the pressure of listservs, with those members that remain being generally dedicated to what listservs are good for - textual exchange. Just a thought...

best

Simon

Hi all

Klaudio Stefancic wrote about ZaMirNET among other topics, in his text New Media - New Networks / New Media Art in Croatia

<http://turbulence.org/blog/2008/07/14/spectre-klaudio-stefancic-new-media-art-in-croatia/>

<http://www.nettime.org/Lists-Archives/nettime-l-o807/msg00024.html>

and Geert Lovink about Syndicate

Lovink, Geert. — My first recession : critical Internet culture in transition. — Rotterdam : V2_Organisation, Institute for the Unstable Media, 2003

"In the third chapter, "Deep Europe and the Kosovo Conflict," Lovink presents his first case study of a parallel network: the Syndicate mailing list created in 1996, and the project Deep Europe, which forged ties between communities in Western and Eastern Europe. By supplementing his analysis with posts from the mailing list, Lovink shows how this network gradually opened up to people outside the media arts community. The involvement of outsiders intensified during NATO interventions in Kosovo when Syndicate served an alternative news media. In 2000, Syndicate shut down as the result of "trolls" saturating the list with encrypted messages. Lovink details the issues raised by the rapid expansion of a collectively developed forum exposed to this type of information overload."

best regards

Darko

Agree with Armin. The "human-technical assemblages" Syndicate was made of were vital. I'm sure Andreas and Inke will be able and well placed to respond, but

maybe the swansong mail they posted on nettime provides a useful overview in the mean time. It's a long story marked by a deep ethos and visionary generosity on the part of those who put the effort into launching and maintaining it, like any that engages deep inter-personal and collective communication. Hard to do justice with hindsight. Especially from the perspective of 2013 list-log-blog-surf culture.

Reply-To: Arns/Broeckmann <inke [AT] snafu.de>

Rise and Decline of the Syndicate: the End of an Imagined Community

Inke Arns & Andreas Broeckmann, Berlin, November 2001

The Syndicate mailing list imploded and went down in August 2001, destroying the life-line of the Syndicate network. The network had been in a shaky situation for a while, due - we believe - to the destabilisation of the problematic balance between personal contacts of list members, lurking and filtering-and-not-reading-let-alone-posting subscribers, and a growing number of self-promoters who used the list as a personal performance space and disregarded the social rules of the online community.

Some people insisted on continuing the list on a new server, taking over the subscriber list, while we decided to form a new list, SPECTRE, which has been running on the previous Syndicate list-serve in Berlin since 28 Aug 2001. The list currently has 250 new subscribers (Nov 01) and continues the tradition of the Syndicate list as a low-noise, open platform for exchange and cooperation in media culture in Europe.

After six years of successful work with and for the Syndicate community, the demise of the Syndicate list in August 2001 was a rather shocking experience for many of us, imposing on us the realisation how feeble such a community channel can be, and how easily destroyed. It proved that responsibility and care are essential elements in a viable social online environment, and we had to learn the hard way that there is no consensus about the rules that should guide behaviour and interaction. The following text gives a brief summary from our personal perspective of the Syndicate initiative as it developed since its inception in 1996, and attempts an evaluation of its end.

Andreas started administering the Syndicate mailing list after its installation on the server of the Ars Electronica Center in Linz (aec.at) in January 1996, helping people to subscribe, unsubscribe and post to the majordomo list. As the subscriber base grew from the original 30 subscribers to about 300 in 1998, Inke joined in administering the list and - together with Arthur Bueno of the V2_Organisation in Rotterdam, who also maintained the Syndicate website and archive on www.v2.nl/syndicate from 1998-2000 - mostly managed the list administration through these years. We taught ourselves the basic majordomo commands, had our private mail accounts jammed with bounced messages, and therefore installed an admin account. Each time we would look into this account there would be hundreds of mails sitting there and voraciously waiting for us ... but somehow it worked. Problems started appearing on an entirely different field.

With its completely open structure (technically and socially speaking) the Syndicate mailing list soon proved to be vulnerable. In the beginning of November 1998 the list was first targeted: all the subscribers were unsubscribed. Luckily we had been extracting the "who"-file on an almost daily basis and thus were able to reconstruct the list quickly. In September 2000 the list software on the server faced a serious crash which the sysops in Linz could not take care of because of the festival they were in at the time. So we decided to relocate the list onto a server to which we would have easier access for administration and configuration. Since then, the Syndicate list was hosted by an ISP in Berlin (openoffice.de) which also soon gave us the opportunity to switch from Majordomo to the more easily administratable Mailman software.

But the Syndicate was much more than a piece of software: it was a network of people. The Syndicate was founded in January 1996 on the last day of the Next 5 Minutes 2 Festival in Rotterdam. It was a network which devoted itself to fostering contacts and co-operation, improvements in communication and an exchange between institutions and individuals in

Eastern and Western Europe active in the media and media culture. By allowing regular e-mail communication between participants regarding forthcoming events and collaborative projects the Syndicate mailing list developed into an important channel and information resource for announcing and reporting new projects, events and developments in media culture. The complete mail archive is kept at <http://www.v2.nl/mail/v2east/>

Since the first meeting in Rotterdam in 1996, which was attended by 30 media artists and activists, journalists and curators from 12 Eastern and Western European countries, the Syndicate network grew steadily. In August 2001, it linked over 500 members from more than 30 European and a number of non-European countries. The original idea was to establish an East-West network as well as an East-East network. In the meantime, however, the Syndicate had increasingly developed into an all-European forum for media culture and art. Over the last few years the division between East and West had been growing less important as people cooperated in ever-changing constellations, in ad-hoc as well as long-lasting partnerships.

Syndicate meetings and workshops have been held regularly, in most cases as part of festivals and conferences. The main meetings have taken place at half-yearly intervals in Rotterdam (Sept. 96), Liverpool (April 97), Kassel (July 97), Dessau (Nov. 97), Tirana (May 98), Skopje (Oct. 98), Budapest (April 99), and Helsinki (Oct. 99), with many smaller meetings and joint projects, presentations and workshops happening in between. Readers edited by Inke and published on the occasion of some of the meetings (Rotterdam 1996, Ostranien Dessau 1997, Junction Skopje 1998) have collected the most important texts from the mailing list in printed form.

It was worth condensing Syndicate stuff in this way because most of the time the mail traffic was dominated by announcements. Attempts to turn the Syndicate list into a discussion list and encouragements for people to send their personal reports, views, perceptions of what was happening, were met by only limited response. In the beginning, when many people on the list still knew each other personally, this strategy was more successful, later, with the exploding rate of lurkers, less.

While in the first three years of its existence, the Syndicate held its meetings quite regularly (almost every six months!), and organised panels and workshops with its members, since 1999 the Syndicate list came to be more like a sleeping beauty which in times of crisis would awake and show its full potential. Suddenly, when necessary, everybody was back on, communicating almost breathlessly with each other ('Have you heard about X?' - 'The cultural center Y was closed!' - 'Z received his mobilisation call.') The list was last activated in order to support Edi Muka, Tirana-based long term Syndicalist, who had been sacked from his post at the cultural center Pyramid by some politically malevolent officials.

The meetings and personal contacts off-list were an essential part of the Syndicate network: they grounded the Syndicate in a network of friendly and working relationships, with strong ties and allegiances that spanned across Europe and made many cooperations between artists, initiatives and institutions possible. The Syndicate thus opened multiple channels between artists and cultural producers in Europe and beyond, which is probably its greatest achievement. It connected people and made them aware of each other's practice, creating multiple options for international cooperation projects.

A structure like that can work so long as it is supported and protected by a sufficient number of participants. It needs an ethical consensus about what is and what isn't possible on the list, which kinds of actions support and which may tilt the social equilibrium. The case of Andrej Tisma, a Yugoslav artist from multi-cultural Novi Sad and a defender of the Milosevic regime throughout the late 90s, is a case in point: many perceived his tirades against the West and against NATO as pure Serbian propaganda which became unbearable at some point. Later, Tisma came back to the list and continued his criticisms by posting links to anti-NATO web pages he had created. For us, he was always an interesting sign post of Serb nationalist ideology which it was good to be aware of. And it was good that he showed that people can be artists 'like you and me', and be Serb nationalists at the same time. The Syndicate could handle his presence after he agreed to tune down his rants.

However, this consensus was further eroded through the last two years. The nn episode on Syndicate in August 2001, then, was a symptom, but not the reason for the death of Syndicate. This started way before August 2001. Not only that there were no more meetings after 1999, one could also notice that since mid 1999 people felt less and less responsible for the list. Many Syndicalists of the first hour grew more silent (this was partly incited by the hefty discussions during the NATO bombings in Yugoslavia), perhaps more weary, perhaps less naive, many also changed their personal circumstances and got involved in other things (new jobs, new families, new countries ...). At the same time, the number of subscribers kept growing: more and more newbies kept flowing onto the

Syndicate list.

The major change that occurred on the Syndicate around that time (1999) was the transition from a network of people and of trust to a more and more anonymous mailing list, a list for announcements like so many others. A growing majority of Syndicate subscribers now tended to see the mailing list merely as a quick and handy tool for spreading self promotion. The mailing list was to serve them for promotional goals, rather than as a tool of communication. When calls went out for support in the administration of the list, far too few people responded at all. Many people still do not understand the voluntary nature of the Syndicate initiative, and that the whole project depended on the sharing of work and responsibility. Too many people took the efforts of too few people for granted. Investing time and energy in the administration of such a list became more and more frustrating. When some fellow Syndicalists joined the admin team early 2001, we could have realised that the project had peaked and should have been transformed into something different altogether.

The net entity nn (Netochka Nezhvanova, integer, antiop, etc.), a pseudonym used by an international group of artists and programmers in their extensive and aggressive mailing list-based online-performances and for other art projects, had been subscribed to the Syndicate list in 1997. It was, as the first of less than a handful of people ever, unsubscribed against its will because it was spamming the list so heavily that all meaningful communication was blocked. In January 2001, nn sent an e-mail asking to again be subscribed to the Syndicate mailing list. (What nn never bothered to realise was that subscription to the list had always been open so that, at any point, it could have subscribed itself - we have always wondered why Majordomo is such a blind spot in this technophile entity's arsenal.) After getting assurances from nn that she was not out to misuse the list, we subscribed it to the Syndicate list.

Naively, as we had to realise, nn went from one or two messages every day in February to an average of three to five messages in April and up to eight and ten messages per day in May and June - and that on a list which had a regular daily traffic of three to five messages a day. The distributed nature of the nn collective makes it possible for them to keep posting 24 hours a day - great for promoting your online presence, irritating for people who have a less frantic life rhythm. nn's messages are always cryptic, sometimes amusing, often tediously repetitive in their quirky rhetorics and style, and generally irritating for the majority of people. Its activity on the Syndicate - like on many other lists it has used and terrorised - soon came to look like a hijack. But the sheer mass of traffic nn was generating, the sheer amount of nn's presence, was overwhelming. Perhaps this phenomenon could be compared to SMEGL, short for super mental grid lock, a term that was developed to describe traffic jam situations in NYC back in the eighties (or was this term coined in Berlin-Kreuzberg's famous Fischbuer? Who knows, the boundaries get blurred...).

In the spring of 2001, nn's and other people's activities who use open, unmoderated mailing lists for promulgating their self-promotional e-mails, triggered discussions about 'spam art', on Syndicate as well as on other lists. Actually, given the extreme openness and vulnerability of a structure like the Syndicate it remains quite astonishing that this structure survived for such a long time. What happened in the course of 2000/2001 (not only to Syndicate, but also to several other mailing lists) was that the openness of these lists, i.e. the fact that they were unmoderated, was massively abused, and, finally, destroyed, by relentless 'creative' spamming. One of the basic principles of the Internet - its openness - suddenly seemed to become a mere tool for attacking this very principle. 'Netiquette' did not seem to be of much value anymore and was sacrificed for the egotistical self-expression of (distributed) artist egos. The irony of this process is that, like any good parasite, this artistic practice depends on the existence of lively online communities: it not only bites, but kills the hand that feeds it. - These parasite nomads will find new hosts, no doubt, but they have over the past year helped to erode the social fabric of the wider net cultural population so much that communities have to protect themselves from attacks and hijacks more aggressively than before. Their adolescent carelessness is partly responsible for the withering of the romantic utopia of a completely open, sociable online environment. However educational that may be, we despise the deliberation with which these people act.

nn got unsubscribed from the Syndicate without warning on a day when there had been nothing but ten messages from her. After some days of silence and sighs of relief, angry protests by nn came through. On the list, accusations of censorship and/or dictatorship were made. A small but noisy faction denounced unsubscribing nn as an act against the freedom of speech. They called the administrators fascists, murderers, and 'threatened' to report the case to 'Index on Censorship'. While some other list members welcomed the departure of nn on and off the list and the admin team again and again explained their move, the ludicrous allegations and vociferous insults continued.

The real shock for us was that the majority of list subscribers did not participate in the discussion and thus silently seemed to accept what was going on. It was personally hurtful not to receive more support against the insults raised against us, but more frustrating was the indifference that made the whole process possible. Within few days, the alienation from the atmosphere on the list was so great that we admitted defeat, re-subscribed nn and began to withdraw from the Syndicate. The list was moved to a different server and is now administered by other people at anart.no/~syndicate. We wanted to avoid further verbiage and conflict and therefore gave up the name, but we insist that from our perspective the Syndicate project that was founded in 1995 ended in August 2001. What remains under its name is a zombie kept alive by misconceptions about what the Syndicate really was. Maybe we should have stopped the project altogether in the summer?

Filtering has, in a way, done us in. Before there were effective e-mail clients that could filter out lists and other mail communication, everybody on the list got everything more or less instantly, which also meant a higher level of social awareness and social control of what goes on on the list. Today, many people filter the lists they subscribe to and only look at the postings at irregular intervals - some mailboxes don't get opened for months. Like this, people consume the list passively and do not even notice a fiasco like the one that we experienced on the Syndicate list in the summer. I guess that some people who remain subscribed to the Syndicate list still have not noticed that anything has changed. For a social community, that kind of behaviour - automated deference - can be fatal.

"There's a spectre haunting Europe ..."

In August 2001, after unsubscribing from the Syndicate, we initiated a new mailing list under the name SPECTRE. It is an open, unmoderated list for media art and culture in Deep Europe. SPECTRE offers a channel for practical information exchange concerning events, projects and initiatives organized within the field of media culture, and hosts discussions and critical commentary about the development of art, culture and politics in and beyond Europe. Deep Europe is not a particular territory, but is based on an attitude and experience of layered identities and histories - ubiquitous in Europe, yet in no way restricted by its topographical borders. (The term Deep Europe was coined by Anna Balint in 1996. It was passed on by Geert Lovink. It was used by Andreas Broeckmann and Inke Arns. It was interpreted by Luchezar Boyadiev. It was used more by Sally Jane Norman, Iliyana Nedkova, Nina Czegledy, Edi Muka, and many others.)

SPECTRE is a channel for people involved in old and new media in art and culture. Importantly, many people on this list know each other personally. SPECTRE aims to facilitate real-life meetings and favours real face-to-face (screen-to-screen) cooperation, test-bed experiences and environments to provoke querying of issues of cultural identity/identification and difference (translatable as well as untranslatable or irreducible). The new list was immediately welcomed by many frustrated Syndicalists who quickly made the move.

SPECTRE is an unmoderated, but by not means open mailing list. With the Syndicate experience in mind we felt the need to explicitly formulate some basic, apparently no longer self-evident netiquette rules, like "meaningful discussions require mutual respect," and "self-advertise with care!" The list is initially hosted by the two of us who also have to approve requests for subscription. The blurb explicitly reads: "Subscriptions may be terminated or suspended in the case of persistent violation of netiquette." We regret that we have to introduce such a system of control but see no other effective way of protecting something that is dear to us. A lack of sensible protection brought down the Syndicate. Information about SPECTRE: <http://coredump.buug.de/cgi-bin/mailman/listinfo/spectre>

We try to continue the good Syndicate tradition of amiable exchange and are more hesitant about the illusion of being an 'online community'. We maintain our romantic belief in lasting friendships and insist on the need to infuse networks with a strong sense of conviviality. We believe in people and their needs more than we believe in art.

Hi Charlotte, all,

Thanks for bringing up The Syndicate.

>So far we've had little mention of the Syndicate list
> >And also more generally if anyone would venture an account of their
>relationship with the Syndicate - what collaboration it led to, and what
>it was like to lose it -

It was easily the most transformation mailing list I've ever been on. It changed the way I viewed the world, opened up parts of it to me in ways that lead to projects and collaborations that are amongst my most treasured, and gave me my most valued network for many years. It wouldn't be overstating it to say that it changed my life.

I remember very well when the list was hijacked. It was deeply unpleasant, and Andreas in particular bore the brunt of some particularly unpleasant, childish behaviour by the idiots who attacked it.

But in a sense we didn't really lose it. We migrated to Spectre, and whilst the list hasn't got the same discursive quality it did at the Syndicate's peak, I think that's probably as much down to the way that people's behaviour on mailing lists have changed, in the wake of social media.

Best,

Honor

>materialism

This is an excellent point, and one we've been trying to make through our work at Lighthouse in exposing the material infrastructures on which our experience of the internet is built. We're currently exploring this in an exhibition called 'Immaterials' (<http://is.gd/immaterials>), and the notion of infrastructure, how we perceive, understand it and act within it, was a major topic of our Improving Reality conference last month. When the talks are up, I'll post them here.

Thanks for raising these excellent examples from the

former-Yugoslavia, Armin. Have you got any references you could point me to for further reading?

best,

Date: Mon, 7 Oct 2013 09:45:54 +0200

dear friends,

thanks for bringing this up, i'm not sure whether i have anything new to say about the syndicate that we have not already said in the 2001 article which sally posted. - being so personally involved from the preparatory conversations in 1995 to the ugly collapse in 2001, i have always found it difficult to gage the more general relevance of the syndicate; but i believe that for many people in the emerging central and east european media and art communities of the 90s, it was an important source of information that provided multiple contact points to each other, and to a wider, international scene. remember also that at the time, for the 50+ core group of the syndicate, the personal encounters during the Syndicate Meetings which took place once or twice a year, possibly had a deeper impact on us that the mailing list could have on its own.

there are some other materials on the v2 archive:

<http://v2.nl/archive/organizations/syndicate?searchterm=syndicate>

and there are reflexions on the role of the syndicate list in research texts by Geert Lovink (was already mentioned here), Rasa Smite, and Clemens Aprich (forthcoming).

unfortunately, the archive of the syndicate list on the v2 servers has been lost and it would be great if we could find a place and help to put it back online. i assume that some people will have more or less complete archives on their back-up disks (zone and vuk were diligent collectors of everything back then). if anybody could offer some concrete, practical help on this, id be happy to hear from you.

regards,
-a

Fascinating discussions (my first email list was rhizome, which Simon Biggs introduced me to around 1994 I think).

Two lists of great significance for the people using them:
http://listcultures.org/pipermail/fibreculture_listcultures.org/
- mainly Australian, the archive online only goes back to 2010 but the list was much older: perhaps others can add a note on whether the archives are still available for the earlier period. Fibreculture went into autodestruct in the mid 2000s, mprphing into a community of blogs and a journal

and of course Sarai.net (their server is chuntering this morning so I can't check if the archives are still there)

Annick gives us a reminder that even in those early days English was not the only language online

Yes Armin, thank you for that important new materialist point. In my own work I have been trying to think through the materiality of art historical practice. Not the artworks, but the objects art historians use and produce in their own work. It troubles me greatly that art historical work is seen as somehow beyond a media criticism of it's own (for example, you can't have art history without photographs and the means of taking them and distributing them). So this more tangible physical network has been on my mind but you put it so much more eloquently. And now to have Broanc connect this to a film is really very useful.

bonjour,

just resending something,

It is about human being's incapability to deal with a subject of community, which most of the time leads to authoritarian actions. I sent this already on September 9th....a kind of abstract reply to what happened on Syndicate.

Maybe it also interesting in regard to responsibility of the the events of September 11th.

(not that I am thinking, that nn's actions can be compared to this. It's ridiculous. NN provides a mirror and looking at it and the reflections of the world I can see in it, I just think that there is a long way to go.)

When do people start to think ?

Regarding the movement excitement of Syndicate mailing list.... well a look into the archives will show, that Broeckmann / Arns refused any public discussion on the list, once they decided to give it up. I guess many of us have these mailings in their mailbox. Not really necessary to resend them. Or is it ?

.... and him.... Syndicate is by the way the most loveliest list, I think... I like it now, very lively.

Claudia

I really think, that the text is fragmentary (and also would need some editing of my English), but ... well anyway, impossible to put some ten years of urban / architectural studies into such a text ... it's more about giving an idea

a web version is here:

From: Claudia Westermann [media@ezaic.de]

Date: Sun, 09 Sep 2001 18:23:50 +0200

Subject: [Syndicate] learning processes / no border concept

A fragmentary introduction to social issues on a level of 'city'

(I took the following text from this site www.criminology.fsu.edu/crimtheory/zimbardo.htm anyone better informed with the issues of psychology than me may add or correct. The experiment described was done by Philip G. Zimbardo, Professor of Psychology at Stanford University. He has an own website at www.zimbardo.com)

Broken Windows

In 1969, Zimbardo placed one 1959 Oldsmobile auto on a street across from the Bronx campus of New York University (a ghetto area), and one on a street in Palo Alto, California near the Stanford University campus (a rather affluent area). "The license plates of both cars were removed and the hoods opened to provide the necessary releaser signals (Zimbardo, 1969)." Within three days, the car in the Bronx was completely stripped, the result of 23 separate incidents of vandalism. The car in Palo Alto sat unmolested for over a week. Zimbardo and two of his graduate students decided to provide an example by using a sledgehammer to bash the car. They found that after they had taken the first blow, it was extremely difficult to stop. Observers, who were shouting encouragement, finally joined in the vandalism until the car was completely wrecked.

This experiment is the basis of James Q. Wilson's Broken Windows Theory.

"The thesis states that human behavior is strongly influenced by symbols of order and disorder. [In a neighborhood] one unrepaired broken window can signal that no one cares, [so that] citizens give in and give up (Wilson, P. L., 1997)." Therefore, the objective for preventing street crimes is to prevent the first window from getting broken, or prevent the first graffiti marks, or prevent the first drunkard from a public display. This has led to Neighborhood Watch programs and increased police foot patrols.

These measures have not had a significant impact on crime, but they have succeeded in making neighborhood residents feel safer.

the most famous example of the conclusion they made is the City of New York. you can find the following text on the official website.

In 1989, Giuliani entered the race for mayor of New York City as a candidate of the Republican and Liberal parties, losing by the closest margin in City history. However in 1993, his campaign focusing on quality of life, crime, business and education made him the 107th Mayor of the City of New York. In 1997 he was re-elected by a wide margin, carrying four out of New York City's five boroughs.

As Mayor, Rudy Giuliani has returned accountability to City government and improved the quality of life for all New Yorkers. Under his leadership, overall crime is down 57%, murder has been reduced 65%, and New York City - once infamous around the world for its dangerous streets - has been recognized by the F.B.I. as the safest large city in America for the past five years.

a few things they do not mention on their web site is:

- the ridiculous high costs (which maybe could be excused)

- if you look at the things on a larger scale, you will notice a movement of crime but not a lowering
 (I have no statistics available here for the US, but I know, that these kind of things were tried in German cities also, and it always led only to a collapse in other parts)

- if you want that it stays 'safe' you have to augment the protection methods permanently

Also known of the US is: completely secluded quarters surveilled and protected, excluding everyone else than the people living there and their guests (this is one step further).

So, what do they do actually ?

As in the above mentioned experiment described, a loss of identity leads to aggressive actions even by people, who you would call 'good' maybe. And in the beginning what was there ? An old car with a broken window apparently not fitting into the system. It is one of the most hardest to bare experiences, when you think of yourself as 'good' and you suddenly realize, that it is very much possible to be 'evil' in a way.

The conclusion made, protects the 'good' from the problem of realizing, that they could act in an aggressive way also, what no-one ever had thought could be possible. And to secure in this way the feeling of identity. This is the most common way to solve these things. Does it have to be this way ?

There are different concepts also. It is called 'urban project' and contrasts the term of 'urbanistik' (sorry can not find a translation - maybe it's 'urban planning', not really actually). It means decentralization and participation of the people living there on every possible level. It is based on the same idea of assuring identification, just that the means are different (they have tested these things in smaller German cities, I just speak for the examples I know). As to say for now it can be observed, that the system works on a level of self protection with a simultaneous lowering of authoritarian actions. Surprising ?

'urban project'
 |
 participation
 |
 identification
 |
 self protection

the self moderation concept discussed on this list would go in the direction of an 'urban project' (actually it's even better, there are more possibilities on a level of virtuality).

this is very shortly... by the way it is not said, that idealistic projects really work out.....

spam art and blogs

From: Josephine Bosma
To: <new-media-curating@jiscmail.ac.uk>
Date: Fri, 4 Oct 2013 14:11:37 +0200

hello all,

If we were to create something like an online archive of art lists and other discussion/community forum communications, how would we include blogs like nastynets? They move way beyond the text format. Any ideas?

I also have an addition to Mez' list of lists, the spam art list run by Mindaugas Gapevicius aka Mi_Ga. I love how he made the contents of the archive visible as a sort of slide show.

<http://www.o-o.lt/asco-o/>

See also my interview with him. He did not realize what it meant to be interviewed at the time, and was a bit sorry he had given such bold answers. I think it is quite funny though:

<nettime> nettime as idea

From: brian carroll
To: nettime-l@bbs.thing.net
Date: Thu, 8 Jun 2006 11:33:35 -0500

* is it possible that 'ideas' that are now institutionalized are part of the problem, in that they do not lend themselves to building up shared views, and instead dividing ideas into categories, which narrows down potentials for building greater knowledge/understanding thru discourse?

(i.e. maybe the thinking/conceptualization is rather weak for and detached from the actual situations, and that *silence* may be a testament to irrelevancy/inadequacy of academic systems of thought to engage situations as they now exist, and thus this could be an indictment of, say, theory itself?)

* years ago i proposed Nettime as if a medium, by which to take on the New York Times, and would add that with all the tech/computer skills, the Listserv model itself should be hacked and modified and expanded to experiment with the _list as a functioning idea, by which to allow discourses to

occur beyond the original designs, such as loops in which offlist discussions may still live, (go on), in the archives as live events, even if not on list, such as tying a BBS or RSS comments feed in with the List, whatever dimensions could be woven (that deal with technology affecting the content, and not simply becoming the content itself, meaningless.

this is what i do not understand about the whole situation: there is probably more diverse talent on this list in terms of culture, knowledge, geography, social awareness, technology and yet there seems to be difficulty in sharing a focus or what is actually of greater value, to the larger organism of nettime. -- why, with all this potential is the list itself as a mechanism not a shared focus by which to transform this situation and not be reliant on the default configurations -- or, for instance, why is it that the issues of philosophy cannot become a focus by which to figure out a way to gain a shared ground by which to build up relations between the various systems of thought, by more than linking to websites or projects, and instead get into these dynamics, on list and in the list as a machinery, in which these issues could in/form the shape of nettime itself? it would seem it has to do with what is seen as important and how it is approached: in terms of ideas, nettime itself is itself an idea that seems to be passed over, and is said to limit other ideas, yet maybe it is more complex and more simple than this.

maybe it is that the 'project' has yet to be nettime itself, as a larger idea, by which to focus shared action on building up a better medium for the things people want to do, via listservs, via e-mail (including attaching small graphic/diagrams so as to communicate ideas, literally, inaccessible without images, which could and would require moderation, image server, etc).

* maybe what is most troubling is that nettime is standing still, and has not evolved as a medium all that much, when there is all the potential for taking it on as a shared project, technical, cultural, social, etc. and making it into something that has yet to exist, and that is DiY from the networks and the ground-up. maybe nettime risks not surviving because it does not know what it is adapting to, or this is not even a question, and that the assumption that its content (discourse) is somehow going to save it may be mistaken-- that its content may be part of the reason it is dying: the cause of its deterioration, looking into the mirror of the vital lack of insight bred in Universities today with regard to how things are actually working, even, that is, the mental modeling may be insufficient, and yet the nettime-model does not necessarily have to rely on failures of ideology, for its own development, it could challenge the institutionalization of methods and forms of inquiry, linearism, all the stuff that is critiqued, and actually experiment and go into questioning mode of the assumptions that are propping up this wasteland of imagination, and bring it all back down to earth, by making the list real, making it relevant, based in common sense and peer review and checks and balances of ideas, as a public forum, which redefines the very questions that all the expertise supposedly existing, fails to account for. that is, relevance, realism, idealism, action, shared agendas. maybe it is psychological, even, a predisposition, based upon academic assumptions, sacred cows, in need of slaughtering.

RE: <nettime> nettime as idea
From: Felix Stalder
To: nettime-l@bbs.thing.net
Date: Fri, 9 Jun 2006 10:38:51 +0200

Hi everyone,

sorry for my previous post, it went out without being finished. What I wanted to say was that many of the themes that critical net.culture talked about 10 years ago are now mainstream. They are now playing themselves out on a scale far beyond 'net.culture', indeed, they have become culture, without any pre-fix.

If that amounts to winning or losing is besides the point. In some ways, it reminds me a bit of the 1968 movements which also transformed daily life (at least in the West), but as the world around them shifted, with consequences very different from what they intended. Again, if they lost or won, is does not really matter. The world is a different place now.

For most of the actors of the early net.culture, this meant either late professionalizing or early retirement. Nettime as a project did not so much professionalize as specialize. It exchanged scope for focus which has moved it a bit closer to academic culture, which is also characterized by that trade-off. But anyone who really knows academia, and the texts it produces (which I personally appreciate), will also recognize how far nettime still is from that. Its scope broader, its style sharper.

Caroline Nevejan <nevejan [AT] xs4all.nl>
> Critiquing others for having done 'stuff', aging and moving on in

> life, I find rather uninteresting, I get interested when I hear what

> you like to do yourself.

I agree, on many levels, nettime works quite well, so there is not an urgent need to change something. But, this does not mean it cannot be improved. Sure it can. But to do that, we need concrete ideas, what would you, personally, individually, like to see in nettime, and how do you put up the resources to do it? The easiest thing is to do it yourself. Silvan Zurbuëck did that when he wanted an rss feed for nettime, he took the feed, pumped into a blog, and now there is an rss feed. [1] Tobias van Veen did that when he wanted to hold a nettime meeting in NA, and now we had it. Great. They had an idea, they figured out a way of doing it (by doing it themselves and roping in others to contribute). This is how things work, not by telling others what they should or should not do. The same goes for the various nettime lists in other languages. People came up with the idea of doing something, and they are doing it. Most of the people on this list are not aware of that, because these lists are in languages few of us speak.

[1] <http://nettime.freeflux.net>, <http://nettime-ann.freeflux.net/>

Andreas Broeckmann <broeck [AT] transmediale.de>
> finally, if you are unhappy with the list, be aware that 'the list',

> i.e. nettime, is what gets posted, of course, moderation plays a
> role in this, but the greater role is played by the things that get
> written and sent, or not, if certain discussions are not happening,
> it is because people are not writing their opinions.

Again, I agree. Moderation is a non-issue, a red-herring. Even if the technical set-up of an email list (conceived at a time when ICT had much less social intelligence built in that it as at times today) lends itself to believing the otherwise. And it's not that Ted and I are turning away the masses who want to do his kind of work. In fact, nobody ever volunteers. Nobody, that's with two zeros. We occasionally ask people who are contributing interesting material to the list if they want to moderate, and the answer has always been 'Thank you for asking, but I really do not have the time'.

There is one exception. Nettime-ann. Here, four people -- Mason Dixon, Tulpje Tulp, Tsila Hassine, and Hannah Davenport -- responded to an open call what to do with the announcements, and are now running this as their own project, connected to the main list by name and lose but friendly cooperation. They are doing a great, if unglamorous, job.

Over the years, we experimented with various set-ups, most importantly dividing the list into two feeds, the standard moderated one and an non-moderated one, called nettime-bold. The interested in the second channel was small from the beginning, and wanted entirely shortly after. The levels of spam and self-promotion seem to be tiring for everyone but the self-promoters. After we had to start manually removing posts from the nettime-bold archive, because people entirely unrelated to the list were accused -- with their names and telephone numbers -- of being pedophiles and sent us harrowing stories how this ruined their lives, because googling their names brought up these posts (google loves nettime and ranks its posts often very high up) we decided that this was not the resource we wanted to provide. When we shut-down the list, nobody seemed to notice.

So, if anyone feels like moderating -- near daily work, over a long period of time -- and knows how to use an email program on a unix shell (preferably mutt), please step forward. If you like to do that kind of work, it's actually rewarding, and, depending on your frame of reference, a meaningful contribution to the progress of humanity.

Felix

yes, nettime works well, but it works better in these occasions (I think I've seen somebody say "it turns to itself"). isn't this a sign that maybe not only the list, but also the way we deal with it need to be revamped? and that maybe it should not be about reflection of what has already happened but about something that could happen?

individual initiatives are always welcome, but if the initiative is

left to a few individuals, what would the results be? NNA was not very well attended (we were a bunch of people mainly from Montreal, Toronto and a few courageous from NY), the issues touched were nothing but a very small portion of what could have been achieved with the help and the support of a larger and more diverse crowd. Am I too idealistic to hope for the best possible outcomes? Maybe there were no questions people were asked to reply to? (and here it was probably up to everybody to put items on the table, not just to the organizers who did more than enough, shame on me that didn't think about it before).

Re: <nettime> nettime as idea
From: Newmedia
To: nettime-l@bbs.thing.net
Date: Fri, 9 Jun 2006 11:41:57 EDT

Roberta:

When nettime was young, it largely revolved around events. Not ideas. Events. The list was often a discussion of events, publishing of "papers" that were given at events, reports about events, quarrels that took place at events, planning for events. Events were at the center of nettime's life back then.

The Metaforum series was central (okay Zentral) to the early growth and excitement of nettime. Indeed, as the history books tell us, nettime was initially formed at an event -- Venice Biennale 1995.

These events were planned. Carefully. Then, of course, these events took on their own life as all good events must do.

I was introduced to nettime in an email inviting me to come to Metaforum III (October 1996). A plane ticket was offered (fund-raised from a local businessman who wanted some free advice from me) and a "keynote" speech slot was promised. I didn't know Diana, Pir, Geert and Janos when I was contacted. They found me on the net (partly because I "attacked" John Perry Barlow, who had keynoted Metaforum II) and apparently thought that I would say something that would help their event. Hopefully it did.

When I got on the plane, there was Eric Davis ("TechGnosis") sitting next to me. He was also invited. We'd never met. So was Manuel Delanda. We also never met. Arthur Kroker was invited but couldn't attend. Likewise for many others.

The night before my "speech," I went to dinner with the organizers to go over my presentation. We decided to change some things to directly "confront" some other topics that would also be discussed and to make sure that everything would be lively and challenging.

Events are hard work. Especially if you want to throw together some interesting people so that sparks will fly -- in a semi-controlled but tension-filled fashion.

Unfortunately (or not according to your perspective), these events were viewed as in conflict with the aggressive efforts by the Soros group to build its own "network" -- recalling that early nettime was highly engaged in bringing people from the "East" (i.e. former communist Eastern Europe) into contact with people from the West -- which inevitably involved many of the same people as nettime.

I've been told that it was communicated to some nettimers that they could expect no funding from Soros et al -- remember that the Soros group was then among the only job sources in the territory -- if there was another Metaforum event. For whatever reasons, there were no more.

Instead, the Soros organization in Ljubljana (Slovenia) hosted the "final" nettime event -- Beauty and the East -- in May 1997. Once again there were

various invited speakers. Peter Lamborn Wilson (aka Hakim Bey) and David Bennehum, among others. Travel expenses were paid and so forth. Nightclubs were rented. Drinks were provided. There was plenty of excitement in the air (and some smoke as I recall.)

For the record, Ted Byfield had "given up" on nettime around then. I made a contribution and helped to convince him to come to Ljubljana. The rest is, er, not quite (public) history -- yet.

I suspect the reason why there has been such an outflowing of commentary about "nettime" (on nettime) in the past week (and the "Ted connection") is simply because there was recently another nettime event. After all these years.

If you wish to build something -- call it nettime! -- then you will have to organize some events.

The better you organize them, the better you mix things up, the better you get people excited, the better you *plan* and *execute* -- then the better will your results inevitably be.

Oh yeah, I came back from "Beast" very excited about where this was all going. Because of the train strike -- which prevented travelling directly from Slovenia to Austria, forcing Ted, David and me to take a train to Germany first -- none of us attended the post-conference ZK meeting. We did however get to stay in the Hotel Orient (as I recall, none of us knew it was already famous due to Ken Anger's 1995 "Love's Last Lament") in Vienna. I suspect that we missed out on something important at that post-event planning session. Perhaps that's where the future of nettime was debated.

There were no more major public events.

I was involved in organizing two things following that -- Technorealism (which was largely stillborn, when Daddy Warbucks showed up) and the Non-Linear Circle (a "salon" that I hosted in my loft once-a-month for two years, 1998-2000.)

As I posted over the years in various ways, the NET is giant surveillance device. Indeed, I believe that it was designed as such by the Pentagon. When I started getting subscribers from Bulgaria on the NLC list (hosted right alongside nettime), I started to wonder exactly who was "tracking" our activities.

Of course, this isn't to say that "watchers" can't show up at events -- indeed, the NYPD "Red Squad" sent someone to actively participate in the NLC -- but so much of what happens at events is, well, "private."

I'm a big believer in events. I hope that there are some more that I'm privileged to participate in -- make it some good ones!

Best,

Mark Stahlman

NYC is awash in terrorism profits -- stock market, vulture capitalism, classified academic studies, lucrative spying beyond anything ever experienced in the capital of world espionage and electronic surveillance, the NYC Red Squad ballooned into a wannabe CIA, the mayor richer than Soros and snorting the coke of leading the free world ambition -- so why not fuck with the celebrity intellectual fashionista party scene here. Thousands of bright youngins and olds are ready to pump-whore their plagiarisms here as on the hustings, and there's no business like techno-blow business, no insult meant toward the wearers pretty well burned out from exporting information confucianism around the globe, well, to bilderburgers.

Weird that NYC never seemed to get the point of the cyber-liberty run up and run down, so out of it the movement was understood only as another carry to be imitated. Only the fringes of the city's main action -- stealing and robbing -- got in on the small beans and that by getting deeper in debt.

A small event in NYC is impossible, rather there are so many none can be noticed except as tiny ads stuck above toilet paper dispensers by pr agents of the downtrodden, which remains the leading profession of cultural unaffiliateds forever drunk on autodidactism.

Two people lunching interviewing each other, imagining one is the subject.

Ted Byfield creates events just by being there, I've seen flocks of hangers-on seeking his magic.

Yoursell, right, OK, but why are Felix and Ted excluded from this? Why is it such a hilarious idea that cannot be debated that both, after seven or more years, now step down and hand over the passwords to an interim group or some other group that will sort out who will do the moderation next? Why is rotation of the moderation of nettime-l not a constructive, concrete proposal?

Another concrete proposal I have is to close down nettime-l[AT]bbs.thing.net and take another address, in close collaboration with The Thing. It would at least temporarily take away some of spam problems.

Yours, Geert

Sorry of my very special notorious Francophone Anglophone;-) but if we can speak in French on Emphyre from time to time, here it is not possible in spite of one aspect of the information on nettime-list in the homepage nettime.org.

I can't speak on the "net(...)" for the most of "(...)time" and specially since more of a year (can be two years). But of the prime history of nettime-l by knowledge I can see how and what, even not from my practice from one hand; anyway my proper emails not being resent as well as I am not from academics even not as self academic, as more I do not master Anglophone languages. At last: I'm afraid that I would present all the characters that being considered here as "babies", so "little", so "small" by a way appearing that it would not be possible to think or Anglophone even being myself a thing but not a system. I have discovered a sort of integrated xenophobia or corporatism (or political line masked by corporatism that you can call of a part tribute to academic) that I could not imagine, as old I am as I cannot see before in the side of activism.

More impossible to exist in a margin of the community that is exactly the question of 'otherness', of the welcome 'other' as common human of political exchange in critical fields.

My own regard in matter of critical theory (and of the criticism of representative theory nowadays) is all on the other. (but anyone can have other choice, I can respect it if it does not disallow me to exist / a radical or critical theory in Politics by these days could be contained inside of a really simply (short) sentence : by this way I mean of RSS both senses of the feed.

Regarding the hard rock answer from any one to Geert about the impossible claiming of nettime foundation it stays that I want to notice from my part that this foundation is exactly the abstract purpose to inform the future subscribers of the list in both and relative to each other abstracts:

" -nettime- is not just a mailing list but an effort to formulate an international, networked discourse that neither promotes a dominant euphoria (to sell products) nor continues the cynical pessimism, spread by journalists and intellectuals in the 'old' media who generalize about 'new' media with no clear understanding of their communication aspects. we have produced, and will continue to produce books, readers, and web sites in various languages so an 'immanent' net critique will circulate both on- and offline.

<nettime> is slightly moderated.

history:

the formation of the nettime group goes back to spring 1995. A first meeting called <nettime> was organized in june 1995, at the Venice Biennale, as a part of the Club Berlin event. The list itself took off in the fall. A first compilation on paper appeared in January 1996, at the second Next Five Minutes events (the so-called ZKP series). The list organized its own conference in Ljubljana in May 1997, called 'The Beauty and the East'. A 556 pages nettime anthology came out in 1999: *Readme! Ascii Culture and the Revenge of Knowledge*. Autonomedia: New York (ISBN: 1570270899). "

==> what stays of it right now? while people were/(are still) following to subscribe believing this multi dialectical symbolic typo-arborescence integrating life, technology, hypermedia, social utopia, history, and Arts, the opening of the world through the opening of the sources, through progressive nettime installation since 1995 till 1999? just clicking "info" of "nettime-" at <http://www.nettime.org/> <http://www.nettime.org/info.html>

Of which academism or theory are you discussing or power linked to reductionism view whatever being the fields you moderate? But certainly not from the point of view of the changing time. It is a new morning, that one of the security and current war as mean instead of politics and critical political economy. They are the mean of the global power itself to destroy all other reality. Taking the same weapons as virtual solution of the critical ideas and practices it cannot be the good solution under my view. But the changing time as reflecting subject of the common. What have changed since 1999? Web, society, political power, education, emigration and so on... As global as singular or local?

But please not denying of this history or you will never know of your own memory while you abusively pretend to hold it to the largest common tribute.

>From this point of view, I think that Geert's provocation on closing the list to have it reborn from this new time, it is really interesting as logical activist attitude happening in real time of the mails against misunderstanding and mortification. It is a defy to be able in telling or analyzing of the changes: web transformations, global and local multi dialectical security, political, social and cultural environments, objectives, subjects, codes, means... Even connection / disconnection.

And more of the public archives regarding the new laws of copyright facing the quote and facing spam that is quite a new situation (all different was the time of having to open web information to the largest web).

May be not of a real conclusion of the list but a real mean to keep it safe from all its external and internal enclosures.

The question of the death of the list it is not of the decision to close it (even it would be or not be closed at last) it is of the end as living solution to create again (the same as musics front of

the repetitive rhythmic which get it progressing, there is a moment where the composition has to finish with the rhythm to have the form of the end as event, then everything is ready to the next creation).

Re born situation of creating among the others is not a death, this is life. The end of meta culture at the moment the risk is that becoming meta meta culture it would have lost all its critical social roots to an exclusive event of abstracted power (that would be a no event :-) it is a not the death of the things, all the contrary. Can be re born from itself in the same place and under the same address or not, whatever the browser to support it.I

It was great to hear guibert's Anglo/Francophone voice and be reminded of something that McKensie Wark said on this list long ago (very rough quote from memory) that these days english does not belong to any one (I would add; least of all the english).

This post also has something of the euphoria for a culture of continuous migration accompanied by the perpetual possibility of closure ("not a death, this is life") as a measure of integrity. Other less inspiring postings on this thread have talked airily "about slaughtering of sacred cows" etc

These avant garde (Fluxes like) rituals or 'tactics' in which ephemerality is taken as an emblem of life and authenticity are assumptions that run deep in our culture. This is particularly true of visual art and as we know from Venice Biennale to Dokumentas the visual arts were a important component of nettime.

But maybe we also have learned (eventually) that the cult of ephemerality is just not enough, that nothing slaughters 'holy cows' more voraciously than the capitalism these movements seek to subvert. The burning question has become how to move on from a "kill your darlings" culture without relinquishing the articulations of freedom we value (sometimes presented as part of the 'precarity' discussion). How to achieve sustainability without institutionalisation (or professionalisation).

The fact that we are arguing (and fighting) 11 years after its birth shows that something in nettime (as it exists now) is worth struggling over. It suggests that nettime has found away to address the questions posed above, in fact and action as well as theory. The list has its ups and downs but is clearly very much alive and (as Felix pointed out) it has not professionalised or institutionalised. It is my belief that we owe this part of nettime's achievement is owed in large part to the current moderators. Not only to the years of quiet methodical un-glamorous work but also the courage to put up a fight when necessary!

This is not the first time that closure has been argued for. In the past there are those who have argued strenuously to close the list and move on in which we would now be talking in the past tense. The moderators put up a fight and kept the platform we are now arguing on open. Whatever differences there may be the years invested in nurturing this space, with generosity and finesse, should (in my view) be too easily disrespected.

I am not arguing that moderators, and their position can not be questioned. But what I am saying is tokenistic expressions of gratitude "great job guys, time to move on..bye". Are shallow and

disrespectful in the extreme. And more importantly fail to engage with an important aspect of the list's achievement.

I would argue that any movement for radical change should be carried out in close collaboration with the moderators and should take a very different approach and tone from some of the peremptory notifications we have seen on this thread. And above all they should seek to work imaginatively with the fact that nettime has found a powerful way of addressing our most pressing issue: sustainability without institutionalisation.

Respect

David Garcia

I haven't posted to nettime in what a Slovene friend would no doubt call "the age of a dog," but read it quite regularly and still consider it a kind of ongoing online cornerstone, and have to say that my vote (be it worthless for the above reasons, or not), is in kinship with David Garcia's eloquent mail today. In my experience when something's really very definitively _not_ broken -- and not broken for the good reason that some few people have made damn sure that it's in a good state of repair -- then "fixing" it runs the real risk of breaking it. So why do that? In other words, a proposal can be concrete without being constructive, and (as Garcia says) can also seem disrespectful and denying of achievement. Felix Stalder writes of personal abuse as being part of the job, and part of the problem in general with work, be it for free (and let's recognize how hard _that_ is in super-streamlined 21st century hypercapitalism) or for money, is that there's always a given quantity of thoughtless abuse that has to be endured, while praise is (or seems) comparatively rare. Nettime's excellent ongoing health, it has to be said, is due to its contributors but also its moderators.

Cheers from wind-swept Ljubljana, where the East has moved East (but Beauty lives on).

Dear David,

At the same time I am touched that you celebrate my return, by an ironical and pleasant version of the return of singular insane or some accidental dust, but I am as more amazed as you told of respectable or unrespectable mean, by how you can link it to Ken whom has nothing to do in this debate where he could take a part if he would hope ? but obviously not :) so please, may be it is simple to leave the indirect voice of Ken in this debate. Or his proper voice ad coming.

I do not want contaminate Ken, the same as he would not contaminate me. We are diverse but solidier autonomies. Being both pride. Proselytism is not exactly our friendship mode, but critical exchange. I trust him as friend in our differences recognizing of what we have in Partage that is of free positive (freedom) creation and ethically trusting together in a cognitive disposition. And I am really working a lot to success in a difficult work

from several sides as tribute to his Hacker that only friendship from his part can support so long waiting for FR emergence next Autumn 2006 (at last).

At the moment you evoke him I want to quote his last interactive work in the institute future of the book, <http://www.futureofthebook.org/> that is simply great critical work organically playing theory instead of theory of the truth (I do not tell why, immediately not being the subject), where more is linked a certain blog on religions and gods title "without gods toward an history of disbelief" by Mitchell Stephens, both works being at my view an emergent and free vitality from New York that fascinates me cheerfully. Of a beautiful arrogance from any few in that appears currently missing here and there in the English-speaking streams of the no thematic lists of which I am a subscriber.

GAM3R 7H30RY

<http://www.futureofthebook.org/gamertheory/>

I am not impressed by contaminations, old use that I could approach in the former times as a mean of post modern Marxist Leninist organizations being bureaucratic power themselves, -with a blind view, a deaf discourse and making dumb the voice (even the vote) of the base- where I transited very fast not being from my part an adept of the hierarchic cup of tea (but from a South tradition, of the voice and of the critical feeling) my cup of tee, in the former times

As I was educated among a psychiatrist clinic by my parents as doctors with their patients, your glance does not deprive to me of any dignity to my proper eyes, being exactly the site from which I learnt that "other" was so strange but so attractive so it is my richness nowadays to be able in discovery whatever the generation and the sexes, to autonomy and self organization.

>From my part I have entered very late the debate since the beginning (regarding Montreal) thanks the very special occasion of reopening the list to critical diverse point of views. But I see how hardly it can be to whom is a following subject of otherness such as not being considered able to debate both together with the little aristocratic and academic but community having the large list in mastering. I mean of hierarchy and advantages over passing the question of the language BUT having the language as media privilege..

I prefer the part of Geert, cannot be my particular friend, even sometimes puritans at my view but never "integrist" and always straight and punctual in matter of criticism of the web community in real vision of the practice, thinking from his experiences of common, not from the part of a lobby nor from the part of a globalizing critical party (may be yes may be not but this is not the public obvious part of his criticism to tribute others); more, he is nearest than every one from nettime ? as well as outsider lists of nettime.org ? as thinker of the diversity of the common; to the part of self-organization as common diversity, from local self-organization till federal self-organization being powerful: that is not exactly the power.

That is really which I hope better to criticize EU, at the time the power abolish the self decision, can be of Art, can be of the social organizations...

Can be more of what you call theory of which I think myself that the time of theory is over passed by the general time of organic essay whatever the field (another regime of theory in essay regarding the opposition between Hegel and Hölderlin about philosophy and poetry that was never solved, just a divide before). At the moment the criticism of political economy has lost the precious symbolic pact of relationship of means in social reports of production (specially capitalism having cut its own link with the social pact of production), something new has to appear of we'll run in repetitive dying as from a traumatic situation to leave getting larger and larger the wide to the total power (Jarry says: "l'ascension du vide par la périphérie" that represents every part even that one of power ? taking the power from every and in every part).

But having a come back to the purpose, please let us note which changes since Geert has left the moderation of the list :

Internet ? code sources and Free sources
Of Web2
Arts
Post productive society
Of security
Of browser of lists
Of spams
Global organizations and alter global organizations

And so on...

Please why it is not possible to have a discussion on that point. Is it a supposed consensus to a political line here that forbid to approach this sort of debate?

And to tribute the best of the list: why not a larger moderation as suggest it Geert? (Be quite: I do not beg my part in it)

Who has resisted the easy blaming of one's familiars when rejected or defeated by the world. Come home from a bad day being kicked by the boss to kick the dog, the kids, the covering mate, reign dictatorially for a moment recounting shopworn grievances against those boringly dominatable by recitation of what went wrongs years ago, to avoid remembering the insults heaped today.

Yes, blame your parents, your college, your professors, your students, your one-time best friends for letting you down after setting you up with barely deserved praise. Woe, whoa, now, get off your ass, forgo raging at the tube, the party in power, the dimbulb who got the job purpose-built for you, and go for a run, working a day or week or month for something other than your idiot ambition to be somebody.

Being somebody was merely a drug fed to you to get you past suicidal adolescence and certainty of worthlessness, to get you into and out of military service, the university, the years plugging away at a dying profession battling the communists or the capitalists or the environmental depredators, or white males, or anybody else not telling you what a loss for humanity you display. If only you'd been this or that, the voices tell you day in and day out, if your delivery was even slightly approximate to your promise, and by the way how about paying the money you owe me, the love you now withhold as if it never stank of cruelty and deception.

Finally, get up on soapbox for the unwashed, preferably somebody else's, yours ineptly constructed collapsed years ago, and orate the narcissistic heathens like yourself.

CIA/MI6/BND/KGB got your number with that narcotic of cheap-ticket piddling egotism. Soros the bagman, following Ford, Rockefeller, shit, even the filthy cold war armaments enriched Yerps.

i don't know, i find it confusing after a period of years in trying to engages ideas on nettime as a supposedly public forum, consisting of 'intellectuals' if not 'the intelligentsia' to have found so many problems with ideas themselves, in dealing with ideas beyond ideologies.

some may call this abuse, though after years of having facts, reasoning, truth, empirical reasoning, 'proof', refutation of 'theory', simply ignored as the status quo of the existing academic paradigm churns on, is, to me, frustrating, insulting, and without

integrity in terms of ideas, and philosophies which purport to serve ideas, yet rather seem to be serving the people serving themselves instead.

this lack of integrity of ideas should not be respected, it should be rejected and it is only accepted as the status quo because it is how people are making their living, however meagerly, yet in terms of ideas related to 'truth' or 'reality' this very compromise makes distortions and bias that lead up to hypocrisy at the level of ideas, reasoning, and the inability to engage things as they more actually are, not as they are wished or fantasized or believed by faith of consensus.

this is not a personal issue, it is a fact of living in this era, which is itself totally failing, systematically, and to deal with this failure also necessitates taking account of how it is made to occur, education being quite 'critical' to how ideas are made into actions which, oddly enough, is in a mode of mass production by which ideas unfit for the existing environment are produced anyway, in surfeit, making its own demands regardless of true worth, need, or value as to what is being sold, versus the actual goods, for instance, 9/11 did not happen in a vacuum, it relates to how ideas can or cannot deal with the dynamics related to 9/11, including in Universities where there are supposedly people who have some superior sense about all this - yet remain totally and absolutely silent with regard to insight as to what is now going on, in any practical sense, including their own role in creating this situation.

thus, the issue of 'objectivism' grounded in empirical knowledge with peer review-- that is, checks and balances on the reasoning of an argument, with regard to facts and logic-- that is what nettime could function as, if it were in the tradition of philosophy and not the hollow fraud that is theory today, that cannot stand as an argument yet continues anyway, regardless, because it can-- because it is what is being 'professed' and institutionalized as a mode of engaging ideas, yet, the assumptions underneath this is detached from a greater reality: physical fact, experiment, and substantive peer review which could _disprove_ any ideas, based on being theses, which are instead more hypothetical and interesting in that, yet assume more dictatorial powers of making laws by thinking itself, -- i.e. i think it, i reason it, therefore, it is true, relatively speaking, of course.

yet, with this gambit of the pyramid-scheming the thinking self, it has in effect created an environment where ideas have turned into a game, and the ruling ideology is the theory regime, as it now stands, which is _beyond_ any tangible critical review, which would ground ideas in a shared space of knowledge, facts, truth, and reason-- and instead becomes a theology of ideas, of faith and belief in a certain set of ideas with boundaries, limits, etc. in other words, closed ideas, boundaries (borders) which, while one may speak against these things in rhetoric, are actually the things which sustain the current inauthentic, disingenuous, and uncritical extension of ideology that is based in ideas that were once answered and never to be questioned again-- because of some deal with the devil (institutions, educational systems) which enable the shell game to continue, because poking at that beast would hurt one's self, not

abuse, then, maybe, to have to consider that there may be natural conflicts in the individuals who profess themselves cool thinkers about things, while slinging constant epithets at ideas, from what amounts to ideological positions that remain unquestioned and part of a massive group think that is the status-quo, even this is understandable, and can be accommodated, yet what this is is also a fundamental corruption of ideas, in academia, in the 'professional' thinking class, (sic) which is unable to actively engage ideas outside of the particular ideological constructs that protect and defend the mindset-- which cannot be placed under review: that is, the observer cannot become the observation, which is a pre-scientific point of view, which is seen in the lack of material proof for ideas, which can wax on about anything, without much regard to substantive views which add up to more than one person's point of view alone, that is, empirical knowledge which builds and spans people and ideas, connects and does not simply divide, conquer, and monopolize ideas in the form of ideologies which are institutionalized by peers, 'professed' and extended as 'the system' which is what it is today: a failure which is incapable of dealing with the existing situation, while the psychological aspect may be delusional if not self-delusional, schizophrenic even, this is not to be considered in terms of those doing the observations, only 'others' outside of this view, the abuse hurled at these others, from such points on high (in the networked pantheon) is truly annoying, yet moreso, banal, boring, tedious, and without merit in terms of ideas themselves and only personas, peer pressure, cliques, and the herd mentality that is more scared than anything, because the ideas cannot stand - and some know

it, and this cannot be defended, and thus it calls into question the grand sweeping claims of theorists and 'intellectuals' who say this and that about big things and ideas, which really exists without any accountability whatsoever. what is the price of being wrong today? nothing, not at thing, you get promoted or go on to become an expert at it, as long as you can pay to play, power, not truth, defining what is supposedly the more real reality, etc. even if it is only virtual, hyped, a bubble culture and bubble intellectualism that is ungrounded, and as such, the slightest disturbance threatens the whole of this overarching ideology which is itself the problem of why things are the way they are, and the status quo in the educational system has something significant to do with this, not the least being its philosophy is completely devoid of common sense, truth, logic, reasoning, debate, peer review, outside of a controlled environment.

this in effect 'privatizes' ideas, in a marketplace which can be cornered, in academics, it is to say that much if not most of what is going on, online and in states, today, is based in this inherited privatization of ideas, which is now the base operation (status quo of ideology) -- and that private language (theory, say), private identities, private reasoning and logic are all the basis for what is next to occur: capitalizing on this situation for one's own benefit, fuck the truth and fuck the others.

so, whatever delusional utopia one may believe themselves pursuing is by and large happening in a context of private thinkers who are doing all the things they rail against, in large-scale economic systems-- except it is happening in ideas, in educational systems-- and it is abysmal and without soul, merit, or insight into the actual issues and actual responses required, outside the narrow and limiting approach -- yet, like true believers, none of this can be brought under question -- no matter if one's flag is anarchism or libertarian, social democrat or whatnot. (queer, atheist, etc) that this is part of the private capitalism of the individual, as governed as a state of affairs, in terms of thinking because it brings with it direct contradiction between the facts and truth and what is being said and 'represented' and 'believed' within such an environment which, as stated, is without consequence for saying one thing and doing another.

this is a consequence of larger issues having to do with relativism in ideas, and this privatization as being a devolution of a once-public system that could not adapt, and instead disintegrated over the last 200 years (in the .US, for example, in the constitution) by which definitions can mutate from representing a higher ideal (where mankind is presumed equated with humankind) to one where this dynamic is replaced by a lesser version (this vagueness leading corporations on the path to citizenship, and representation, in what has evolved into a corporate dictatorship today).

so, while one may call into question the points of view which 'profess' universalism via 'the magic of theory', it is without greater empirical truth, in the sense of a sharing of facts and reasoning that goes beyond this privatization of ideas, which instead functions as ideology, it is pyramid building because, if there is a peer group (of like minded theorists, privatized thinkers) there is a private empire/empricism which can grow, while it excludes actual 'difference' and all the other keyword 'big ideas' that go into its own justification, as if this is universal representation, when instead it is a bill of goods that are not actually what is being sold, it is a knock-off, rip-off, a cheat lie and steal.

so, what about this theft, robbery, in terms of ideas, in a public forum, and dealing with it? it does not exist, so far as it seems in this nettime. it is unnecessary to engage, because it is optional (ah, relativism, 'options', the market, etc). if based in public debate, facts, truth, "accountability" for the theses (ur, theory) and accepting that the basic situation in ideas is that they can be disproved (!), that this is not necessarily simply abuse-- and instead, squaring ideas with the truth of what exists.

if this is not necessary, then nettime as it now seems, is also unnecessary for this is a private list of people who have private ideas who are unable to have public debates and only talk past one another in terms of ideas, which do not build up to anything more than markets of limited views which are fundamentally opposed to a sharing of views, of ideas, and reasoning in an open forum-- because it does not function in terms of ideas, and instead, in terms of extending ruling ideology.

to question the ideology and reason complex ideas has no effect -- it is out of place if it is to question the underlying assumptions which drive this mechanism, which is itself unintelligent in the larger scales, if not allowing partial knowledge, partial worth, of the relative points of view, yet if they do not share a common structure,

it negates the truth of all arguments in a zero sum game, which is what constantly happens, and instead, cultivates only the delusions of egos, which is its own problem in terms of philosophy, because this also acts as a mirror of the limits of viewpoints, where they cannot get beyond, including personal points of view, which may have more to do with social groups and being on the 'inside' (else being ignored, invisible, suspect, conspirator!) -- it is incredulous and pandering to the weakness of this existing social system which is so goddamn hypocritical as to be obscene, intellectually, and it is expected one is just supposed to go along with this flow of things! because that is the way it is, that the strategy is itself not totally fucked up!

no words will change this, on this list, no facts, no argument, it is ideology, it is being able to be wrong, partially wrong, partially right, yet words have not been able to accomplish the heavy lifting because the ideology is so complete and the deep-freeze of ideas, so stuck in another age, abuse is ignoring these facts, these dynamics, this absolutely decrepit situation and the total lack of any accountability for being wrong, for having ideas being disproven and ideologies detonated, on list, and yet go on as if living in oblivion, which pretty much accurately describes the situation today.

that means, yes, maybe we all are included and each can realize our own limitations, yet there are issues that go beyond ourselves, our egos, our private ideas and agendas, and this is the realm in which philosophies change, where the basic assumptions are tested and transformed, based on reasoning, debate, new views, etc, and attempting such 'rigor' on nettime has been and is futile, because instead it is seen as insulting to the aristocratic system of representation that now reigns, that is, it is a total system, and if this cannot be accounted for in the ideas here, the ideas have little or no merit when claiming to deal with such dimensions, it is only playing around in fictions, and without risk, and without true ability to deal with what is going on, outside of pure ideology which is more complex, demands more, is more humbling, and might crush a good portion of those who profess to not be ideologues and have capitalism also hidden within their genes.

this is not to continue to speak past 'nettime as an idea' as if politically incorrect, it would be to have integrity about ideas, as ideas, and instead, this is nettime as ideology -- moderate it.

All

I think I can say that I have been on nettime for as long as I can remember but, please, will someone change the channel?

I can't be the only lurker around here who is BORED TO DEATH with the entrails of nettime, who did what to whom in 1996 etc.

If there is one way to kill nettime it is keep posting this self-absorbed prattle for weeks on end.

John

John,
I feel double about what you say.
Your right and many lists have been destroyed by endless self meta-discussion.

On the other hand from time to time it may be needed for at least a little while. To clear the air. And that has something to do with the peculiarity of a list as a social/publishing space.

In other words it is not just TV where you can just 'change the channel' neither is it a space for discourse alone it is also a community of sorts and as such has a community memory.

Arguing over its meaning may also involve questions of historical fact including personal issues between members of the community. And yes sometimes its boring.

But I do not think that these discussions are disconnected to issues of more substance. How we treat each other in our communities of discourse is an important expression (and test) of our politics in practice.

Maybe something of the old feminist slogan holds true in this instance: "the personal is political".

Best

David

Yes. Totally. I agree. Entertain me please, damn you. Entertain /me/.
With every post. With every topic. If a topic comes up which doesn't interest me, I will write in and complain. Dear BBC, er, Nettime.
How dare you presume to have an uninteresting thread. You, who have only had interesting threads since 1896! Please stop discussing this boring topic at once. How dare you attempt to discuss something that I find boring. I mean really.

> I can't be the only lurker around here who is BORED TO DEATH with the

Oh come on, John. Nettime died years ago. Netcraft confirms it...

Cheers,

Wayne

I like this problem and I had to think about an interview with Andrea Branzi I recently read:

"As always, there is the problem of the environment and the problem of the environmentalists. These are two separate questions. Personally, I have never met an environmentalist who gave any signs of a concern for humanity, a sense of delicacy toward people (who are an important part of nature)".

It might be unnecessarily impossible per se, but what about the idea of style - in activism ...

>way of addressing our most pressing issue: sustainability without
>institutionalisation.

i agree that the tone of "some" of the exchanges [please, let's not homogenize] has been more self-serving than visionary and imaginative - on this thread and others prompted by the NNA - and that the pronouncements of the "death of nettime" too have been self-perpetuating in the way that the "the death of the author" ultimately has been for its author! respectfully, i would add that the moderators - present and past - have not been outside this dynamic but have directly contributed to it. i'd also contend that nettime itself is currently understood as an institution - otherwise, why question whether NNA had much to do with nettime rather than acknowledge the model of sustainability it put forth through engaging others outside the nettime proper? and why such struggle over nettime's history? - and that institutionalization is not necessarily bad - neither is it entirely avoidable; show me a tactical intervention grouping and/or a public space that is not already institutionalized in one way or another - so long as the institution is open to conflict, re-definition, re-organization and rejuvenation [by which i mean reflective of a refreshed demographic, landscape, vision].

in all recent exchanges presumably triggered by the CPR gathering ["I'd like to now propose a change of identity from NNA to CPR to signal that some of the people who attended the gathering including some of the organizers, presenters and attendees came from other milieus*"], we have been focussing too much on the internal dynamics and rivalries of nettime (however we might define that interiority), but haven't given nearly as much air-time to the substance of discussions that took place, most of which were less packaged and more performative and dialogic than could be easily forwarded to the list in written text as an essay. this too was a rewarding aspect of the gathering that directly points to an inherent limitation of lists and the necessity for more real-space encounters where written communication isn't the only modus operandi.

talking about sustainability, many of the presenters proposed or illustrated diverse models for sustaining critical practice through local and tactical economies (e.g. ilesansfil.org and koumbit.org), collaboration across disciplinary and geographic boundaries (e.g. ekur.ca and memefest.org), and practice/action-oriented organizing (e.g. act-mtl, viralknittingcollective and [Magnetic Identity Liberation Front](http://MagneticIdentityLiberationFront)). to me, these pointed to a qualitative move away from imagining the internet as a permanent address - prime intellectual real estate of the 80s and 90s - and toward seeing it as a tool of communication and organization - without as much utopian overtures that also were the dominant discourse of the previous moments.

outside the presentations, one of the most interesting conversations i had (that went on over the course of two days and a few inevitable and chance encounters) was with roberta and alessandra about precarity movement and their work ("action") that they are planning for toronto. (see Alessandra Renzi, 11 Jun 2006, Subject: <nettime> Fwd: [RK] No struggle against the void. Report from Barcelona.) i's interesting to observe that vocal nettimers have paid so little attention, at least on the list, to the 'new, immanently flexible yet radical social subject - the precariat' (Kernow Craig, 6 Oct 2004, Subject: <nettime> Precarity and n/european Identity) since it was brought up on the list (19 posts in total since 2004, most of them one-offs), thus clearly exhibiting an institutional reticence (for example, see Keith Hart, 19 May 2006, Subject: Re: <nettime> Mona Cholet/ le Monde Diplomatique: France's precarious graduate) to respond meaningfully to calls coming from a 'younger' generation of intellectuals and critical practitioners whose ambitions are not entirely defined by their academic orientation and status but are neither anti-intellectual nor anti-academic (is anybody else sick of how simplistically these charges have been deployed and implied recently?)

i agree with david garcia that sustainability is a pressing issue, but i'm not entirely sure about the nature of whatever it is we are sustaining. i repeat myself: there has been too much emphasis on personal(ized) histories and dynamics (mostly issued from a tiny, tiny minority of nettime subscribers) and not enough on the substance of what we might call critical (net) culture. at the very least, CPR (and the follow-up list exchanges) opened a fissure in seemingly monolithic nettime culture and exposed some of the underlying conflicts. this is a productive moment. it'll be interesting to see how it gets used.

be well.

<nettime> notttime: the end of nettime

From: nettime mod squad

To: nettime-l@kein.org

Date: Wed, 1 Apr 2015 07:35:14 +0200

Dear Nettimers, present and past --

The first nettime message was sent on 31 May 1995[1] almost twenty years ago. A lot has happened since then, and we're proud of how well this list, and the larger nettime 'neighborhood', has traced many of these epochal changes. The list's alumni/ae is a who's who of critical

culture across an incredible range of fields. They -- really, *you* -- have helped to redefine activism, shape national and international legal and economic reforms, lead international cultural festivals and some of the world's most famous museums, produce astonishing works of art, write fiction and nonfiction that's won awards and redefined entire disciplines, and build crucial free and open-source software, to name just a few things. And those are just the 'heroic' stories. There are many more obscure ones that, if anything, are even more impressive, as even a quick glance at nettime's Wikipedia entry will show.[2] A few nettimers have passed away, and we miss them dearly, still. Moreover, most like-minded projects of a similar age have either vanished or, alternatively, have succeeded by forsaking their alternative status for the discursive bonds of institutional security. Nettime stands alone as a deliberately, even radically independent project. Its migration over the years -- in-berlin.de, desk.nl, material.net, thing.net, waag.nl, and now kein.org and bitnik.org -- tells just one part of that story.

[1] <http://www.nettime.org/Lists-Archives/nettime-4-9810/msg00048.html>

[2] <https://en.wikipedia.org/wiki/Nettime>

But if times have changed, Nettime has not. At a time when an email address as such is becoming a generational marker (for many younger people it's little more than a tool of the man), the very idea of a mailing list is itself an anachronism. It's slow -- sometimes slower than a mailed letter would be, at this point. It takes time to read and write. And there's no images, no video, no memes, no numbers, stats or ranks, no friends or followers -- in short, there's not much to like about it. 'Tactical' media has gone viral -- it's mainly absorbed in its own anthologies -- while 'viral' media have become a cliché for marketers and other assorted bottom-feeders. Nettime is still devoted to criticism of the net, in a way. But how could that matter when it's debatable whether 'the net' even exists anymore? Hasn't everyone else moved on to the post-digital? 'Posttime', anyone?

In this and many other ways, nettime has been 'graying'. It's wedded to a particular Euro-American moment, the so-called summer of the Internet, which has since turned to winter. Nettime's once-radical embrace of the ex-East -- or, if you like, of the ex-West -- barely extends to Hungary now, and has nothing to say to the decisive conflicts around Russia's borders, obviously (but not only) in Ukraine. Its early tacit prohibition on ritualized debates about Israel and Palestine has grown into a complete failure to address the profoundly important dynamics across parts of the world conventionally -- and reductively -- called 'Muslim' or 'Arab'. These areas are too often consigned to the 'timelessness' of conflict, but there's every reason to believe that their liberatory struggles could ultimately define the future of the 'WEIRD' nations. China? Barely a peep about it. Africa? Nettime is nowhere there. The seas, the skies, the circulatory flows? Nada. And how about nongeographical 'areas' where the most moving cultural changes are happening -- in the flowerings of new forms of subjectivity around the world and the new forms of sovereignty they're giving rise to. Silence. But, really, who cares what a bunch of straight white cis guys -- which is 95% of the list's traffic -- think about those things? Really.

We briefly hoped that we might begin to address these questions and more with a twentieth-anniversary conference in Bucharest. Not a 'revival tour' of nettime's ageing heroes but, instead, some broader kind of gathering around newer, open questions. Unfortunately, that didn't pan out. Nettime is not mobile and there is no app for that. After considering these and other options, and trying to imagine how we could 'upgrade' nettime's creaky infrastructure so that it'd at least have a chance, we've reluctantly come to the conclusion that it would be better to make a graceful exit. So we've decided to fold up shop on 30 May, the day before the list would turn twenty. Nettime has a troubled history when it comes to unsubscribing people -- plus, since we're stuck in 1995 and *none* of this this is automated -- so we're asking that each of you to pitch in by unsubscribing yourself before that date. You can find the link to do so here: <<http://nettime.org/info.html>>.

Personally, we -- Ted Byfield and Felix Stalder -- would like to say that it's been a pleasure and an honor to moderate the list for the last seventeen-odd years. It's been a part of our lives, and we'll miss it very much.

Hi Mod squad, you are not serious, are you? Lets get 50 together!!!

While the deficiencies of nettime that you describe are real, it is still the only place where I can reach out to a nearly global crowd of critical thinkers, and it still has an impact which I can verify by the stats of my website and by direct qualitative feedback. when I send something to certain other lists it gets drowned out by announcements or mindless techno-babble. and while the identity of those who frequently post here confirms to stereotype, mostly male white and over 40, or much older :-)) I would assume that the demographic composition of subscribers is much more diverse than that, and mailinglists have been an anachronism since the www, so that's no argument at all

please reconsider
best regards
Armin

**Re: <nettime> nortime: the end of
nettime**
From: Keith Hart
To: nettime-l@kein.org
Date: Wed, 1 Apr 2015 11:45:39 +0200

Felix and Ted,
I can understand that you might be fed up after all those years. Thanks for your heroic labour. If no-one else wants to take it on, so be it.
But there is something intellectually dishonest about the historical, social, demographic and geographical reasons you give for winding it up. It boils down to saying that the mission identified in the gos doesn't work any more. I know that Geert is desperate to find a new mission in the age of anti-Facebook. But nettime doesn't need a purpose. It is itself.
No doubt we each have our own use for it. I find a uniquely eclectic assortment of links that members pass on. I get to read Brian, Patrice, Michael Gurstein, even Felix and Ted occasionally. I have been very ill and I'm making a comeback now. The network provides an ideal audience for some of the things I want to say. It doesn't matter that it's archaic. So is email, they say. The repertoire evolves, but retains the old forms with the new. Nettime absorbs less than 2% of my onlin, but it nourishes me and I have nourished it.
It must be onerous to be a gos internet activist who feels he is past his sell-by date. It is true of course. Avant-gardism of that kind has

had its day. I don't feel alienated by what succeeded it, since I was never a cutting edge techie in the first instance, just a fellow traveller. Yet the network has character, built out of the layers of its accretion. It is brutal to cut nettime off in this way. Of course, there may be no takers to succeed you. In which case RIP. But having held on for so long, is it a case of apres moi le deluge?
Keith

Thanks to Ted and Felix for all their effort over the years managing Nettime.

And thanks to this community. I first subscribed in the late gos during the height of the dot com boom here on the west coast. Nettime was a

welcome counterpoint to the Wired magazine ethos of the era. This list is also how I learned about the work of David Garcia, which intrigued me, so I went to the Netherlands to study under him at HKU. And now, over 15 years later, I still find that the writing here provides insight I don't get elsewhere in my firehose media diet.

Thank you, all.

Eric

Yes, nice April fools joke, nice parody of the type of cool kids, tech-determinist, change celebration, fast-capitalism, rhetoric not only hegemonizing the tech sector and pop culture but also colonizing much pseudo-critical media studies discourse.Ä

e.g.

>Ä "It's slow -- sometimes slower than a mailed letter would be, at this point. It takes time to read and write. And there's no images, no video, no memes, no numbers, stats or ranks, no friends or followers -- in short, there's not much to like about it.

.... Hasn't everyone else moved on to the post-digital? 'Posttime,' anyone? But now that it's after April 1st, it's (net)time to tell everyone it's: 'April fools'?

I look forward to many more years of slow reading and thoughtful deliberation... thank you to all,

Date: Thu, 2 Apr 2015 00:26:36 -0500

Whether or not the announcement of nettime's final curtain has me playing the fool, I am happy to be provoked into asserting my enormous appreciation of this list and its dedicated moderating squad. Although I don't post, I do often read (or scan) and am grateful for the intellectual company of the regular voices here. Most of the communications developments listed in today's obituary that put nettime in the rearview mirror are in no way a satisfying substitute for this unique forum. I've subscribed since ... 1997(!) so observed many changes in the dynamic of the list: its trajectory describes in heterogeneous if not totally incommensurate detail the transformations of (mostly white and male alas) techno- subjectivity in our wildly interesting lifetimes. Of course it's only one small bit of the torrent, yes, mostly white and male, but also constituted of mostly good faith attempts to grapple with two decades of social and terrestrial convulsion. So, the frenetic world of electronic communications would/will be a little lonelier for subscribers like me (indulging in a little sentimentality here). Thank you to Ted and Felix and the long line of contributors.

I suspect the prank is that, given the timing, we will think this is a joke.

many wishes,
claire pentecost

Hello Ted (long time no see!), Hello Felix,

I'd like to add my voice to this discussion. I have subscribed to Nettime (on and off) for many years and I still enjoy its alternative edge. Yes, you are right, many topics are not covered, and many audiences are invisible (although I do count as a female subscriber), but was it ever different? I don't recall Nettime ever being truly generalist or diverse in its postings. I do remember a time when Nettime was more lively, but to be honest, the low traffic is one of the things I enjoy about it (and one of the reasons I actually read what comes through it). In some ways you seem to be saying that Nettime no longer fulfills the expectations you set for it, which is not only valid but also perfectly reasonable and fair especially since you are its main, longtime caregivers. If that is the case then, congratulations on your wonderful work and thanks for the things you've helped us accomplish.

Best. Ana

sad if true - very. I've been a sleeper for too long but have always relied on being able to access nettime since, what, sometime in the 90s.
yes email is slower, but speed and brevity are not the only virtues, or youth the only time for considering the difference between shit and diamond, a distinction that the list has been fine tuned to for its several years. If indeed it's to go, many thanks to ted and felix; if there are relay runners ready for the baton, more power to them; and if anyone knows of places where a pace between the blinking of twitter and the geological pace of journals allows considered response to urgent issues, please post

I was really sad to read this. I really value the nettime list. I can't think of another forum that allows me to connect to these issues on a daily basis. I can't think of another group that I subscribe to that has the same depth of discussion. That's not to say that these group discussions and community dynamics are never problematic, but when is it ever otherwise?

I'm not sure if I've ever contributed anything to nettime myself, but I'm a reader; I pay attention to these threads in my inbox and they provide a welcome critical heft in the middle of other lists populated by calls for conference papers and e-mails calling me to action on avaaaz or Loomio :)

Part of what I like is that the discussions use plain text; they aren't restricted to 140 characters or punctuated by rich media. Surely the fact that they take this very simple form is what has allowed the list to progress and endure! And also what makes it potentially open to change or flexibility in the future!

**Re: <nettime> nottime: the end of
nettime**
From: David Garica
To: nettime-l@kein.org
Date: Thu, 2 Apr 2015 17:07:09 +0100

Brilliant - I don't for a moment accept that it was a simple April Fool. It was deadly serious. But still on April 1st Ted & Felix found the only legitimate way to break the golden rule of Nettime: no meta discussions!

Alongside skilful and authoritative moderation the no meta-discussion rule was one of the principal secrets of Nettime's longevity helping to avoid destructive inward spirals that had destroyed many earlier on-line forums. So by threatening to pull the plug the meta-discussion genie has jumped out of the bottle. So now what? Will it prove to have

been the 'suicide pill' or the risky surgical intervention required to revive the comatose patient?

The answers to Modsquad's painfully forensic critique (ouch) lie in our hands. So let's put some concrete propositions on the table, before hastily reinstating the golden rule.

Here's a starting pint; it may just be coincidence but I would say that the list was most vibrant when nettime people found ways to get together in person, spending days together in inspiring and strange locations. Either connecting to festivals or conferences or off its own bat. So for at least one more time (and hopefully more) let's revive this lost part of the original model! In the original post the Mods referred to a Bucharest 20th birthday plan that didn't fly. Well maybe we should put some other scenarios on the table. I am sure there are many places that would happily host this. I have some thoughts on how this might look but as usual they are hopelessly Amsterdam centric... I am happy to report (I am sitting there now busily 'anthologising') that a new generation of uncynical people and possibilities are emerging from the ruins and demonstrating the resilience of this culture. But of course that's just my historical bias I'd happily travel to pastures new.

One other thought though there is much talk of 'sharing' nettime writers used to share (and risk) far more. I may be mistaken but as the community (dangerous word) and its discourse has developed it has also professionalised and not always in a good way. Where once writers would have rehearsed their ideas here in rough form I suspect that the pressures around academic/publishing commodification creates a greater reluctance to expose the ideas before publication. Could this be why it feels a less risky, energetic and generous space or am I (as usual) being nostalgic.

Thank you to you Modsquad

David Garcia

Dear Ted and Felix --

I read your announcement yesterday and have been trying to figure out how to respond. I have discovered yet another 21st century mental malady, which I'll call FOMO(OS): Fear of Missing Out on Sadness. Others have already posted their appreciation for your moderating (which I second), their regrets about not being as active as they used to be (ditto for me), and Brian even used the corner bar metaphor that I'd been noodling with.

All I can say is that nettime was a huge part of my intellectual life early on, and that I've appreciated the list and your efforts even as I moved from regular poster to constant reader. Just recently, I appreciated all of the interesting discourses about money, neo-liberalization and Bitcoins, areas I'm not writing about myself, but that obviously inform the worlds we live in.

As for the issues about a text only list serve, it may be a generational preference, but nettime offered (offers?) a place for the long-form argument to thrive, a venue to try out ideas beyond listicles without the clutter of gifs and banner ads, and the distractions of endless internal links, so that one could actually read another's thoughts and attempt to grapple with them. The process of reading nettime nurtured was neither elitist nor vanguardist, it came from and contributed to a long and distinguished tradition of thoughtful argumentation, and yes, the buildings of communities, from Republics of Letters to Empyres of Email. So, whatever happens, thanks for keeping this list going for so many years, and for encouraging others to contemplate what it means to them and how nettime or its successors might thrive.

Best --

amazing that there is any accolade whatsoever for this institutionalised censorship! give us less of what you think we might read! how nice to be sheltered from unwanted intrusion into your comfy institutionally-sponsored lives! pack o' lies dies

You cannot politically defy the institutions when all you really wanted was to be clasped to their bosoms and hope in time to be cherished under the very framework of oppressive values you are thinking of overcoming. That would be co-optation, revolution only in the sense of a circulation of elites rather than the extirpation of the very impulses of elitism. Society is like a stew; if you don't stir things up every once in a while then a layer of scum floats to the top.

Dear mod squad

> First, nettime isn't shutting down.

phew I was close to going into grieving mode - although I'm very much a lurker

and only an occasional poster nettime has always been an intellectual touchstone for me and a welcome bit of brain stimulus in my not very academic and sometimes mindnumbing daily existence.

> Moderating is snippets of time scattered across the day, there's nothing especially heroic or monumental about it.

Frankly that's exactly what's heroic about it - it's so much easier to make a grand gesture and so much harder to keep up a daily grind - so I'd like to chime in with the richly deserved chorus of thanks to Ted and Felix.

I don't agree with the diagnosis that this patient is 'comatose' - it's still the most thoughtful and honest net-critical platform that I know of even if the shiny novelty has worn off a bit. But these things can be very cyclical - what looks a bit tired today can easily be 'rediscovered' tomorrow and appreciated all the more for its retro integrity. Old media find new uses: vinyl has made a come back and it seems working with chemical film has become the new cool thing to do for media artists. I know we're ageing but the worst thing to do is to try and be down with the kids like some embarrassing uncle.

> And there's no images, no video, no memes, no numbers,

On 2015-04-02 12:05, Alex Foti wrote:
> i mean let's not commit suicide,

Yeah, let's not do that, not the least because, as Bifo pointed out, that would be a response entirely in line with how systems works.

The initial post was neither entirely serious, nor simply a gotcha joke that exhausts itself through revelation. Rather, it was meant as way to break our own unwritten rules, as a way to open a discussion about the list, on the list (as David Garcia immediately recognized). And not because there is an urgent crisis to be addressed, innovation to be implemented, or any other managerial goal to be reached. Nor did Ted and I need a collected pat on the back to fight off the impending burn-out.

No, it was meant provoke a moment to think about something that for many of us has become part of daily life. Those things tend to disappear into the background, we take them for granted, assume that some form of impersonal institution is taking care of it without much of our involvement.

And, really, nettime is the opposite. It's fragile, has no back-up, and, most of all, relies nothing but good will, many cross-crossing friendships, some dislikes and, beyond that, and a strange kind of communion of people who, as I far as I can tell, do not easily take to communions.

So, for me, the question is what do we want to do with this? Which does explicitly not mean, how do we want to change that? Perhaps there are things to chance, perhaps we do not want to chance much. The latter might be a good thing, since many of the structural features that are now setting nettime apart stem from the fact that we missed out on a lot of innovations that lead others and net culture, which is mainstream culture today, down the rabbit hole of frenzied, quantified narcissism.

If anything this thread shows that while we are all more than aware of the shortcomings, we still see value in the effort of collective thinking that does not lend itself to being measured, put on CVs or otherwise made direct use of. To create and maintain something like this is a real collective achievement by all of us, past and present,

and perhaps, even future. Even if whole is perhaps more than the sum of its parts, it's the parts, that is the time and energy everyone is contributing, both through writing and reading (which is falsely called lurking) where all of this comes from. We are encouraging you, that is, us, to think of how might bend this collective effort in shapes more congenial to you/us. David Garcia suggested a few ways that this might be done and I'm sure he missed a few too. This is not a task that needs to be addressed today, there is no deadline, but a next week, a next month, and a next year.

Felix

Hello friends and comrades! Interesting thread... first I was threatened since reading told us that something beautiful could stop once again, like so much beautiful things lost nowadays. But I understood what and why Felix and Ted called us to think and discuss. I do not publish mostly time because I write hard and wrong into english but I read the posts, it is important to feel what the redactors resent and think in matter of analysis and as projects, in this chaotic moment. This free server list since so much year it is a chance. A chance so much universal and so much singular a track from the late XXth century. Mostly a chance such as critical acts at the moment the social networks are not anymore our media. Please do not put it in the trash bin... Let it live if you can dear mods, and with us too. I pay tribute to Geert, Pit, Felix, and Ted.

I'd guess this is mostly due to it being archived and easily searchable. I certainly find it harder to take risks and admit vulnerability in such an environment. Though archiving and searchability are certainly useful. One answer is pseudonymity, but that brings its own limitations.

Re: <nettime> notttime: the end of nettime
From: Eric Kluitenberg
To: nettime-l@kein.org
Date: Fri, 3 Apr 2015 16:46:36 +0200

dear nettimers,

So, nettime is not, for the moment going to disappear, and I'm for one quite happy about that. I feel ambivalent though about the way in which the issue of 'taking stock' of the current substance (or lack thereof) of the list and its extended constituency (to avoid the overused term 'community') has been raised.

For me the greatest quality of nettime is its continuity and continued presence, with all its defects and shortcomings, but still. And this is in no small part due to the continued efforts of Ted and Felix keeping this edifice alive and dragging it through extended periods of sluggishness. I used the word 'monumental' in a private mail to Ted the other day (off-list) and saw that he already integrated it in his recent negation of all the shoulder patting rumbling through the ascii flows...

Well OK let's move on then.

I think there are a number of issues that need to be unpicked from this 'intervention' that require some reflexion and possibly also some actions to follow up on.

First an uneasy one that so far only Ted dared address (yesterday): ownership of the list and what extends from it - Ted and Felix don't know if they could, or have the 'right', to close this list down even if they wanted to - despite their extremely extended 'stewardship' of the whole affair. And Ted's right - I don't think that this list and what it extends into is or should be / can be 'owned' by anyone, and therefore nobody in particular has the right to shut it down. Still, things need to be maintained, both technically, editorially and as a living social entity - all that doesn't happen by itself and if the extended constituency would not find somehow a solution for it the thing would in effect disappear if Ted and Felix stopped taking care of things.

That's an unresolved dilemma that afflicts many of such invaluable not for profit / not for glory enterprises - a bit of 'crowd funding' will not solve this. David Garcia is talking about 'resilience' instead of that other overused term 'sustainability', but we don't know exactly how to organise this beyond personal sacrifice (sacrificial labour is a more apt term here than 'affective'). That's an important one for our list - how to solve this (not just for nettime)?

But then there are a whole bunch of specific issues lumped together in the original posting that should in fact be taken separately. I think, before we make a judgement about the larger whole. I've copied the paragraph again at the bottom of this message.

So let's unpick:

- the summer of the internet is over: that is in itself already a question whether or not this moment and its momentum is over! I actually don't really think so, but it has become a much more complicated space of activity to get to grips with - the walled gardens of (anti-) 'social' networking platforms (that everybody nonetheless seems to flock to, so where are the alternatives that are so unlike the corporate mainstream?). The revelation that the control society was every bit as bad as we had imagined it in our worst nightmares... The sad fact that the massive participation in online media and self-mediation has not by itself and of itself lead to a more open, democratic, equitable society (or should we say 'collective'?).

- the former 'East' for the most part does not exist anymore - it is now rather a vanguard for political experiments that set a tone for much of Europe to follow. What was still termed 'enduring post-communism' during Next 5 Minutes 4, back in 2003, now really seems to have come to an end. The rise of chauvinist authoritarianism voted into power in Hungary is not so much a regression to the past as it is a prefiguration of a future we must desperately try to avoid.

- that we have so little reports and discussions about what is happening on Russia's borders is actually hardly a surprise. The only ones who could offer us a genuinely interesting perspective on what is going on are the ones inside Russia, who live that situation. But they will not speak out in public - it's too dangerous. Do it and not only will you put your own life at risk (think of Oleg Kyreev's so-called 'suicide' after openly supporting the idea of an orange revolution in Russia - we will never forget that!), but also the livelihood of your friends and family (losing jobs, benefits, housing, opportunities) - this is all very real and the last thing you will do when in such a situation is speak out in public (archived for eternity). No wonder there's no voices on this list that could enlighten us. We are very much back to the good old days of 'Kremlin-watchers' who attempt to interpret spurious signs of tightly controlled (media-)enactments that could mean anything or nothing at all - really.

- China, Middle-East, Africa, and for that matter Latin America, all very much absent indeed and we miss this dearly. There are net.cultures in these places, but they are not with us. I agree fully with Ted and Felix here that this is a major issue. In the past we had a healthy inflow from South Asia via the Sarai 'constituency', but that too has dried up, largely because it migrated to Sarai's very active Reader List and other fora, but we've somehow lost touch. I guess for a variety of reasons.

- nettime could do more, much more to connect with the new generations of what I usually refer to as the 'movement(s) of the squares', and what Ted and Felix call the 'flowerings of new forms of subjectivity and the new forms of sovereignty that they give rise to' - indeed. The generation issue is not so relevant for me. The more important point would be to build on nettime's continued presence to create connections between different generations, to exchange experiences and knowledge, to learn more from what is happening right now, to understand, create solidarity, gain new insights and energies... That wil not happen by itself, but requires a dedicated and conscious effort - would that be thinkable in the context of nettime? Who knows? Maybe...

- the 'profoundly important dynamics across parts of the world conventionally -- and reductively -- called 'Muslim' or 'Arab' - when I want to figure out something there, my first stop is always the superb Jadaliyya blog. But there are no 'Jadaliyyans' on nettime, alas, none so far as I am conscious about. And yet they are only one e-mail away. For the Tactical Media Files resource I collected a number of contributions from that 'constituency' and never had a problem getting a swift response and co-operation, so what's stopping nettime?

I think the idea for (finally) a nettime meeting again (after way too many years) is a really valuable one. And indeed it can take many forms, but it would be great to meet up for this, discuss, debate, invite youngsters and non-grey/whites/males/euromaricans and so on, cross-connect, pollinate, infect, contaminate and infuse, all that. Let's again be 'proud to be flesh'.

In short, let's move from self-reflection to some concrete actions...

up for the next 20...

);

in appreciation,

eric.

Hi everyone.

I too wondered what nettime meant to me at the spectre of its possible demise. I don't think of myself as active in the contributing sense, but definitely active in consuming the fantastic output (and I mean fantastic in terms of volume, speed, and ideas bouncing through the posts). The loss for me would be that I am being exposed to thought

and histories I would not come across in other contexts. And yes, not a peep about so many things. But a lot of peeps that have taken me to quite some places.

So nettime fuels me in a unique way, big thanks to those who share here. Very interesting and a pleasure to see it (and some of its constituents) in this April 1st relexivity.

cheers
Colin

People who just (or mostly) read on-line do not deserve the creepy designater - lurker.

Reading is a very different experience when done in the knowledge that we can at any point respond. Even if we never actually do.

New ways of reading and writing, making and being together (appart) is something I first learned about on nettime.

Date: Mon, 6 Apr 2015 12:45:39 -0700

Dear Ted and Felix,

Well, I started reading from the most recent and *shocked* replies, and

then, I went back to find this long email.
Crazy, but, I was just thinking, something I do occasionally - :) (about two days ago) about the fact that nettime
STILL has the old, grey email interface and the form of a list....when Mark Zuckerberg and his cohorts have dazzled 9 billion people - like burgers - to "add content" - because its more exciting, hogs up more bandwidth, acts like Reality TV and spreads ad sprawl globally... and I thought, "hmmm, its kind of a good thing, kind of a relief, kind of wonderful that nettime is still nettime and there are few "content-delivery" expectations, and there are some half way interesting arguments, texts, writings, reviews...

This is such a cop out not a confession of radical/unradical...well, thanks for keeping the list "alive" but please, don't tell us, after running a low tech internet list for almost 20 years, that the reason you are folding is because the Internet is "post" and there are not enough pictures on nettime...I thought low-tech, high-concept was the idea....n5mj...you know? Not "multimedia" to use a 90s term. I thought this was what made nettime cool, not measuring it against snailmail...I thought SLOW MEDIA was good media...and wouldn't some younger people, if you two have gotten tired, to take over some of the list work?

I'm sad that there's no merit in the good old list format...as seen by so-called critics of technology... what happens to looking to nettime for something crisp to be said about technology?

Huh?

I'm confused

Thank you David for this observation.

this is my first post after reading (lurking) for some years and doing it passionately. Nettime list is research and study material, much more alive than any blog or social media. It is a living portal. And am glad to see so many people I know here, and so many people I will get to know in the future.

Even if sharing means two way communication, and my lurking is not especially friendly to other list inhabitants, I am taking that all the ideas and info here is to be shared to others who are not on any lists. So thanking everyone in their name too,

Best

Krunor

A reassuring side effect of announcing the death of someone or something whether it be an April fool prank or not is that people you don't know turn up for the funeral with eulogies and elegies.
As an art student nettime was my first real encounter with an active critical net culture I preferred to listen and learn and have never actively contributed but please do not mistake silence for absence, clearly there are many of us here who value nettime. It has for me always been a source for provocation and inspiration. It's great to see so many nettimers here. Thank you all. I hope we will continue to celebrate the spirit of nettime together for some time to come.

Dear Moderators, Thank you for your thankless work.

If this list goes to the web or to a service, Google or otherwise, I won't be coming along. I don't do blogs, I don't use anything that requires that I establish an account, and I don't execute code that others send (Javascript, for a prime example). As long as nettime remains multi-cast plaintext, it is free from the lion's share of toxins, broadly defined, and it will have me as a subscriber.

Thanks Ted and Felix for revealing that you weren't completely serious, as well as for your incredible energy in editing all through the years, bringing many lively thoughts and fascinating conversations to us in what has seemed like "real time."

I note that when I began to subscribe, at Bruce S's suggestion, back in the 90's, Deleuze and Guattari's thought seemed the polestar by which all else was reckoned. It has utterly disappeared, without replacement, as far as I'm aware. My guess is this is not peculiar to nettime, and may not be a bad trend at all, but it is in some ways a sobering fact that obeisance to some kind of possibly vague but "higher" thought is understood as no more needed or helpful. To be sure much of that was a kind of academic posturing at one time likely to help in certain careers, but no longer. Still one misses the poetry of it, a bit, along with the sense in retrospect that the world was then young and full of mystery, or at least of "miasmal mists."

Does someone else - perhaps you, Felix and Ted, have a clearer sense of why none of us see fit anymore to enclose our writings in that kind of gift wrapping?

Best,
Michael

From: adsl487504 {AT} telfort.nl
To: nettime-1@kein.org
Date: 4 Apr 2015 11:24:26 +0200

Nettime took off in a studio next to mine at Kuensterhaus Bethanien, in 1995. I did not get then very well what Geert and Pit were up to, as my Eastern European mind was warped around different issues. But it was precisely the Eastern-European, non-US-centric side of nettime that made it fly well, in spectacular loops, from Berlin to Budapest to Ljubljana, from net-art to the post-Soros era.

The Bucharest meeting, which has been presented here in the initial posting as a symptom of nettime's end, was my idea. Last year in July, after taking over the directorship of the National Museum of Contemporary Art (MNAC) Bucharest, one of my first thoughts has been to the flesh meetings of nettime, and to what they meant to me, and to others.

I briefly shared with Ted first and then with Felix my feelings, and my interest in bringing about a nettime gathering at MNAC, in Bucharest (sorry David, no more Amsterdam for once). At the same time I shared my reservations about the current lack of interest for this region (yes, Hungary, Ukraine, Russia, the Baltics, Poland, the Black Sea and the Danube question, Romania even), and the dominant non-iconic preoccupations of the list, which make it slightly off-beat for a vivid, rapidly growing community of young people here, who are mainly interested in visual culture, activist art, cross-media experiments, and the complicated politics of the region.

They come and tell me that the buzz goes about Bucharest being the Berlin of the 2015s. Might be. MNAC is located in what has been called for many years Ceausescu's Palace; now we have here as neighbors the Romanian Parliament. It is an interesting setting, Leviathan. We do not have fancy budgets, but a great terrace with a view on the construction site of the what will be the National Cathedral of Romania (!). And we have the skills to animate good gatherings and good parties.

The rest is on you, nettimers. If this sounds like an invitation, then come with the details.

Sincerely yours,

Calin Dan

You cannot politically defy the institutions when all you really wanted was to be clasped to their bosoms and hope in time to be cherished under the very framework of oppressive values you are thinking of overcoming. That would be co-optation, revolution only in the sense of a circulation of elites rather than the extirpation of the very impulses of elitism. Society is like a stew; if you don't stir things up every once in a while then a layer of scum floats to the top.

**<nettime> choose-your-own adventure:
a brief history of nettim**
From: nettime's mod squad
To: nettime-l@kein.org
Date: Sun, 1 Nov 2015 16:24:30 +0100

Eric Kluitenberg and David Garcia asked us to draft an entry/essay on <nettime> for their upcoming anthology on tactical media, so we did. But it quickly became clear that if we seriously believed our argument, we'd need to invite comments from the entire list. So, without further adieu, here it is:

<https://docs.google.com/document/d/1f5Gndq40aFOJMIi8lOT79y7iX6wtWzByYK4cITJRLA/edit?usp=sharing>

If you have a Google login and use it, you can comment with attribution; if you don't or you'd prefer not to, you can comment anonymously. Either way, we'll do our best to address or incorporate suggestions.

In many ways, we think this is the next intuitive step after the 'nettime' April Fool's mail. This essay is very positive, but we've also tried to be fair in assessing the list's weaknesses and failures. We hope you'll do be fair as well.

Of course we're aware of the glaring irony that it's a Google Doc. Like it or not, they're an excellent way to collaborate on a text. And, as Benjamin Mako Hill pointed out, Google has most of our email because it has all of yours.

the mod squad
(Felix and Ted)

The list as open collectivity: <nettime> at 20 years and counting

Ted Byfield & Felix Stalder

This is an insider account. Both of us have been deeply involved in the <nettime> project from very early on, and most of that time on a daily basis as the list's moderators. So our story is inevitably biased in ways that we are probably not even aware of; but we hope to make up for this with a nuanced account of the transformations of the project which have kept it, for more than 20 years, an important node in the free-ranging, oppositional examination the cultural and technopolitical transformations of the present. As the footer appended to every message states:

<nettime> is a moderated mailing list for net criticism,
collaborative text filtering and cultural politics of the nets

Indeed, the peculiar relationship between transformation and continuity is probably the key to understanding <nettime> and why it has remained relevant for so long and why we call it an "open collectivity." By this, we mean a group of people held together by a shared horizon grounded in common experiences, vectors of interest, and modes of agency; but rather than relying a fixed internal structure or charismatic personalities, its internal composition remains fluid and shifting, in response to desires, pressures, and opportunities.

In "technological" terms, it has barely changed at all. Since its founding in late October of 1995, its material basis has been a mailing list à la simple piece of software, running on a server, which manages a subscriber list and distributes email to them. Moreover, <nettime> has always restricted message to the text-only format. Initially, this convention was driven by humanitarian aims of maximizing access (for users who connected over a low-bandwidth modem) and minimizing software conflicts. Over time, though, this became central to the list's culture and, as more communication turns image-heavy, one of its distinguishing features. So there are no "styled" formats, no attachments, and no images, sound, or video. At first, <nettime> used the majordomo software package, then later Mailman; both are standard (mostly) free software programs. There are some minor tweaks to mailman so the list can still be moderated using a command-line interface à la arcane but efficient à la but that's it. Nothing special.

Running a mailing list also involves technical decisions and social approaches that shape not just the daily ebb and flow of traffic but also the cumulative archive. We recognized this early on, and formulated a few minimal "policies" à la for example, discouraging "bare" URLs and encouraging people to send complete texts, which over time ensured that, unlike most mailing-list archives, <nettime>'s would become an open library of substantial ideas rather than a chatty jumble of links to bitrot, parked domains, and malware traps. Other choices have contributed to this unusual resource à la notably, the use of a pseudonymous "digestive system" to anonymize many contributions and incorporate interesting texts on current (and sometimes past) events and phenomena.

The list has always been hosted on noncommercial servers run by people within the open collectivity that formed around the list. First, at the International City Berlin, then from February 1996 to July 1999 at desk.nl, then after a brief temporary asylum on material.net (NYC), the list moved to bbs.thing.net (NYC), and since July, 2007 it has been hosted on kein.org (Munich). Its archive, which as of late 2015 contains more than 22,000 messages, the full traffic since the list's inception, was hosted first by the Society for Old and

New Media (waag.org [Amsterdam]); since 2014 on servers run by the media arts collective IMediengruppe Bitnik (Zürich). For most of the users, whose numbers rose slowly but continuously to about 4500 in late 2015, these changes in the technical infrastructure were barely perceptible.

Relying on fluid relations of friendship made it possible to run the project without involving any financial exchanges, not even donations or grants. Someone pays for the domain name, but that's it. Everything is donated in kind, according to ability and according to need. There was never a compelling reason to develop any formal organizational structure, and in light of periodic ruptures in funding patterns that led to so many failed cultural organizations a many compelling reasons not to. As an organization, then, <nettime> is made up of deep, overlapping ties of mutual interest, friendship, respect, and commitment. For those without such ties <nettime> might sometimes seem exclusive or even "closed," culturally speaking.

This approach is not without its peculiar twists, to which we will return, but extreme informality enabled the open collectivity to morph into numerous shapes, to adapt to changing needs and interests of this constituency, and to keep everything on a voluntary, self-motivated basis. Moreover, rather than focus on specific issues or projects, <nettime> provided a deliberately open context for disseminating, debating, and documenting the wider range of ideas à digital human rights, media law and policy, intellectual property, security and cryptography, media activism, aesthetics and art practice, and the changing construction of "the artist," to name just a few à from which local activist practices sprang. As such, for at least some first-generation subscribers it became a "university of the nets," a high-signal, low-noise internationalist source for radical theories and practices.

Thus, while the list's technology has remained simple and stable, the collectivity and the value it provides to its members, has undergone subtle but deep changes. This can be summarized by dividing the last 20 years of history into four phases. This periodization is admittedly somewhat arbitrary, but for present purposes it should serve to highlight the intertwining threads of continuity and change.

The Delirium of Networking: the "heroic period," 1995à1998

<nettime> was founded at a time when the Internet was far from "ubiquitous." Even where it was available it was often hard to reach, through cranky modems and creaky connections. Once connected, it didn't take much effort to stumble into raging debates about the what this "Internet," which appeared to many as a tremendous but vague promise, was supposed to be. The loudest chorus was American, many of whom advanced the notion of cyberspace as yet another new frontier and new territory for cowboy romance. <nettime> immediately positioned itself against such spatial metaphors.

The time of nettime is a social time, it is subjective and intensive, with condensation and extractions, segmented by social events like conferences and little meetings, and text gatherings for export into the paper world. Most people still like to read a text printed on wooden paper, more than transmitted via waves of light. Nettime is not the same time like geotime, or the time clocks go. Everyone who programs or often sits in front of a screen knows about the phenomena of being out of time, time on the net consists of different speeds, computers, humans, software, bandwidth, the only way to see a continuity of time on the net is to see it as a asynchronous network of synchronized time zones.

<nettime> emerged from meetings of European artists and activist interested exploring the new possibilities of the net for artistic and political experimentation with a maximum of independence from established institutions. Initially the list served as way to keep these discussions going between meetings and to include people unable to travel at the frantic pace of events. The first years were delirious as international communication as a daily activity was new to almost everyone. The self-styled task of creating a new "European" net culture was never about geography à it was about affinities. Those involved included deep connections into the former East Bloc, which had opened up only a few years earlier, as well as important contingents from North America and Australia à all within a medium with no fixed rules or expectation, which contributed what Geert Lovink once called "the short summer of the Internet." But not everyone felt content with the new lingua franca, English, and the vague borderlessness of the Net. Soon, additional <nettime>-lists appeared, as fora for discussions in Dutch, Romanian, French, Serbo-Croatian, Spanish/Portuguese and other languages. Not all of them thrived, but some did, for almost as long as the English language list.

The iconic statement from this early period is still Richard Barbrook and Andy Cameron's "Californian Ideology," published in Mute magazine. This essay provided a powerful critique of the "bizarre fusion" of seemingly contradictory elements: neoliberal worship of the entrepreneur and the market, irreverence of anti-authoritarian counterculture, and McLuhanite technological determinism. This "heterodox ideology," they argued, systematically omitted the crucial roles of public funding and of grassroots activists in the history of the Internet, erasing non-market histories and futures.

Given how dominant the internet has become in such a short time, it would be easy to overlook how the adoption of a mailing list to connect these diverse people and contexts was itself a form of media activism. There is an open question whether, over time, the mailing list has become so normalized as to lose that potential, something that happened arguably to other "tactical media" à for example, guerrilla video. We think not à and that it's worth reflecting on unexamined potentials mailing lists may have (say, compared to commercial and image-driven "social media").

From the beginning, <nettime> served as an environment for experimentation with the new medium and, beyond that, as a collaborative platform to prepare publications outside of it. The physical fact of these publications latter was seen by some as prima facie evidence that an effort remained "real" à and its absence evidence that an effort had somehow lost its way. However that may be, the combination of continuous exchanges and sporadic meetings (often "parasitically" attached to larger cultural events) and publication proved to be productive, flexible, and durable.

This mode of operation enabled a wide variety of people to forge a core of shared experiences, both personal and collective. As a result, the list's subscriber base quickly approached 1,000, many of them significant artists and thinkers in the early net cultures. The preferred offline publication format was that of a newspaper: quick, dirty, and easy to distribute while travelling. Between January and November 1996 five newspapers were published in connection with festivals across Europe, and in 1997 another one. In the same year, the collectivity provided the backbone of the "hybrid workspace" at the Documenta X exhibition. By 1999 <nettime> was already publishing its own anthology ReadMe! ASCII Culture and the Revenge of Knowledge; and in 2001, an edited version of nettime was part of the catalogue of the Slovenian pavilion at the Venice Biennale.

But summers don't last long, particularly short ones. Two main fault lines quickly opened up within the collectivity. First, some sought to use the list to advance narrow personal/political agendas. Second, open conflict between "net.artists" who sought to explore the boundaries of the list-format (for example, by what would later come to be known as "trolling" as an art practice) and "net.theorists" who insisted the list should be a channel for ambitious net.criticism. In 1997 a number of net.artists left the list in protest and founded another, called 7-11. Paul Garrin, a New York-based video artist-activist known for his confrontational style, promoted a series of projects, including an alternative DNS authority, and hijacked <nettime>'s subscriber base for his own short-lived "<nettime.free>" list. And, throughout these years, a shadowy procession of seemingly 24/7 always-on entities variously known as antiop, =cw477abs, integer, and netochka nezvanova (or "nn") assailed <nettime> and other forums with astonishing messages that combined furious bile, ASCII art-inspired deconstructions, and scathing and often-brilliant critiques of authoritarianism à as well as promotions of his/her/their software.

These tensions were addressed by switching to moderation mode, a function that is baked into the mailing-list software. But since there were no clear rules for how to moderate, and rejected messages remained invisible, this led to acrimonious debates about "censorship" and a brief experiment with an "unfiltered" version of the list, <nettime-bolds>. Varied proposals for how the selection process (and of course who is doing the selecting) could be made more flexible and spontaneous were advance à for example, by changing platforms from a mailing list to something else in order to allow subscribers to do their own idiosyncratic "text filtering" à but nothing ever came of them.

A third tension arose early on, which the <nettime> collectivity has never found adequate ways to overcome: gender bias. Nettime has always been very male à not necessarily in terms of its subscriber base but certainly in terms of its communication culture. There was quite a bit of overlap between <nettime> and early cyberfeminism (including the "faces" email list), but the collectivity never found adequate ways to provide an environment for explicit, sustained feminist discourses. And, to the extent that feminist and gender-oriented ideas have played

a pivotal role in broader liberationist movements around the world, this tacit weakness has marginalized <nettime> as a resource for younger activists. <nettime> is far from unique in this regard: the difficulty of addressing often implicit and unacknowledged biases is a key weakness of the informal mode of voluntary organisation, offline and online (from free software communities to Wikipedia). Within <nettime> this problem has been widely recognized and periodically acknowledged (for example, with citations of Jo Freedman's classic 1971 text "The Tyranny of Structurelessness"), but this has never translated into substantial practical change.

In retrospect, it's not surprising that debates in <nettime>'s milieu would anticipate many of the basic operations that underpin the follow/like economies of social media. However, and particularly in the context of narcissistic hyperdifferentiation that defines "social media," it was fortunate that <nettime>'s moderation wasn't splintered. Rather than relying on a system of technically implemented (and therefore enforced) differentiation, an open collectivity communicates in a unified environment where everyone is equidistant. In <nettime>'s case, it proved to be much more fluid and able to negotiate imprecise shifts in taste and attention. It was this implicit vagueness that gave <nettime> a supple adaptability that many other collective ventures lost in the ensuing strife.

Crisis Intervention: the bombing of Serbia (1999)

All of these debates faded quickly into the background once NATO started to bomb Serbia on March 24, 1999. As is often the case, mass media on all side shifted into propaganda mode. (See also Veran Matic's text in this volume.) <nettime> suddenly turned into a channel in which people on the receiving end of the bombing campaign, the members of the collectivity who lived in Belgrade, reported the terrifying facts in near-real time. This provided an important counterbalance to the media narratives, which were dominated by the video-feeds from "smart" bombs and their implied ideology of a "clean" war. The reach of these dispatches from the ground was considerably farther than just the list itself, since several members of the collectivity in the West worked in the media and used this material in their stories. At certain critical times, the feedback loops established through <nettime> were much quicker and more accurate than those provided by major news providers such as CNN. Retrospectively, this was a pioneering moment for both "citizen journalism" and "real-time crisis monitoring," two functions are now separated into blogging and derivative "micro" platforms such as Twitter. At the time, though, they hadn't yet been articulated as such and were still unified within email.

At the end of an extremely intensive period, in which the collectivity had to learn to cope with the relentless and intimate reporting of the dirty realities of war among friends who suddenly found themselves on different sides, the collectivity was exhausted. Though shortly after, energizing events took place in the streets of Seattle and set off another short summer, that of the anti-globalisation movement which had forced its way onto the global stage, drawing heavily on the new modes of horizontal communication provided the Internet.

The Long Bust: the dot.com crash, 9/11, and the lure of social media. (2000&2008)

The bursting of the bubble of Internet stocks in March 2000, signaled the end of the first irrational exuberance of the Internet. Things got considerably worse in the following year. The brutal police crackdown of the massive protests against the G8-Meeting in Genoa Italy in July 2001 was a turning point in the state's response to the antiglobalization movement. A few months later, the events of 9/11 not only caught the important New York-based contingent of the collectivity up close, but it soon became apparent that this would not only lead to new wars abroad, but also to new repression at home and surveillance of online communication.

While the champions of the Californian ideology rebounded from the shock of the stock market with a new label, Web 2.0 and, soon afterward "social media," the mood within the collectivity remained dark. The new developments were quickly analyzed as a profound reengineering of the Internet infrastructure away from the early decentralized designs towards new centralized platforms firmly in the hand of (venture) capital. The fact that in early days of social-media investors were happy to sustain losses in exchange of market share, barely obscured the new power-relations that were being implemented.

The arrest of Critical Art Ensemble's Steve Kurtz, an important voice in technoculture in the US and Europe, in May of 2004 was significant in its own right and also symptomatic of the increasingly humorless and violent view the state and corporations were taking to the domain of media activism. After Kurtz's wife died unexpectedly of a heart

attack, emergency workers interpreted the scientific materials in Kurtz's home in the worst possible light and called in federal law enforcement agencies. He was subjected to a years-long prosecution for criminal mail and wire fraud under the USA PATRIOT Act. It showed to many that critical cultural practice, as Konrad Becker put it at the time, "does in fact touch the nerve of occult power in the techno state," à even (maybe especially) when it operates on a purely semiotic level. The overblown repression of a critic of the techno-political power system now appears as a precursor of the stepped-up repression of hackers and journalists surrounding WikiLeaks, Anonymous, and other renegades.

During those years, <nettime> was declared dead several times. In some ways, then, it's surprising that the list, rather than fading away, shifted gears toward deeper historical analyses of the networked condition à notably, Brian Holmes's essays on history and transformations of cybernetics.

By now, one consequence of moderation and its strictly voluntary mode was becoming clearer. The new social media intensified the speed and sheer volume of communication, making message lengths shorter and visual content ever more pivotal; above all, reaction became the dominant currency. <nettime> by contrast, moved in the opposite direction à mainly by not changing at all. Moderation necessarily involves a delay, which, given the contingent nature of collective efforts, could be as little as a few minutes or as much as a few days, depending on circumstances. Far from being an obstacle, though, this often introduced a slight (and manipulable) lag to exchanges on the list, which allowed time for reflection in reading and writing rather than reaction. Discussion threads extended over days, sometimes weeks, and often would be taken up again at a later point. The fact that each member had a local copy of the list's conversation in his or her email folder (in addition to the online archive) provided the collectivity with a sense of its own history and allowed for an uneven accumulation of collective references and knowledge.

Living the crisis: the return of the (un)real (2008&)

Two events cast into sharp relief some of the basic concerns that have been important to <nettime>'s collectivity from the beginning à and showed the brutally bare extremes that power structures would impose in order to preserve their privilege, even at the cost of never-ending and expanding crisis. First, the catastrophic effects of financialization as a core element of neoliberalism and the willingness of the state intervene on behalf of "too-big-to-fail" banks became shockingly apparent in the wake of the 2008 economic meltdown. And second, the blanket surveillance of military-communication complex relies on to detect and contain social unrest which was made public by the leaks of Edward Snowden starting in 2013. Such issues that had been staples of <nettime>'s discussions à the role and shape of infrastructures, the materiality of politics, the continuities and transformations of capitalism, the possibilities of resistance and imagination of radical alternatives à and suddenly, they found mainstream resonance.

Particularly in the wake of 2008, as cultural funding dried up in many countries, <nettime>'s no-money collectivity model has proven to be resilient and sustainable. In some ways, the double crisis that marks the second decade of our century, is bringing <nettime> back to its roots. And intense interest in socio-technical infrastructures and understanding social critique that is fits the current social transformation needs not only theoretical tools, but also new forms of organisation. It is, perhaps, this twin concern, more than anything else, that has motivated the collectivity for such a long time.

Whether it remains capable of generating substantive contributions to this distributed efforts that takes place in many contexts and modes around the world remains an open question. Some serious and absolutely legitimate criticisms à many of which hadn't been voiced on the list in years, in some cases because their advocates had long ago given up à were summarized in an April Fool's prank in 2015, in which we announced that we were closing the list:

<nettime> has been 'graying.' It's wedded to a particular Euro-American moment, the so-called summer of the Internet, which has since turned to winter. Nettime's once-radical embrace of the ex-East à or, if you like, of the ex-West à barely extends to Hungary now, and has nothing to say to the decisive conflicts around Russia's borders. Its early tacit prohibition on ritualized debates about Israel and Palestine has grown into a complete failure to address the profoundly important dynamics across parts of the world conventionally à and reductively à called 'Muslim' or 'Arab.' These areas are too often consigned to the 'timelessness' of conflict, but there's every reason to believe that their liberatory struggles could ultimately define the future of the 'WEIRD' nations. China? Barely a peep about

it. Africa? Nettime is nowhereville. The seas, the skies, the circulatory flows? Nada. And how about nongeographical 'areas' where the most moving cultural changes are happening à in the flowerings of new forms of subjectivity around the world and the new forms of sovereignty they're giving rise to. Silence. But, really, who cares what a bunch of straight white cis guys à which is 95% of the list's traffic à think about those things?

We formulated these criticisms in the context of a failed effort to stage a new and different <nettime> meeting farther east than before, and with a renewed emphasis on learning about where and how (and maybe when) activist efforts had migrated à efforts that were media-savvy yet ignored in mainstream media. The list's flexibility, and the 'equidistance' we noted earlier, limit participants' ability (and probably their motivation) to act collectively.

And, of course, <nettime> also shares other serious weaknesses with media-activist efforts, sometimes very literally. The list's reliance on noncommercial and volunteer resources have also made it vulnerable in basic respects. At times, its minimal infrastructure depended on servers shared with more radical members à for example, cToy, the Yes Men, and Ricardo Dominguez's 'Floodnet.' When their more radical activities led upstream ISPs to shut these servers down, <nettime> (along with many other projects and people) came under direct threat. More recently, its lack of organizational resources has prevented it from incorporating resources like Twitter and Facebook, which are widely seen as essential organizational tools.

These weaknesses run the risk of letting <nettime> drift even deeper into its own peculiarity à as Morlock Elloi, a staunch pseudonymous in the collectivity, put it in late 2015 à to become just another group of 'self-similar[s] in faraway land,' where like-minded people substitute their irrelevance for the joy of being together. The list's waning emphasis on face-to-face meetings and media-activist actions might be a symptom that the list was becoming increasingly 'bourgeois' à which it no doubt was, to a certain extent. It also reflected the aging demographic of <nettime>'s core members à for example, their growing concern with stable professional jobs (particularly in arts-oriented segments of academic), raising children, and so on. Whatever the cause, there's no doubt that less emphasis on face-to-face meetings has also diminished the spontaneity and force the collectivity would be capable of.

The question of how to articulate and navigate shifting, contingent relationships between continuity and transformation, which has always been central to <nettime>'s success, remains at the fore. Four time, the collectivity has managed to re-attune itself to changing circumstances. Whether it can continue to respond in flexible and relevant ways to newer conditions à and, crucially, to attract younger contributors à is very much an open question.

so good!!! thanks! this text comes timely and is a motivating read.

recently you noticed i started being around nettime more often... this little historical text here is a great milestone and feels also very inclusive. I approve and always recommend recommending making less individual names, but perhaps more organization names, to support what everyone of us is doing in different but well attuned directions for which nettime seems to be a metronome. So I'm happy if Dyne.org can fit somewhere there, but I have no idea where really.

I was recently rather upset at hearing and reading Geert going around to call himself the "founder of nettime". Then rather than that, perhaps his INC initiative also deserves a quote in the text.

ciao

> The crucial intervention so far has been the unprecedented injection of some 12 trillion USD into the global monetary system by central banks, which know very well what each other are doing. The next crucial intervention will be to actually *do* something coherent with that money.

Global volumes of currency trading alone are in the order of 5.3 trillion USD per day. What capacity do the central banks of the world have to substantively influence the overall system?

Great to once again be able to tune in to Brian's imaginative sweep. Just to add to Brian's example below important but informal collaborations connected to nettime I would definitely add all (except edition 1) editions of Next 5 Minutes festivals of Tactical Media. Nettime acted like an important additional room in which the issues that informed the content of the festival sometimes sourced, debated and developed. In the last edition the content development was segregated and developed through Tactical Media labs (TML) in various countries. I'll just recall one because it left an interesting legacy which still feels potent. Its the NYU TML took place in the heart of the city shortly after 9/11 and so of course the and its organisers were still reeling and the planned event had to (in every sense) pivot. The result was a so called Virtual Casebook in which many regular nettime contributors (and many more who were not) generated a series of responses to the attack which, whatever its limitations, still represents a collective snapshot of that moment refracted through the subjectivities of this community (yes I dare to use the C word). In my opinion remains a valuable way to re-connect to that moment. Its still worth re-visiting as a snapshot in time:

https://www.nyu.edu/fas/projects/vcb/case_g11_FLASHcontent.html

"From the beginning, <nettime> served as an environment for experimentation with the new medium and, beyond that, as a collaborative platform to prepare publications outside of it." In terms of publication, Ted and Felix are firstly talking about the "Zentralkomitee" readers that were published in the early days of nettime. But there is a more informal and sometimes unacknowledged type of collaborative writing that emerges from this kind of list, which is also worth some attention. For example, "my" texts on cybernetics in the mid-2000s were to a certain degree products of list-wide debates, as I usually indicated somewhere in the footnotes to the published versions. I also had the great experience of launching a collaborative project on the subject of 'Technopolitics' through mailing-list exchanges with Armin Medosch and others (that project didn't actually start here, but nettime has been the most important venue for written debate about those issues). I would be curious to know if some others have had interesting experiences with this type of informal collaboration?

Dear nettimers,

It feels a bit awkward to respond in this thread as the co-editor of the anthology this text is going to be part of, where I think the text is going to be a great contribution, a fascinating account of twenty years of <nettime> from a first-hand perspective. However, I am deeply intrigued by the remarks Brian made about a 'third-order cybernetics' and his call to start figuring this new order out (a 'third age of net-critique' as he calls it). This is what I want to respond to here.

The anthology we are putting together is part of a larger project, on-going under a mundane working title 'tactical media connections', with the aim of connecting different generations of activists, artists, theorists, discourses and practices between the classic era of tactical media and current practices and conditions, with the hope of developing a more informed perspective to move into the future. The project has been introduced on the list so will not dwell on this further.

One of the things which is on my mind with this project is to raise the question: 'What kind of interventions are required right now?', assuming that we are in the post-#occupy and post-prism era. For a variety of reasons we have seen that the various 'occupy' quasi-movements (formations) have failed, unable to transform themselves into somehow coherent and potent political forces (in part because of their over-reliance on the play on affective registers), with the possible exception of Spain as also indicated in the thread started by Alex Foti ('What if we were all right but all wrong?'), which runs interestingly parallel to this one. And the post-prism condition need not really be explained - the confirmation of our worst nightmares about the extent of the electronic surveillance apparatus that dwarfs all sci-fi fantasies that may have preceded the Snowden Files disclosures.

So, what does 'intervention' mean in this context? Does it still make sense to think and talk about this at all? How could intervention be conceived of as somehow meaningful, viable, efficacious (able to produce desired results)?

What strikes me, but comes as no real surprise, is the clear presence of the recent work that science and political philosopher Bruno Latour has been doing on what he calls 'Facing Gaia', and what Brian refers to as 'Earth-system' (see: [1]<http://www.bruno-latour.fr/node/487>). This comes as no surprise because Brian and I discussed this in private conversations, and also because his recent work with the Compass group in the Mid-West region (around Chicago) takes up the challenge of thinking through the meaning of 'general ecology' - see: [2]<http://midwestcompass.org/>.

The crucial point here, in my view, is the boundedness of these global transformations Brian is referencing by our existence on Earth, the planet as a system of interdependent parts, and the finiteness of resources available to and within this system. As Latour also observes in one of his recent lectures, the prospect of the human species (or a future Ark of Noah carrying the biological diversity of the planet) embarking on an exodus into space to new 'Earth-like' worlds has been emphatically referred to the realm of fiction by calculations of the amount of energy and resources required to ship even a tiny segment of the Earth's current population to the nearest inhabitable worlds, which makes the entire exercise an entirely laughable fiction. It equally reduces the chance of us ever being visited by some remote superior extraterrestrial civilisation (that can solve our problems) to zero. In short: We are Earth-bound.

Philosopher and aesthetician Jean-Francois Lyotard once observed that the avant-garde arts share with the techno-sciences and advanced capitalism an 'affinity with infinity': the infinite ability to see, the infinite ability to know, and the infinite ability to realise / make / produce. This dictum no longer holds true. We are coming up to final limits, material and ecological. They are drawing ever closer and given the rapid material developments in the so-called emerging economies with exponential speed. The horizon is no longer that of the

infinity of the avant-gardes, techno-sciences, and advanced capitalism, but instead the finiteness of the Earth's material and ecological resources.

This imposes clear limits on the scope and extension of third-order cybernetics and the new modes of global governance (or non-governance) that accompany this new order. Latour develops his thinking along a simple line: he considers these systems as being designed by someone, some groups, some agencies, and that to attune them with boundedness imposed by the Earth-system we need to re-design these systems. The discipline of 'design' (in a broad sense) then takes center stage in the process of what he has described ever since his 2004 book 'Politics of Nature' as 'the progressive composition of the good common world'. This book is interesting here because it was written in response to the stagnation of green politics in Europe and elsewhere, so with the book he also put the question on the table: what kind of intervention is required now? - in his case in response to a perceived crisis of green politics.

'Design' for Latour is crucial because it introduces among other things, an attention to detail. When dealing with largest possible systems, and especially when facing the largest of them all, the Earth-system (Facing Gaia), attention has to shift according to Latour to the smallest possible details, and intervention has to emerge at the microscopic level of re-design and subsequently scale up to the macro-level in a process of collective experimentation.

Such a process can only begin with a clear and critical analysis of the 'design' of 'third-order cybernetics, and all this clearly exceeds the frame of the tactical media book as such. It does however suggest a clear call for at least one particular intervention in response to this question that has been haunting me since at the very least the beginning of this tactical media connections trajectory (but actually much longer), what kind of interventions are required now?

Whatever you call it, a 'third age of net-critique', a critical examination of the design of third-order cybernetics, figuring out the post-anarcho-illibertarian condition, this is certainly an important and challenging suggestion to take up.

The next steps then already clearly indicate themselves: How can one imagine such processes of re-design, at what levels, through which practices? What are the roles that activists, artists, theorists can assume there? And how can these things be put into practice? (politics)

Amidst the gloom we can see hopeful beginnings, the theories and practices of the commons that rely on scalable and self-sustaining community based systems of exchange, co-operation and governance. The transference of principles of free software to open content and free culture production, the experiments with distributed currency and transaction systems - but none of them and also not combined are enough to produce a viable counter-veiling force to what Brian has so nicely described as third-order cybernetics.

One possibility is of course simply not to act, at least not initially, and wait for these systems to collapse under the weight of their own internal contradictions (the crash-scenario). I very much oppose this view, the damage and the amount of suffering this would produce are unimaginable and the whole point of critique and (attempts at) re-design is to avoid exactly this scenario.

It is the failure of 'global governance', in as far as such a thing exists at all, that it is unable to address the ravages of this impending new order and so we cannot resign ourselves to either only re-design on the microlevel, nor to the design of self-sustaining communities, let alone to inertia while waiting for the crash.

The critical analysis / deconstruction of this impending order can be a step one towards developing ('designing') new and efficacious forms of intervention - that I see as a clear and potentially productive suggestion.

Then a final practical note: we are participating in some debates and with a workshop with the tactical media connections project in the upcoming edition of Transmediale (Feb. 3 - 7, 2016). We will also use this opportunity of the festival as a gathering place to hold an informal meeting during the festival, exact date and time still need to be determined as soon as the overall festival schedule is fixed. Much in the tradition of the nettime meet ups that are referenced in Ted's and Felix's text. It would be great to see people there and debate about these and other ideas.

We'll post details also here and on our blogs when we know place, date,

time, but as stated in the text such physical meet ups are extremely important so we hope we can have a more direct exchange there.

bests,

eric

On 04 Nov 2015, at 04:53, Brian Holmes <bhcontinentaldrift[AT]gmail.com> wrote:

As noted last April Fools', there will be good reasons for fresh conceptual collaborations in the future. The neoliberal order with its bewildering anarcho-libertarian ideology is on the way out. We are headed toward a new state-form based on third-order cybernetics, or general ecology, in which finely grained data on global populations will be used to repress those populations, but also to facilitate and channel behaviors more adaptive to the overall earth system. As resource use continues to grow, survival issues will increasingly make earth-system dynamics into an ultimate reference point, directly present and determinant for all experience, yet not susceptible of direct control. This leads to fundamental epistemological shifts, with many cascading effects on human-machine combinations (we cyborgs, I mean).

(...)

However, I think that key aspects of the coming round of global development will be orchestrated by the new inter-state/inter-imperialist order, in order to coordinate production/consumption and provide earth-system level services for all included populations. Who will do this? A consortium of countries including China. Whether the US or the EU will be part of it, I don't know. In short, the 21st century is not likely to be your grandpa's political economy!

I don't expect any recognizable pattern to become visible for a decade or more; but it is likely that that the decisive breakthroughs of the future are actually being invented right now, without us knowing it. First-order cybernetics was analyzed, critiqued and subverted in the Sixties and Seventies, and second-order forms were at the heart of our concerns in the Nineties and the Noughties. Don't you think a Third Age of net-critique is dawning? Who wants to have a go at that one? curiously, Brian

By providing freshly printed and essentially free money to private banks (sometimes even foreign banks, in the US case) governments were able to stop cascading failures and halt any drift toward a great depression. In China a huge infrastructure program was undertaken.Â In Japan money has been funneled directly to consumers. In Europe, the EU bailout of nationalized banking sectors has concentrated tremendous new power in Brussels. The global currency markets are not coordinated. States, to the contrary, pursue geo-economic grand strategies, that's the big difference.

I could easily produce some stats (using Jaro Mail, ehehe) but my current archive goes back only to 31 March 2011 without scavenging in backups. Here below a quick graph made using the last 3893 messages, I believe I'm breaking no privacy in reposting all strings that have already appeared in the From: fields

I think Patrice deserves a mention as most prolific contributor by far
I wonder what are the all time totals, I believe he can make it.

Date: Mon, 9 Nov 2015 09:15:49 -0500

Dear Nettimers:

"McLuhanite technological determinism" . . . !

As maybe the only person from the Wall Street "wing" of the technology industry (with at least one confirmed *weird* "assignment" from the CIA) to ever participate in nettime -- starting with that late-night phone-call from Diana asking me to "keynote" MetaForum III (in Oct 1996), guessing that I was the "anti-Barlow" -- I resemble that remark.

<http://www.pcmag.com/articles/0,2817,1265385,00.asp>

Perhaps some of my friends on the list would be interested to hear that I've started a strategic research Center, partnering with a retired Naval intelligence officer and many others, to consider how *digital* technology changes civilizations -- starting with China (which I first visited shortly after going to Budapest).

www.digitallife.center (<http://www.digitallife.center/>)

Thanks for *all* of your help along the way, I really couldn't have done it without you . . . <g>

Nettime is in bad shape, don't you think?

It has still a lot of goodwill, and more generally there's renewed interest in formats of exchange and collective thinking that aren't defined by the logic of social media. But the dynamics that social media companies exploit are hardly limited to a handful of platforms. For example, nettime has its own 'influencers' -- a 1%, so to speak -- who generate the vast majority of list traffic. That's been true for years. The discussions they sustain may variously seem interesting or annoying, but either way they've become somewhat formulaic. An attentive reader knows more or less what to expect based solely the subject and the sender; and even meta-discussions about whether the list is dominated or by this or that tendency are largely dominated by the same few people.

Some might argue the debates that have animated nettime over the last year -- the trajectories of postwar society, neoliberalism, the 'digital,' complexity, surveillance and big tech, Brexit, media and elections, Assange, even the Anthropocene in all its terrifying inclusiveness -- are the defining issues of the day. Maybe so. But if the nettime project had settled for a consensus model of the defining issues of the mid-'90s, it would never have gotten off the ground, and it certainly wouldn't exist almost 25 years later. The challenge, we think, is to maintain a space that

attracts ill-defined ideas and uncertain issues -- things and not-things that don't quite exist yet and yet haven't been buried under torrents of authority and theory.

So, what can we do?

In the past, we've asked people to think about outreach -- say, inviting new people from new contexts. It seems like that's had limited success: but at a time when nettime has been limping along, it's hard to get excited about inviting people to join an environment so heavily defined by habit. We've also joked that shutting it down before it fades into complete senescence might be best. But that joke wasn't really funny, in part because it wasn't meant to be: it was a way of expressing serious concerns about the list's increasingly parochial status.

Now, we have a simple proposal: let's switch roles.

It goes like this:

If you've posted more than others to the list in the last 60 or 90 or 120 or 180 days -- the math matters less than the spirit -- take a break. Let others define nettime, a space made up of nearly 5000 subscribers.

If you haven't posted to the list -- say, because it seemed like your ideas, concerns, or whatever you want to share wouldn't fit with nettime's habits -- maybe that will change.

Think of it as an un-grand experiment: a way to see what else might happen, who else might speak, what less familiar ideas, perspectives, or styles might spring up. Maybe the list will fade into silence, and we'll be left with a paradoxical object, a list composed *entirely* of lurkers -- not such a bad non-end for nettime. Or maybe not. There might be many ways to find out. For now, rather than the 1% debating how narrowly to define good manners, let's see if a different 'we' can change things.

OK, I'll bite, as someone who has posted much less than others, but been a member forever.

This new policy as is as shallow and milquetoast as YouTube's reluctance to ban actual nazis, misogynists and white supremacists from its platform and all the subsequent mess that has been roiling social media over the last week.

Now, there aren't too many outright types of these people on nettime (a few, like Morlock and others) but this consistent bourgeois misunderstanding of contextless "free speech" and a libertarian fetish for nonintervention is really galling, especially on a list that strives hard to understand the social and political and ideological underpinnings of what is ostensibly neutral (eg technology).

I urge you to actually start moderating again.

Frank.

I resemble that remark, and I object to it strenuously!

WTF is a "consistent bourgeois misunderstanding of contextless 'free speech'"? And what makes that misunderstanding "bourgeois" in nature?

As the moderators have heard me say before, my two issues with this list remain that it is (a) too much a monoculture of ideas and (b) relies too heavily on jargon.

Jargon that impedes comprehension, while at the same time softly slandering those "we" (used loosely) dislike (c.f., "bourgeois"; also the use of "neoliberal" in the initial post).

Solzhenitsyn (are we allowed to reference him, or is he too much of a conservative to be taken seriously here?) wrote, in his stellar book "In The First Circle," about the concept of the Language of Maximum Clarity. We should strive for this (and it's certainly the opposite of "bourgeois").

As for the ideological monoculture... I don't know what to do about that except go back to my list filtering and lurking.

Sascha

Low-poster, relative newcomer, appreciator of what nettime allows, confesses hazards of doctrinaire free speech since 1992:

1. Got kicked off several fora for annoying, angering, pissing off moderators.
2. Got kicked off Twitter for violating ToS, fingered family members of Trump jackass.
3. Got booted as moderator for allowing unfettered postings, "too immoderate."
4. Got rejected from several journalist-related fora for not being worthy, no commercial cred.
5. Got accused often of "going too far" with publications and opinions, violated official secrecy.
6. Got slew of mail-list postings rejected as being not appropriate, not list-flattering.
7. Operate unfettered mail list with about 50 subscribers, one of which posts at length.
8. A list moderator committed assisted suicide begging me to approve, which I refused, condemned. List now unmoderated, but almost dormant.
9. Have always been opposed to moderation's censorship, redaction, privileging, lollygagging, career-building, intolerance, buttering-up, on and on, understanding those attributes are given for language, intelligence, education, esteem, pride, ego, herding, chastising, excluding, prejudice, shutting on.

10. Online has bred innumerable pestilential moderators, a very few exceptions, nearly all psychotic, god keep them from coercive control of their families, colleagues and subscribers.

11. Here's a UK appeals court quashing murder rap of a woman who hammered her husband to death for "coercive control:"

<https://www.judiciary.uk/wp-content/uploads/2019/06/challen-approved.pdf>

12. Lurking is much superior to posting, leaking, confessing (mea culpa).

13. Silence is free-est speech.

For me, "bourgeois" is equivalent to "middle class", whatever this one means. In parts of the world where "bourgeois" constitutes a dictating majority, "free speech" is, IMHO, equivalent to casual speech and is a way to entertain during social gatherings. In other places, this is a way to put oneself in a troublesome situation (with degree of troublesome varying from ostracism to execution).

[...]

> As for the ideological monoculture... I don't know what to do about > that except go back to my list filtering and lurking.

To avoid ideological monoculture, per analogy to avoiding eating monoculture, feed yourself from different sources.

From: Sascha D. Freudenheim

To: nettime-l@kein.org

Date: Fri, 7 Jun 2019 17:49:37 -0400

Thank you, Tomasz, for chiming in.

Your definitions are interesting. But if we take them as a starting point, I find myself still struggling to understand Frank's intended put-down, as well as his complaint. This list serves no real purpose beyond a kind of digital entertainment at a virtual social gathering. I'm not dismissing it's value in that context, but as a group (however loosely constructed) we are not self-consciously engaged in the active process of "changing" anything except our own minds through dialogue. (Or not changing them, as is likely often the case.)

So, Frank, if that definition of bourgeois suits you, and if you agree with Tomasz's framing on the connection to free speech, then why are you here?

For those of us who do live in places where speech can create trouble--and no doubt many of us do, and more of us may yet soon--then it would seem a gratuitous swipe at the speech they post here to dismiss it that way -- and to suggest that the moderators are ill-equipped to manage it or understand it in that context.

As for my "feeding" habits, indeed, quite right. If anything my media intake is polymorphously perverse.

Sascha

Just adding my two cents, as per the call. :) I only discovered nettime in the last few months. I'm a computer-child, I've grown up on the net, and one of the people who now take a more conservative or critical approach to tech. I came here because I am trying to develop as an artist, working with the net as a medium and reflecting critically on the net and its constituent parts. I don't post in to every thread because a lot of the time I don't have anything worthwhile to add, but I appreciate reading; most of the contributions on this list are really insightful. The fact that people are posting meta threads like this is a good sign to me, I appreciate a community that can take a critical view of itself. If nettime does rap up, let me know where you all go, I'd like to talk more. :) John

Ted and Felix, firstly let me say that it's nice to read your email concerning the list. I guess lots of us lurkers think we are not eloquent enough to get into discussions. Perhaps some of us are not used to virtual exchange, or just can't bother to take sides that are so uniform. It might happen that we are killing the list if we don't let hyper active ones to act. At the end, lurkers are here to learn from drama of leftright hyper zigzag. Personally, I like some posts that some others don't and would hate to miss them. My daily amount of Morlock and Morlock-haters is something I love to hate. I would miss it. If that is what nettime is, so what? This said, I fully expect that other lurkers write and hopefully there is new wind in nettime sails, so am

fully supporting your initiative. Karim

Just forwarding this up.

From: Karim Brohi <karim@trauma.org>
Sent: 8 June 2019 14:35:45 BST
To: John Preston <wcerfgba@riseup.net>
Subject: Re: <nettime> Nettime is in bad shape. Let's see if we can change it.

Nettime is in bad shape - as are most (all?) of the email based discussion groups on the Interwebs now. I run another mailing list, started in 1995 in a medical

specialty area - which finds itself in the same state.

Back then email was cool.

Now, for most, email tends to be a flood of work stuff and a pseudo todo list.

Drafting an email is now work, and not associated with pleasure or pure intellectual pursuit. But there's no other suitable medium either.

Social media platforms are too brief to develop ideas.

Too easy to fire back "your idea is stupid".

Blog posts and newsletters are too one-sided.

Developed/owned by a specific individual/group of individuals. Comments never have the same precedence as the original post.

The post 'belongs' to the originator, not to the community. Maybe usenet/google groups comes close, but nobody uses them - perhaps because there's no (effective) 'app for that', and there has to be an active process of logging in.

(Email alerts end up in... email). In brief - I think it's the medium not the message.

The whole Internet needs a new medium that encourages long-form discourse and thereby deep community.

That was email, but now it isn't email.

I don't know what

is now. Karim

Each medium of communication has a different quality and bandwidth about it, and we can use a multitude of media -- nettime doesn't have to be /just/ a mailing list. Some of us might be better able to contribute via IRC or other more real-time media.

John

Hi René, RE: I tend to make egregious typos & grammatical mistakes that I don't catch until it's about a week later.

Same with me, I'm dyslexic and much prefer making and programming as a way to understand the world. On social media, particularly Twitter, I've learnt not to worry so much, though Nettime is a more intimidating space...

To: nettime-l@kein.org
Date: Sun, 09 Jun 2019 12:47:10 -0400

Thanks, Sean and all for these salient replies.

I have often been active here, but had been offline more than I like related to living in Arabia; some things you'd imagine, others not. More than anything else, I have been creating a VR research center and doing a snowstorm of paperwork. My intentions are to be here more, as my research is revving up again.

I value Nettime a great deal in that it remains one of the places where a high concentration of fine minds, whether they pop in or out like virtual particles into the cyber-aether, usually pop out clear thought.

Another thing is that for the past three years, I have been traveling into Central Asia, Married an Iranian, coming to know the Eastern Hemisphere, and seeing what Geert Lovink and I had long discussions on here in Abu Dhabi relating the slide of Krokerian Bimodernism to American global colonial war capitalism under the Plan for the New American Century to the collapse into spheres of influence with the rise of Trump.

Actually a lot more than this, but the flood of understanding has taken a while to coalesce.

Looking forward to more conversation.

I've been active long ago, and lurking for a decade or more, with only sporadic comments and adds: this look like a good prod to get us silent majority out of the closet, the thing that keeps nettime valuable is a) the contributors, timeliness, and swift smart dialogues and b) that there still seems to be a common purpose.

social media start taking the forefront about ten years ago. The neo-populist right begins to replace the neo-liberal right about ten years ago. Is there some shared diagram?

Other lists died for their own reasons: one because it seemed like everything interesting was on blogs, back when the blogosphere was a thing. Another because a concept / art movement / political trajectory could be exhausted so fast it scarcely seemed worth inventing new concepts etc.

Mailing lists are asynchronous, which is great: more time to think; less kudos for fast reaction times. More consideration in every sense of the word in a few days I'll try to post something closer than this reflection on the medium to what I think this list is for: the aesthetics, politics and aesthetic

politics
of the early C21st --

consideration, wonder and hope

Sean

I'll keep it short as I've said it before some years ago...

I think the pro-active moderation was the whole specialty of nettime, fostering high quality and inclusiveness. Since you dropped that (possibly because it was too much work, so I'm not blaming) the list slowly lost its focus just as all the sociologic research I look into predicted... maybe Pit can give it the original pitch back? Hugs from NK, C.

Carlo and nettime! Thank you for this, Carlo. I could not agree more, the deliberate effort of mods to put material that is provocative and worthy on the list...BUT, it may also be, and this is where mods could also help...that the great net debates have disappeared or died out. There are new debates, but who is framing them relative to networks.

The question comes up more and more - where is the whole idea of networks that was once? Answer: sorry, social media has everyone blissed out on their own screen.

The great debates that enlivened networks of the 90s, have become muddled to the point that "networks" per se don't seem to carry much weight online - now it's the app, it's the website - which don't always reflect a living community of net-users as we know...or maybe we are imagining networks differently than before and that does not help. Common interests which drove the formulation of networks and network 'flows' seem to have been replaced by something else. Who is the we of any network now...I don't know...that was my feeling when I read this. So, yes, we need the heavies, maybe...to frame the debates so we can bat our own balls back and forth and to and fro on nettime. Molly

Most formerly valuable mailing lists are dead, Carlo.

Here you find a recent quote from Joichi Ito:

"You know that little girl in The Exorcist? That's what the internet feels like to me," Ito said. "You have this little girl and you think she's going to become this wonderful kid and then she gets possessed and starts becoming this demon. And we have to exorcize her and we have to kind of bring her back."

Forwarded on behalf of Nina----- Forwarded message -----From: "Nina Temporal" <nina-temp@gmx.de> Date: Sun, Jun 30, 2019 at 3:59 AM Subject: Aw: Re: <nettime> Nettime is in bad shape. Let's see if we can change it. To: Molly Hankwitz <mollyhankwitz@gmail.com> Hi Molly,

Thanks, I have a similar perspective.

but wasn't allowed to post it on nettime - unfortunately it seems that disallowing Andreas to disseminate Standard sexist phrases like I Would probably have no other topics than sexism, has put me on a watch list.

So, even if we have different opinions about JA, Would you mind forwarding this? (see below, only that Part.) Thanks!

I am especially concerned about this new regulation ruling out the big names, as Ted and Felix explicitly came

up with it after I asked them for help in relation to the onlist sexism and racism and

offlist Harrassment by JA disciples (no big names) I was exposed to after criticizing JA. But the current development is nothing I Would have endorsed - it doesn't heal the racism of a Morlock Elloi, it only leads to the big names writing privately somewhere Else, which is a pity. I mean, the amount of New people writing here is great, but I don't see why both couldn't coexist.

Best N

My mail that didn't get through:

I wasn't in favor of the principle of disallowing the people who usually write here to continue with the same frequency. They probably now simply discuss in private, elsewhere.

But I think it's great that so many "new" people are writing here.

Saying nettime would have lost its quality is an insult right into the face of these people. And not even true. And sometimes phrasing new perceptions needs a while - and is a courageous endeavour - whereas following beaten paths of the discursive findings of past decades might gleam with terminological perfection, but reveal at best only extra layers of outdated truths.

Especially in the field of tech/media one should always be aware of this - even more so, as not only the technology we are using is rapidly changing, but also the brains of new generations succeeding as recipients of these.

That said, I always did like the discourse the nettime Community was known for, and I'd regard it as a loss if it was impossible for both to co-exist here. But trying to artificially preserve only that one approach here feels like calling for it to become an exhibit in the museum of natural history, with its own display, boxed in under glass, and with its protagonists guaranteed a part in the next sequel of "Night at the Museum" ... (although that'd be kinda cute).

N.

Re: <nettime> Fwd: Re: Nettime is in bad shape. Let's see if we can change it.

From: John Preston
To: nettime-l@kein.org
Date: Sun, 30 Jun 2019 12:54:11 -0700

Thanks Nina, Molly, André, David, Allan, and everyone else for all your insight on this thread.

I'd like to chime in with a quote from our own slice of web [1]:

<nettime> is not just a mailing list but an effort to formulate an international, networked discourse that neither promotes a dominant euphoria (to sell products) nor continues the cynical pessimism, spread by journalists and intellectuals in the 'old' media who generalize about 'new' media with no clear understanding of their communication aspects. we have produced, and will continue to produce books, readers, and web sites in various languages so an 'immanent' net critique will circulate both on- and offline.

The internet, as is the want of any globalised socio-technical system, has de-localised what started off as a small group of people operating in a particular time and place: there are no borders on the Internet.

Perhaps we do not need to state a purpose for the list, its character is determined by its history and content, which I suppose is why these meta discussions can be (a sign of) destabilising in an waning community. Certainly it is useful to extract common themes. I like 'netcriticism' as a focus, as it ties in very much with my developing perspective.

In netcrit terms I no longer consider 'the net' to be the Internet, or even just our increasingly complex relationships with machines, but rather an all-encompassing socio-technical system, composed of people, computers, materials, machines, and various relations and transactions between them -- similar to Hakim Bey's conception but I try to think of it a model of the economic and power relations in the physical world, rather than as just an abstract space of information which might map on to the world somehow.

In that respect I see the list as covering quite a wide area of discourse, but with a focus on our contemporary setting, and hopefully with a pragmatic slant too. I believe we (civilization) are nearing both ecological and social tipping points, and we need to take action to discover and fix the parts of this sociotechnical system which are causing harm to the planet and our local communities.

Re: <nettime> introducing {AT} nettime_bot
From: nettime mod squad
To: nettime-l@kein.org
Date: Mon, 4 Jan 2016 17:31:18 +0100

On Mon, Dec 28, 2015 at 10:31:34AM -0800, morlockelloi[AT]yahoo.com wrote:

> Would it be possible, for those who don't want their names ending on
> TWTR disks, to have a Subject: tag that bypasses the bot - for example
> "MO:" (mail only), like in:

Done -- and thank you for this excellent suggestion.

>From now on, if you include #ANON in the subject line of a message, the [AT] nettime_bot twitter bot will omit the sender's name. The link will still point to the same old nettime archive, so it's trivially easy to find out who sent a message -- just one click.

Starting with this message, the footer at the bottom of every nettime-l message will include an additional line to explain this:

Other suggestions, about the twitter bot or anything else, are welcome.

Cheers,
the mod squad
(Felix, Ted, Doma)

<nettime> Down with moderation

From: nettime's mod squad
To: nettime-l@kein.org
Date: Fri, 18 Aug 2017 13:21:03 +0200

This is a good time to say that nettime hasn't been moderated for the last several weeks -- since July 4th, to be exact. We didn't announce the change because it didn't seem necessary. Inward-looking meta-debates about moderation on nettime have always been at least partly boring, and they were sometimes destructive -- so why invite another one? Why not let them fade away with moderation?

Whatever you think about nettime now, it seems safe to say that the list would have ceased to exist long ago if it hadn't been moderated. But over time, as the list has become sleepier, the benefits of moderation have become fewer. And, as Keith's message shows, moderation has downsides -- for example, uncertainty about whether some messages have gotten lost in the shuffle.

Over the last years, moderation -- to a large extent -- consisted of menial tasks such as rejecting onliners and ask people who submitted bare URLs to write a brief intro and post the entire content into the mail, since the nettime archive is, actually, an archive. So, we ask you do keep this in mind -- along with all the rest -- when posting to nettime.

Also, for all the people who care about nettime, think about inviting new people to post their own interesting material.

So, for now at least, any message from a subscriber should immediately appear on the list. Non-subscribers' messages are held for manual approval. If anyone seems to be abusing the list, we'll flag their address so their messages need to be manually approved.

the mod squad,
Felix, Ted, and Doma

Subject: <nettime> digestion digest
From: nettime mod squad <nettime@kein.org>
Date: Mon, 19 Jan 2015 06:27:37 +0100

As nettime comes up on its twentieth birthday, we've started looking back at what happened. What follows is a nearly complete list of more than 700 different identities we've given to nettime's digest function over the last 16+ years.

Cheers,
the mod squad

<nettime> Nettime-bold is dead
From: the nettime mod squad
To: nettime-l@bbs.thing.net
Date: Wed, 28 May 2003 19:17:40 +0200

Dear Nettimers,

We are closing nettime-bold. Some weeks ago, we stopped archiving it because the archives kept breaking.^[1] Now, because the cost of running the list is high in terms of load on the nettime.org server and the benefits are low in terms of creative or 'open' uses of nettime-bold, we are closing the list for good.

As an experiment, Nettime-bold was a failure, but a revealing one. First, there was very little interest in it. At its best, nettime-bold had about 130 subscribers, which, at the time, was 5% the subscribers nettime-l had. Originally, when the decision to launch nettime-bold was made (Feb. 2000) we intended as a way to make the moderation process more transparent. Since there was some discontent with the moderation, we thought that alternative moderations might spring up, using the same base feed as nettime-l. It didn't happen.

Second, and more importantly, it seems like it's impossible to run a completely open channel, even if you don't care about the quality of the content. The Internet, as an environment, has become so 'hostile' that 'undifferentiated' openness is not a practical option anymore. This happens both internally, in the sense of people who know the list abusing it deliberately (to make an artistic or political point), as well as externally, where the list becomes just one in a million anonymous addresses, available for \$19.99 to any spammer.

This is not surprising. Flame wars, list flooding and spam are we well-known problems. But it raises the question how to maintain openness in an environment you cannot assume even the most basic assumptions to be shared.

This is not to say that it's impossible to keep a communication channel open (slashdot, wikipedia and, we guess, nettime-l are working examples) but it means that there is a need to upgrade both the technical platforms and thinking about what 'openness' means.

One thing this no longer means is an unmoderated nettime channel. RIP, nettime-bold.

[the nettime mods]

<nettime> Nettime is dead

From: anna balint

To: nettime-l@bbs.thing.net

Date: Fri, 30 May 2003 16:27:12 +0200

Dear mod squad,

i thought the contrary, that nettime is exactly the only list that failed to remain open in the new media criticism&art lists environment, every other list came up with an idea...

I am one of those persons whose mails normally don't hit the nettime quality standards or does not fit in the policy, and this also makes me even more than oppose moderation, but besides that, i think nettime failed exactly because of moderation or bad moderation in several respects:

- it lost the intimacy of personal communication and personal culture as opposed to commercial and largely spread push content and academic culture
- it failed to cover both Western and Eastern underground culture, largely based on the aesthetic of the imperfect *West* or on formal perfection *East* [just think to nettime's resistance to ASCII art and culture, law-fi, or compare this mail of the mod squad with a former mod mail <http://amsterdam.nettime.org/Lists-Archives/nettime-l-9802/msg00002.html>]
- the list suppressed or neglected among others criticism concerning female participation, race politics, multiple cultures, information and network culture
- together with the increasing number of subscribers the list gave up somewhere to found the Neue Frankfurter Schule, but it also failed to concentrate on research both in the field of art and media. Somehow first it became a dog driven by the tail of media activism, a term originally coined by Toshia Ueno to describe the task of including subcultures and counter cultures in an interface remaking and changing the public sphere - now look, nowadays even online activism is meant for saving curators of the elite. Meanwhile, together with establishing, the list also became one of the many lists...
- moderation is a good ground for abuse, it may exclude alternative views, and favour unjustly other ones, ex aequo et bono it does, and so does nettime's moderation model - just to mention the example of nettime's influence on the syndicate list once started to encourage East and West European art and information exchange, where the two West European moderators failed to recognize a subscriber's East European attitude and identity, and kicked it off the the list without the community's approval, without discussion, and even without letting known the unsubscription.

Problems with the nettime moderation started with the rejection of posts that could have been relevant for the list content, goal and manifesto, and ends with the complete change of the character of the list.

- Pit Schulz was sighing from his boots in 1996 that there is need of a software for a list, I don't know what happened since then, where is that software?

Why did the nettime bold include all the spam, why the list was not set to reject non-subscriber's mail?

Even a small list like syndicate, that has no institutional support except for hosting the list on a safe server, experiments much more in the field of information exchange, with the KKnut project for example, that allows direct interaction of URL, text, and a mailinglist. Have a look at <http://anart.no/~syndicate/KKnut/>.

- if once the nettime meeting took place as a 'let's also do something' alibi when I wanted to go to Venice in 1995, and since i did not get the visa for Italy, i got the nettime list instead of Venice, now, together with the dead of nettime bold,

i state that I don't need it anymore, this year I'll make it to Venice, and i am one of the five guards who keep alive the fire of openness at the syndicate list.

greetings,
Anna Balint

To: nettime-l@bbs.thing.net

Date: Sat, 31 May 2003 11:18:58 -0400

Anna Balint's list of complaints about nettime and its moderation trends points to the inherent problems and strengths of moderation, filtering, and focusing. People, ideas, announcements are excluded. She bundles those as examples of abuse.

However, in list after list, where there is a very diverse and volatile group and no moderation, you can have a small number of people who can drive large numbers away. The membership may grow, but the cohesiveness of the group (if that's a goal) suffers.

My guess is that nettime moderators are trying to balance this. Balint thinks they have failed (and tells us why). I think nettime has worked quite well, though I have come and gone a couple of times.

In 2003 there are so many choices for group interactivity besides mailing lists (which are still the most important basic tool). Web-based ones like scoop and drupal allow voting and self-organizing,

<http://www.drupal.org/>
<http://scoop.kuroshin.org/>

And there are wikis, and blog wikis, and other new hybrids surfacing each week. Populating those with interesting ideas and people remains the ongoing challenge.

Steve

Re: <nettime> Nettime is dead

From: Ian Dickson

To: nettime-l@bbs.thing.net

Date: Sat, 31 May 2003 19:06:59 +0100

Interesting debate, that, broadly speaking, says you can't please all of the people all of the time.

Maybe we can help.

We could implement Nettime in CommKit.

CommKit is designed to help build complex scalable communities.

This would create a multi themed community which would include, in parallel, sections that were entirely moderated, to areas that were a free for all, and all shades in between.

Access would require username/password but once in, a members could configure to operate entirely by email. (This is largely an anti spam, anti abuse feature).

Members would control their own experience. So I would probably join a fully moderated area. Others might go moderated, plus join the, for example, unmoderated section of the New Media Arts group.

We could also allow non executable attachments (which wouldn't be distributed by email, no point in filling up those dial ups with the latest 10MB video art. Email members would be told that an attachment

exists, and that they can get it from the site).

This would also be a V2.0 implementation, and so could include the option to allow members to publish searchable info about themselves, thus aiding offline developments.

Let me know if you want to explore this.

Cheers

I think these figures serve no useful purpose.

I switched to nettime-bold but soon found replies to threads appearing that never made it to nettime-bold in the first place.

I posed the question several years ago, and got an explanation of why it happened that way, but we didn't get much further than that.

<http://amsterdam.nettime.org/Lists-Archives/nettime-bold-0104/msg00096.html>

Sort of killed the whole point of being on the bold list for me, so I gave up and went back to nettime-l.

I think an unmoderated version of nettime is a good idea -- I would join it, if it worked.

I volunteered to help at the time, even met with a moderator to discuss what we could do, but there seemed to be a major resistance going on at the top.

>
> I think these figures serve no useful purpose.
(you know the rest from the thread...)
<-snip-->

My response:

The key to this dilemma is time. Nettime bold is not successful due to the amount of time it takes to filter all of the submitted material. In an ideal world, all nettimers would have the time to look over every e-mail sent to the bold list, but this is not possible as everyone is attached to some sort of obligation that takes time away from full immersion in possible meaningfulness...

I think if the time were available bold would be very successful, but the truth is that most decent publications need editors -- I do not care how decentralized the net may become, this will always be true to some degree. Editors have been around for quite some time in order to subsume noise. Unfortunately, editors (by default) hold a certain privileged position within the intellectual power structure -- Nettime volunteers are no different. Let us be honest about this and move on. Though I do think the bold list should be made available in some form -- even as messy garbage... who knows, maybe someone could appropriate it as a decadent state of overproductive awareness.

Keep on editing, but find some way to leave some (that is where the real challenge is...)

Re: <nettime> Nettime-bold is <bleep>
From: Andreas Broeckmann
To: nettime-l@bbs.thing.net
Date: Fri, 30 May 2003 09:56:13 +0200

dear cpaul,

the whole thing is really easy; you create a mailing list that receives everything sent to nettime-l as a forward; this list is nettime-bold, and you and others can subscribe, communicate etc. on it, as well as push stuff from bold to nettime-l, however, if _you_ don't create and maintain this list, _somebody else_ will have to do it, and i fully understand that the current moderators don't want to be that 'somebody'. maintaining a successful list, incl. communication with confused subscribers, surprised sys-ops, and an ever-growing amount of spam, is time-consuming, and i am surprised why people are not more inventive when it comes to creating alternative channels.

all you need to do is ask the nettime mods for including

forward inc [AT] fastmedia.net

and you get the whole thing unfiltered. become a bold archivist!

greetings,
-a

as such the bold feed had a noticeably degraded signal to noise
ratio, since it was missing messages which were not originally
sent to the correct nettime-l address.

this unfortunately reduced its usefulness as a playground for
inventiveness, for archiving, and even for reading by humans.

i am not disappointed to see that generation of nettime-bold go.
it gives the moderators troubles, end it.

i would like to engage with an unmoderated nettime, but i think
the difficulty of accessing a raw feed in its fullness continues
recursively.

Incredibly Important Administrativa, Sort of

From: nettime
To: mettime-l-temp@material.net
Date: Fri, 11 Jun 1999 22:17:38
+0100

<nettime-l-temp [AT] material.net> is the temporary home of the nettime-l list
while desk.nl rebuilds its list-serving machine. please continue to send
messages to <nettime-l [AT] desk.nl> and your commands to <majordomo [AT]
desk.nl>.
nettime-l-temp should be active for approximately 2 weeks (11-28 Jun 99).

[greetings...as of Tue, 8 Jun 1999 10:18:38 +0200 (CEST) or so,
basis.desk.nl, the computer nettime runs on, has been more or
less dead. it's alive in the sense that it receives mail, but
dead in the sense that it cannot distribute mail. desk is pre-
paring to upgrade the server, but that might take a few weeks.
so, until that upgrade is complete, we are moving the task of
distributing nettime to <material.net>; however, the *incom-
ing* addresses will be the same: mail for distribution to the
list goes to <nettime-l [AT] desk.nl>, and all majordomo commands--
un/subscriptions--to <majordomo [AT] desk.nl>. while the kludge is
in effect, unfortunately, mail will be 'From: nettime.' we'll
mangle it so that the subject line includes who actually sent
the message, and all messages will have a header and a footer
explaining the situation. over the next few days--today being
11 june--we will resend all messages that arrived but seem-
gly were never distributed. we expect this situation will last
for about 2 weeks. thanks for being patient. --cheerrs tb/fs]

22.O

<nettime> kein nettime-l
From: nettime's_mod_squad
To: nettime-l@kein.org
Date: Thu, 19 Jul 2007 15:44:30
+0200

Dear nettimers,

For many years, through work and play, the nettime-l moderation team has
maintained this list from locations, both banal and exotic, around the
world with very little interruption. For lurkers, the break of the last
week probably seemed like the usual summer slack; but for those who sent
messages to the list, error message may have revealed that something was
afoot.

The Thing in NYC -- in particular, bbs.thing.net -- has been nettime-l's
home since July 1999. However, a reorganization of The Thing's energies
and resources has been long overdue. And that, in combination with server
problems, put the list offline for the longest time since it made its
first move, from desk.nl to a temporary home on material.net.

We'd like to offer our sincere thanks to thing.net, and the people who've
made bbs.thing.net such a fine home for nettime-l for eight years, almost
to the day. In particular, we'd like to thank Wolfgang Staehle for his
patient and generous support of the list (as well as many other excellent
projects in our neighborhood).

Nettime's new home is at kein.org. Kein currently hosts hundreds of lists
very effectively, so we're especially grateful to Florian Schneider for
graciously setting up the peculiar configuration this list needs. Really,
we couldn't have asked for a better technical or social environment.

Please note that nettime has now new addresses:

--> to post to the list: nettime-l [AT] kein.org

--> to reach us: nettime [AT] kein.org

--> to un/sub: majordomo [AT] list.kein.org

All the rest -- in particular, the archives at nettime.org, maintained
by Michael van Eeden at the Waag in Amsterdam -- will remain the same.

For those who automatically filter email and/or rely on the list's host
or headers to process list traffic, please note that this move will
probably require some effort on your part.

Ted Byfield
Felix Stalder

<nettime> the we of nettime
From: nettime maillist
To: nettime-l@desk.nl
Date: Fri, 22 Aug 1997 01:19:14
+0200

dear nettimers

apologies for the break. it took a while to check the technique..
 this is quite a fat message - you can see it as a practical
 answer to Jordan's last posting, following Geerts clear and
 elegant reply.

it's a bit paradox, just in the moment we have to discuss a lot,
 the list is getting 'out of control'. there must be some
 undercurrent streams which are popping up now in strange ways.
 after the '5 year plan for nettime' Geert and me posted in January,
 which was fulfilled until now, even if extremely ambitious, we
 have now the problem how to deal and distribute the success of
 nettime without breaking down under the needed restructuring of
 reaching a new level of organisation which fits to the changed
 needs. First, it would need a collaborative description of these
 needs, it's partly just a question of scale, but there are
 many more questions.

to leave me one question here: what problems have nettime and
 name.space in common?

Instead of theorizing i'd like to go to the level where
 'i can do something for all of you' without hurting anyone too
 much. a moment of silence isn't bad for reflection, the question
 is still if we need moderation and how we decide about it.
 a basic problem of 'practical democracy'.

during the last weeks i got several mail concerning the
 question of moderating nettime, basically expressing a
 'clear yes' (ok, there was one 'better not') so, for the
 next weeks we will go to the model which was already
 tested last year and should work as an interim solution
 until we have found something better.

the two channel interim model:
 the nettime-l maillist
 (moderated - by Geert and me until now) and
 alt.nettime (unmoderated), both are subscribable.
 see the how-to below.

If this becomes extremely difficult, or if many of
 you are revolting, we just get back into the old mode
 again, but i doubt that it will work for long.
 It is an experiment and it needs your participation
 critique AND understanding.

how to deal with the interim solution:

A) alt.nettime:
 contains *all* mails from nettime-l plus *all* replies.
 there is (almost) no traffic limit, the best way
 to use this is via a newsreader: zero scarcity!

newsgroup:
 news://news.thing.at/alt.nettime or
 news://www.icf.de/alt.nettime or

<http://www.dejanews.com> ...

by mail:
 nettime-t [AT] thing.at
 alt.nettime [AT] workspace.icf.de (temporary)

subscribe to the newsgroup:
 send mail to listproc [AT] thing.at
 subscribe nettime-t Your Name <your address>
 into the msg body

B) nettime-l:
 like before, but with more editing/moderation.
 post reports, essays, manifestoes, lectures..
 expect some filtered mails appearing at the newsgroup
 and more pauses between sendd text-packets.
 also see >some questions< below.

a special case: announcements
 one suggestion was to set up an own mailinglist for mail-flyers,
 (nettime-annonce) which sends out weekly digests. anyone likes to
 help with this? it could easily grow and would then need an own
 moderator. before announcements will get compiled into a digest
 by hand, and if urgent send out immediately. someone has then
 to decide which announcements are out of context (private CVs)
 or spam (commercials). with the double mail from Hotwired
 lately i wasn't very sure. i would help a lot and add to the
 quality of nettime if someone else would like to do this
 independently.

some questions:

- * how to get to know 'who are we, me, you and the rest of us':
 subjectivation and identification is still a burden, nettime
 in a whole did not count too much on it, let's keep it this way.
 what colour do you have? who is representing your desires?
- * how to get nettime more 'radical democratic' without destroying it?
- * how to find, discuss and build up new technical solutions which loose
 the limited and inherently feudal model of the majordomo behind?
- * how to program and design social interfaces and free groupware before
 nettime has to adapt to given proprietary and closed software standards?
- * how to keep or put nettime in the hand of the community instead of
 creating distrust, envy, discordia and a potential abuse of power.
- * how to keep up the ongoing and still working 'gift economy' of
 pre- and re-publishing without getting in trouble.
- * how to let nettime not become a slow discursive battleship under
 one central command-and-control-structure.
- * how to add more critical questions without getting lost in
 a self-destructive nettime criticism.
- * how to avoid the creating of splinter groups AND a forced unified
 will under some unwritten dogmata OR a aporia of noise?
- * how to continue this experiment with this extraordinary group
 of mindful people to still let surprises and conflicts happen,
 but also work on a continuity and effectivity in the discourse
 (on and of the net).
- * how to apply technology to enhance and specify the social
 functionality without loosing coherence and the productive
 aspects of a working economy of gifts? (is an inner-circle,
 a group of the oldest nettimers viable, or do we need more
 'political apparatus', voting, formal debate... and: how
 to distribute tasks+responsibility if there is 'no money
 in sight'? do we all have to become electronic monks?)
- * what is a moderator, what are his/her tasks, what are the
 responsibilities? is there a way to collectivify, enhance or
 distribute the task of moderation without adding more chaos
 and paranoia.

-- hope these questions are not too compromising, any
 criticism and commentary is welcome, whatever comes
 in your mind, post it and it will get digested and
 reposted here. ---

2. next practical projects (new work to be done.):

A) the nettime offline archive:
 as announced long time before, there is a chance now
 to put the complete nettime archive + zkp1.2-3.4 on a cdrom.
 (plain ascii nettime archive from June 1995 to September 1997,
 3.1/2 inch disc) it will get payed by ars electronica and
 distributed through their channels. (le parasite) it will
 remain public domain for non-commercial use. any suggestion
 for the cover and the database design and a cool copyright
 disclaimer are welcome. this weekend a text will follow where
 every author will get asked for permission. the print run
 will be around 1000. We try to find a way to make an quick

& easy shipping for subribers possible.

ZKP4, and the world
same counts for the zkp4 which will be soon available
through the v2 archive in Rotterdam, thanks! Ljudmila still
sits on ca. 5000 copies. Here in Kassel we will probably
will be able to run empty. We successfully used the dX postal
service (thanks!) and all the authors should now have their
private copy, everything else needs extra funding. IF YOU out
there like to redistribute ZKP4 (find <http://www.factory.org/nettime>)
in Australia, Asia or Amerika please go in contact with us.
We will try to ship as many as possible copies to Rotterdam
where there is a big harbour.. (You might re-sell the copies
for the shipping costs.)

B) the book also called the nettime bible:
a team of some highly engaged nettime editors will meet
in Kassel during Sept., this group was growing not at least
through the meeting in Ljubljana. we will try to make the
process as transparent as possible without playing 'parliament'.
there will be a way for every serious nettimer to intervene.
we'll work on a raw version of a table of contents sorting and
selecting the textes and locate them around 'several planes'.
Someone mentioned a comic's section, more graphix etc. It is
yet completely unclear who will do this. The first manuscript
may get printed soon for common comments. Mieg van Eden at
factory.org is currently working on a annotation solution,
this will make Paraphernalia (Frank Hartmann) possible
and introduces dialogue into a more discursive text form.

C) a better place for the nettime-techies:
There is also the idea about setting up the virtual
domain nettime.org. Walter van de Cruisen who soon opens a
web-multiuuser-irc-moo at ZKM will redesign the ZKP-site
and downgrades to HT TP:O. It was long planned to start
a technical mini-mailinglist on the software-side
of nettime, the collaborative interfaces, publishing tools,
e-cash-machines, profile-data-bases, object oriented data
heavens, indulgent agents, chat, net-phone, and psychic
applets, GNU groupware, nettime-linux, and possible contributions
to the content liberation front may get discussed here. Let's
bring some theory and practise into a result (or at least some
cool plans), if you want to add, your competence, time, brain...
please write at this moment to mieg@factory.org or pit@icf.de

processing more diversification
(as discussed in Ljubljana):

SYNDICATE!
(ex-east)uropean issues theoretical and mainly practical,
specially if media-art related should go now to the V2East list
syndicate@aec.at := Moderator is Andreas Broeckmann <abroeck@v2.nl>
who waits for your mail. it's growing and the output of and after
the meeting in Kassel is amazing, big future. it is obviously
a list with very pragmatic not to say infrastructural goals and
it works(?) perfectly as an example of synergetic coexistence in
the nettime neighborhood.

FACES-L
very cyberfeminist issues get discussed in faces-l@icf.de
moderators: kathy@icf.de, diana@icf.de, and Connie Sollfrank
<100136.14@CompuServe.COM> et.al. i heard its very productive and vivid.
please have a look at Faith Wilders article posted here on nettime
and expect an surprising autumn.

other friendly neighbors:
Rewired, Rhizome, Telepolis, Ctheory, Mute, Meme, E-minds, Well, RRE,
Enode, The Obvious, Netly News and many more (unsorted), who likes to
administrate a list of cross-links? it will go onto the desk.nl site and
would need some gardening from time to time.

ok i don't want to bother you with more sermons. it would be great
if nettime would get back into the good groove. tell us what you think.

From: Tapio Makela <director@kaapeli.fi>
To: nettime@icf.de
Subject: Suggestion for Nettime...
Dear Pit & other Nettimers,

Being aware that no unified "we" is neither possible nor desirable, "we"
cannot be a starting point for a constructive discussion in an open
list such as Nettime. "We" refers to an understanding of a common ground
or an identity somehow negotiated or represented in Nettime. For me, at
least, Nettime is not about belonging to a group, but rather voluntarily
participating into a flow of writing, discussions, info bits, and
nonsense. Hence "us" may merely refer to those on the list without further
commitments in terms of one's identity.

What surprises me on this list is also a partial closed-mindedness about
different positions from which critical perspectives can arise. Perhaps
for many artists and scholars in a grant based understanding of
independent positionings it is difficult to accept that their
economical independence is that only in relation to a private sector. What
would that signify?

Any of "us" working with new media or any processes that are embedded in
technological change, a connectedness to small and also international
enterprises is there. I would say that more people on this list are more
keen to pinpoint the connections of VR to military industry than their own
connectedness to commonplace media industry. State & Art grants are
connected to art industry with its own gauges of power.

What I am getting at (to put it short since time is limited tonight and my
flu is bugging me off the keyboard) is that polarization of private and
public capital in terms of political or critical standpoints is not
relevant. At the same time I want to stress, that this remark does not try
to argue against public funding, only the (perhaps neomarxist undertoned)
tendency to make that polarity a political gauge.

Situations for private and public funding certainly have different
political ties in each culture. Here in Finland I, as well as many other
colleagues, are getting extremely tired, angry, and disappointed of the
public cultural funding due to its negativity towards youth & change. Art
industry and public funding here are a close marriage, and the space for
critical activity therein almost impossible. Hence, the possibility to
create independence through other than public sources of funding for
critical activities is extremely interesting at the moment.

If, through using the innovative cultural and media know how and "our"
international networks, it is possible to create such economical
enterprises, how could that somehow deteriorate the position of critique?
Or is the fact that someone or some group of individuals can generate such
a source of economical self support considered as threatening among those
who are dependent on it not existing?

Supporting the privately generated funding as the only alternative is
equally embedded in archaic (very current) politics, neo liberalism. Mixed
media, mixed capitals, mixed identities is the state of affairs
independent of Nettime and any thoughts expressed within.

I am not interested in discussing with people who want to attack this
position: there is nothing there for me to defend. It is not a position of
"my subjectivity" - - only a point of view about some very central issues
around "Hybrid Media, Hybrid Capital".

If there are others interested in an interdisciplinary analysis of this
subject matter, I would like to invite you to do a net publication with me
for next year. I will also coordinate a conference next year autumn in
Lapland with Hybrid media and capital as a central theme.

When both media and capital are seen as hybrids of social, cultural,
economical and political layers, no single layer can exist in total
isolation from one another. This leads towards a more responsible idea of
business, but also a more socially and economically connected "art". For
me, no matter in which realm I move, being critical is being political in
each realm through texts, acts and interaction.

To go briefly back to the idea of "us". Internet as an environment is seen
often as far too total, as if its importance was a determining factor of
how one performs as an "I". On Nettime, I think, many of the contributors
perform as writers, artists, poets, hackers, academics, media activists,
off-media activists, or through some other frame of reference.
Everyone is seen through their "Name" in the "From"-field, but what does
that signify? Like right now, the "I" who writes has still 37.7 degrees of
fever, does not use text editing but direct telnet due to something on my
web server, I sit inside the Attila Parasite, busy as usual, not enough
time to follow all the info bits on Nettime, especially now, ill, too much
to do... So being the very random partial "I" on Nettime, as one of the
very fragmentary random "us" there is really nothing else to decide about
besides how to keep this list as an innovative and constructive
environment for potential dialogue - - some of "us" may actually have
common interests.

Dated: August 18, 1997

The Computer Professionals for Social
Responsibility (CPSR) <<http://www.cpsr.org/home.html>>, by their attorneys, submit these
comments in response to the Notice
<<http://www.ntia.doc.gov/ntiahome/domainname/dnsnotic.htm>>
released by the National Telecommunications and
Information Administration (NTIA)
<<http://www.ntia.doc.gov>> soliciting public
input on the present and future systems for
registration and administration of Internet
domain names.

SUMMARY

The current controversy over the Internet=D3s
Domain Name System (DNS) raises important
questions about how the Internet, as a
decentralized, global medium, should be
administered and governed. While much of the
Internet was invented and originally funded by
the US Department of Defense and the National
Science Foundation (NSF) <<http://www.nsf.gov/>>, and although its governing institutions were
initially established and sanctioned by the
American government, the Internet=D3s technical
standards and basic policies have in fact been
set by a number of ad hoc, consensus-based
consortia comprised of Internet service
providers, engineers and users. This system
worked for a long time because of the shared
goals and technical sophistication of the
Internet=D3s original academic-based user
community. See And How Shall the Net Be
Governed?, by David R. Johnson & David G. Post
<<http://www.cli.org/emdraft.html>>.

But increasing commercialization and explosive
growth have begun to strain the consensus-driven
process of Internet administration. The strong
and widely publicized reactions of many
providers and users (and foreign governments)
against the Memorandum of Understanding (MOU)
developed by the Internet Ad Hoc Committee
(IAHC) <<http://www.iahc.org>> for revisions to
Internet domain name registration and
administration <<http://www.gtld-mou.org>> show
that the stakes are high and that more open,
considered and perhaps formal mechanisms for
Internet self-governance -- and for evaluating
alternative DNS proposals -- are called for in
the present environment. In these comments, CPSR
focuses on proposals for reforming DNS with a
view toward maintaining open Internet
self-government, introducing competition into
Internet domain name administration, separating
DNS management from trademark protection, and
supporting the continued growth of the Internet
itself. (CPSR addresses each section of the NTIA

Notice, and as requested our comments in
Sections II-VI follow the organization of the
Notice.)

As discussed more fully below, CPSR -- a public
interest alliance of information technology
professionals and others concerned about the
impact of computer technology on society,
founded in 1981, with over 1,400 members and 22
chapters nationwide -- believes that DNS is too
important to the structure of the Internet for
DNS =D3reform=D3 to proceed in a hasty or
ill-conceived manner, particularly without
adequate input from consumers and other users of
the Internet. Whatever its merits, the IAHC
process was closed, rushed and unbalanced,
leading to a proposal that should not be
endorsed by the US government. CPSR commends
NTIA for commencing this open, thorough public
airing of DNS issues, and for its express
acknowledgment that DNS reform, like other
aspects of Internet governance, should remain a
matter for the Internet community itself, not
national or international government agencies.

CPSR proposes that changes to the current DNS
model must reflect the twin goals of maintaining
Internet self-governance, thus minimizing
government=D3s substantive role in Internet
administration, while avoiding the continuation
of de facto DNS monopolies in the increasingly
commercialized Internet. We also emphasize,
however, that there is no present =D3crisis=D3 in
DNS administration that requires hasty
implementation of any system for DNS reform,
including those proposed by IAHC, Network
Solutions, Inc. (NSI) <<http://www.netsol.com/papers/internet.html>> and others. Unlike IAHC or
NSI, CPSR believes that the twin aims of
competitive Internet services and
non-governmental Internet administration can and
should be applied to the DNS system. A sensible
plan for DNS reform combines the better elements
of both the IAHC and NSI proposals, while
jettisoning others. In this light, CPSR proposes
the following principles for reform of the
Internet DNS system:

A. The Internet domain name registration process
should be opened to competition for all existing
and newly created generic top-level domains
(gTLDs).

1. Shared gTLDs should be administered by
competing registrars, with restrictions imposed
only based on any technical limitations.

2. No registrar (NSI or others) should enjoy a
proprietary interest or commercial "ownership"
of any gTLD, including ".com".

B. Domain registration should be separated from
trademark issues.

Registrars should not be involved in trademark
dispute resolution, but rather should refer all
trademark issues to appropriate national and
international judicial bodies.

C. The Internet's "root" server administration
responsibilities should be coordinated and
centralized in order to assure reliability and
scalability of the Internet.

D. The DNS reform process and ongoing DNS
administration should be handled in an open,
balanced and non-governmental manner, with full
participation by consumers and small commercial
entities, in addition to trademark owners.

1. International quasi-governmental
organizations (ITU, WIPO, OECD, etc.) should
have no formal role in Internet governance or
domain name registration. The extensive new
bureaucracy for domain name management and

oversight proposed by IAHC, including a Swiss-based Council of Registrars (CORE), a Policy Advisory Board (PAB) <<http://www.pab.gnld-mou.org>> and a higher level interim Policy Oversight Committee (iPOC), is unnecessary and counterproductive.

2. National governments (Commerce, DOD, etc.) have no necessary role in DNS administration except for ISO 3166 TLDs (e.g., ".us", ".de," etc.) and maintaining fair, open and competitively neutral Internet self-governance organizations.

3. The IAHC process was inconsistent with open Internet self-governance and biased towards trademark owners. With encouragement from NTIA, the Internet Society (ISOC) should be required to open up the process to permit full debate by the global Internet community on DNS practices. The absence of any "crisis" in domain name resources allows for thoughtful and deliberate consideration of DNS issues.

4. Hasty implementation of the IAHC approach will continue to splinter the Internet community and would unnecessarily involve international quasi-governmental organizations in Internet governance. The DNS reform process should be slowed in order to permit achievement of a consensus approach that all interest groups (including Internet users/consumers) can support. No "rush to reform" is necessary.

5. The US government should not endorse, and should actively oppose, intervention by ITU and WIPO in the DNS administration process. The government should not attempt to unilaterally dictate any specific domain name registration process for gTLDs, which are global Internet resources.

[good luck! to be continued...]

From: Patrice Riems -patrice [AT] xs4all.nl-
Subject: a semi-open letter to Paul Garrin

semi-open letter, because nettime is a semi-closed mailing-list :-)

Dear Paul,

For something that looks like ages now, I have been following the name.space saga on nettime. It is surely our longest lasting tele-novela (tele for telenet, of course), and I must say, I thoroughly enjoy it, and find it very informative. I also think nettime is and will remain the right platform to project & discuss the name.space issue as part of the general internet politics, was it only since if it was not in nettime, where would I be able to get all that information?

Now, the main visible (as opposed to substantial) characteristic of the name.space saga as it evolves on nettime seems to be its volcanic quality, whereby you play the role of some kind of very ill-humored Dante's Peak, out to engulf all those who dissent with you in a fierce pyroclastic storm. Like a seemingly increasing number of readers of this list, I think the point has been reached where this approach damages rather than serves your cause.

Over the last weeks you have - again - become more and more strident (and in the process also a bit (c)rude), about people harbouring doubts about any or all aspects of the name.space project, something I feel is everybody's good right. You also made (IMMO) the mistake of taking criticism of name.space for criticism of your own person and/or your bona fides, whereupon you saw fit to return the compliment. In so doing you look and sound increasingly, excuse the dutch word, "verongelijkt" (something like "put against one's will in a situation of not being right/believed". Now Leibniz said that dutch was probably the best language to write philosophy in (some home-work for Byfield, Cook & Stahlman here...), so let me explain my point further. There is another dutch expression, which says that there is a big gap between "gelijk hebben" (to be right) and "gelijk krijgen" (to be accepted as being right). To me that seems to subsume your situation in the name.space

issue. I'd like to add: this is not a drama, and every one of us, especially the somewhat maverick/marginal/mal-pensants type that constitute this nettime "movement", is more or less constantly in this situation.

Now I have always considered the name.space project as a very good initiative, and I continue to do so, (if you want to know why my name does "not" appear on the petition: my browser/machine could not locate it!). I have gladly, if very modestly, supported it, and I think it has many merits, was it only to make a lot of racket among those who would wish to take over the Internet without anybody noticing. I do not buy everything you say be it about name.space commercial viability, or its support of artists, or its technical feasibility in general, not only by what I am able to judge by myself (in technical matters: next to nil), but also because of the criticism I hear/read, all of which is not as totally silly, biased, and incompetent as you choose to portray it. But I need not to agree with everything in order to think of name.space in terms 'globally positive' (to borrow a phrase from good ol' French Communist Party parlance...). And I think that would be the opinion of the majority of the people on this list, but I fear that you are eating into, rather than expanding that majority.

So my modest advice to you Paul, with all due respect for your manifold activities and initiatives (or rather: because of them), would be: chill out! Cut the vindictive pronouncements about people disagreeing with you. And of all the homework you assign other people (I fear to think what might come my way!), do just one item yourself: #8 : smile! As I know you, you're very good at it.

With very best wishes and kind regards,
patrice

Subject: Bibles

Geert wrote:

>>> By the way, there are several Bibles in the making now
(a quick, thick and dirty one and an academic American anthology). <<<

Are we going to learn at one point what these "Bibles" contain? I am an atheist, and wouldn't want to find my postings in anything called 'bible', especially without knowing about it.

I don't mind if the material from this list gets xeroxed occasionally. But this summer the ZKP 4 reader seems to pop up on every single event I go to. And if the postings from this list appear in academic anthologies, it becomes an entirely different matter.

I don't understand why every little posting from this list has to be printed 'quick and dirty' on paper to begin with, when there is a handy online archive at the factory-server.
[general question: why doesn't the paperless office, book, academia, entertainment exist yet? general answer: we live still in a hybrid media culture and that's what makes it interesting.]

I don't even think that everything that goes over this list is worth saving or publishing - just think of the embarrassing flame war between Garrin and Cook last weekend. Would anybody want to see it in print how two grown-up men tell each other not to pee in their pants? [a bit more trust in the moderators?]

Don't get me wrong: I highly appreciate the effort that you, Geert and Pit, have put into setting up nettime and keep it running. And I feel indebted to you for creating this context from which I personally gained a lot. I met people I probably would have never met without nettime, and established important relationships with some of them. I also made use of nettime material for my work as journalist, and I tried to contribute to the nettime context by posting some of my own work.

But now it looks like nettime is turning into a publishing house or a content generator for print publications. That's why I think that some clarification of the issue of "bibles" (content, distribution of the "quick and dirty" one, etc) would be in place.
[don't hurry, like before: no profit will be made finally, and if then it will get reinvested. let's continue to think about an 'author collective' without becoming an institution or a company, networks of trust, that there is content with a certain value here, should be out of question, that the moderators are not 'running away with the server', too.

whoever read until here, please comment on this and we will compile a next digest. Q: What kind of publication you would imagine as the best of all possible for nettime? How it would look like? Where you will get it?

Yours,
Tilman

Re: <nettime> what is going on, on nettime?

From: Alan Sondheim
To: nettime-l@bbs.thing.net
Date: Tue, 17 Aug 2004 22:53:39 -0400 (EDT)

It's not only what moves people these days, but how people are moved, and, to be honest, how one wants to move them. It's a question on the one hand, of course, of political/political economy, especially for some of us, bandwidth/distribution economy - but it's also a question of language and languaging itself, which is where, uncomfortably and belligerently, nn comes into play, as well as codework.

As I wrote you - I'd like to see the Unstable Digest started up again, by Florian if he wants, or if not, I can work with other people on it - the balance was wonderful.

There's a related issue, and that is, that what moves people is always open to exploration, to wonder - for me, that's what holds my interest in codework and its ilk, nn and jodi even now, and many others working across net media.

- Alan

From: Josephine Berry <josie[AT]metamute.com>
Subject: On Lurking

Since we're currently engaged in list metaphysics....

I should start by declaring myself to be a virtually full-time, unrepentant and chronic LURKER.

And let's face it, where would you all be without us? This legion of quivering intellectual rabbits whose awe of the post-it intelligentsia is so great that we'd almost rather cut off our right hands than hit that send button.

Nettime without LURKERS would be like Hollywood without the opiated masses or football without larger louts - no fun and bad business.

What is wrong with bystanders? Why the shameful denigration of the word LURKER? Is it supposed to make us feel like naughty school children or criminals? Stop lurking around out there, and put your hands where we can see them!.

Where would all you performers be without your audience anyway? Who would bother to pay you those royalties if us drones didn't queue up dutifully to consume your wares?

No, but SERIOUSLY: most of us know how great the fear threshold is to posting, but that doesn't mean that LURKERS are a bunch of labotomised victims sucking pre-chewed life through a straw. And - whilst I'm up here suffering on this soap-box - I'd say that LURKERS shouldn't be admonished but encouraged. Why? Because they help form the community within which this all happens and because they give an n-dimensionality to events which means that posters can't be sure of their audience and what they're thinking. Uncertainty is useful, it makes us sharpen our wits and back-up our arguments. It means we never know which conversations are being had where beyond all of Nettime's eight circles. It means that what can't be measured can't be instrumentalised.

[Gospel chorus reaches its stirring climax and then dies away]

Yours without shame,

Lurkers Anonymous

any effort to couch the "nettime.free" spectacle in terms of "electronic disturbance", "millennial hysteria", etc., within an international medium such as Spiegel-Online, would pose a an additional modus for marginalizing those people who do real work in these areas.

i find that intent appalling.

the "nettime.free" tagline of "Speak freely or Unsubscribe!", which counterposes two contradictory antecedents (since one can neither speak via their list nor unsubscribe from it) is the entire point to their performance. why aggrandize it any further when there are much more salient stories in our midst?

pxn

From: "A. Cinque Hicks" <cinque[AT]kdi.com>
Subject: still more on moderation
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

Now I see that accusations of forgery, fraud, and hoax are being thrown around freely with regard to nettime.free. Real list? Net.art? The difference is irrelevant. What is relevant is what the "schism" (if that's not too dramatic a word) says about this particular sphere of human relations.

I share Armin Mendosch's sense that what has become a partisan bash-fest is useless at best, and destructive at worst. When I signed on (very recently) I quickly understood that this was mainly a forum for cerebral discussion on relatively academic topics. Fine. I have appreciated much of what's been written here and find the forum very useful not in spite of, but *because of* its formality. Again, fine. Apparently that wasn't fine with some people. They were free to leave and elected to do so. Again, fine. This doesn't have to be taken as a threat (questions of nettiquette, bracketed for a moment here). What we have had here has been in my experience a sort of "night at the opera," a highly structured environment that was never meant for random shouts and mummings. Some people have decided that they would rather be at home with shoes off, listening to the radio. So what? That's okay, too. I for one welcomed the idea of having two forums to serve two different purposes, and had planned on staying subscribed to both. (Again, setting aside for a minute the questionable etiquette through which this came about.) And as I understood it, at least

one nettime moderator was all for the idea of having other lists if people felt the need for them. Yes, yes, I see that nettime.free positioned *itself* in a combative posture. I simply ignored that, and would urge other people to do the same.

If I have been misguided in these observations, I'm sure someone will let me know.

peace,
ch

To: post [AT] nettime.free.xs2.net
From: Matthew Fuller <matt [AT] axia.demon.co.uk>
Subject: a proposal

What concerns me here is to open-up a situation where the 'community' which nettime 'free' ostensibly intends to make its intervention on behalf of, isn't actually done a disservice by the instigation of this list. There is an opportunity now to meet the obvious demand (of whatever size) for a zero or low filtration channel that works in some kind of relationship with nettime-l.

One political banner that has been raised over the start of this mailing list is Freedom of Speech. Freedom of Speech is as clearly a con in this case as elsewhere. It is a rhetorical manoeuvre that worked well in the context of the Eighteenth Century in defining a potential political subject against monarchy and colonialism. It is not nuanced enough to deal with this context. As a historical refrain Freedom of Speech is a metaphor for interfacing a political/ technical reality that it largely misses. That is why the demands for a completely unfiltered mailing list ring entirely true when taken solely on their own ideological terms but founder into absolutism or bad design when attempts to realise them are made.

People constructing mailing lists should look closely at what they are doing: creating systems of enunciation. This is what we need to make happen with regard to this matter - a close attention to the implicit politics of the technology.

We need to look at what collaborative filtering, networks, etc. actually mean and can be made to do. In the context of a list or lists focused on critical thinking about networks, coupled with the technical abilities of people to go beyond rhetoric into actual construction, one would hope that this might be done with the careful attention it deserves. This is not a call for a technocratic solution. The tools to deal with this situation already exist and can be developed in the texts, people and

machines on the list.

At the moment it seems unclear whether the intention behind nettime.free is to maintain any relationship with nettime-l, or any of the other variations on the list. If not, it might well be useful to make it clear. Obviously a first step towards this would be to immediately stop the compulsory subscription of nettime-l subscribers to the new list.

If the intention for the launch of this new list is in fact to provide a channel for all the material which is filtered from nettime-l, and not for instance to start a new list with other foci of attention, or to merely duplicate what nettime-l already does, then arrangements need to be made to make sure that happens in a thorough and open manner.

As one of the people involved in moderation of the nettime-l list, but not here or anywhere else speaking on behalf of the group, I am quite happy to state that the filtering is minimal and careful. However, since the demands have been made to remove filtering from the list and someone is clearly prepared to provide server-space for this to be done there is an obvious opportunity for this demand to be met.

Perhaps what is needed first is for people wanting a strictly unfiltered mailing list for critical writing on the net and related areas to decide what they actually want, and what relationship, if any, it should have to the current nettime. If no relationship is wanted, then it might well be useful to change the name of this list from nettime.free and to make this clear.

There is of course the possibility that the initiation of this list is purely designed as a temporary intervention without any commitment to continued work on the list. This would be a waste of everyone's time.

PROPOSAL

Working on the assumption that there is not just a desire but an actual commitment to continue a connection between nettime-l and nettime.free, what I suggest is that it is possible to find a way for nettime.free to become the unfiltered channel to nettime-l that has been discussed but never implemented, rather than split off into a separate list. If it is done well, this is a good opportunity to distribute the work and infrastructure involved and to satisfy the demand for a list with none or little filtering as well as for a filtered list.

If this is to be the case I guess the key question is how do we ensure that:

- (whether destined for filtering or not) posts don't slip through the cracks
- multiple postings are unnecessary
- the 'free' list receives all the material that is filtered from 'nettime-l'

Subsequently, it might of course be necessary to look at filtering levels for the unfiltered list. Bounce messages, requests for unsubscription, and spam from entirely irrelevant address harvesting senders, etc. etc.

This could be a relatively simple process.

1. Texts destined for both lists would be in the first instance mailed to the nettime-l address.
2. Posts that are unfiltered from the nettime-l list would have their headers stripped and text formatted as usual and sent to this list.
3. Posts that would normally be filtered from nettime-l would, instead of being deleted, be forwarded to the nettime.free address. The headers of these posts could subsequently be stripped and the text formatted at whatever level is deemed useful by the moderators of the nettime.free list. It might in time be seen to be necessary to introduce some level of filtering in this context.

This model still allows for people to post solely to nettime.free, allowing the possibility of 'self-filtering' from nettime-l. So long as there was clarity in the footer / FAQ etc. of both lists about the function of the two channels ensuring that this is not done by mistake this should not pose any problem.

An alternative to this is to revert back to one mailing list and to open a distinct unfiltered channel if it is clear that there is an actual demand for, and commitment to, maintaining this channel.

It is useful that dissatisfaction with the nettime list has been matched with the technical capacity to act. Now what is needed is for this act not merely to evaporate into a gesture, but to match itself again with thought, communication - and more construction.

First though, allow people to unsubscribe.

Matthew Fuller

Subject: Re: Welcome to Nettime.Free!

>Welcome to NETTIME.FREE, the renewed, UNMODERATED AND OPEN

>Revival of the Nettime Community!

I follow this list a while out of curiosity, but also feel offended, because I never subscribed to it. I would have preferred to get one announcement only and then to have the free choice to subscribe or not.

>Once again, there is an OPEN LIST for Nettime, free of
>any unwanted censorship,

Sounds somewhat surprising to me. You mean in this list there will only be the wanted censorship? Then again you have the problem what is tolerated and who will decide. There is no reason to expect that everybody will agree about everything. Different opinions about what is acceptable are inevitable on a mailinglist with many members, it's inherent to the mailinglist as an open social system. Also without a moderator. It just depends on coincidental events when the discussion about this starts. And imo it's very easy to play jerk and provoke this discussion with some very unwanted mail.

> hidden agendas, personal tastes,

It's rather common that members of communities have their own agendas. And messages about net.art, media, etc without personal tastes just seem impossible to me.

>anal-retentive book editors/librarians, respiratory diseases,
>and other information-hostile elements that have corrupted
>the initial mission of the nettime list as established by the
>founders of Nettime in Venice, June, 1995;

Are some personal conflicts fought here over the back of nettime members who, like me, have no clue what this is about?

>No more digestion/indigestion...just free flow of information!

Please no. I find free flow of information as presented here a naive concept. As if you just would open a tap on Internet and the free flow of information streams out. Yes in the sink. The problem is that I only want relevant information. And I haven't got all the time of the world to sort it out.

More theoretical: a community exists because of a meaningful communication among the members and with an environment. This takes place in a limited amount of time. What selection takes place, what is filtered out, constitutes the character of a community. And there is a physical limit on the amount of communication: time. Within this limit the relevant information has to be sent and received. Selection is a vital condition for a community not to die in information overload. No selection, no community.

The point is not whether selection takes place or not, but how. The ideal situation is that selection takes place at the source: contributors voluntarily restrict themselves to the subject of mailinglists, newsgroups or debates i.e., are clever enough to understand what the subject is, and there is an agreement about what belongs to the subject. But ideal situations tend to be seldom. An open mailinglist is an extremely vulnerable process of communication. So how to keep it working, how to select?

Sometimes I have the feeling that the naivety of the sixties got a revival among Internet-enthusiasts and that the founding of nettime.free is one of the symptoms.

From: "Michael H. Goldhaber" <mgoldh[AT]well.com>
Subject: Moderation in all things? Re: <nettime> on moderation and spams

I too would like to express my support and thanks to the Nettime moderators, or filterers. Obviously, to be able to use a delete button wisely, one has to have some idea of what one is deleting, and that takes scarce attention. By taking on that task, nettime filterers put us in their debt, even if, inevitably, were any other one of us the filterer, that person would surely choose a little differently. Any active listserv and its overall output can be of value only if it is in the hands of only a few guiding intelligences at any one time, and it is to those minds that at least some of the attention to the list must go.

There is a deep point here, and not always such a pleasing one: that pure democracy can never operate, except at an extremely small scale. No matter how much everyone on the list might support notions of equality and democracy, thoughts which some think quite important will get shut out. Trust must be placed in some few, no matter how they ended up as moderators; of course, the trust is highly conditional; if they abuse it, we stop paying attention. Yet while they have it from anyone, they have real and unequal power, as do those whose work they find worthy of attention.

I also want to agree with Josephine Berry. We lurkers (as I usually have been of late) help make the list workable, by refraining from seeking attention when we feel we have little to add.

Finally, all that said, no matter how unreasonable the position of the "nettime.free" founders might be, its (apparently) brief insurrection did generate a burst of intellectual excitement, and it ultimately probably increases the value and solidarity of nettime. Utopian extremism has its value too.

Best,
Michael H. Goldhaber

Re-Routing Nettime:
An Exercise in Electronic Disturbance

Surprise "Columbus Day Outing"

By Paul Garrin

Personal note:

My sincerest apologies to anyone who was offended
or inconvenienced by this exercise. It was not
intended in any way to be malicious or aimed at any
specific persons or groups in any way other than
in comedic parody.

Blasphemy in the face of Orthodoxy

As when Sinead O'Connor ripped up a photo of the Pope on live
television. Bad PR for Sinead because she was unclear, or misunderstood.

I won't allow that to happen here, although it may because some people
will pre-judge and tune this out. That's their choice. Perhaps some of
them already understand what this is about, although not what it appears
to be on the surface.

Things are not always as they seem. It's all a matter of perception, and
how that perception can be "managed".

Nettime was "re-routed" temporarily. It was a terribly rude intrusion
that disregarded every tenet of "nettiquette". It could have been done
silently, by simply opening up another channel, without the rude intrusion
into the order--or what has become the "Orthodoxy of Nettime", but that
would have served only to turn a blind eye and a mute tongue some of the
events unfolding outside this list that have an adverse impact on all of
your future access, privacy, security and autonomy online.

It was an act of "Disturbance" using counterintelligence tactics to sow
discord amongst a group and display its poles of affiliations and
sympathies. It's to show how easy it is to do this, but no indication of
how subtle something of this nature can be, so the rudeness was intended.

It was a loud intrusion in many people's minds, not only because of what
was sent over the open channel, but that the channel was opened in the
first place without their permission.

The flame-bait was a convenient element to make it as rude as possible
although it wasn't directed at any one individual alone, but at the
attitudes being parodied by the Nettime.Free message.

Any interpretation of that information is totally up to the reader.
The message was _meant_ to provoke.

And what it got was the expected chain reaction of pettiness and insults
in return. A very funny assortment of stuff, I must say. Another attempt
to deconstruct this event may contain some of those responses, perhaps
even as rendered by antiop :-)) so he can print it out and hang it all
over some wall that he's trying to climb to get noticed in the "artworld".
(I forgive the kid--he's young and everybody wants to be famous).

This call to action is a wake up call, in the spirit of Electronic
Disturbance. A "weekend outing", a "Columbus Day Raid" The insulting tone
of the list was the "agent provocateur" whose mission it was to sow
discord even if it meant drawing fire. (I didn't try very hard to cover my
tracks. In fact, I didn't.) I just switched on the server and left it
alone, while inadvertently leaving the subscribe commands disabled...and
the server ran away! Sorry about that. Hope the few extra messages in
your mailbox didn't ruin your day. If it did, then please, log out and go
out and take a walk, you've been online too long.

Rerouting Nettime was a staged "exercise" as an "operation" using an
emotional trigger...otherwise known as a "Psychological Operation" or
PsyOps. In this case, it was insulting implications about members of the
Nettime Moderation Team, and the users having information "forced" upon
them without their choice.

Some people call it "dirty tricks". That's what it was. You have to
experience dirty tricks so you can begin to understand them. One of the
purposes of this exercise was to personalize an experience within a fairly
large and somewhat diverse group and exploit the differences.

The scenario involved several elements:

Identify a target group: Nettime

Identify discordant issues: Moderation, Moderators, Ideologies

Identify sympathetic affiliations: pro moderation/con moderation

Identify exploitable conditions: subscribers complain about moderation

Provoke confrontation: Clone the list and run it on another server that
is not managed by the moderators thereby removing
their control over content flow although the list
itself has not changed.

Use a provocative message to polarize the group.

This resulted in opposing elements aligning in
blocks defining further affiliations and sympathies.

Unforseen elements subscription requests proc inadvertently disabled
introduce added resulted in loss of subscriber control and
chaos added to the outrage when users could not
"unsubscribe"

This leads to speculation and rumors about the
list operator and his intentions, and insults
and insinuations are spread.

Intended result: it calls into question many issues concerning current
events that effect our access, privacy, and autonomy on
the internet and many are turning a blind eye just when
issues are being decided behind closed doors which
will affect thier future access, privacy, security, and
autonomy on the net and probably off the net as well.
It's time to focus on strategies that will educate and
empower each other to protect our future of free choice
and free will, and not a time to sink into complacency
and inaction.

The beginning of discussion and action.

[-empyre-] ... once upon a time ...
From: Melinda Rackham
To: <empyre@lists.cofa.unsw.edu.au>
Date: Sun Jun 2 14:02:44 EST 2013

hello -empyre-

That it is eleven and a half years since I sent out invitations to 50 people to join
-empyre- is quiet unbelievable!

I was looking for that original email invitation however it seems to have been
lost several laptops ago - instead I've located an article from September 2002... an
archival window into -empyre- as a fast growing 9 month old baby...

At that time I was writing my PhD, building non propriety 3d worlds, and
-empyre- was instigated as a forum to discuss theoretical issues around virtual
and media art practices. The early -empyre- years ended for me in late 2005,
participating only sporadically while I was Director of ANAT, then curating in
Australia and China. My last -empyre- discussion was Manifest Dynasty: Media

Arts in China, co-moderated with Edward Sanderson in November 2010. For anyone interested there is a fascinating archive of the early guests and topics here - <http://www.subtle.net/empyre/guests.html>

My personal -empyre- era seems forever ago. Currently I'm totally enjoying being off grid - researching a book titled Attachment - exploring forced adoption, loss and identity formation. The work is primarily autobiographical; seamed by the fictions of virtual and imagined reality; anchored by the psychology of Attachment Theory. Its a different perspective on the relational realities I've explored over many medias and decades.

I have met so many wonderfully articulate, generous and very smart people through -empyre- over the years - too many of you to name - who stimulated my intellect and enriched my emotional landscape. I'd like to specially shout out to the dedicated moderator team I worked with for the longest period - Christina McPhee, Michael Arnold Mages and Jim Andrews.- u rocked! Congratulations to today's moderators for keeping pushing new boundaries, and too everyone who has contributed in moderation, administration, technically and in discussion to make -empyre- the sophisticated community it is today.

long live -empyre-

Melinda Rackham

-empyre- :: soft skinned space

-empyre- mailing list sprang into being in January 2002, hosted on the College of Fine Arts server at UNSW. It is an online forum which regularly invites guest artists, theorists, curators, producers or administrators from the Australia/Pacific and International media arts field to discuss their projects, publications, pet theories and productions. It intends to focus on media art issues in depth, without necessarily being academically referenced, or concerned with delineating areas of practice into interactive, or digital, 2 or 3D, net or rom, or PDA, or flash, or image or text.

The list has a specific format for a number of reasons. Over the years I had been getting frustrated with the low ratio of signal to noise on other lists, and seeing lists like Recode and Syndicate be torn apart by the constant revision of the social structure of the list - i.e. discussions over what was appropriate in mailing list etiquette in terms of announcements and postings. How to deal with those who were perceived to break these codes of behaviour overtook actually talking about media arts topics and the lists died. I also wanted a discussion space which would explore topics specific to 3d spaces on the web, as I had been working in that area of practice for a few years and discovered a vibrant global community discussing the technical issues associated with web3d, but no avenues for the more aesthetic or theoretical discussions of networked dimensional environments. And most importantly, I saw other lists where the culture of the Internet and impacts of technology were being discussed by writers and academics, but not by artists who were making work in the field.

-empyre- aims to fill those gaps. How it works is that each invited guest speaker has the list for period of time to discuss different aspects of their new media practice, or their books or their sites, or performances, or curated shows. After a few format changes... (our first guest, theorist and artist Ollivier Dyens, held the forum space for almost 6 weeks discussing his book and website Metal and Flesh.) list guests are generally now in two-week slots. Topics range from artist/curator Patrick Lichty speaking on PDA, wearable, and hand-held art; to producer Antoaneta Ivanova discussing digital copyright and artist rights online.

Offline -empyre- would equate to a casual lecture series, or a resident workshop program. The list provides the space and the audience, the guest decides the topic, and is responsible for posting. Lately I have been organising guests with complimentary interests for each month, eg Adrian Miles and Jill Walker from RMIT, Melbourne and University of Bergen, Norway discussed blogs and video blogs; and Curators/writers Valérie Lamontagne and Sylvie Parent, both from Montréal discussed aspects of gallery and online curation, web history and factors relating to the visibility of web.art.

The list aims to have diversity in its scheduled topics, and to be flexible enough to adapt to current events. In March this year, while the Web3d Art show was physically installed at the ICA London, -empyre- simultaneously provided an online forum, where a large number of the artists from the show, including John Klima Jaka Zeleznikar and Tamiko Theil discussed the issues in their work. Similarly, E-lounge the online follow-up from an Atlantic rim conference held in east coast Canada is coming up in October, covering issues like net.art and wireless networks. Other forthcoming guests and topics include a discussion on projected identity and public/private web spaces with code poet Mez; the Japanese mathematically based Method art movement with Hideki Nakazawa; Cyber feminisms with Julianne Pierce; Constructing Virtuality and Avatar Manifestos with Gregory Little and Joseph Nechvatal; and Artificial Life with theorist Mitchell Whitelaw.

When I launched -empyre- as an experiment, I thought it would be a cosy intimate group of around 30 people, however it attracted diverse subscribers. The numbers go up and down as people try it out to see if they like it, some people who've been there a while leave, others join for a specific guest or topic. Currently it's around 370 subscribers, with around 40% from the Australia/Pacific region, the rest from North America and Europe with a splattering from Eastern Europe, South America and Asia. One of my future goals for the list is to expand the subscribership in Asian regions.

It is a low to moderate traffic list with an average of 30 messages a week. Regularly about 15% of subscribers post - there are a few who have something to contribute to the discussion on every topic, as well as constantly changing posters dependent on the guest and topic. The rest of -empyre- are silently lurking... which is an interesting form of participation. Recently I overheard someone on the list who had never posted, discussing a list topic in an offline context, and I realised that a mailing list's influence is far beyond what happens publicly online, it reverberates - becomes interactive in the wider community. People contribute by reading, nothing is passive. A lot of people also make interesting observations either to myself or to the current guest instead of the whole list, as it does take time to become involved with an online discussion. To quote Sean Cubitt - empyre-'s August guest - "One thing I wanted to murmur about here is time: the proliferation of different times. There's the time of sending, the time of reading and the time of replying on a list."

List etiquette issues of course are always present... from its inception I have had strong guidelines as to what are appropriate postings, for example -empyre- is not a chat space, nor an announcement or self-promotion list, nor online performance space. It's for topic discussion only, and I state up front that I will unsubscribe anyone who consistently disregards these guidelines without entering into debate. And I've had to remove or ask a few people to unsubscribe already. So it is quiet strict in that sense, however if people don't like those guidelines there are many other lists available.

Initially I thought -empyre- would run for a year and then close, as it takes time and energy to maintain a list, however because it works well and the format has built a momentum, it will continue. Christina McPhee, a US West Coast media artist, and Adrian Miles from RMIT, Melbourne are joining me as co-moderators and co-administrators, scheduling next years guests and topics. We are always looking for others interested in maintaining this locally based spunky online community.

**<nettime> Re: the condition of net.
time**
From: brian carroll
To: nettime-l@bbs.thing.net
Date: Wed, 14 Feb 2001 00:18:37 +0000

writing is an impossibility. writing universally. communicating
has limits. sound, image, text. all have ways of seeing, ways
of perceiving, there is no unbiased author, no unbiased text.
language changes, time changes. meaning changes. ways of seeing
and saying and doing, all change. thus the nettime signature file:

a question arises, as a subscriber/participant in this networked
space-time, it centers around nettime's definition as a list, and
its mission/purpose, and the context(s) in which it arose...
in this last footer, a few statements about nettime's identity are
made, which are as follows:

nettime1 = net criticism + collaborative text filtering + cultural
politics of the nets

nettime2 = moderated mailing list

from a subscribers perspective, there seems to be a conflict within
this constitution of the list:

this is to say that the issue of moderation does not cleanly fit
together with criticism + collaborative filtering + cultural politics

nettime1 =/= nettime2

first, this is a condition or a situation of mailing lists, not of
nettime alone, in my experience, but it is also something that needs
to be interrogated and investigated to see if there are any other
alternatives for the goals, yet i am left wondering...

does nettime1 = nettime_now?

first, addressing the thorny issues surrounding nettime2 as a
moderated mailing list, apparently this has been a constant issue
and i imagine something of a daily issue for those moderating, if
indeed there is a lot, some, or no moderation going on, it is a
spectre that seems to haunt the idea of open-communications about
politics, and criticism, in that, there being no real universal
meaning/understanding/language, the decision can never be uniform.
i.e., nettime means something different for every participant...

IF there is no uniform language (universal understanding/meaning)

THEN can there be a uniform, and thus, fair moderation mechanism?

nettime exists, embedded in language, while ideas are exchanged,
they are done so in and of language, yet, in my eyes, nettime
would probably not delve into language_as_language as it might
seem off-topic, and it might well be, in some contexts, but not
in others, but moderators may not see it the same way, so what
way are we all seeing the texts we input and get as output..?

IF uniform language does not exist and moderation does exist

THEN a basic understanding of what makes nettime a common forum
for imperfect language could be established which constitutes a
shared, although imperfect understanding of 'what is nettime'.

= nettime'

to check the above statement, we need to parse the signature
file through the code:

does nettime1 = nettime'

(net criticism + collaborative text filtering + cultural politics
of the nets) = (common forum + imperfect language + understanding)'

it is a muddled question, the variables for variable_nettime' would
need to be determined, but in my personal experience, i do not see
these two being equal, given the following parse...

criticism + filtering + politics + culture =/= nettime'

this is not because of an arrogant view that nettime must serve
an individual's view of nettime, but that the keywords, as keywords,
criticism, filtering, politics, culture, are all multidimensional
and cross-culturally, dissimilar, if only because of language itself.

question1 = "is there more to understand in the language of nettime
than in the texts of nettime?"

IF question1 = True

THEN nettime exists as language filter, processing meaning

IF question1 = False

THEN nettime exists as a textual filter, processing interpretation

based on specific language (texts in English, Dutch, Spanish, etc.)

this brings up another question that is central to the nettime.sig...

question2 = "can moderation of nettime1 ever be separated from
its political dimensions?"

one could say: IF question1 = False, THEN question1 = False, and
conclude that, because of 'textual' and not 'lingual' understanding,
that cultural politics are what skews nettime as a moderated forum,
in that texts are being filtered for interpretations, and not meaning,
this is not to say this is actually the case, but by leaving these
variables undefined, it could be perceived, and at times it could
be the case that meaning is overridden by pre-interpretation, but
equally, could there not be texts with almost no meaning that also
make it through moderation because of this very same paradoxical
phenomenon, so that:

any nettime1 moderation = censorship, fascist moderators, et cetera.

if it is a truism that 'all politics is local', might it not also
be possible that all nettime moderation is inherently political?
thus, what are the chances that nettimers share the same politic
and that nettime represents such a unified front- nil, anyone?

IF nettime is a unified entity

AND it is inherently political, from moderation to contributors

THEN when nettime is referred to as a group, such as 'the
nettime crowd', does this presuppose a shared political view?

IF SO what is this shared political view?

i myself believe there is no such view, and can be no such view
in terms of texts, culture, the internet, and collaboration on
these terms, not that politics is an end-use to aim for, this is
not because of having a better system, but because of the belief
in the fallibility of interpretation, logic, and language in the
act of communicating and thinking ideas, and reality itself.
what is our shared reality? what is 'our', or 'we', in terms
of nettime? or is there no common 'we', some level of shared
understanding and meaning... beyond the subjective/objective,
beyond the dichotomy, lies paradox, the EITHER-OR goes N-OR,
and BOTH-AND, things are much less clear, yet more realistic.

Therefore, what are the assumptions of...

nettime' = shared understanding, shared meaning'

for example, the word 'intelligentsia' may for a certain majority
evoke one image, for another group another, or even more complexly,
many views, none of which is in any sense finalized, but it is
left-to-be-decided/interpreted, while others already have their
interpretations, thus, the universal meaning may be there in the
language of the idea, but not in the interpretation of the text.
this, not being an anomaly but ever-present and pervasive in the
discourse, of language as text, sound, image: interpreted.

nettime = source code (language) that is already compiled (interpreted)

to talk/discuss (discourse) just about the compilations without
addressing the basic foundations in language is to make a huge
assumption that we pre-exist with some kind of shared meaning,
quicker, it would be, to recognize there is no shared meaning
and to go about finding a base knowledge from which to speak,
share, act on common goals, but instead, discourse dis-courses...

there is a thing i believe could be said to be 'the condition of
nettime' in that, online, everyone is here, relating, and trying
to find some commonality from which to work, for some it is much
easier because of geography and the shared interests, such as
'English football clubs and community initiatives to buy them out
as a way of making action in the world' involved, the tangibility
of action is localized, nettime is globalized, a condition, in
that net.time could be considered networked.time+space, given
the physics of time and its entwined relationship with space.

question3 = does networked.space-time define only online space-time,
or does it include the networking of space and time,
and if so, via what mediums, is nettime any less about
the telephone or radio than about the networked computer?

here's the overall statement running through my head, causing me
constant crashes when trying to interpret nettime compilations...

"the condition of nettime?" = reverse-engineering, through the
interpreted text, a shared meaning
of language, and thus the universe.

thus, shared ideas are embedded in texts, and their interpretations
and not in ideas and their meaning, or so it is posited... case in
point...

one could attempt to find a universal understanding/meaning for
JODI's work online, this could be done cross-culturally, through
texts, using specific languages, but with similar interpretations.
yet the difference in understanding will always, inherently be
there, in the text, as it is a lossy medium. there is always
another perspective, another view. what is common about JODI's
work? i would contend that the universality of JODI's work is
not likely to be found in any art history book, or in any attempt
to understand the works without understanding their contexts.
thus, the statement:

[a universal understanding of JODI's work is more likely to come
from understanding electrons, molecules, and a handful of dirt,
than in any world history of art, because of the imperfection
of interpreted language. how can one view JODI's work without
understanding the lineage for the medium in which such works,
and their logics, are based? While coding may in some sense
be more uniform than other languages, in its usage as text,
it still needs to be compiled, and interpreted by the end-
user/perceiver, and belief plays a role, what if there is no
overriding shared/common belief? does this make a universal
textual analysis/discourse of the work infeasible?]

a speculative statement based on the above:

[meaning is pre-supposed but does not actually pre-exist]

we make meaning, who is we?

if nettime makes meaning, who is nettime?

is there any shared meaning on nettime?

if so, is nettime's shared meaning closer to dirt or to net.art?

do nettimers' universally share their interpretations of language
more with the intersubjective facts (truths) of electrons or JODI's
art-works/texts?

these are not meant to be derogatory statements to net.art,
whatever that is understood as being, as interpretation is
unclear, universally, the statement could mean multiple
things, such is the nature of the distributed mailing list.

thus, when words like ideology and institutions and keywords
being defined by others in different ways than another's meaning,
all are examples of the fissure between the interpretation of
language and its meaning, to focus on interpretation, while also
assuming shared meaning, is the Achilles heel of nettime, but even
this statement is particular. if there is no shared identity, how
can there be a shared meaning? if there is no shared meaning, how
can there be any shared interpretation of the text, that is not
itself always embattled with mis-reading as an altruistic goal
in the Production of Discourse as Discourse, an end-in-itself?

it might be interesting to conduct a nettime census, but then
again, it might not. could be done using a free cgi-poll, and
the questions could be made up in advance, but then again, it
would define nettime as a group, as would the questions, which
could also be negative, in terms of market research and its use
in playing to the crowd. it is just this overwhelming sense of
assumption, not nettime-specific, but nettime-aware that people
on nettime are more likely than others to take up and find a
way onward, to do the things that many have gotten online in
the first place for, to organize, to make a difference by
working together with others on shared ideas and goals...

nettime? = what are these shared goals and ideas?

in my opinion:

nettime? =/= cultural politics, text filtering, net criticism

as these are all based on the interpretation of texts, and not

their meaning as language, and with the identities of the people
whom are ciphering and deciphering this meaning.

networked.space-time = nettime?

hunk, stud, female: piece*(geschrift)
document, article.

by Paulien van Mourik Broekman and Josephine Bosma

Neither of us were there when Nettime was born, but we
think we are close enough to the source to know its
radiation, its personality almost. Nettime can nearly
be treated as a character. Its loose form and the firm
but loving embrace of its participants give it a different
feel then do its descendants or its copycats. However,
there is still something uncomfortable about it, which we
will try to get as close as possible to in the following text.

What is most striking about Nettime is its wish for close
personal contact. Nettime-meetings have been organised under
the banner of conferences like Next3Minutes or Metaforum,
and a big one which truly shows Nettime's sweet face is the
meeting planned for May 97 which will be held in three
different cities in former Yugoslavia: Ljubljana, Zagreb
and a searsoort.

Nettime seems to be an island of humanity in the mediated
world of the net and its periphery. Anybody can send anything
at anytime to its open list. Though, for a discussion mailing
list, this is in itself not unusual, combined with the very
human and personal treatment of its members, it means that
Nettime could be a fertile breeding ground for new writing
talents, a free space to experiment with styles and thoughts
for artists or theorists or what is most interesting: it could
be a place for non-writers in the extreme sense of the word
to vent their opinions on highly philosophical matters, a place
where professional intellectuals and illiterate mediaworkers
communicate. And this is where something seems to go wrong.

Nettime has a lot of members. The issues that pass the revue
titillate many minds. Yet only a very small part of its members
'open fire', even when the battle is practically in their own
backyard. We have heard someone say he is afraid to write. Why
is that? Speaking in public is not easy, most of us know that,
with the exception of the natural performers. But is that the
only problem? From many sides the same remarks about Nettime
are heard over and over again. The texts, the announcements
and the world that seems to be hidden behind them are found
extremely interesting, but there is this enormous threshold fear
to react. And it seems to have something to do with these same
good texts.

At conferences the way an idea is communicated is a mixture
of that of the objective, learned scholar/professional and
that of the masterspeaker, the politician, the salesman.
Theories are presented and discussions are initiated in the
oldfashioned manner of the college, where knowledge was a
clearly shaped object of power, with a beginning and an end
and, perhaps, guards flanking its sides. Even the audience
seems to submit to these rules of polite respect for the erect
manner of speaking that also dominates the universities and
political meetings.

The way texts and knowledge is spread and treated through
new media might not just offer new possibilities, but it might

be a revolution which even academics will have to deal with. New media are not just effecting old media like books, tv or radio. It also effects institutions. Their heritage needs to be dealt with and transformed. It is not so that we mean to say that what comes out of this heritage, like styles of writing and thinking, is wrong or needs to be dumped. It just feels a bit uncomfortable.

Fortunately Nettime does not pay its contributors for their efforts. This saves us from endless plowing through the long, highly abstract theoretical pieces of the professional macho theorists who like their masturbative seeds to choke the throats of the doubting student, the searching poet or the wacko artist. Many writers still have these sharp, fast pens though, which they learned to hold so well during their professional careers. And only the wackos seem to have the (unconscious?) guts to reply to them. What happens instead of the shared thought trains often is the safer but less effective private mail exchanges, the whispering at the backdoor, which takes the sting out of the debate. The only way to fight this syndrome without losing the credibility or impact of net.criticism is probably to work with an awareness of how textual critical authority, maybe invisible to its producer, can simultaneously encourage and suppress the introduction of new voices/communications.

The metaphor of the academy can also be used in a more positive way though, as - though invisible due to the same characteristics that make the net such fertile ground for gender switching etc. - the range of ages, professional and personal experiences of those who subscribe to Nettime is no doubt vast. The email communicated thinking, feeling and being that make up Nettime's shared persona touches on the very slippery areas where practice, personal experience and theory (for want of a better word) intersect. In fact, don't they in most social interactions? Distinctions made here between these categories are, by necessity, crude. Given that this is what we have to play with, the fact remains that some postings will seem more relevant to some than others, for reasons that go beyond simple qualitative criteria.

Some postings that may seem like so much "noise" to 'seniors' concerned with their own particular patch of high-theoretical discussion, may link in more directly with the lives and lifestyles of other subscribers. Yet conversely, those self-same subscribers (and we say this from experience) learn much from even the shortest exchange on topics they may not be intimately familiar with. A more personal inflection on otherwise theoretical postings manages to communicate the really valuable experience gleaned from working in an area over a long period of time.

The issue of noise does clearly connect with Alexei Shulgin's plea for avoiding professionalism in favor of freedom for development and experimentation, which he seems to have meant for the art-side of Nettime mostly. This is applicable to the whole of Nettime's working field though. The tempting and sometimes threatening idea of separating the art-hemisphere from supposedly more practical workingfields seems completely out of place in the context of the experimentation workers in new media are inevitably obliged to engage in.

Of course this broadening of discussion can also slide into a situation where... 'plus ça change': the 'lurkers' feel privileged to listen to the masterspeakers, not just in the lecture hall as before, but in the newly-opened private spaces of the gents' loo and the corner of the professors' refectory.

It is a pity that some interesting professional writers whom we know must have eye and heart for helping to find a solution to this problem are too busy being professional elsewhere. Of course, not everyone has the tireless energy of the few one-man broadcasting houses that push Nettime forward (thanks) so perhaps it wouldn't be a bad thing if some others circulating in the technoculture circuit would every now and then step down from their pedestal and be among the crowds again, not just at conferences, that seem to be like holiday camps to them and where of course personal exchanges of ideas and inspiration are limited to small groups of people only.

We have to say that even though these mechanisms that we have described above are in our opinion the major reason why the

Nettime platform does not work to its fullest possibilities, there have also been a few little incidents on Nettime that have created the impression that one has to be careful with postings. A few times people have been thrown of the list for reasons that were not always clear to everybody, but seemed to have to do with certain not clearly visible *rules*. Not everybody has the chance to ask the moderators face to face what is going on and to discuss it. For this reason it seems necessary that after such an incident, and hopefully we will not have too many, a warm and inspiring invitation to doubters and searchers is spread, which could maybe also function as a kind of basic, userfriendly Nettime manifesto.

Nettime is a social entity; above all else its energy comes from its community-oriented nature. The above is not meant as a dead-end complaint.

It is more a response to a slightly troubling and seemingly contradictory tendency within the discussions of nettime that have discouraged certain interesting subscribers to participate. In the long run this may create problems, nobody likes being an unintentional lurker. The network of subscribers is a valuable one for all of us, and loosing good but in the world of theorywriting inexperienced people due to inaccessability would be a damn shame. If we are to avoid building with institutionalised male dominated structures of theoretical discourse that existed within the academy of old, which profitted from specialisms, narrowing the gaze and heading for one clear goal, and we reflect now, in practice, the diversity of this list, the threads of this tendency might need to be unpicked and rewoven.

The vagina is the boss on internet

New media female artists inspired by erotics, identity and social interaction

Surfing on the internet I find the 'Virtual Themepark' from the most interesting cyberfeminist artist group VNS Matrix. It all sounds very promising and as a hetero woman I click on the Viral Pleasureworld. I am disappointed, because I do not find any beautiful naked men on the screen, but a universe with purple planets and the text 'Viral Pleasure World'. As soon as I want to continue I always come back on the first page. Only at 'The end of the World' I finally get to the 'Filthy Genderworld' where I see a group of tiny little people who are licking each other. Further on I step on Gashgirl's homepage, who's real name is Francesca da Rimini. This is one of the ladies from VNS Matrix. On this page I finally find some more 'information' about their work: wordmixture of textfragments from SM-stories, film titles and computer terminology that are connected to each other. The title above this page says enough: 'GenderFuckMebacy's palace of Unparalleled Cynicism', oldfashioned artistic enigmas that are larded with sensual quotes, to which's meaning you can quest for hours and hours being an outsider.

Cyberslut

VNS (VeNuS) Matrix wants to create confusion. The four Australian ladies want to make chaos in the standards and values from today's society, because they do not agree with the woman's status within. They make electronic art that questions the computer mass culture and her products in a playful but brutal feminist way. VNS matrix acts on a humorous way against men's women-unfriendly and sexist outbursts on the internet. These cyberfeminists are not afraid to use any means to achieve their aim. So they are not against sex, porno or even against men. They think that it is only just about time that women take control on the internet from men, because men behave badly. Still too many women suffer from obscene remarks.

The Corpus FantasticaMOO, an internet game, illustrates clearly how obscene creeps should be punished. VNS Matrix, virtually pierced, masked, harnessed and weaponed with the most horrible torturestuff, enters dark internetsurroundings by pseudonyms like Psybapussy and Cyberslut. There they terrorize everything male as soon as it logs in in this Tartaros-like domain. Someone who entered as Quentin Tarrantino, for example, was almost sent to the virtual heaven by Psybapussy's dangerous C46-weapon. The girls are the boss and their femininity is sacred. The core of their realm, the Matrix, can only be reached by the virtual clitoris. The vagina is the symbol of the female power. In their 'Bitch Mo Manifesto' the ladies swank about making art with their cunt. Their pussy is also capable of fighting against 'Big daddy mainframe', 'Big Daddy Mainframe' is the symbol of the male society, that is still dominating both the real and the virtual world. The 'Mainframe' is also a widespread product of computertycoon IBM.

The art of these cybervamps is at it's most beautiful in their fantastic projects, that are based on internet- and CD-rom games like Quest and Doom. In 1995 they made in cooperation with the artist Leon Cmielewski an project named 'The user unfriendly interface', where as many as possible people should be insulted. On these beautiful pages it was not allowed to click anything. When someone was naughty and clicked anyway, the computer yelled angry at this person and the buttons changed into insects that walked away from the screen. People also had to fill in their dreams and desires, so

that the program could curse and jeer at them. This program was not meant to be an attack to the male society, but to the dominating commercials and the standard mass products, that always have to be userfriendly.

The game of communication

VNS Matrix is also trying to investigate in what way the game is a symbol of social interaction in cultural life. Is pleasure an important condition to experience art? Interactivity gives one the power to interfere in a work of art. The non feminist artist Agnes Hegedüs sees the new media as an interesting territorium for investigation in the field of social interaction. In the new media raises a new culture of games, that is both interactive and telematic. She thinks it is special that everyone can pick a different identity. The result is that communication via internet is more playful than in real life. The internet is a game of seduction. Not the seduction of being connected on a distance is addicting, but the mysterious rendez-vouses of people gives a sexy kick. On internet people can meet each other without being seen, they can pretend to be anyone in any way.

Hegedüs' 'Televirtual Fruitmachine' from 1994 is based on this playful interactive aspect. De installation is a big screen on which three puzzle pieces of a fruit machine are projected. In front of the screen are three tables with a joystick. Three different people can join into this game at the same time. The fruit is referring to the forbidden fruit from Paradise and seduction. In contrast with VNS Matrix, who wants to see the new digital world dominated by women, Hegedüs does not think that is necessary. When the man and woman identity can be swapped in the virtual space, the genderidentity will be less important. The idea of genderswap with the help of the media was already being issued by Marcel Duchamp, who let himself been photographed as Rose Selavy (Eros c'est la vie); travesty as sexual pleasure.

Metamorphosis

The body will be less relevant according to the Australian artist Jill Scott: by means of technique we will be nomads in both the body and the soul. She thinks technique is very fascinating and she illustrates that very brilliantly in her gorgeous interactive film-installation 'Frontiers of Utopia' from 1995. The ill Zara does not live in the real world: everything she does is via the computer: working communicating and living, for this is the only way to forget that her body is soon going to die. In this installation the visitors can 'setup a dialogue' with women who are in this film. These women come from different areas of the 20th century and tell things about their ideal society. Emma from 1900 hopes for freedom for public opinion, Pearl from 1930 is dreaming of equality of race, Gillian from 1960 thinks of technical advance in socialist society and Zara from the 20th century believes that the technique can solve all problems.

Thanks to technique the body can be improved. This theme is very popular among feminist artists. Even when a woman is not ill, her body needs to be improved by technique. The dutch artist Inez van Lamsweerde is hacking artificial bodily changes from healthy females, by making beautiful ridiculous computerpictures on which she used photomodels and window-figures. The female figures on her photo's have something unreal: in the series 'Thank you Tighmaster' from the early nineties Van Lamsweerde stuck doll's eyes on a woman's face. She thinks too many women cannot be themselves anymore, but have to look like Barbie.

Bitter Herb Menu/Brutal Myths

"The cosmedical industry is a form of keeping women surprised" claim the american artists Sonya Rapoport and Marie José Sat. The reason why men dominate women is because they are scared of them. That is why women were called witch. "The firsts woman Eve was already called bad and even the most evil woman that has ever lived" is one of the ancient myths that was going around in the middle ages according to Sat and Rapoport. They say, that this myth is still going on in the arabic countries and that's why the women do not get any political chance over there, and that is why woman in some countries are being circumcised. This is a primitive form of cosmedical surgery. In the western world women are forced upon strict diets and cosmedical surgery.

The Bitter Herb Menu is a metaphor for the so called badness of women. In Genesis, Sat and Rapoport continue, God condemned mankind to work at the fields and to eat the harvest. That is why these artists choose for the herbal witchcraft as a symbol for the wholesome harvest of women, because in early times women were seen as spiritual curers in ancient times. This has changed later in the middle ages, when spiritual curers were seen as dangerous witches. The first part of the website 'Brutal Myths' describes which bitter herb poisons the mind of the man, so he will believe that women are bad. In the second part of the digital work of art is the healthy herbal garden with wholesome herbs.

Vagina Dentata

On the Bitter Herb Menu one can find the bitter herb "cleavers", which lets a vagina eat a penis. The principle of the Vagina Dentata, the mighty and male-swallowing vagina is to be found in different cultures. Because men are afraid of this Vagina Dentata, women are being circumcised, so that they cannot urinate in a normal way or enjoy sex. The liberation of women is to take revenge of them by castration, says the Bitter Herb website. The herb that is punishing men so severely is called Heartsease. The Vagina Dentata is a beloved subject among cyberfeminist artist, because it is the ultimate symbol of destroying male power. Women can be in charge then. The Bitter Herb menu sees the Vagina Dentata in a mystique and occult context. But VNS Matrix sees the vagina Dentata in a playful way as a vampire like tart, who is called Dentata. Dentata has to shoot men in the 'Cybersquat', a virtual game surroundings from VNS Matrix.

Interactive rituals in the Bitter herb Menu, that are made by the visitors, contribute to the destruction of the myth of women being evil and calm the phobias of men. Sat and Rapoport think that in this way they are contributing to the development of the World Wide Web as a new artistic technological medium, that is free from sexual prejudices and differences, so that the reputation of women can be purified.

Common Ground

The internet is a free space and that is why women can take advantage of that. Sonya Rapoport sees the web as free and easy to give a presentation from feminist art. She hopes to reach also people who would otherwise never go to an exhibition. She is striving to a kind of common ground: a virtual space linked to different female artists. The dutch artist Mathilde Mupé has already made links on her homepage to different feminists in cyberspace. The german video artist Ulrike Rosenbach and the american art critic Lucy Lippard have already set up feminist art institutes in the seventies where female artists could cooperate.

Much female artists see the internet as a possibility to communicate in a role playing game, where people can change their gender. Some feminist artists want to gain power over men on the internet. For them the game of sexuality is a form of power instead of romance. The sexual organ is not only capable of enjoying sex, but also of urinating, multiplying and dividing the human race into the suppressed and the dominating species. These feminist artists see the internet as an opportunity to be the boss on internet. They do not want to lose their gender, but they want to gain dominance over the male in their female glory. The gender identity should therefore be emphasized according to them. The question is whether this is still relevant in an age of androgyny and transsexuality, because the body can also be changed in today's society.

Peter,

I think you are very right about this and I think that other people should know this too. That's why I am sending this to the nettime list.

I wrote this article because I wanted to write something about feminist art on the internet and not because I am an feminist. Although I think that the ideas behind the feminist arts are very interesting. I do not agree with them. I also think that men and women should be equal. I left my opinion out of the article, because I wanted to give a kind of objective prescription, maybe I should have given more of my own opinion in it.

Kind regards,

Anne

I agree, but on the other hand may mail box is quite full with all nettime discussions, so how can the others cope with that. It's impossible to read all the things, while some mails are very (too) long. The thing about new media is that text informations should be short and precise, the long stories should be printed. I just can't use computer as a book, my eyes get sore. It's a multimedia machine.

> I wrote this article because I wanted to write something about feminist

> the ideas behind the feminist arts are very interesting. I do not agree with

> them. I also think that men and women should be equal.
What is feminist art? It's a kind of statement. But on the other hand, if you look global, there are about 51% of women and 49% of men on the world. So women are majority (typical in racism is dictatorship of majority on minority). I'm O.K. with that, but I think a lot of feminist artist don't get it. It was funny when a guy on the LEAF meeting in Liverpool this year pointed out, when there was 'women-only' meeting, that it would be maybe more relevant to have 'shy-only' meeting, because somebody said that one of the women attributes is shyness. Are men not shy? Don't you think I can make feminist art as you can do the macho one? Specialty on the net. Art is trans-... Everything else is and excuse and pure activism. Sexism is far out. And the worst is that personal shit is then abstracted to whole population. Aren't we individuals? There are differences between people, everyone is different person. And of course there are shitty women and shitty men.

> I left my opinion out of the article, because I wanted to give a kind of > objective prescription, maybe I should have given more of my own opinion But I got your opinion and I'm supporting it.

Best,
Peter

Re: <nettime> Translation: The vagina is the boss on internet
From: rebecca l. eisenberg
To: nettime-l@desk.nl
Date: Tue, 17 Jun 1997 02:27:32 -0700

I just wanted to note briefly, that there is hardly any statement that I find more insidious and offensive, when not outright simplistic and apologist, to insist that "usually feminists are transplanting their personal >>accidents, their personal experiences, i.e. misunderstandings with their >>partners into common market."

Feminists are repending to *institutional* sexism, and fighting against sexism constitutes neither the airing of dirty laundry nor the promotion of sexism itself. Many people are feminist before they even have any "partners" to be "angry" about -- for example, my first feminist awakening involved the way that *teachers* treated me in math and science classes in my pre-teen years. There's no bitterness over boyfriends there; rather, it is justified anger at a world that assigns females a presumption of incompetence while assigning males, at the same time, a presumption of competence. The goal is to break down barriers and promote equality, and I think that you badly misrepresent feminism as it is known to the great majority of people, both male and female, who identify as feminist, by insisting otherwise.

That said, I did actually have an objection to the circulated "Vagina" post. In my opinion, as well as my best understanding of the nature of biology and human sexuality, the female body part that is most analogous to the penis is the *clitoris* rather than the vagina. It is a fairly common complaint among feminist scholars (and has been for a while, in particular in reaction to Freud's terrifyingly absurd assumptions about female sexuality) that a focus on the vagina, rather than on the clitoris or the vulva in general, looks at female sexuality from the point of view of a penis in search of a hole. This is not to insist that the vagina is irrelevant to sexuality for all women, but rather, it is to make the argument that, if you are going to reclaim space for women, and then identify women with the sexual organ where their sexual response is generally considered to be located, the clear choice would have been clitoris rather than vagina.

Alright. You don't like *teachers*. I don't like some of them either. You can identify as you like. Feminist is O.K. I'm Marsian, two heads and wings, little green creature. But on the other hand I'm Peter Tomaz Dobrila and nothing else. Please to meet you Rebecca. Give those teachers names. Some car drivers are even worse. So what to do?

Great! Sigmund Freud was a wanker. But debate about penis, vagina and clito is unfamiliar to me. Don't we have more in our bodies! Toes, liver, heart, brain, arms, legs, feet, head, kindeys, eyes, ears, smell, voice, touch, etc. Isn't it all involved in our whole behaviour, work, sex, etc.?

Best,
Peter

In the United States, the accepted meaning of i.e. is "that is." This is
very different from "for example," which is signified by "e.g."

Regardless, the point stands that feminism is not about revenge against bad
men. It is about a social movement that promotes equality of the sexes,
and that actively fights against sexist stereotyping. Period. If I read
correctly, you yourself insisted that you were "not a feminist" (a
conclusion that could have been inferred from context had it not been
stated explicitly). Given that, how can you justify trying to define my
social movement? It is offensive.

Who is blaming sexism on "the thole world populations <sic>"? What I
stated clearly, and what I repeat again, is that feminism is about
promoting equality of the sexes, and striving to achieve a world where
opportunity is not restricted on the basis of sex and/or gender. The fact
that the majority of the people who live in this world take part in a
sexist culture of some sort does not change the goals of the movement,
which are to enact change and promote equality.

That is patently absurd. Feminism is not a fight against "teachers." Many
teachers were "not" that way. Feminism is a battle to break down sexist
stereotyping, and what I gave an example of was the stereotype that insists
that women are not competent in math and science, and that succeeds, to
this day, to keep unjustly many highly qualified women out of lucrative
and challenging occupations. To the extent that individuals are hired
and/or promoted based on their sex rather than based on the quality of
their work (and to deny that this happens is to look blindly upon the
world) helps no one because it promotes an inefficient marketplace and
inhibits the full range of human and technological progress.

You are Peter, but you are also male, and you have benefitted from being a
male, in some way or other in your life, whether you admit that or not.
Perhaps you have benefitted only from the fact that you need not actively
fear rape as you walk down a city street at night; or perhaps you have
benefitted from that fact because you have a much better real opportunity
to become an elected member of the government (at least if you were a US
citizen) than your female colleagues. But you have benefitted.
Personally, I strive for a world where gender, the social construct, does
not exist at all, and in which we can all be viewed as individuals first,
and male or female (or hermaphrodite) as one of our many other individual
traits. But we are not there yet, Peter, and denying the existence of
institutionalized sexism brings us no closer to that final goal.

>
There are many erogenous zones in the human body, both male and female,
and NOTHING I wrote suggested otherwise. But a focus on the vagina is
clearly phallogentric, and a decision not to even mention the clitoris --
which, I repeat, is where female sexuality is said to be "centered" in a
way analogous to the male centering of sexuality on the penis -- is not
trivial. No act of sexism is trivial, and I must repeat that I find
hardly any action more pernicious than the denial that sexism exists.
Sexism exists. The fact that you, personally, have perhaps never felt
the direct harms of sexism only provides evidence of the fact that sexism
divides the world by gender, and assigns the burdens and benefits
inequally. The fact that many women (most of them much younger than I am)
and perhaps most men may disagree with this perspective does not mean that
sexism does not exist.

I believe that your intentions are genuine. So if you want truly to create
the egalitarian world that you would like to think exists today, do
something about it. Join the movement. Read the literature. Talk about
it. Get involved. Don't just sit there.

Sorry. So e.g. But maybe is English i.e. I'm not sure. It is not my
first language.

> Regardless, the point stands that feminism is not about revenge against bad

What equality, if there are 'women only' things? Don't you think this is
xenophobic, chovinistic and even racist? Isn't it just stereotyping?
It's the same as with your "teachers". Most of my teachers were women,
so I should go macho, while I didn't like all of them... I'm not a
feminist and I'm not macho. I'm human, I suppose I'm not a dog. Social or
sex movement? Be precise. Society involves ALL (human) beings. And no, I'm
not offensive. I like you and it's O.K., if you are feminist. Just I don't
agree with it, making social movements with the thing between your legs.

> Who is blaming sexism on "the thole world populations <sic>"? What I

> which are to enact change and promote equality.

No, as long as there are 'women-only' things, you can't talk about
equality. All different all equal. With other statements I'm supporting
you. I have a better word: humanism - it doesn't include gender, while
feminism does.

> That is patently absurd. Feminism is not a fight against "teachers." Many
> teachers were "not" that way. Feminism is a battle to break down sexist

So you're battling one sexist stereotype with another. Not very sensible.
I agree with other (mostly). You pointed out *teachers*, not me. Isn't
that your personal thing? I was prosecuted by communist government and
was thrown out of University. So what? Should I fight all communists? No.
I like them. I like communism.

> You are Peter, but you are also male, and you have benefitted from being a

For my benefits look above. But it's not my trauma. I just don't have Ph.D.
I admit everything else.

O.K. You think not? Why? Fuck the government. I have a much better real
opportunity to die (better: change my aggregate state) earlier than you
would. And I have a much better real opportunity to be beaten by a gang.
And I had a much better real opportunity to go to prison. And I've got
a much better real opportunity to be shot. Welcome to my benefits. US is
not the whole world. So what do you know about ex-socialism? It was
great.

I'm not denying 'institutional sexism'. But it exists for male as well.

Look for your opportunities and don't believe everything Rosa Luxemburg
and Clara Zetkin wrote.

> There are many erogenous zones in the human body, both male and female,

I see that sexism exists, even through your explanations. But you can't
fight sexism with other sexism. Is penis vulva-centric? What male? Who?
I mentioned clitoris. CLITORIS. VAGINA. PENIS. BREAST. I'm proud of
clitoris, even though I don't have one. This is getting ridiculous. Better
name all sexists and we can E-mail them. I'll help you with that.

Hi,

> What equality, if there are 'women only' things?

Come on, get real!

maybe you come from a different planet than me, but i grew up
surrounded with *men only* things, and still i am often enough the
one woman only amongst males (whether it's in the rock biz,
industrial art, university...)

so excuse me, if women want to have their own things for a change,
bad enough if they're having a minority status in society when in
fact they are the majority in population. (ever heard that woman do
about 60 % of all work but possess 3 % of property?)

would you dare to get mad about if a ethnic minority wants to do
their own thing? i don't think so. so be consistent. it's the right
of every *minority* to gather and do their *own thing*.

as long as *the thing between your legs* as you call it is considered
to be an indicator for your abilities and interests - it very well
is still an issue.

not to talk about how female sexual body parts got degraded by men in
the past, so talking about the CLITORIS and the VAGINA, SLUTS and
CUNTS is about regaining what belongs to us, giving it new meaning
and pride.

GOT TO PUT THE CLIT BACK ON THE MAP!

> Better name all sexists and we can E-mail them. I'll help you with that.
It's not just people - it's a system that's sexist. _nobody_ can
really claim not to be racist or sexist, but we can try.

cheers,
dozza

p.s. for some more provocation:
there is the idea, that men alone should carry the burden of paying
taxes for all the costs involved with crime that to the highest
degree are committed by men!

I disagree. I'm a heavy reader, and it costs me much more to buy printed matter than to read stuff on my computer. In any case, you can always print it out yourself, or just skip it.

> I just can't use computer as a book, my eyes get sore. It's
> a multimedia machine.

This happens to many people, but not everyone! I spend 2-3 hours a day reading text on my computer, and almost never have that problem. Here are some hints:

Use text (DOS) mode, not graphic (Windows) mode.

Increase the resolution. Most PCs come set for 400 lines in text mode, but they can do much better. 600 lines is about right for a 15-inch monitor.

Find a better color combo than black and white. I use lemon-yellow text on a dark blue background.

I use a free program called SVGATextMode to accomplish the above adjustments. I run it under the Linux operating system, but a DOS version is available also -- here's the URL:

<ftp://sunsite.unc.edu/pub/Linux/utils/console/SVGATextMode-1.5-dos.tar.gz>

[-empyre-] from finance to...feminism
From: Anna Munster
To: <empyre@lists.cofa.unsw.edu.au>
Date: Sun Sep 18 08:04:43 AEST 2016

I've really been enjoying the discussion on net art and finance but I did say I was going to use a three-way prism to think about 'then' and 'now'. I thought I'd start another thread to pick up a discussion on feminism and net art.

What I'm really interested in here is the 'return' of feminism in the last couple of years, generally, accompanied by a younger generation of artists and poets' interest in feminist digital/net.art from the '90s. I'm not sure how generalisable this is - perhaps it's a bit more specific to Australia. But here's an example:

Then: VNS Matrix: <http://vnsmatrix.net/>
Now: Xenofeminism: A Politics for Alienation: Laboria Cuboniks, <http://www.laboriacuboniks.net/#firstPage>

I am taking liberties with the term 'net art' here. VNSMatrix were not strictly 'net.artists'. Nonetheless, their presence with net culture in the '90s - they inhabited Lambdamoo, were active participants around discussions on net art and net critique on 'nettle', set up 'recode', a list that discussed net critique and net art in an Australian context, and were individually involved in net art projects such as 'doll yoko': <http://dollyoko.thing.net/>

Interestingly, the recently reformed for their 25 year anniversary to do a live one-off performance in 2015.

Likewise 'Xenofeminism' is not a net.art project as one might traditionally think net.art. BUT it consciously traces a lineage to VNSMatrix and the 'performance' of online and cyber identities. In some ways, we could call it contemporary networked anti-performance art (ooo even I am gagging at that mouthful of a moniker!).

Why I find it interesting is that it continues to push and explore the important relation that so much cyberfeminist and net feminist (art)practice of the '90s brought to light: the network and identity.

Whereas VNS Matrix located a network culture 'erected' on the exclusion and subjugation of the female body, Laboria Cuboniks radically engage with the re-formation of identity itself under the conditions of contemporary networks:

'If 'cyberspace' once offered the promise of escaping the strictures of essentialist identity categories, the climate of contemporary social media has swung forcefully in the other direction, and has become a theatre where these prostrations to identity are performed' (from the Xenofeminism manifesto)

Perhaps what both the 'then' and the 'now' of feminist 'net' art have in common is a desire to 'un-perform' the network!

Thoughts? Misgivings?

Re: [oldboys] Re: maria fernandez/ suhail malik on cyberfeminism
From: Maria Fernandez
To: oldboys@lists.ccc.de
Date: Sat, 1 Sep 2001 01:52:12 -0400

Thank you to Pauline for sending my piece to the list and for your comments. They were right on target. I regret to have missed the beginning of this exchange. The exigencies of relocating transatlantically and moving two households have kept me off line for the last two weeks. I'm currently living among boxes so my communication may remain intermittent for some time...

Connie: I was intrigued by your reactions as my brief comments do not deviate significantly from previous, more extensive critiques of cyberfeminism, including the paper by Faith Wilding "Where is the Feminism in Cyberfeminism", a version which is posted in the OBN web site. Wilding also questioned cyberfeminism's lack of definition and goals yet to my knowledge you have not responded (publically) with similar zeal.

As Pauline observes, I do not think cyberfeminism is over. Quite the opposite, it has hardly begun! I believe that critique is constructive. Rather than deeming it a futile exercise (as you suggest), it can help one to reflect on and refine/define one's position.

Connie, you wrote:
"there is a tradition within obn discussing the understanding of politics. (see also mute #13) and the main question is if something (like cf) can

have a political concern if there is not clearly formulated goals; if there can be by a different understanding of politics than an intentional, which clearly was the feminism of the 70s."

I'm not clear of what you are arguing here. Are you saying that in the deliberate formulation of politics it is not necessary to have an intention? Just how can one hold a committed political position or sustain political activities without any goals?

"for me it makes much more sense to rethink strategies and tools than just replacing one goal by another and using the same strategies to try to reach them."

Here I agree with you. This is precisely where critique, reflection and discussion can help.

"that feminists accuse each other for only being feminist of career reasons is an old tradition, as old as the fact that proclaiming to be a feminist /cyberfeminist does harm to your career. it doesn't lead anyone anywhere and mostly shows personal envy. to make a serious topic out of it you have to be honest about female competition which is a complete taboo ..."

To my mind, that women excel in their chosen careers is entirely consistent with feminism. I'm in favor of healthy competition and/or careerism (as long as it is not exploitative or denigrative of others). In the case of political movements, I believe that political considerations and vision are central and professional and career motives should be guided by and complementary to a political vision.

"but there will also be a section at the conference talking about what the hell is it that ties obn together?"

Perhaps such a discussion will clarify obn's positions.

Best of luck!

Maria

re: critique of Haraway

Dear Maria and Connie,

I too was intrigued by Connie's comments.

I think that is quite telling when it is OK to heavily critique Sadie Plant but not OK to critique Haraway. I actually see the merits of both writers, as well as their weak points, but within their respective disciplines (Haraway a science historian and Sadie Plant a philosopher, both from different parts of the world with completely different contexts, and different generations.) Is it not a bit contradictory to refute a critique on Haraway's ironic manifesto, its promises and what has happened over 20 years on? Or is this the "dissonance" that OBN is supposed to be based on?

As for the following comment

that is why i have never accepted a critique like the one from maria, saying cyberfeminism is not political or critical or radical or whatever nice adverbs there are around. why doesn't she [simply] formulate her idea of a political cyberfeminism and contributes it? why is it the better political gesture to blame others for not doing what i think has to be done? i am happy that this very comfortable gesture doesn't work any longer with cyberfeminism.

Isn't what Maria wrote a contribution?

It will be really interesting to read about the conference as I hope it will clarify some of my thoughts at the moment re: OBN. I hope that it will show

me that there is more of a sense of community than this bickering I receive in my e-mails. I am really trying to get a grasp of what it is all about.

All the Best,
Clara

Dear all,

Just a few notes on the debate on criticism & cyberfeminism --

As someone working on writing and reading, I've found past OBN postings on what to criticise and how somehow, well, confusing. As I understand it, feminist theory is centrally self-reflexive, meaning that writers situate themselves in relation to other authors, past or present (Braidotti's feminist footnoting) and engage in different kinds of critical dialogues with them. Criticism is not about dissing people's work or not seeing what they are arguing or where from... since debate without any attempt to listen/read/grasp the other's arguments does not really qualify as critical practice.

I really do not understand why for example Plant's or Haraway's work should not be revisited critically. I think the opposite, as both authors have in different ways been highly influential for cyberfem practices, textual or other, and remain to be so. Without critical encounters we would be left with either silence or celebration, neither of which seems too great an option. Without criticism the limits of thinking and blind spots of argumentation remain untouched and unquestioned, and without linking one's argumentation to the work of others there is no productive dialogue.

Criticism is central and productive in marking differences and continuities. As attractive as the idea of each formulating their own version of cyberfeminism is, it is of little use unless these individual formulations engage in debate with each other, provocations included, and come to terms with criticism.

Now this is kind of obvious but I'm typing it anyway -- there really is no need to agree on the merits of individual authors' work, or what cyberfeminism possibly stands for, for finding some common ground to speak on. This kind of forced consensus would be ever so dull!

But, again, I don't think there's danger of this happening. If OBN is a community, I do hope it's a critical one.

my best,
Susanna

Hi Connie, Maria, Clara and Susanna and all: I just came back from Ars Electronica where I was on the Female Takeover panels with Connie, Nina Budde, Lynne (sorry don't remember last name at the moment), and snerгурutshka (a group of 3 young women artists from Linz). Our main objective was to talk about strategies of feminist or cyberfeminist art. There are so many things to say about this panel and I am still so upset

and jet-lagged that I can't think straight. But one thing stands out which relates to the current discussion about critical and theoretical cyberfeminism. Sneguruschka collective presented a taped statement (even though they were there in person) that they refused to speak about their work and that they refused theory--specifically it seems, feminist theory. To me that was really disturbing and a real regression, a silencing of women, and a silencing of history. Is this what feminist struggle has won for some fortunate women? that they can do whatever they want without any feeling of responsibility to communicate with women from other fields and practices and countries, with differences of access and economic placement in the world? I know that we can't save the world, but I do feel that if we have a platform from which to speak then we are responsible to speak not only for and to and about ourselves, but to a much broader constituency that does not yet have a platform. We know women's history only because some women (and men) have made it their life-long work to explore it and teach it and write about it and show it and fight to have it represented as part of world history. It can so easily be lost. As a feminist and cyberfeminist I value immeasurably the theory that women are producing and the generative and critical conversations which that theory allows me. My work would be nothing without it.

I hope to write more about Female takeover etc. after I have calmed down a little.
cheers, faith wilding

Hiya old boys,

Sorry to butt in after never doing so, but I could do that if Maria doesn't mind. I co-edit Mute & have got the final version + the opposing viewpoint (from Suhail Malik) somewhere here, as they've just been extracted from the page layouts to go on the Web. They were both part of a regular double pager we do sort of juxtaposing opposite points of view on a topical issue. They'll also both go up when our next issue (21) comes out.

Two seconds.....

Best,

Pauline]

Hi,

This re: yesterday's promise to send over a so-called 'head-to-head' we published about the mysterious wane and wane of cyborg figures... as well as the question mark hovering over their material impact. The very brief history to this is that we asked both authors, whose opinions we suspected would differ significantly, to crystallise their feelings into a kind of top 5.

(Oddly enough, the pretty much simultaneous revisitation of the subject by Mute and Adbusters - which admittedly were very different - kind of disproved our own premise about the strange fading of the Manifesto's influence. I've since heard from Debbie Shaw, who wrote a letter to Mute in reply to Suhail Malik's statement, that Donna Haraway is very mystified by this resurgence in interest :).

Anyway, here it is.

Bests, Pauline

----from Mute20----

In 1985, Donna Haraway unveiled "The Cyborg Manifesto", thrilling cultural studies bods, new agers, feminists, and cyberpunks alike with its mix of military, political, laboratory and hippy flavours. Consigning the boundaries between the born and the built and the subject's oedipal development to the rubbish dump of history, Haraway's politics of the information age created waves. But ten years on, has the radical promise of her manifesto been borne out by history? Maria Fernandez and Suhail Malik both think it hasn't. But fear not, their reasons for agreeing are completely opposed

The Cyborg (sweet sixteen and never been cloned)

In an era when nearly everything, from small seeds to large computer networks, entails practical or metaphorical organic and machinic fusions, the 'cyborg', that product of early Cold War cybernetic theory, and detoured by Haraway a generation later, has lost its political clout. Haraway's cyborg, 'not of woman born', the illegitimate offspring of militarism and patriarchal capitalism, was modeled upon the meztizaje (racial mixing) of Mexican Americans. Acknowledging that she wrote the piece at a particular historical moment and primarily for women, Haraway's cyborg was an inconstant figure able to incorporate spiral dancers, electronic factory workers, poets, and engineers: a figure who allied diverse oppositional strategies, from writing to biotechnology. Given this radical theoretical openness, what did the Cyborg Manifesto (CM) really manage to achieve?

1. CM was an early recognition of the fundamental and irreversible changes brought about by digital technologies. Pre-dating Dolly, the Visible Man, the Visible Woman, and the (purported) completion of the

Genome Project. Haraway discerned society's transformation into a "polymorphous information system" and "the translation of the world into a problem of coding", both phenomena with specific effects for women worldwide. In the 1980s, Haraway was one of a handful of cultural critics to write about the double-edged possibilities of biotechnology, a major focus of cultural work today. Her prediction that control strategies applied to women to give birth to new human beings would be developed using the language "of goal achievement for individual decision-makers" had, by the 1990s, become painfully clear.

2. CM urged feminists to embrace new technologies as tools for feminist ends. This was a pressing antidote to the pernicious notion, popular at the time, that women belonged exclusively to 'nature'. The manifesto proposed that feminists definitely could and should use the master's tools to destroy (or at least disrupt) the master's house.

3. CM contributed to the growth of a pan-global labor consciousness, acknowledging the key role of women as workers in the global economy. It also inspired the development of cyberfeminism in various parts of the world. But in contrast to Haraway's feminist, socialist and antiracist politics, Cyberfeminism eschewed definitions, political affiliations (including feminism) and even goals.* The political effectiveness of so undirected a movement is still to be determined. Issues of race and racism, primary in Haraway's formulation of the cyborg have been avoided in cyberfeminism. This silence could prove as destructive here as it was to Second Wave US feminism. One can only hope that cyberfeminism is still open to transformations.

4. CM proposed feminist associations based on affinities, not identity. Haraway wrote the manifesto in response to endless fragmentation of the US Second Wave feminist movement along the lines of ethnic, racial and sexual identity. The manifesto called for the crossing of boundaries and for a re-organisation of women on the basis of affinities of political kinship. Cyberfeminists followed Haraway's lead to associate on the basis of affinities but at present, with some exceptions, these affinities tend to be career-oriented rather than political.

5. CM reinforced and popularised earlier utopian feminist imaginings of a world rendered gender free by technology. Effectively, what this really meant was that those who could afford medical services and technology would be able to 're-generate' themselves at will. For a small segment of the world's population this has indeed been liberating and empowering. Previously 'monstrous' prosthesis became beautiful. If the original radicality of Haraway's cyborg lay in its illegitimacy, the ubiquity of digital, ex-military, and genetic technologies suggest that the cyborg is now a recognised legal citizen, much more a creature of social reality than of fiction. The utilisation of the cyborg as an image of edgy radicalism was, and still is, the territory of electronics and the fashion industry. As cyberfeminism emphasises the cyber and backpedals the feminism, the most radical politics of the manifesto have been largely ignored.

Maria Fernandez

The Cyborg Fifteen Years On, Five Complaints

We know what a cyborg is: the hybrid transfiguration of the human and the machinic into one continuous, prosthetically extended, technically or organically enhanced and integrated body, mind and generalised culture.

The hope of this integration is for a transorganic or transhuman future, something like an entirely new evolutionary stage of life which will surpass the organic limitations of brain and body in favour of new, unlimited potentialities. A new sort of future that undermines the divisions and boundaries between the human and its others; a cross-disciplinary movement that, as Donna Haraway asserts in her foundational text, "The Cyborg Manifesto", has characterised liberal societies in (post)modernity.

The cyborg is yet another manifestation of the collapse of the traditional bounded stability of the human and its anthropocentric beliefs. But this notion of the cyborg is a lazy reconfiguration of already well-established political and moral sensibilities why?

1. It
 duplicitously welcomes the technoscientific hybridisation of the organic

and the technical while maintaining and perpetuating the critique of technological rationality which has characterised left-liberal activism and humanities. Neither aspect is transformed by what is in fact a confrontation but comes to exist side-by-side in a typically vague optimism in which all transgressions of boundaries are welcomed, without adequate consideration of content or the difficulties involved. In this way, the theory of the cyborg perpetuates the standard assumptions of leftist (and proto-hippie) critique.

2. This hypocritical determination only serves to reinforce equally naive notions of an extended freedom and responsibility which, rather, the cyborg is in the service of. There is something disgustingly, liberally 'communitarian' about the cyborg in its current appreciation, which could be readily taken as a covert if naively assumed parochialism or, better, Americanism. No surprise that this should come from those on the nice left where 'contestation' always involves 'respect' and 'creativity' rather than war and destruction (see Hardt & Negri's approbation of Haraway in *Empire*).

3. Cyborg theory is mostly a self-serving sexying-up of critical liberalism through great gadgetry and concept-busting movements in the technoscientific organisation of living material and extended systems. Tie-dye T-shirts are swapped for leather deathpants and ethnic beads for prosthetic hardware in a desperate bid for contemporaneity.

4. But the errors and dogmatism of the now common notion of the cyborg also extend to the understanding of what is actually happening in the technosciences. The cyborg is a theoretical fiction since how the machinic and the organic in fact materially interact and combine is not and cannot be accounted for by a theory ultimately based on abstractions.

5. This tendentious, primarily phantasmatic appropriation of technoscientific development as 'cyborgian' precludes a technically precise and fully inventive understanding of organico-machinic integration in favour of asserting what has been going on in well-meaning left-liberal circles for some time anyway. It is a complacent reduction of the actuality of the organico-machinic nexus, dulling it into politically comprehensible and polite terms.

Yes, which explains the first and perhaps lasting impact... but what I think is occurring now, or at least with things like the totally mistakenly entitled 'Cyborg Manisto' associated with Adbusters (<http://www.cyborgmanifesto.org>) which was a spoof lambasting the oldest-fashioned version of the cyborg and seemed wholly unaware of Haraway's different formulation), is that it's coming back again, but in a kind of amnesiac haze, and, unlike before, accompanied by serious animosity. This is what I believe mystifies her - not the initial interest.

>i, personally, always understood cyberfeminism as an operational mode
>which is first of all, based on activity, which means you become a
>cyberfeminist by developing your own cyberfeminist theory/ piece/
>work/thought - whatever medium you prefer to work in - and contribute this
>to the discourse, the discourse, at least the one around obn is not just
>open enough to allow all possible approaches, but obn's basic idea is to
>build platforms which allow exactly this.
>
>that is why i have never accepted a critique like the one from maria,
>saying cyberfeminism is not political or critical or radical or whatever
>nice adverbs there are around. why doesn't she [simply] formulate her idea
>of a political cyberfeminism and contributes it? why is it the better
>political gesture to blame others for not doing what i think has to be
>done? i am happy that this very comfortable gesture doesn't work any
>longer with cyberfeminism.

Well, I feel very uncomfortable speaking for someone else, and as you seem to imply that Maria is on this list, I'm sure this won't last for long, but surely these two things aren't mutually exclusive! First of all, her points re-emphasize Haraway's and presumably go along with cyberfem's 'non-natural' use of technological tools; second, I think it's clear from everything's she's saying that she thinks the story ain't over - as it were - but yes, that there's a frustration there at the lack of specificity regarding what are broadly understood as its aims, and the 'backpeddling' on the feminism half of its name; third, I think she's trying to reclaim for something-like-cyberfeminism a far more diverse understanding of what 'cyber' might be in the global economy - to bring in all the far flung female identities which Haraway brought into the equation. Fair cop, no? Can't *that* be a contribution, from a practitioner whose 'medium' is text? When she talks about careerism, well, that stuff is so personal that the single term cyberfeminism just becomes too big an umbrella to really categorise the who and the why, but it's fair to posit it as a worry: even if it only functions to be shot down, including by those who may think careerism is a useful political strategy.

By the way, Suhail Malik lectures in art theory in the fine art dept. of Goldsmiths, here in London. Essentially, in this article he was revisiting a subject that was already a bane of his in 1994 - when he wrote one of our (Mute's) first big essays: The Immateriality of the Signifier: The Flesh and the Innocence of Michael Jackson.

Byeece, Pauline.

tnx pauline,

for posting the whole piece and putting it in context.
i started by just quoting in order to shed some light on the... achim, case.
>Donna Haraway is very mystified by this resurgence in interest :).
reg, this i'd say that it just reflects a general need for 'prophecy', and if a thinker manages to condense a complex construct of ideas into a handy formula like a manifesto, a star is born.

i, personally, always understood cyberfeminism as an operational mode which is first of all, based on activity, which means you become a cyberfeminist by developing your own cyberfeminist theory/ piece/ work/thought - whatever

medium you prefer to work in - and contribute this to the discourse, the discourse, at least the one around obn is not just open enough to allow all possible approaches, but obn's basic idea is to build platforms which allow exactly this.

that is why i have never accepted a critique like the one from maria, saying cyberfeminism is not political or critical or radical or whatever nice adverbs there are around. why doesn't she [simply] formulate her idea of a political cyberfeminism and contributes it? why is it the better political gesture to blame others for not doing what i think has to be done? i am happy that this very comfortable gesture doesn't work any longer with cyberfeminism.

and i am really looking forward to her political approach to cyberfeminism.

cheers,
cornelia

hi pauline,

tnx for 'speaking for someone else'...

yes, maria is on the list, but maybe she is on holidays or so. i hope she will also take the opportunity to comment.

>First of all, her points
>re-emphasize Haraway's and presumably go along with cyberfem's
>'non-natural' use of technological tools;

ok

>second, I think it's clear from
>everything's she's saying that she thinks the story ain't over - as it were
>- but yes, that there's a frustration there at the lack of specificity
>regarding what are broadly understood as its aims, and the 'backpeddling'
>on the feminism half of its name;
good that it's not over otherwise we had to ask ourselves what we are doing
on this list;-)
(maybe we have anyway, oe esp. because it is not over)
there is a tradition within obn discussing the understanding of politics. (see also
mute #13)
and the main question is if something (like cf) can have a political concern if
there is not clearly formulated goals; if there can by a different understanding of
politics than an intentional, which clearly was the feminism of the 70s. for me it
makes much more sense to rethink strategies and tools than just replacing one
goal by another and using the same strategies to try to reach them, but there will
also be a section at the conference talking about what the hell is it that ties obn
together? i dont know if we have the goals on our banners afterwards. maybe
some have their goals already, just on very tiny banners!

>third, I think she's trying to reclaim
>for something-like-cyberfeminism a far more diverse understanding of what
>'cyber' might be in the global economy - to bring in all the far flung
>female identities which Haraway brought into the equation. Fair cop, no?
>Can't *that* be a contribution, from a practitioner whose 'medium' is text?

it is at least a starting point. as you all might know already we are having the
third international conference this year in december, just working on the call, and
this will be exactly the right place to talk about utopias, understanding of politics
etc. and to present more profound ideas of cyberfeminist politics i.e.
>When she talks about careerism, well, that stuff is so personal that the
>single term cyberfeminism just becomes too big an umbrella to really
>categorise the who and the why, but it's fair to posit it as a worry: even
>if it only functions to be shot down, including by those who may think
>careerism is a useful political strategy.

that feminists accuse each other for only being feminist of career reasons is an
old tradition, as old as the fact that proclaiming to be a feminist /cyberfeminist
does harm to your career. it doesn't lead anyone anywhere and mostly shows
personal envy, to make a serious topic out of it you have to be honest about
female competition which is a complete taboo, still, and one should take into
consideration that not everyone wants to go into the arena and take the risk to be
publically beaten up, and if you do so, is it just for career reasons?!

anyway, i finally had an inspiration for a domain name for my new homepage:

www.cyberfeminist-career-center.de
i think it is really funny;-)

best, c.

<nettime> a byte of VN

From: Josephine Bosma

To: nettime-l@desk.nl

Date: Sat, 28 Jun 1997 10:21:12
+0200 (MET DST)

Its summer, although you wouldn't believe it here in cold Amsterdam.
Nettime has been rather silent, and the mails that did come were
very long and also the connection to anything like net.criticism
was somewhat lost to me sometimes.

Here's a little byte of VNS, an interview I did with Josephine Starrs
the 26th of March this year. It was kind of an addition to another
interview I did with Josephine and Leon Cmielewski about their
user unfriendly interface and their emotional computerlife, so its
not very long or deep. As I said, just a byte of VNS, for your
enjoyment.

JS: VNS_Matrix was four women: Francesca Di Rimini, Virginia Barratt,
Julianne Pierce and myself, Josephine Starrs. We started about five
or six years ago with the cyberfeminist manifesto for the twentyfirst
century.

We started posterizing cities in Australia with that manifesto. We wanted
to work with technology, we're all from different backgrounds: writer,
performance artist, filmmaker. I was from a photography background. We
didn't have access to any particular new technology, but we had access
to a photocopier, so we just started writing about technology, because
we were worried that it seemed such a boys domain at that time, in the
artworld and so on.

We started computers and we did internet performance work, we've done
installations, we've done billboards. We had this agenda of encouraging
women to get involved if they want to look at their relationship with
technologies, to get the hands on the tools and to have fun with it.
Part of the project was to use humour in this process, rather then a
seventies style of feminism where you got up on a soapbox and blabla..
We tried to make it like technology isn't intimidating, its fun to use.
In proces we all started to get completely sucked in and we started
having too much fun I think. (laughter)

The last project has been to make this computergame called Bad Code.
So far we've made the prototype of that. Now we are looking for
developers to develop it further.

JB: Its for girls right?

JS: Its not particularly FOR girls, its just not aimed at fourteen year
old boys. So by not aiming at fourteen year old boys, girls like it.

JB: You're from different disciplines, but do you all have a feminist
background? Hows the average age? Do you think there is different
generations in feminism?

JS: Yes, we all have a feminist background. We are all in our mid
twenties.(laughs) Our ages range from thirty-three to forty-two,
so..I don't know how to answer the last question. I guess there's all
that stuff about the first wave and the second wave of feminism, but
cyberfeminism goes beyond all that.

JB: It covers all of them?

JS: yeah.

JB: Do you have any examples or other cyberfeminists that you enjoy?

JB: Certainly. Lets see, who would be on our list of cyberfeminists..
Well, Sadie Plant is my favorit cyberfeminist. I love her quote that
cyberfeminism is simply the acknowledgement that the patriarchy is
doomed. I think Sandie Stone and Brenda Laurel should be on the list.
There are a few groups in Australia, the Digtarts, Linda Dement, Zoe
Sophoulis, lots of women working in the area and writing about new
media and so on.

JB: Are there any females (they don't have to necesarely call themselves
feminists) that come before the cyberfeminist wave, that inspired you?
That you think have made a kind of breeding ground for you to work from?

JS: Its true that I was influenced in the eighties, like everyone else,
by writings of french feminists like Ingaray and Kristeva. That french
feminism kind of informed our original manifesto in a way. But we were
trying to use that as a springboard to find another way of looking at
things. And I guess Donna Haraway especially inspired us at the time.
There are a lot of women artists that a lot of people have never heard
of in Australia who started to work in the area, like Linda Dement who
did the CyberFleshGirlMonster-CD. She is a good friend. We thought
feminism had become far to theoretical and we didn't know which way to
go. So we thought: what did they do in the seventies, they had
manifesto's and they got out there and posted.. So we thought we'd
become activists. We had a lot of fun doing it, more in a sort of
ironic, humorous way.

JB: Feminism is a bit suffering from the fact that the diversity in
issues concerning women, who make up half of the world population and
have different backgrounds and possibilities, this diversity is vast
and hard to work with.
Are you working in any way with the issues there or do you seek
connections with for instance groups that fight for very simple basic
rights?

JS: I have done a lot of teaching in art schools and community set ups.
I know what it is like to teach a woman how to use a computer, who has
a real fobia.

There are different ways of teaching, without intimidating people
completely. In that way we've tried to be active and encouraging women
not to be intimidated. We live in Australia, its a wealthy western
country. We're aware of the fact of course that there are all these

women in for example the Filipines going blind making this technology that we're using. We feel that we can't cover everything though, we are cynical about the techno evangelism coming out of California saying technology is going to save the world and make everybody happy, because it always talking about a certain part of the population of course that have access to that technology. But it is not going to make us stop using it, or stop us from networking with different people.

JB: Talking about women online: do you think, with Kristeva and Irigaray's work in mind, can you notice different styles of discourse on line between women and men?

JS: That's a good one. If you're talking about chats or moos, everybody's trying to peek whether you're talking to a man or woman, and I think I've probably been fooled some of the time, also a lot of people thought I have been a man and I have gone with that and pretended to be a man. But in terms of the writing, I think some of my friends who are writing, I am thinking now of one of vmsmatrix: Francesca DiRimini aka Gashgirl, that her writing is particularly influenced by perhaps feminist writings. So it sort of has grown up and then expanded onto the online thing, because it's a nonlinear kind of writing and because you can use the hypertext in a different sort of way. I do not want to generalize, but there is a nice style that women are developing in their online writing.

JB: What do you think will be the future of academic male discourse online?

It can never stay as straight as it is..

JS: (laughs) I have no idea. It is very straight yes. I am amazed by some of the postings that happen. I don't join in a lot because often it's just so serious, just so straight. I prefer to have to play online, play with words and play with the people that I'm corresponding with, which aren't all women.

JB: I think I understand what you mean, but of course if somebody listens to this or reads this, they might very well think: O, there are these women again, they cannot have a serious conversation. I don't think you mean serious, right?

There's something else in these texts that you cannot log into, cannot connect to. Could you describe it in a different way?

JS: I guess its more that the style of writing puts a distance between you and the person that is supposed to be communicating with you. That's the only thing I can say really. I talk about serious issues with the people that I correspond with. I am not belittling seriousness. There are a lot of serious things to be discussed. There is a lot of serious work to be done. But there is also this thing of putting a distance between you and the person you are communicating with.

JB: and this serves a purpose of course, but now I am leading the witness.

<nettime> Where is feminism in cyberfeminism

From: Faith Wilding

To: nettime-l@desk.nl

Date: Tue, 6 Jan 1998 15:31:10 -0500

Where is Feminism in Cyberfeminism?

Faith Wilding

Introduction

"What is cyberfeminism? Sadie Plant claims it is an absolutely post-human insurrection -the revolt of an emergent system which includes women and computers, against the world view and material reality of a patriarchy which still seeks to subdue them. This is an alliance of 'the goods' against their masters, an alliance of woman and machines. It is a revolt of the chattels."
--Caroline Bassett, With a little help from Our (New) Friends!

During the recent Cyberfeminist International (CI) meetings at Documenta X in

Kassel, Germany (1), much discussion centered on whether or not there should--or could--be a definition of cyberfeminism. FACES (a women only on-line list) had been debating this issue with varying degrees of passion for months; the press and other interested parties wanted to know; we, the participants, wanted to know. The chance to talk about this important issue face to face was invaluable since this perplexing question lies at the heart of many of the contradictory contemporary positions and attitudes toward feminism(s) on-line, which need to be addressed if there is to be an engaged (cyber)feminist politics implemented on the Net. By looking more closely at the reasons put forth against defining cyberfeminism, and their implications, and by offering some possible definitions of cyberfeminism, I hope to suggest how such a politics might be translated into practice. The impetus for this essay springs from the experience of eight days of intense daily living and working with almost forty women participants of the 1st Cyberfeminist International. The daily collective interactions, discussions, presentations, meals, work, and play, represented a browser through which possible practices of a cyberfeminist movement became visible. The women present understood this to be a significant historic moment; subsequent on-line discussions and planning are adding to the evidence that much research and development still lie ahead.

Against Definition

"The 1st CYBERFEMINIST INTERNATIONAL slips through the traps of definition with different attitudes towards art, culture, theory, politics, communication and technology--the terrain of the Internet." --1st CI Press Release

Some definitions of cyberfeminism have already been offered in the writings and art practices of Sadie Plant, VNS Matrix, Linda Dement, Rosi Braidotti, Alluquere Rosanne Stone, and others. Why then this preoccupation with definitions of cyberfeminism in the CI discussions? The reasons given for refusing to define cyberfeminism--even though they may call themselves cyberfeminists--indicate a profound ambivalence in many wired women's relationship to what they perceive to be a monumental past feminist history, theory and practice, and its relevance to contemporary conditions facing women immersed in technology. I will discuss four of the main manifestations of this ambivalence and explore their implications.

1. Repudiation of "old style" (70's) feminism.

According to this argument, "old style" (70's) feminism is characterized as constricting (politically correct), guilt inducing, essentialist, anti-technology, anti-sex, and not relevant to women's circumstances in the new technologies. This is ironic because in actual practice cyberfeminism has already adopted many of the strategies of avant garde feminist movements, including strategic separatism (women only lists, self-help, chat groups, networks, and woman to woman technological training), feminist cultural, social, and language theory and analysis, creation of new images of women on the Net (feminist avatars, cyborgs, genderfusion) to counter rampant sexist stereotyping, feminist net critique, strategic essentialism, and the like. The repudiation of historical feminism is problematic because it throws out the baby with the bathwater and aligns itself uneasily with popular fears, stereotypes, and misconceptions about feminism.

Why is it that so many younger women (and men) know so little about even very recent histories of women, not to speak of past feminist movements and philosophies? It is tempting to point the finger at educational systems and institutions which still treat the histories of women, minoritarian, and marginalized populations as ancillary to "regular" history, relegating them to specialized courses or departments. In the US, young women entering college often blithely claim equality with men declaring that feminism isn't needed anymore--in complete disregard of the fact that the very structures of the institutions are masculinist; that what counts as the main body of knowledge to be conveyed is still almost entirely white, male, and western European; that the new technology departments springing up everywhere are heavily male dominated (2); and that women professors still are less likely to be tenured, tenure-track, or full-time, and often still make less than male professors at comparable ranks. And all of this despite the fact that as a recognized field of knowledge and study, feminism and gender studies are firmly established in academia.

But the problems lie deeper than the education systems. The political work of building a movement is a technology which must be learned by study and practice and needs the help of experienced practitioners. The struggle to keep practices and histories of resistance alive today is harder in the face of a commodity culture which thrives on novelty, speed, obsolescence, evanescence, virtuality, simulation, and utopian promises of technology. Commodity culture is forever young and makes even the recent past appear remote and mythic. On a recent panel a young woman said that 70's feminism has taken on mythical proportions for her generation, making the prospect of measuring up to such a history overwhelming for her and her peers. Conversely, many older feminists are unsure of how to connect to the issues of new media generations, and how

to go about translating feminist ideas to the information culture. The problem for younger women then, becomes one of how to create a feminist politics and activist trajectory of their own to address new cultural and technological conditions and experiences.

To be sure, the problem of the loss of historical knowledge and active connection to radical movements of the past is one which is not limited to feminism—it is an endemic problem for leftist movements in the US. By arguing for the importance of the knowledge of history I am not interested in invoking nostalgic homage to moments of past glory. If cyberfeminists wish to avoid making the mistakes of past feminists, it behooves them to know and analyze feminist histories very carefully. And if they are to expand their territory on the Net and negotiate issues of difference across generational, economic, educational, racial, national, and experiential boundaries, they must seek out coalitions and alliances with diverse groups of women involved in the integrated circuit of global technologies. At the same time, close familiarity with postcolonial studies, and with the histories of imperialist and colonialist domination—and resistance to them—are equally important for an informed practice of cyberfeminist politics.

2. Cybergirl-ism.

Judging by a quick net browse, one of the most popular feminist avatars currently offered to young women on the Net is “cybergirl-ism” in all of its permutations: “webgirls”, “not girls”, “guerrilla girls”, “bad girls”, etc. As Rosi Braidotti (3) and others have pointed out, the often ironical, parodic, humorous, passionate, angry, or aggressive work of many of these recent “grrrl” groups is an important manifestation of new feminine subjective and cultural representations in cyberspace. Currently there is quite a wide variety of articulations of feminist and protofeminist practices in these various ‘groups’ which seem to range from “anyone female can join” chatty mailing lists, to sci-fi, cyberpunk, and femporn zines; anti-discrimination projects; sexual exhibitionism; transgender experimentation; lesbian separatism; medical self-help; artistic self-promotion; job and dating services; and just plain mouthing off. Cybergirl-ism generally seems to subscribe to a certain amount of net utopianism—an “anything you wanna be and do in cyberspace is cool” attitude. Despite the gripings against men in general—and technogeeks in particular—which pervade some of the discussions and sites, most cybergirls don’t seem interested in engaging in a political critique of women’s position on the Net—they’d rather “just do it”, and adopt the somewhat anti-theory attitude which seems to prevail currently.

While cybergirls sometimes draw (whether consciously or unconsciously) on feminist analyses of popular representations of women—and on the strategies and work of many feminist artists—they also often uncritically recirculate and re-present sexist and stereotyped images of women from popular media—the buxom gun moll; the supersexed cyborg femme; the ‘90’s tupperware cartoon women, are favorites—without any analysis or critical recontextualization. Creating more positive and complex images of women which break the gendered codes prevailing on the Net (and in the popular media) takes many smart heads, and there is richly suggestive feminist research available, ranging from Haraway’s monstrous cyborgs, Judith Butler’s gender masquerade, Octavia Butler’s recombinant genders, and all manner of hybrid beings which can unsettle the old masculine/feminine binaries.

The many lines of flight of cybergirl-ism are important as vectors of investigation, research, and invention. But these can’t replace the hard work which is needed in order to identify and change the masculinist structures, content, and effects of the new technologies. If it is true, as Sadie Plant argues that “women have not merely had a minor part to play in the emergence of the digital machines....(that) women have been the simulators, assemblers, and programmers of the digital machines.” (4) then why are there so few women in visible positions of leadership in the electronic world? Why are women programmers and hackers still a tiny minority, and often considered anomalies? Why is the popular perception still that women are generally anti-tech, and at best secondary players in the high tech world? Sadly, the lesson of Ada Lovelace is that even though women have made major contributions to the invention of computers and computer programming, it hasn’t changed the perception—or reality—of women’s condition in the new technologies. Being bad girls on the Internet is not going to change matters much either, nor challenge the status quo, though it may provide refreshing moments of iconoclastic delirium. But if grrrl energy and invention were to be coupled with engaged political savvy and practice....Imagine!

3. Net utopianism

Many cyberfeminists feel that the e-media are completely new technologies which give women a chance to start afresh, create new languages, programs, platforms, images, fluid identities and multi-subject definitions—that in fact, the e-media can be recoded, redesigned, reprogrammed to meet women’s need and desire to change the feminine condition. This variety of net utopianism declares that the choice is yours in cyberspace—you can be anything you want to be—and refuses to be pinned down to definitions which

might imply a fixed set of beliefs, practices, or responsibilities or a fixed subject position. As has been noted in a previous essay (5) there is much to be said for considering cyberfeminism a promising new wave of feminist practice which can contest technologically complex territories, and chart new ground for women. It is of utmost importance however to recognize that the new

media exist within a social framework that is already established in its practices and embedded in economic, political and cultural environments which are still deeply sexist, and racist. Contrary to the fond delusions of many net utopians, information exchange on the Net does not automatically obliterate hierarchies through free exchange of information across boundaries. Also, the Net is not a utopia of nongender, it is not a free space ready for colonization without regard to bodies, sex, age, economics, social class, or race. Despite the indisputable groundbreaking contributions by women to the invention and development of computing technology, today’s Internet is a contested zone historically originated as a system to serve war technologies, and is currently part of masculinist institutions. Any new possibilities imagined within the Net must first acknowledge and fully take into account the implications of its founding formations and present political conditions. This being so, it can be seen as a radical act to insert the word feminism into cyber space, to interrupt the flow of masculine codes by boldly declaring the intention to bastardize, hybridize, provoke, and infect the male order of things by politicizing the environment of the Net. It is people who can become politicized, not machines, though they may be enlisted as allies in our conspiracies. Feminism has always implied dangerous disruptions, covert and overt action, war on patriarchal beliefs, traditions, social structures. Cyberfeminism can model a brash disruptive politics which aims to dismantle the patriarchal conditions which produce the codes, languages, images, and structures of the Net.

4. Fear of political engagement

Another ambivalence about defining cyberfeminism is the fear of forced political consensus, the fear that discussions will be closed and differences elided. Perhaps by refusing definition, regressive identity politics and party lines, political squabbling, and ideological formulations can be avoided. As a playful counter to the desire for definition, and as a provocation to the press, the CI composed and posted the “100 Anti-theses” (a parody of Martin Luther’s theses) which “defined” cyberfeminism by saying what

it is not. This definition by negation or absence was an attractive means for engaging conversation, piquing curiosity, and engaging in language play—and it was certainly fun as a collective writing project. But one cannot describe something by saying what it is not, and once the playful point is made, it’s clear that the 100 antitheses are too abstract, ambiguous, and evasive to function as an organizing strategy politically. While there are many cyberfeminists who are developing extremely sophisticated feminist theories of language, subjectivity, the body, technology, and female representation in cyberspace, there is little understanding of how these theories link to the mundane realities of diverse women’s work and experiences on the Net - much less how they could translate into a transformation of net practices and structures. During the CI discussions at Documenta X, and subsequently on-line, it has become more and more evident that current conditions of Net politics and cyberspace demand more than playfulness if cyberfeminism is to be a force in critiquing Net policy, structure, hierarchies, access, and the effects of new technologies and technoscience on women. Arriving at definition is itself part of an emergent practice, for definitions will shift and complexity as practice becomes more complex. Definition can be a declaration of solidarity with those engaged in justice struggles and “freedom projects” (6) everywhere. Cyberfeminists have too much at stake to be frightened off tough political strategizing and action by the fear of squabbles, ideologizing, and political differences. If I’d rather be a cyberfeminist than a goddess, I’d damned well better know why, and be willing to say so.

Definition as a political strategy

Linking the terms “cyber” and “feminism” produces a crucial new formation in the history of feminism(s) and of the e-media. Each part of the term necessarily modifies the meaning of the other. “Feminism” (or more properly, “feminisms”) has been understood as a historical—and contemporary—transnational movement for justice and freedom for women, which depends on women’s activist participation in networked local, national, and international groups. It focuses on the material, political, emotional, sexual, and psychic conditions arising from women’s differentialized social construction and gender roles. Link this with “cyber”, which means to steer, govern, control (especially automated systems), and we conjure up feminism at the helm: New political, social, and cultural possibilities which are quite staggering. “CyberfeminismS” (7) can link the historical and philosophical practices of feminism to contemporary feminist projects and networks both on and off the Net, and to the material lives and experiences of women in the New World Order, however differently they are manifested in different countries, among different classes and races. If feminism is to be adequate to its cyberpotential then it must mutate to keep up with the shifting complexities

of social realities and life conditions as they are changed by the profound impact communications technologies and technoscience have on all our lives. It is up to cyberfeminists to use feminist theoretical insights and strategic tools and join them with cybertechniques to battle the very real sexism, racism, and militarism encoded in the software and hardware of the Net, thus politicizing this environment.

While refusing definition seems like an attractive, non-hierarchical, anti-identity tactic, it in fact plays into the hands of those who would prefer a net quietism: Give a few lucky women computers to play with and they'll shut up and stop complaining. This attitude is one of which cyberfeminists should be extremely wary and critical. Access to the Internet is still a privilege, and by no means to be regarded as a universal right (nor is it necessarily useful or desirable for everyone). While brilliant consumer marketing has succeeded in making ownership of a PC seem as imperative as having a telephone, computers are in fact powerful tools possession of which can provide a political advantage (the personal computer is the political computer). If the Internet is increasingly the channel through which many people (in the overdeveloped nations) get the bulk of their information, then it matters greatly how women participate in the programming, policy setting, and content formations of the Net, for the information coming across the Net needs to be contextualized both by the receiver and the sender. On the Internet, feminism has a new transnational audience which needs to be educated in its history and its contemporary conditions as they prevail in different countries. For many, cyberfeminism could be their entry point into feminist discourse and practices. While there is a great deal of all kinds of information about feminism available on the Net (8) --and new sites are opening up all the time--it must be remembered that the more this information can be contextualized politically, and linked to practices, activism, and conditions of every day life, the more it is likely to be effective in helping to connect and mobilize people. A potent example can be seen in the Zamir Network (Zamir "for peace") of BBS and e-mail which was created (after the eruption of civil war in Yugoslavia in 1991) to link peace activists in Croatia, Serbia, Slovenia, and Bosnia across borders via host computers in Germany. The point is that computers are more than playful tools, consumer toys, or personal pleasure machines--they are the master's tools, and they have very different meanings and uses for different populations. It will take crafty steerswomen to navigate these channels.

While cyberfeminists should avoid some of the damaging mistakes and blindneses which were part of past feminist thinking, the knowledge, experience, and feminist analysis and strategies accumulated thus far are crucial to carrying their work forward now. If the goal is to create a feminist politics on the Net, to empower women, and to create new possibilities for becoming and action in the world, then cyberfeminists must reinterpret and transpose feminist analysis, critique, strategies, and experience to encounter and contest new conditions, new technologies, new formations. (Self)definition can be an emergent property which arises out of practice and changes with the movements of desire and action. Definition can be fluid, and need not mean limits; rather, it can be a declaration of desires, strategies, actions, and goals. It can create crucial solidarity in the house of difference-- solidarity, rather than unity or consensus--solidarity which is a basis for effective political action.

A Cyberfeminist cell

How might cyberfeminists organize to work for a feminist political and cultural environment on the Net? What are various areas of feminist research and net activity that are already beginning to emerge as cyberfeminist practice? The 1st Cyberfeminist International during Documenta X in Kassel can serve as an example of a prototype cell of feminist Net organization.

A varying and diverse group of more than thirty women--with a steady core of about ten--worked and lived together during the CI. The women were self-selected by open invitation to members of the FACES (women-only) mailing list (affiliated with nettime). The main responsibilities for organizing the CI workdays was taken on by OBN (Old Boys Network)--an ad hoc group of about 6 women--in on-line consultation with all participants. Besides deciding on the content of the CI, the OBN took care of the myriad details of housing, travel, scheduling, technological needs, interfaces with nettime and Documenta, budgeting and communications. Because of the open and exhaustive on-line communications between the OBN leadership and participants, collaborative working relationships were already established by the time the participants met together face to face in Kassel.

From the first day this collaborative process--a recombinant form of feminist group processes, anarchic self-organization, and rotating leadership--continued to develop among women from more than eight countries, and from different economic, ethnic, professional, and political backgrounds. Each day began with participants meeting to prepare the Hybrid Workspace, work on various task-forces (text, press, technical, final party, etc.) and organize the public program for the day. There followed three hours of public lectures and presentations for Documenta audiences. Afterward the closed group

met again for dinner, and to discuss common issues such as the definition of cyberfeminism, group goals, future actions and plans. Work was divided according to inclination and expertise; there was no duty list and no expectation that everyone would work the same amount of hours. Space was opened up for conviviality, impulsive actions, brainstorming, and private time. At all times connection of participants to the FACES list was maintained electronically. Practically all group activities were video- and audiotaped and photographed. Many of the women brought their own computer equipment from

home and set it up in the open work/meeting space; and most of the lectures were accompanied by projected images and readings from the lecturers' web-sites. Two of the Russian women who were traveling to Kassel by a circuitous, even illegal, route because of visa problems, faxed in their trip diary all week as a performance, until they actually arrived. Another participant taught the group how to set up CU_SeeMe_ connection and continued

to participate virtually after she had to leave. Thus there was an interesting interplay between virtuality and flesh presence. The face to face interactions were experienced as much more intense and energizing than the virtual communications, and forged different degrees of affinity between various individuals and sub-groups, while at the same time making all kinds of differences more palpable. Brainstorming and spontaneous actions seemed to spring more readily from the flesh meetings. The opportunity for immediate question and answer and extended discussion after delivery of the papers also enabled more intimate and searching interchanges than are usually possible through on-line text only communications.

There was a wide variety of content presented in the various lectures, web projects, and workshops: Theories of the visibility of sexual difference on the Net; a workshop on digital self-representations of online women in avatars, databodies; analyses of gender representations, sex-sites, cybersex, and femporn; strategies of genderfusion and hybridity to combat stereotyping, essentialism, and sexist representations of women; a proposal for schizo-feminist embodiment; discussion of the fetishistic desire for information, and the paranoia created by the new technologies; a quiz on famous women in history; studies of differences between women and men programmers and hackers; an examination of electronic art based on language rather than numbers; reports on the organization and nature of webgirls lists, and much more (9).

The chief gains from the CI were trust, friendship, a deeper understanding and tolerance of differences, the ability to sustain discussions about controversial and divisive issues without group rupture, mutual education about issues of women and the e-media, as well as a clearer understanding of the territory for cyberfeminist intervention. Some participants felt that too much time and energy had gone into the public programs at the expense of more in-depth closed group discussion. But there is much to be said for cyberfeminists being able to present their research-in-progress to each other in this kind of discursive and experimental format. While the CI did not result in a formal list of goals, actions, and concrete plans, there was general agreement on areas of further work and research. These include:

- * Creating a list of cyberfeminist artists, theorists and speakers to be sent to media festivals, presenting institutions, museums, and other public venues.
- * Creating and publishing cyberfeminist theory, net criticism, position papers, bibliographies, data bases, image banks.
- * Creating a feminist search engine which could link cyberfeminist websites; feminist lists, country by country reports of netactivity and cyberorganization for women.
- * Creating coalitions with female technologists, programmers, scientists and hackers, to link feminist Net theory, content and practice with technological research and invention.
- * Cyberfeminist education projects (for both men and women) in technology, programming, and software and hardware design, which address traditional gender constructions and biases built into technology.
- * A transnational cyberfeminist action alert site.
- * Creating new avatars, databodies, new self (ves) representations which disrupt and recode the gender biases usual in current commercially available ones.
- * Cyberfeminist meetings at all media festivals, activist conferences, exhibitions, and on other occasions whenever possible.

Conclusion

"(Cyber)Feminism is a browser through which to see life." (10)
If cyberfeminism has the desire to research, theorize, work practically, and make visible how women (and non-women) worldwide are affected by new communications technologies, technoscience, and the masculinist, capitalist dominations of the global communications networks, it must begin by formulating its political goals and positions clearly. Cyberfeminists have the chance to create new formulations of feminist theory and practice which address the complex new social conditions created by global technologies. Subversive uses of the new communications technologies can facilitate the work of a transnational movement which aims to infiltrate and infect the networks of power and communication through activist, feminist, projects of solidarity,

education, freedom, vision, and resistance. To be effective in creating a politicized feminist environment on the Net which challenges its present gender, race, age, and class structures, cyberfeminists need to draw on the researches and strategies of avant garde feminist history and its critique of institutionalized patriarchy. In order to disrupt, resist, decode, and recode the masculinist structures of the new technologies, the tough work of technical, theoretical, and political education has to begin. Cyberfeminists must resist tropic and mythic constructions of the Net, and strive to work in activist coalitions with other resistant netgroups. Cyberfeminists need to declare solidarity with transnational feminist and postcolonial initiatives, and work to use their access to communications technologies and electronic networks to support such initiatives.

Notes

1. The 1st Cyberfeminist International met during the cyberfeminist workdays in the Hybrid Workspace at Documenta X in Kassel, September 20-28, 1997.
2. At Carnegie Mellon University, women students comprise about 10% of the computer science department.

The Future is Femail"
 Some Thoughts on the Aesthetics and Politics of Cyberfeminism

By Verena Kuni

What intrigues me, is being alternative and completely conformist at the same time."
 k.d. lang

1. Preface
 The following text reflects the attempt to reproduce a lecture I gave at The First Cyberfeminist International in Kassel, in September 1997. I have since revised and added to this essay based on responses to presenting it to different audiences. It is presented in very abbreviated form here. (The full-length version of this paper was published in the Cyberfeminist Reader by OBN, ed. Cornelia Sollfrank).

This essay centers on visual representations of gender, and is especially addressed to artists (re-)presenting their work in the visual field of the World Wide Web who are concerned with this issue in their everyday practice.

2. Future is Femail!
 Now, just to add an ad for Cyberfeminism--let us admit that...
 Future is femail. This is a fact most men seem not to be capable of accepting - except in the case it is called Barbarella and has the body shape of Jane Fonda.

One of the issues of Cyberfeminism should be to question how to get even with old-fashioned fantasies of that kind and to throw a pinch of sand

into the gears of cybernetic bachelor's machines (Junggesellenmaschinen), how to finish off the damned sexist-machistic colonisation of Cyberspace...

(Here I omit a long discussion of the development of the Internet within masculinist structures; of Sadie Plant's and Donna Haraway's contributions to the discussion of the relationships of women and technology; and a discussion of the definition of cyberfeminism.)

3. A new subversive cyberfeminist energy takes effect wherever women artists work consciously with means of replication and simulation rather than referring to traditional strategies of representation. At this point, it seems to be near at hand that electronic media - as they principally support different techniques of replication and simulation - should match a correspondent artistic practice perfectly. Sounds like good news for feminist artists working with new technologies: Is Cyberfeminism just another name for a new born feminist avant-garde?

At this point it is important to ask ourselves about specific effects of new media technologies that might seriously interfere with the break with concepts of representation (as claimed by Sadie Plant). To answer this question in relation to the aesthetics and politics of Cyberfeminism, the World Wide Web as an expanding field not only of feminist activities, but also of artistic practice seems to be an appropriate area to discuss.

4. Label it! On Netchicks and PopTarts
 Similar to the multitude of different notions and concepts of Cyberfeminism discussed in the field of theory we can find a broad range of Cyberfeminist presence on the Web: from personal hompages to ambitious zines, from weblogs, jumping stations and networks to artistic projects there is a growing number of sites provided by women that are not only dealing with feminist issues, but also associate themselves explicitly with the label Cyberfeminist". But how can we distinguish between feminist" and Cyberfeminist" webwork? As I have already pointed out, regarding the discussions about the relations between Cyberfeminism and the so called "Old school feminism" on one hand, and the continuing disagreements between different feminist and Cyberfeminist positions on the other hand, it does not make very much sense to define Cyberfeminism as the sum of feminist activities. I would like to propose another definition: Cyberfeminist practice as both a political and aesthetic strategy - and, as a strategy working consciously with means of replication and simulation rather than referring to traditional strategies of representation. But how far does this definition fit into a medium like the World Wide Web which is loaded with one of today's most common means of representation: the image? Well, representation is not only built up on visuals, and do not forget that basically the WWW is nothing but a big hypertext. Unfortunately, this doesn't make things better at all.

Net politics begin with the naming of a domain or a site - and in general this will be a name that defines not only its geographic or physical origins, but also the contextual and ideal framework a project is situated in. According to this, let us look at how feminist and Cyberfeminist projects deal with this tool. What can be noticed here generally is that on the one hand a majority of feminist as well as Cyberfeminist sites refer to a spectrum of terms more or less explicitly associated with femininity in respect to the female sex. On the other hand the way this term is related to the female sex seems to be a first criterion to distinguish between feminist and cyberfeminist presence on the Web. At first hand, this can be mentioned as an indication for the unease of a younger generation against concepts developed by an older one that worked on a different basis not only considering the historic situation and the socio-political context, but also considering the media available to work with - and therefore leading not only to a different self understanding, but also to different strategies. As RosieX from the CyberFemZine "GeekGirl" remarks, even the idea of a "movement" itself is based on an older style feminist rhetoric which tended to homogenize all women with the same wants/needs/desires to embrace each other [...].

Whereas feminist projects tend to relate to terms like "woman" or "femina" or to go back to names grasped from the pool of history and mythology like "Ariadne", "Elektra" or "Sappho" - thereby following similar concepts to many projects during the first and second wave of feminist movement that tried to point out the need for consciousness about a "female identity", "herstory" and so on - looking at projects associating themselves with the concept of Cyberfeminism we can find a remarkable predilection for the use of a special slang I would like to describe as an ironic play with the so called toys for boys, recognizing traditional notions of "female identity" as already prestructured by the male perceptions of the female". For example, there are quite a lot of names using and sometimes also fusing the world of computer technology with phrases normally used as vulgars for women, for female sexuality or for ugly feminist, as in Clara Sinclairs "Netchicks Homepage", Akke Wagenaars "RadicalPlaygirls", Crystal Tiles "Feminist Pop Tarts", the german "Cyberweiber" - and yes, we can even put the notion of

Cyberfeminism" into this category. Another major part of the projects refer in a similar way to the word 'girl' changing it into 'grl' and thereby citing the Riotgrl movement that emerged from the music scene during the eighties and transferring it into cyberspace, as it is the case in site-names like 'PlanetGrll', 'GeekGrll' and so on. Similar to the Riotgrl movement in music (or the Bad Grlls in contemporary fine arts), this is also about the need to be part of a scene and at the same time keep one's distance to the gender politics it is ruled by. As Chrystal Tiles from the Feminist Pop Tarts' puts it: A very practical reason grlls/geeks/nerds use these codewords in titles or our site is to make it clear that we're not naked and waiting for a hot chat with you! I mean, just do an infoseek search using the keyword 'grll' or 'woman' and see what you find. Cybergirl.com (not to be confused with Cybergrll!) is a nekkid-chick.gif site or something [...] Ever heard about the cliché 'It's not a man's world, it's a boy's world'? Well, I think of girl, geek, grll, etc. as words women of whatever age can use to signify that we refuse to play the circumscribed, no-win, lady/cutie/muffin/angel/whore/bitch game, and a way to fight back against the boys will be boys and old boys stuff that is so subtle, yet so powerful in our society."

Following this, it seems that within the 'Name Space' of the World Wide Web Cyberfeminist Grllism is not only a means to create and to claim free spaces' for women in the net, but a strategy of masquerade as a tool to undermine dominating gender politics that keep control over the female data set' (i. e. visual or linguistic objectifications of that which male netusers regard as 'female') as well. Furthermore this strategy is not only important for the naming, but also for the visual design of Cyberfeminist web projects, as I will try to demonstrate in my sketch of an iconology of Cyberfeminist webdesign' following below. By trying to find categories and common grounds I do not intend to return to the problematic issue of a 'female', 'feminine' or 'feminist aesthetic'. Rather, my purpose here is to describe Cyberfeminism by the means of its aesthetical and political strategies - and thereby to develop perspectives on the representation of gender in the visual field of World Wide Web.

5. Masquerades of the Cyborg

Regarding the Web as a visual field and stating that Cyberfeminist politics include the screendesign, we will have to take a closer look at the constituting elements like the construction of a site, the use of logos and frames as well as colours, background textures and so on. At first let us ask what a Cyberfeminist website could look like. Is there a possibility for an imaginary with a Cyberfeminist bent? For quite a lot of theorists in the field of Cyberfeminism the use of new technologies is more or less closely associated with the desire to erect a new symbolic order in cyberspace that allows not only for imagining notions of identity and sexuality beyond the binary code, but to incorporate them as well. In this context, the figuration of the Cyborg as outlined by Donna Haraway plays an important role as a synthetic techno-flesh being that in itself already dissolves the gendered knot between body and cultural identity.

"The cyborg as imaginary figure and lived experience changes the notion of what at the end of the twentieth century is being understood as the experience of women."

Another notion to discuss is the concept of hybridity, founded on the idea of difference rather than of identity. Donna Haraway characterized her cyborg as "an ardent adherent of partiality, irony, intimacy, and perversion." Following that, we may conclude that the potential of a cyberfeminist figuration—any public image, be it a logo, a corporate identity, or a screendesign—could be based on a strategy of difference and hybridity. Or if we speak in terms of visual representation (as Judith Halberstam proposes it in reference to Judith Butler) as a strategy of masquerade that may be the only option to outline different images and different visions of possible alliances of women and technology.

Coming back to our reflections about possible strategies for visual artists working on and with the World Wide Web: Is it possible to understand masquerade as a strategy of representation beyond representation, let's say: a representation that at the same moment undermines traditional concepts of representation by using techniques of replication and simulation, irony and parody?

I would like to finish by looking at that what we could call the current reality of Cyberfeminist practice on the World Wide Web, thereby trying to condense the results of my investigations in this field into a short summary of what I call an iconological reflection' of the aesthetics and politics of Cyberfeminism. In so doing I am proceeding from the assumption of the World Wide Web as a kind of graphic interface that can be understood as an arena of visual representation where aesthetics and politics are woven together inseparably.

6. Blue Stockings and Tupperware Aesthetics

Looking at the majority of websites devoted to feminist issues, in the first instance we will find a lot of them following what I already described as the traditional practices of first and second wave feminist movement. However plain and unpretentious the design of a site, there will be at least the good old Venus' Mirror as a sign to show the project's orientation, others will use the colour purple to design their letters, some even do not hesitate to use a floral patterns for their backgrounds and frames. And of course there is the traditional way of labeling, by calling the projects after 'big names' from women's history', be it mythological as Artemis', Ariadne', Electra', be it historic like the zine Blue Stockings' referring to suffragette's movement or just simply by naming the public': 'WWWomen', lesbian.org' and so on. No doubt this politics of definition makes sense in a world wide business center, where you want to place and distribute your offers by using a clear concept for sales promotion - but thinking of Cyberfeminist strategies as mentioned before we will still look for something different. Given the fact that there are lots of projects calling themselves not 'only' feminist, but 'Cyberfeminist', this group will be our field of research.

Indeed, browsing through the variety of Cyberfeminist activities from personal homepages to those run by groups and associations, from e-zines to artistic projects, there's no question that the range of webdesigns is being broadened significantly - but yet the impression will remain that in sum there are common features as well, allowing us to continue our reflections about how Cyberfeminist aesthetics and Cyberfeminist politics might correlate. And of course, we will also have to ask in this context, how far the practice correlates with the strategies projected and claimed in Cyberfeminist theory. For example, regarding the fact that representations of femininity on the web are widely dominated by the male gaze (be it to sell pornography, be it to sell technology as toys for boys) it is no wonder this is also an issue for Cyberfeminist activities longing for a practice of difference. But at the same time, we will have to bear in mind that working on this issue means to get into the complex of representation, body and gender politics where difference is always in danger of being confused with and mistaken as the 'other', a perspective from which any visual notion of 'women' will be an image mirroring traditional points of view.

First of all, a really remarkable part of Cyberfeminist iconography refers to an already existing pool of images of 'strong' and 'liberated' women, i. e. the cross-dressing vamps of the roaring twenties', the super-women known from comic strips like 'Superwoman', 'Spiderwoman' or 'Hellcat', the sexy biker bitches and supervixen pin ups invented by the sixties, up to the angry grlls of nowadays riot grll movement - in short : in the majority stereotypes of liberated women that still bear a lot of sex appeal as well. And regarding the webdesign itself, it is also remarkable that quite a lot of them - if not addicted to the current fashion of techno-pop imagery with brilliant colours and psychedelic background patterns - tend to prefer pastels to create a new 'tupperware aesthetics'. Even if the Cyberfeminist housewife no longer deals with household technology only, the GeekGrll operator girl is no longer surrounded with phones and wires, but with motherboards and chips, even if some of the SuperGrlls wear intellectual glasses and even if the 'All men must die!' -homepage threatens the surfers with blood red weapons of all kind: In the end, all these images refer to a repertoire of one dimensional images of femininity - and we will have to consult them carefully again and again to ask in what way the intended shifts and breaks support a different notion of female identity and are appropriate to undermine rather than to confirm the traditional stereotypes of gender.

Appendix: A Cyberfeminist iconology in short

Duration Performance: The Economy of Feminized Maintenance Work

Faith Wilding

[Performer dressed in a maid's uniform and apron sits at a computer console typing these words:]

This is a story about invisible hands.

This is a story about endless work.

This is a story about women's work of maintenance and survival.

This is a story about the laboring female body in the invisible feminine economy of production and reproduction.

This is a story about repetition, boredom, exhaustion, stress, crashes.

This is a story about tedious, repetitive, straining, manual labor harnessed to the speed of electronic machines.

[During the narration, the following loop is projected on a video screen:]
 clean, wash, dust, wring, iron, sweep, cook, shop, phone, drive, clean, iron,
 enter, mix, drive, delete, clean, purge, wash, merge, edit, shop, fold, phone,
 file, select, copy, curse, cut, sweep, paste, insert, format, iron, program,
 type, assemble, cook, email, fax, cry, forward, sort, type, click, dust,
 clean, etc.

1. Feminist Maintenance Art: In recent decades, the mass deployment of electronic technology in offices and workplaces has profoundly changed the structure of work, and the relationship of home and work life in ways that are having particularly disturbing effects on women. In the US, women who have largely been concentrated in the lower echelons of the labor market--such as clerical work, the garment industries, manufacturing and service jobs--are increasingly being thrown out of waged labor and forced into part time privatized telework, home-based piece work, and service labor. This situation is once again confining many women to the private sphere of the home where they perform double maintenance labor; that of taking care of the family, and that of working in the global consumer economy. Made possible by automated Information Technology (IT), and controlled by mobile capital, it is a market economy based on just-in-time production and distribution strategies that speed up and control the pace of work and life.

The global disappearance of secure salaried and waged jobs does not mean the end of hard labor or tedious, repetitive, manual maintenance work. Worldwide, much of the rote maintenance work of keyboarding, data entry, electronic parts assembly, and service labor is still done manually, predominantly by women. But the spread of automated machinery into the workplace and the hidden nature of homework and telework is contributing to making women's work and women's laboring bodies invisible again.

In the 1970s feminist performance artists developed work which made visible women's laboring bodies and their daily maintenance work--the repetitive, endless, unpaid work that sustains and makes possible the daily lives of individuals, families, and institutions. The feminist duration maintenance performance--the actual performance of a domestic task such as ironing a sheet, scrubbing a floor, etc. lasted as long as the real-life task--thus compelling the audience to experience the real-time tedium of women's maintenance work. Feminist maintenance and duration performances were a strategy to make women's labor visible, and to foreground issues of working conditions, the gender division of labor, unpaid labor, and agency in women's domestic work and lives.

Recently, cyberfeminists have begun to meet, both face to face and electronically, to discuss ways of analyzing, revealing, and transforming women's current relationship to IT, as well as how to intervene in the replication of traditional gender structures in electronic culture. I will discuss some ways in which these concerns relate to women's changing labor conditions worldwide; and also suggest how the 70's strategies for making maintenance labor visible could be adapted by cyberfeminist artists and activists today.

[Performer returns to console and types. Her typing is projected on the screen.]

By the early 1980s, women in the US were 43% of the paid labor force. And 43% of all paid employed women were clerical workers. In the US, women were: 80% of all clerical workers 97% of all typists 99% of all

secretaries 94% of bank tellers 97% of receptionists A MAJORITY OF THESE JOBS WILL BE/ ARE DISAPPEARING In the US women currently are: 31% of computer programmers 29% of computer systems analysts 16% of executive managers 92% of data entry operators 58% of production operators 77% of electronic assemblers THESE STATISTICS ARE NOT CHANGING FAST. Black women in the US are: 3% of corporate officers 14% have work disabilities 59% of all single mothers. HOW MANY OF THESE JOBS WILL DISAPPEAR? At home all women are: 66% married working mothers 100% of mothers 99% of childcare workers 99% primary caregivers to the aged 83% of unpaid household workers 99% of domestic caretakers 99% of physical, emotional, and psychic human capital maintenance workers. IN THE ELECTRONIC HOME WILL MOTHERS BECOME OBSOLETE? IN THE ELECTRONIC WORKPLACE WILL WOMEN BECOME OBSOLETE?

2. The Political Conditions of Homebased Telework

(Note: Many of the particulars of this lecture refer to conditions in the US, but they are also applicable to many Western European countries, Canada, and Australia.)

Recently, cyberfeminist theorists, activists, and artists have been addressing the role of women in the history of computer development, and the contemporary gender constructions embedded in the new technologies. In "The Future Looms," cyberfeminist Sadie Plant exemplifies some of the more wildly utopian claims that have been made for women in technology: "After the war games of the 1940s, women and machines escape the simple service of man to program their own designs and organize themselves; leaking from the reciprocal isolations of home and office, they melt their networks together in the 1990s." (2) This free mythical realm—neither home nor workplace—presumably is cyberspace, which is imagined as a brave new world for women. Would it were so! But alas, research reveals a far more complex situation for most women who work in the high tech industries. Here I will briefly summarize the political and economic conditions of contemporary female office and home-based teleworkers, and the regressive effects on women's roles in the home (and of the home in the market economy) caused by the displacement of large numbers of employed women who have been forced back into the "informal" (part-time and home work) labor economy by the global restructuring of work.

When large numbers of [mostly white and middle-class] women first started entering the waged labor market, their traditional gender roles of maintenance and service were easily translated into the division of labor in offices, banks, and many other work places. Beginning in the late 1890s women increasingly became the majority of copyclerks, typists, calculators, stenographers, switchboard operators, bookkeepers, clerical workers, filing clerks, bank tellers, keypunchers, and data enterers. When automated office technology was introduced in the 70s, women also became the majority of computer users in offices and work-places. Because such a high percentage of employed women (43%) are clerical workers, it is important to study the effects of the deployment of information technology on clerical work. Researchers have noted the differences in how women and men use computers: "women seemed to have acquired computer skills that leave them doing very different jobs than men who use computers." (3) These skills tend to be the rote entry, filing, and maintenance of data, done in isolation in front of a terminal. No particular new skills or knowledge are needed for this work, and most companies never invest the money to train women clerical workers in more advanced computer techniques that would give them a chance to climb the internal company job ladders. They are condemned both to mental and physical repetitive stress syndromes to such a degree that the turnover in clerical workers is almost 100% in many offices.

In the 1990s many of these clerical jobs are being replaced by automated computers and networks of robotic machines. Secretaries and clerical workers are the first casualties of the electronic office. Lacking advanced skills and knowledge capital, these displaced women workers often have no other choice than to resort to low-skilled part time work, or home-based telework. Such "home-work" includes different kinds of work ranging from professional telecommuting, entrepreneurial businesses, salaried employment, and self-employed freelance work, to (often illegal) garment and needle industries, electronic parts assembly, and clerical computer work. While for some upper-echelon female white collar workers and professionals telecommuting has become part of their job and enhances their value as employees, for the great majority of other casualties of electronic joblessness, the forced "choice" of home work is a big step down—measured in terms of wages, benefits, and working conditions—even from clerical work in an office, and usually amounts to nothing short of the enslaved maintenance work that keeps global capital's production lines and data-banks speeding along. Opportunities are especially bad for women of color and immigrants, who tend to be concentrated in jobs with the lowest level of skills most affected by office automation.

The political conditions of office and homework in the 90s are restructuring home and work life in crucial ways, and are producing a

worldwide labor crisis.

Home work is feminized labor:

Feminized home work is a structural feature of the contemporary US telework, data-entry, and service economies, as well as an aspect of the global sweatshop economy (which includes all kinds of assembly work), and the computer chip and electronic parts manufacturing industry. "To be feminized means to be made extremely vulnerable; able to be disassembled, reassembled, exploited as a reserve labor force; seen less as workers than as servers; subjected to time arrangements on and off the paid job that make a mockery of a limited work day; leading an existence that always borders on being obscene, out of place, and reducible to sex." (4) Work is restructured in a way that downgrades and feminizes professional work, and in turn lowers the pay level and satisfaction of the job. Ironically, much of the automated technology was designed to replace the rote maintenance labor—mostly performed by women—in offices and factories, and the resultant displacement of women from the public workplace, and the renewed invisibility of their work, has had the effect of devaluing women's labor and home-making services even more, both financially and emotionally.

Home work sustains the gendered division of labor:

It is hardly news that home-based work in industrialized nations has historically been extremely exploitive. The global restructuring of work manifests locally, and home work usefully demonstrates "problems in capital-labor relations and in the gendered division of labor." (5) Telework is defined as "work delivered to the worker via telecommunications as opposed to the worker going where the work is." "Home-based" telework refers to the individual working in the home, rather than in a centralized location. Surveys show that teleworkers are 5 times as likely as other workers to be women and to be working illegally, without benefits or insurance. Teleworkers are often not trained in the proper uses of machines and materials, or informed of the health hazards of certain processes. They are paid by the piece—even by the keystroke—rather than by the hour, and the pressure to speed up production and work longer hours is motivated by economic necessity rather than by the employer. There is never time to retrain for higher levels of work, or to get the education to participate in the more lucrative work of knowledge production and management. For example, although women were central as early developers of software, after it became evident that software was the lucrative part of computer technology, they were increasingly demoted to coding and keystroking functions, and have not been able to regain their early level of participation.

Home work reinforces women's subordinate status in the home and labor markets: Despite the much discussed separation of public and private spheres, the history of home work clearly shows that public power (capital) has been used to structure the private lives and control work opportunities for women. Add to this the fact that the new communications technologies have opened the home space to the world, and conversely have brought the world into the private space of the home, and we get a blurring of boundaries that allows surveillance of the home-based worker and "makes the home more accessible to employers, marketers, and politicians." (6) Women teleworkers become industrialized women, while women in waged jobs become Taylorized homemakers. As sociologist Arlie Hochschild noted: "[people]...become their own efficiency experts, gearing all the moments and movements of their lives to the workplace." (7) For home-based teleworkers there is no distinction between home and workplace, with the result that when both personal and worklife become Taylorized they have no escape. For women who have often been forced to "choose" home-based work because of the lack of childcare options—a common problem for illegal aliens, for example—home-based telework therefore amounts to a doubling of their bondage to the home space. The blurring of boundaries in the home-space between private and public also often places the woman in a doubled psychological subordination—to her employers and to her husband. The traditional feminine roles of emotional caregiving and physical caretaking become entwined with her externally controlled, maintenance telework in the home. In the long run, female rebellion against these pressures could have the effect of redefining the division of male and female labor, and of repositioning the importance of home life and private free time within the public economy and social relations. In the short run, since home life has no recognized public economic value, it is being more and more curtailed, automated where possible, and reorganized to serve the needs of paid work; and women who work at home have the doubled role of worker and caregivers.

Home work undercuts progressive labor conditions and standards:

The geographic mobility of capital made possible by IT uses waged labor, which is space-bound, with the result that geographical areas are increasingly reduced to the status of a captive labor pool. While this makes new modes of production (especially home telework) possible, it does not challenge "the place of the home in the economy, or of women in the

home" (8). The home space and the female working in it under the sign of "choice" actually become the site of regressive labor practices and intrusions of outside control made possible by the dissemination and flexibility of the very information technology that now immobilizes and isolates the woman worker. This isolation also contributes to women's increasing marginalization in the computer sciences, and to the stratification of women in the computer industry between a small percentage of highly skilled engineers, scientists, systems analysts and knowledge workers, and the vast numbers of low-paid, low skilled computer workers. It is this great disparity and its concomitant economic and political consequences that cyberfeminists need to study and address.

[Performer goes to console to type]

I'm the Total Quality woman. I am the culturally engineered, downsized, outsourced, teleworked, deskilled, Taylorized mom, just-in-time, take-out, time-saving, time-starved, emotionally downsized, down-right tired... My home is my work, my work is my home.
I work with machines; I live with machines; I love with machines: computer, modem, TV, VCR, printer, scanner, refrigerator, washing machine, dryer, vacuum cleaner, cars telephones, fax machine, hairdryer, vibrator, CD player, radio, pencil sharpener, blender, mixer, toaster, microwave, cell phone, tape recorder...
[Animated bits come on screen]
IT is now the single biggest part of the US economy, 11% of the GNP. Globalization. Free Trade Zones. The Market Economy.
Bye Bye Borders.
There is no place to hide.
Knowledge management: Husbandry for ideas.
Mass customization: The market of you.
Just-in-time learning: knowledge at your fingertips.
[Performer puts her arms round the console and chants]
Just-in-time conception, just-in-time production, just-in-time delivery, just-in-time assembly, just-in-time laundry, just-in-time dinner, just-in-time childcare, just-in-time quality time, just-in-time sex, just-in-time pleasure, just-in-time pain, just-in-time stress, just-in-time insanity, just-in-time sacrifice, just-in-time drugs, just-in-time death.

3. Activism, Intervention, Resistance

The political conditions of home-based telework I've outlined pose questions about the effects of restructuring work for women in the integrated circuit: Will this reorganization of work further stratify jobs by race, ethnicity, and gender? Will the changes in work structures "reproduce existing patterns of inequality in only slightly changed forms, perhaps leading to different, more subtle forms of inequality?" (9)

What are possible points of intervention, resistance, and/or activism for cyberfeminists and artists (among whom I include myself) working with computer technology? On the micro level, it is time to educate ourselves thoroughly about these conditions, and to disseminate this information as widely as possible through the different cultural and political venues in which we work. We must rethink the contexts in which computers are used, and question the particular needs and relations of women to computer technology. We must try to understand the mechanisms by which women get allocated to lower-paid occupations or industries, and make visible the gender-tracking that obtains in scientific fields of work. For example, many women tend not to choose certain fields because of the "male culture" that is associated with them.

Cyberfeminists could use the model of the recent feminist art project "Informationsdienst" to create "Information Works" that address the political conditions of telework, and make visible how the deployment of IT is affecting the restructuring of work and the loss of jobs in the market economy worldwide. (10) A teleworker's bill of information and rights, disseminated to offices and private homes through a webpage on the Internet could also clarify the linked chains of "women's work" and working conditions for women worldwide. A "Home work School" on the Internet and in local community centers—taught and organized by home working women (many of whom are increasingly artists, single mothers, poor urban black women, immigrants, and displaced older women)—could offer (free) classes in everything from the politics of the new global labor economy and its effects on women's lives and work, to feminist history, and creative and practical lessons in upgrading computer skills. Wired women need to form new unions that bring together women computer engineers, analysts, managers, programmers, clerks and artists. We need to form coalitions with immigrant rights groups that are interested in computer literacy. The classical tactics of organizing to improve working conditions must be translated into new forms which take into account the decentralization and privatization of workers, and subvert the already established communication chains of IT to reach and organize the people displaced by it. The creative ideas of cyberfeminist artists experienced in computer networking could be especially useful here.

On the macro level, cyberfeminists need to initiate a visible resistance to the politically regressive consequences of relegating women back to the homework economy and imposing on them the privatized, invisible, double burden of labor. Many libertarians, economists, and labor leaders are addressing the social isolation and economic privation suffered by millions of casualties of electronic joblessness by calling for the creation of socially productive jobs with a guaranteed annual income (or a social wage) for workers displaced by automation. They are also supporting moves for a shorter workweek, for job sharing, for more equal distribution of knowledge and maintenance work, and calling for corporations that benefit from the global market economy made possible by IT to return some of this great wealth to support a Third Sector of social and community work. While many of these demands seem desirable steps toward a more equitable labor economy, in practice they amount to a social welfare tax, and do nothing to challenge the intense stratification and concentration of wealth and power, increasingly produced by the global market economy, with devastating effects, on already marginalized, impoverished, and invisible populations, and on women. Cyberfeminists need to analyze the effects such schemes might perpetuate on the gender division of labor. Will women continue to be concentrated in the low-paying "caring" and social maintenance jobs which double and extend their housekeeping "skills" to the whole community? Or will we fight to have such socially productive work be revalued by awarding it decent salaries, benefits, and job security? Such work should be acknowledged as vital to the survival of human life and should be highly rewarded—not just monetarily, but also by granting workers the greatest autonomy in planning and structuring the work, by having them determine working conditions, pay, benefits, and hours. Above all, we must rejoin the fight that was never won: the re-valuing—by way of decent wages, benefits, and improved labor conditions—of the human work of childrearing and family care-giving that is vital to the productive lives of all human beings. If such maintenance work were liberally rewarded, and balanced with adequate free time and educational and social opportunities, it would be work attractive to both men and women, and could do much to substantially change traditional domestic—and paid labor—gender roles.

Given the groundbreaking changes IT is causing in the relationship of home to work, and in the place of the home (and private life) in pancapitalist economies, some radical rethinking must take place about women's changing conditions in both the domestic sphere and the public economy. The suggestion that the home should again become a locale of resistance to capitalism's predatory effects on privacy, sociality, and free time may be a regressive one for women, because it treats these problems as private ones with private solutions. The utopian promises claimed for IT—for example, the possibility of being freed from never-ending repetitive work and heavy manual labor; the drastic reduction of working time for all people and the concomitant expansion of self-managed free time—must be skeptically countered with a critique of the ways in which IT has actually increased work time and has eroded aspects of the pleasure and meaning to be found in work—such as sociability, worker solidarity, job security, and pride in skills. This critique should be combined with vocal opposition to and denunciation of the reintroduction of regressive labor conditions and policies for workers worldwide. It is crucial that we address the human sacrifice that the worldwide proliferation of home-based telework and sweatshop labor causes for millions, predominantly women. The wide social indifference to such vast inequities once again renders invisible the life-sustaining unpaid or underpaid maintenance work performed by women.

<nettime> Josephine Bosma: What are Words Worth**From:** mute**To:** nettime-l@desk.nl**Date:** Sun, 26 Oct 1997 19:38:09 +0100 (MET)

This text appeared in the latest edition of Mute, in which there is a little special about cyberfeminism.

*

What are Words Worth?

How to discover the cyborg in yourself? Once the question was, in answer to the ultimate patriarchal image of god as man and man as god: how to discover the goddess in your female self. Tragically long after the council of Trente somewhere in the 16th or 17th century where the question 'Do Women Possess a Soul' was raised, the discussion about women being a social construction or a species that is essentially born, has continued deep into our times. After Donna Haraway's *Manifesto for Cyborgs* 'I'd rather be a cyborg than a goddess', the term cyberfeminism was born. 'Rather being a cyborg than a goddess' means shaking off some last remains of possible male sexism which lie hidden within the meaning of the word 'goddess'. Cyberfeminists attack patriarchy within one of its bases of power: the creation of rules for communication and the exchange of information. Taking part in the development of the internet, which is by no means a finished product, and defining the world differently from there, they can slip outside of traditional structures. Like most 'alternative' net-related culture however, cyberfeminism has stayed in the margins of both real life culture and the internet for the past six years. Now cyberfeminists seem to be expanding their territory.

Technology has always been dominated by its male contributors (despite many attempts to get girls to participate), but with the internet it seems technology has bred one of its rare products that women can easily connect to. Here we have a toy or tool that is not just highly technically complex, but also offers great social challenges. This is technology that 'lives' and is connecting to lives, creating new realities, emphasising dormant freedoms of expression and being. Now that computers are connected to networks and offer an expanding social perspective, it is much more interesting to get involved in the development of the hardware, software, theory and social practice of 'computerlife'. As Alla Mitrofanova, a cyberfeminist and media critic, amongst other things, says: 'Generally speaking the internet reality is a specific cyberfeminist issue. I think that net communication could easily show this freedom of presentation mode: freedom of images, of roles, of subject-concepts.'

Now this freedom needs to be explored and, more importantly, it should produce new realities that extend to the real life situations (outside the net that is) of women, as it's still 'war' the minute you go out on the street. Alla Mitrofanova thinks that with a change of (self)perception, comes an automatic change of reality: "Some knowledge constructions, some psychic constructions, discursive and non-discursive practices regulate our physical activity and that's why there is a correlation between our presence in the internet and our real behaviour outside of the computer screen. While we have no centre in the internet space and can choose different possibilities, we can see in real life that our behaviour shows signs that there is no centre, no male or female position in the field of motivations, and that we are relatively free in the choice of aesthetics." The question provoked by a statement like this of course is: do experiences like this go beyond the very personal and how deeply can they affect social and political life in the long term?

The term 'cyberfeminism' needs some exploration and elaboration. With its relative incomprehensibility outside of a small circle, this might not be a bad thing. Sometimes that means starting from the beginning. The Old Boys' Network, an initiative of amongst others Cornelia Sollfrank, who is mostly known for performance art, will explore the following questions in the Workspace at Documenta this year: 'Cyberfeminism.... Fresh ideology? New code of behaviour? Artistic playground? Semiotic straightjacket?' Cornelia Sollfrank would like to keep the term cyberfeminism as open as possible: "As far as I know there are no definitions or there are many different ones. We'll try to bring together all the different notions of this term. We'll think of strategies for how this term could perhaps help set up a new goal, a new political goal." And: "For me cyberfeminism is a concept of every single person starting to think by themselves and not reading the big thinkers." This last idea seems like an unwise misinterpretation of

democratic and emancipatory principles. Especially in a time when the development of feminism into post-feminism, neo-feminism, cyber-feminism is scattering the powers of women and confusing their goals, all will benefit from some historical awareness. The writer Faith Wilding wrote after pre-reading my article: "I think we should all read whatever we can. Ignorance of what has been done and thought by others will only lead to needless repetition and lost time."

"I think, in light of our experiences online, our investigation of network communication areas and mailinglists and websites, that women don't have a dominant voice in these media, although they have a lot to say. Maybe the environment of the internet is really a great environment for women, because people can't interrupt what you're saying. Men can't interrupt you. You can always finish your sentence online," says Kathy Rae Huffman, curator and media critic. She has started an initiative called Face Settings with her friend Eva Wohlgenuth, who is an artist, that deals with communication between groups of women. Being born travellers and explorers they are interested in getting groups of women just outside the 'network community' connected and giving them a 'kickstart' on the internet. Besides all the other specific information that can be found there, they have online parties via their website and a closed mailinglist called Faces. Concerning the groups of women from 'remote' places like Zagreb, St. Petersburg, Bilbao or Dublin that are not so present within many internet discourses, Kathy Rae Huffman says: "They have different perceptions of what the internet is and what communication means. It's much more important to be connected to people outside, they don't have many opportunities." Asking yourself what cyberfeminism means, the sharp contrast between the opportunities for rich and poor, men and women, races and cultures within a fast developing high tech world becomes disturbingly evident, it grows on you in an eerie way.

Once part of 'The Network', will all 'cyborgs' automatically be equal? What does it mean to communicate online? Eva Wohlgenuth: "We think that women are communicating differently and we somehow observe how we are doing it ourselves. We observe our contact with other women." A basic idea behind a lot of cyberfeminist rhetoric is the disappearance of gender on the net. However, this idea is often uttered carelessly. In the same way that the alleged absence of the body in virtual networks has created many misunderstandings, now the wish for freedom of gender and the fragile real presence of this freedom in a liberated mind are connected to the invisibility and intangibility of presence on the net, creating the illusion of freedom from undesired genderrelated social and political constructions. What freedom is there in the 'disappearance of gender' when this freedom is one of hiding in travesty, androgyny or invisibility? Could there be other approaches for establishing this greatly desired freedom?

As written language is the main medium of communication on the internet, it is a logical step to see if maybe here there is already a noticeable and usable difference in communication and the creation and perception of knowledge and culture. Like with the present changes the internet brings, there has been a previous 'information revolution' with the invention of print at the end of the middle ages. This invention liberated us from the possession and creation of knowledge by the church, but it had some disadvantages too. "If there is one thing that print has given us, it is the concept of standardisation. Partly because print itself doesn't change, the medium has helped to promote a mindset in which we want other aspects of life - and language - to remain fixed and unalterable." In the book *Nattering the Net* by Dale Spender, a researcher and teacher who is also 'co-ordinator' of WIKED, a database on women, the first chapter is a wonderful reader for anyone involved in the books-versus-computers debate. "The dismay and distress at the passing of the print era has more to do with bringing to an end a patriarchal presence that has been encoded in communication than it has to do with the loss of print." Writing on the net is different. This means once again that powers will shift and culture will be redefined. To have influence in this, one has to be present and shape the change. This presence needs to be a noticeable and clear one.

Josephine Starrs of VNS Matrix mentioned, when asked which women had influenced her, the French philosophers Irigaray and Kristeva. Their 'écriture féminine' has a radical approach to language as a liberation tool. When asked if she sees different styles in discourse between men and women online Josephine Starrs says: "...I am thinking now of one of VNS Matrix: Francesca Da Rimini aka Gashgirl, ...her writing is particularly influenced by feminist writings. It has sort of grown up and then expanded into the online thing, because it's a nonlinear kind of writing and because you can use the hypertext in a different kind of way. I do not want to generalise, but there is a nice style that women are developing in their online writing." Academic, male discourse as it is extended on some internet mailing lists, is an insult to the nets' possibilities. The intentions of writers who refuse to let go of traditional reasoning are often lost in the lustre of datafragments that whirl across a computer screen. I can imagine some good and maybe funny cyberfeminist actions here. Rules and traditions concerning linear reasoning and the creation of meaning by academics and institutions could be tackled in performance-like interventions on different internet platforms. Women who engage in this

should be aware of the fact that what they do might not be appreciated. The internet was designed and produced by many, many males and they are very protective about its protocols and traditions. 'Internet research has to have an appropriate analytical discourse: not descriptive, not hierarchical, but operative...' Alla Mitrofanova is a good analyst of the tool she likes to work with: 'The Internet came not through thinking, not through concepts or images, it came through practice, through functioning.' It is within this functioning that new ideas and interventions could occur. Diana McCarthy, involved in the organisation of the Faces mailinglist, writes: 'I think one of the main failures of feminism was that it went for equal inclusion in a rotten system. What I'm more interested in is a feminism that looks to change paradigms that are bad (even if they are efficient).'

Maybe some of the qualities of the commotion, the creation of visions which erupt with the development of a radically new communication tool bear close resemblance to the experience of the uncovering and denouncing of restrictive social phenomena. Maybe some freedom lies in the dissection and deconstruction of the style of media use by the 'dominator', patriarchy. Maybe all we have to do is amplify, intensify the revolutionary force of the new media themselves. The definitions of rationality, science and art, all restrictive, male academic traditions should have trouble surviving. We do not only want the streets back, as the slogan for safe streets goes, we also need a much more radical change: we need language back. Josephine Bosma

"As a woman I have not enough formal expressions, in discourses there is no cultural expression of the body and the sexualised body. Motherhood and pregnancy are totally hidden under medical and pedagogical discourses. We have silence in the most productive existential experiences. Having freedom we have kind of strong creative obligations to produce more formal expressions in a poetic way. That is what cyberfeminism and other extravagant self articulations are about."

Alla Mitrofanova, Rotterdam, April 19th 1997.

Notes on the Political Condition of Cyberfeminism

Faith Wilding and Critical Art Ensemble

Cyberfeminism is a promising new wave of (post)feminist thinking and practice. Through the work of numerous Netactive women, there is now a distinct cyberfeminist Netpresence that is fresh, brash, smart, and iconoclastic of many of the tenets of classical feminism. At the same time, cyberfeminism has only taken its first steps in contesting technologically complex territories. To complicate matters further, these new territories have been overcoded to a mythic degree as a male domain. Consequently, cyberfeminist incursion into various technoworlds (CD-ROM production, Web works, lists and news groups, artificial intelligence, etc.) has been largely nomadic, spontaneous, and anarchic. On the one hand, these qualities have allowed maximum freedom for diverse manifestations, experiments, and the beginnings of various written and artistic genres. On the other, networks and organizations seem somewhat lacking, and the theoretical issues of gender regarding the techno-social are immature relative to their development in spaces of greater gender equity won through struggle. Given such conditions, some feminist strategies and tactics will repeat themselves as women attempt to establish a foothold in a territory traditionally denied to them. This repetition should not be considered with the usual yawn of boredom whenever the familiar appears, as cyberspace is a crucial point of gender struggle that is desperately in need of gender diversification (and diversity in general).

The Feminist Cycle

One aspect immediately evident is that the Net provides cyberfeminists with a vehicle crucially different from anything available to prior feminist waves. Historically, feminist activism has depended on women getting together bodily—in kitchens, churches, assembly halls, and in the streets. The organizing cell for the first phase of feminism was the sewing circle, the quilting group, or

the ladies' charity organization. Women met together in private to plan their public campaigns for political and legal enfranchisement. In these campaigns the visible presence of groups of women plucked from the silenced isolation of their homes, became a public sign of female rebellion and activism. Women acting together, speaking in public, marching through the streets, and disrupting public life were activities that opened up political territories that were traditionally closed to them.

During the second wave of feminism, which emerged in the early sixties, women again started meeting together to plan actions. They met in consciousness-raising groups that became the organizing cells for a revived feminist movement. This time, feminists began to master a new tactic: Creating counter-spectacle in the media. Women staged actions targeted at highly visible public icons. Such patriarchal monuments under feminist assault in the US movement included the Miss America Pageant, Playboy offices and clubs, Wall Street, the Metropolitan Museum of Art, the Pentagon, and the White House. Everywhere the actions occurred, the news media was there to document outrageous female misbehavior. These tactics spread the news of growing feminism nationally and internationally. Visible female disruption and subversion also provided images of female empowerment that inspired many women (and men) to begin taking direct autonomous action on behalf of the rights of women.

If the first wave was marked by women's incursion into new political territories, this second wave was marked by a march into new economic territories and by a reconfiguration of familiar ones. Most significant was women's demand for access to the means of financial independence—a struggle that continues in the third phase of feminist practice. On the more traditional end of the struggle, domestic space was no longer perceived as a totalizing feminine space, but was re-presented as a space of ambiguity with both celebratory and exploitive characteristics. On the political front, feminism focused on liberation practices, and left the old right wing practices behind, such as temperance movements.

The third wave of feminisms (cultural-, eco-, theoretical-, sex positive-, lesbian-, anti-porn-, multicultural-, etc.)—often collectively dubbed Postfeminism—continues to use these models of public action and rebellion. A recent case in point was the short-lived but highly visible Women's Action Coalition (WAC) that began in New York in late 1991, following a series of events that enraged women in the US: The dramatic, nationally televised Hill/Thomas hearings; the William Kennedy Smith and Mike Tyson rape trials; and the judicial battles over abortion rights; all these contributed to a sense that it was time for women to launch a "visible and remarkable resistance" to social, sexual, economic, and political oppression and violence. WAC quickly became a media attractor as it launched action after visible action. WAC produced a spectacle that was hip, sexy, cool, fun, outrageous, and visible. Eight thousand women joined in the first year, and chapters sprang up around the US and in Canada. Much of this initial success was due to the highly effective communication and networking system that WAC immediately organized. Central to this system was a phone tree, combined with adequate access to fax machines, e-mail, and media contacts. In a sense, WAC was an early proto-electronic feminist organization. Having motivated and organized so many women, WAC reinvigorated feminist activism, and, in the US, led a new wave of contestation in all the traditional feminist territories. Like most radical organizations, it was only a temporary tactical organization. It was unable to survive its rapid growth, and all too soon reached critical mass, when explosive splintering forced it to choose one of two outcomes: purge and bureaucratize, or dissolve. WAC wasn't able to organize its way out of the contradictions of difference, nor was it able to continue resisting some of the dogmatic tendencies of "mainstream" and "security state" feminism which proscribed certain behaviors, beliefs, and lifestyles. While the former option of purge and bureaucratize was first attempted, the fabric of radicality was strong enough that dissolution spontaneously occurred.

The third wave (with a few exceptions) has missed moving into one crucial area, however, and that was the revolution in communications and information technology. Cyberfeminism represents a new set of explorers ready to move the struggle into this new territory. As yet, the movement is still too young to face struggles inherent in the economy of difference. As on most frontiers, there still *seems* to be room for everyone. At the same time, there are lessons to be learned from history. Radical movements in their infancy tend to return to past patterns. Cyberfeminism is no different, and key feminist issues such as feminine subjectivity, separatism and boundary maintenance, and territorial identification are bound to arise again, even if they seem dead in other feminist territories.

Territorial Identification

What is the territory that cyberfeminism is questioning, theorizing, and actively confronting? The surface answer is, of course, cyberspace, but such an answer is not really satisfying. Cyberspace is but one small part, since the infrastructure that produces this virtual world is so vast. Hardware and software design and manufacture are certainly of key importance, and perhaps most significant of all are the institutions that train those who design the products of cyber-life. Overwhelmingly, these products are designed by males for business or military operations. Clearly these are still primarily male domains (i.e., men are the policy makers) in which men have the buying power, and so the products are designed

to meet their needs or to play on their desires. From the beginning, entrance into this high-end techno-world (the virtual class) has been skewed in favor of males.* In early socialization/education, technology and technological process are gendered as male domains. When females manipulate complex technology in a productive or creative manner, it is viewed and treated as a deviant act that deserves punishment.

This is not to say that women do not use complex technology. Women are an important consumer market, and help maintain the status quo when the technology is used in a passive manner. For example, most institutions of commerce or government are all too happy to give women computers, e-mail accounts, and so on if it will make them better bureaucrats. This is why the increased presence of women on the Net is not solely a positive indication of equality. It is a very similar situation to late 50s/early 60s America when middle-class husbands were more than happy to buy a second car for their wives—as long as it made them more efficient domestic workers. Technology in this case was used to deepen the confinement of women within their situation rather than liberate them from it. (As a general rule, anything you get without struggle should be viewed with intense skepticism.) The technology and technological processes to which women currently have access are the consequence of structural economic necessity. However, all we need is a shift in consciousness to begin the subversion of the current gender structure (this is the positive side of so many women being on-line).

Thus, the territory of cyberfeminism is large. It includes the objective arenas of cyberspace, institutions of industrial design, and institutions of education—that is, those arenas in which technological process is gendered in a manner that excludes women from access to the empowering points of techno-culture. However, the territory does not stop there. Cyberfeminism is also a struggle to be increasingly aware of the impact of new technologies on the lives of women, and the insidious gendering of technoculture in everyday life. Cyberspace does not exist in a vacuum; it is intimately connected to numerous real-world institutions and systems that thrive on gender separation and hierarchy. Finally, cyberfeminism must radically expand the critique concerning the media hype about the “technoworld.” While the utopian cyber-spectacle has been adequately deflated by documentation of its abuse of the bureaucratic class, low-end technocratic class, and workers involved in product manufacturing, this critique, in terms of gender and race, is very modest. For example, who can possibly believe that age, race, or gender do not matter in cyberspace? The ability to assign oneself social characteristics online is only an alibi for a very traditional and exploitive division of labor that is representative of the overall system, and a seduction element for those whose real-world social environment has been eliminated by pancapitalism’s destruction of social spaces of autonomy. We must also ask what awaits people in a minoritarian position once they are online? Will they find familiar and significant rhetorics, discussions, and images? Is there a continuity of discourse between the real and the virtual (as there is for the white middle class)? While there are virtual pockets in which continuity exists, the overwhelmingly representative situation is geared to the same majoritarian consciousness that is found in the real-world. In other words, elements of social stratification are reflected and replicated in cyberspace.

Notes on the Political Condition of Cyberfeminism continued:

Separatism and Boundary Maintenance

Whenever feminism begins pushing its way into new territories, the avant garde members of the movement face incredible problems and nearly insurmountable odds.

Cyberfeminism is no different. Relatively few women have the skills to see through the cyber-hype, to understand the complexity of the system, and most importantly, to teach other women how to survive and actively use the system. For most women in the technosphere, it takes all their energy simply to survive transgressing the norm and learning massive amounts of dense technical information. Just doing the latter is a difficult task that few people accomplish, but throw in the condition of gender isolation (learning and working in a male domain) and the generally negative social representation of being a geek girl (i.e., going against the grain of female construction) and it becomes immediately apparent that alienation levels are extremely high. Under such conditions, as in the past, separatist activity has been a useful tactic, as well as one that can foster efficient pedagogical situations.

Kathy Huffman often jokes that “in cyberspace men can’t interrupt you [women].” The joke is funny because it does represent a truth of gendered interruption; however, the pessimistic side of this point is that women are interrupted in cyberspace. They are often overwhelmed with counter-discourse, ignored, or totalized under the sign of being “politically correct.” A remark by a woman may not be interrupted, but continuity of discourse, with particular regard to women’s issues, is often interrupted. Here again there is a need for separatist activities at this point in post/feminist decolonization of cyberspace. During this early stage of development, women need to experiment in developing their own working and learning spaces. This kind of activity has occurred in all phases of feminists’ territorial decolonization, and has shown itself to be very productive. Separatism should be welcome among cyberfeminists and among those who support a cyberspace of difference. It should be remembered that separatism among a minoritarian (disenfranchised) group is not negative. It’s not sexist, it’s not racist, and it’s not even necessarily a hindrance to democratic development. There is a distinct difference between using exclusivity as part of a strategy to make a specific perception or way of being in the world a universal, and using exclusivity as a means to escape a false universal (one goal of cyberfeminist separatism). There is also a distinct difference between using exclusion as a means to maintain structures of domination, and using it as a means to undermine them (another goal of cyberfeminist separatism).

At the same time, separatism can reach a point where it is counterproductive. The cycle of useful production in regard to separatist activity can be traced by the applicability of one of its main slogans: “The personal is political.” In consciousness-raising groups, personal information is typically disclosed. Then patterns begin to emerge out of these disclosures. Notions that were thought to be personal, private, idiosyncratic, and psychologically bound turn out to be points of group knowledge and represent sociological tendencies. Group members come to realize that their “individual” problems are only mirrors of social pathologies that affect all the people of a given class, race, gender, etc. In turn, each individual comes to realize that it is not a personal flaw that led he/r to be in an unacceptable socio-economic situation, but that the structure of the political economy is to blame. In order for this process to succeed, there must be a solidarity of identity, and when oppression is high, this can only happen in a separatist environment. However, once these social currents are discovered and this knowledge is deployed among the given social group, the need for separatist activity drops and can even become counterproductive. At this point, the uneasy romance between coalition and diversity can begin.

For feminism in general, the time for separatist action seems to be over; however, we must remember that all areas of society are not equally gendered—some territories are more equalized than others. Given that cyberspace is one of the most inequitable, it should be expected that a number of early feminist organizational and educational tactics will be revived.

Feminine Subjectivity

Cyberfeminism is currently at that unfortunate point where it has to decide who gets to be a separatist cyberfeminist and who does not. The haunting question of “what is a woman?” once again returns. In theory, this problem is graspable, but first, what is the problem? Looking back on any feminist movement, there have always been tremendous conflicts within women’s groups and organizations brought on by attempts to define feminine subjectivity (and thereby, “us” and “them”). In the second wave, the feminine was defined in a manner that seemed largely to reflect the subjectivity of white, middle class, straight women. The third wave had to debate whether or not transvestites, transsexuals, and other “males” who claimed to be female identified should be accepted into activist organizations (and at the same time, women of color, working class women, and lesbians all still had grounds for complaints). In addition, it was never decided how to separate the feminine from other primary social variables that construct a woman’s identity. For example, part of the problem in many feminist organizations, and in WAC in particular, was that the middle class professional women had the greatest economic and cultural resources. They therefore had greater opportunity for leadership and policy making. The women outside of this class felt that the professionals had unfair advantages and that their agenda was the primary agenda, which in turn brought about a destructive form of separation.

These are but some of the practical problems that have emerged out of the issue of exclusivity and imperfections inherent in definitions. Defining feminine subjectivity can never be done to the satisfaction of all, and yet, practically speaking, it has to be done.

The current theoretical solution to this problem is to have small alliances and coalitions that do not rely on bureaucratic process. Such coalitions should be expected to dissolve at various velocities over time. Also, naively humanistic or metaphysical principles (depending on one’s perspective) like “sisterhood” should be left in the past, and we must all learn to live with the conflicts and contradictions of a house of difference. Of course, this is easier said than done. Truth changes with the situation. In a territory like a US or British cultural studies department, we can talk about living in a house of difference. In other more inequitable territories, it is more difficult, and clear boundaries (often essentialized) of differences for identity purposes are often required. For

example, telling a person of color who has just been beaten by the police that “the officers were only reacting to a racist textual construction that links people of color with the sign of criminality” is probably not going to have much resonance (even though in legitimized academic territories the argument is quite convincing). While the simpler explanation, “your ass just got beat because you are a person of color” will be quite convincing, because in this case, who is on what side of the racial divide is unambiguous in the mind of the unwilling participant. In this context, the hard boundaries of essentialism make sense and have greater explanatory power until the ambiguity that emerges out of successful consciousness raising and contestation becomes a part of everyday life. Consequently, one can expect that essentialized notions of the feminine will continue to appear and find acceptance.**

Dinner Parties

Cyberfeminism is currently drawing upon social and cultural strategies from past waves of feminism. For example, dinner parties that celebrate women’s achievements and serve as convivial coalition building events are a famous part of feminist history, as witnessed not only in the fundraising dinner parties held by female suffragists, but also in Judy Chicago’s *Dinner Party*; in Suzanne Lacy’s art/life performances; in Mary Beth Edelson’s “Last Supper” detournement; and in the countless feasts prepared and served to each other by feminists all over the world in the past decades. In recognition that women need to feed each other and desire conviviality, Kathy Huffman and Eva Wohlgenuth in their Web project, “Face Settings,” are using the medium of the dinner party as an organizing and educational tool for cyberfeminists. The events—which often happen during international media festivals and symposia where men are the leading actors—are meant to overcome the isolation of cyberculture, to get women connected to each other, and to help them begin to learn and use electronic technology in producing their own work. It has been shown that forming strong working groups among people who only communicate virtually is far less productive than forming groups among people who also meet in the flesh. For this reason, it is important for cyberfeminist to make opportunities to meet together bodily and form affinity groups to facilitate building a transnational, transcultural movement. And what better way than a dinner party to dissolve the estrangement so often produced by even the friendliest online communications? Indeed, the virtual medium must not replace the affective and the affinity-building functions of presence.

<nettime> Cyberfeminism Part 3

From: Steven Kurtz

To: nettime-l@desk.nl

Date: 14 Jul 97 15:46:32 EDT

Notes on the Political Condition of Cyberfeminism continued:

Cyberfeminist Education

Cyberfeminists have already grasped the importance of making hands-on technological education for women a core priority. But this education needs to be contextualized within a critical feminist analysis and discourse about women, Netculture and politics, and the pancapitalist labor economy. Cyberfeminists need to make their voices heard much more strongly in the discussion of Net development. In doing so, cyberfeminism needs to think about who they consider their constituency. As a cultural and technical avant garde, cyberfeminists need to remember that most women who now work with computers and information technology in first world countries are at best glorified typists, for whom the computer simply represents an intensification of work. The question must be asked: What relationship do these women have to technology? How is this relationship produced, and how can it be contested? Cyberfeminism could provide a consciousness raising site where women can tell stories about their experiences with all the different aspects of technology, and how it affects their lives. Such a site could teach women to question the increasing transparency of technological incursion into their workplaces and into everyday life. And of course, there must be ongoing education, information, and activism concerning the feminized “global homework economy (Haraway)” which is profoundly worsening the lives of women in developing countries. Feminist education (women’s studies) as it was pioneered in the US in the early 1970s included the idea that a “separate” education, where women would not have to compete with males, and where they would have the freedom to frame issues and ask questions that challenged the hegemony of received practices and ideas. The Feminist Art Programs in California, for example, maintained their own studios, courses, and teachers within an institutional academic structure. But more deeply, it also became evident that a separate space allowed uncensored and radical experimentation that included the meltdown of traditional disciplines, practices, and territories of expertise, and that initiated some postmodern art

practices that have changed the face of mainstream art and art history in the US. What might a feminist educational program in computer science and media technology accomplish? Imagine!!

Cyberspace lends itself nicely to the creation of separate learning and practice spaces for different groups, and it seems fruitful to expand and maintain these spaces for now in the spirit of feminist self-help. One of the most important educational tools cyberfeminists can offer is an ongoing directory of electronic strategies and resources for women, including feminist theory discussion groups, electronic publishing and exhibition venues, zines, addresses, bibliographies, mediaographies, how-to sites, and general information exchange. While compilations of these resources are already underway, there is a growing need for a more radical and critical feminist discourse about technology in cyberspace (as opposed to discourse in critical and media studies departments in universities). In cyberfeminism, this discourse arises directly from actual current practices and problems, rather than from abstract theorizing. Thus cyberfeminism offers the development of applied, activist theory.

An obvious group to target for cyberfeminist networking, education, and expertise is the first generations of young women now graduating from schools and colleges (mainly in the US and Europe) who have had some training in electronic media and in media theory. Having already begun to work in electronic media in school, many of these young women will be searching for ways to get electronically connected, and thus will experience in full force the gender whammy of cyberspace. While many of them have had some exposure to feminist theory and practice in the academy, most of them will be faced with a terrifying void when it comes to feminist support and access in cyberspace. Since cyberspace seems to attract younger women, it is important that cyberfeminists develop projects and sites for purposes of recruitment. Cyberfeminist Body Art

Bodies generally are all the rage on the Net—whether they are obsolete, cyborg, techno, porno, erotic, morphed, recombined, phantom, or viral. But most of these “bodies” are little more than recirculated commodified images of sexuality (particularly female and “deviant” sexuality) or medical imaging (such as the infamous Visible Human project), and are presented uncritically. Many artists are contributing to an explosion of body art on the Net, much of it simply a transposition of what already exists in other media.

Cyberfeminist body-centered art is coming alive on the Net. As to be expected, the vagina and the clitoris have pride of place in much cyberfeminist work such as that of VNS Matrix. “Cunt art” was a fiercely joyous, liberatory, and radical rallying icon for feminist artists and activists in the 1970s. Women’s consciousness-raising and medical self-help groups regularly examined each others’ genitals and reproductive organs, and the speculum became the symbol not only of sexual liberation, but also of feminist demands for reproductive freedom and for a woman-centered health-care system. As Donna Haraway suggests in *Modest Witness*, feminists interrogating technoscience (and particularly the new reproductive technologies), need to arm themselves with “the right speculum for the job,” one that “makes visible the data structures that are our bodies.” The visualization and data-gathering engines that drive both the new information and reproductive technologies can be redirected and applied to the task of “designing the analytical languages [the speculums] for representing and intervening in our spliced, cyborg worlds” (Haraway, p. 212).

Cyberfeminism can create reconfigured networked bodies in cyberspace, bodies that are passionately incorporated in textual, visual, and interactive works. Simultaneously, deconstructive projects that address the proliferation of dominant cultural, gender, and sexual codes on the Net will be more effective if they come from a strong, libidinal center, and are understood through the filter of women’s history. Indeed, cyberfeminist body art projects are haunted by women’s bodily histories. They are often motivated by rage against the forces of censorship, repression, and normalization. Primarily, though, they are motivated by absence—the absence created by female infanticide, clitoridectomy, anorgasmic medications, suttee, footbinding, enforced celibacy, sexual misinformation, lack of birth control information, rape, forced pregnancy, and by female restriction and confinement.

Part of theoretical feminism’s project has been to explore the possibility of difference in female sexuality and desire. Much French and American feminist, literary, and psychoanalytic theory in the 1980s was dedicated to this research. The Net offers possibilities for exploring these questions in a new technological and information setting, and among a new population of author/producers who are more grounded in practice than in theory. Although this line of research seems to have left the binary of woman/nature far behind, it is by no means certain that it will not fall into some of the traps of essentialist feminism, or succumb to the lure of simply countering masculinist Netculture with a feminine Netpornography. There is much to be gained from consciously interpolating women’s histories and bodies into cyberspace; much can be learned from naming the absences, and beginning to create a multifaceted, fluid, and conscious feminist presence.

Conclusion

It seems safe to say that cyberfeminism is still in its avant-garde phase of development. The first wave of explorers, amazons, and “misfits” have wandered into what is generally a hostile territory, and found a new land in need of decolonization. History is repeating itself in a positive cycle, where feminist avant-garde philosophies, strategies, and tactics from the past can be dusted off and reclaim their former vitality. Separatist activities in the real or virtual forms of dinners, discussion groups, and consciousness raising sessions are viable once again. Essentialist philosophies enacted in body art, cunt art, and identity maintenance recombine with constructionist notions of identity development. An epistemological and ontological anarchy that is celebratory and open to any possibility is threading its way through cyberfeminism. The dogma has yet to solidify. At the same time, the territory is a hostile one, since the gold of the information age will not be handed over to women without a struggle.

To make matters worse, a big tollbooth guards access to this new territory. Its function is to collect tribute from every entity—individual, class, or nation, that tries to enter. Entrance for individuals comes at the price of obtaining education, hardware and software; entrance for nations comes at the price of having acceptable infrastructure, and to a lesser extent, an acceptable ideology. Consequently, a more negative cycle is also repeating itself, as the women who have found their way into cyberterritories are generally those who have economic and cultural advantages in other territories; these advantages are awarded through class position, with its intimate ties to cultural position and race. As this group helps open the borders to other disenfranchised groups, it must be asked, what kind of ideology and structure will await the newcomers? Will it be a repetition of the first and second waves of feminism in political and economic arenas? Will cyberspace and its associate institutions be able to cope with a house of difference? Knowing and understanding the history of women’s struggle (along with other struggles in race relations and class relations) is essential—not just as a resource for strategies and tactics, not just so tactical responses to cybgender issues can be improved, but also to see that the new gender constructions that come to mark the entirety of this new territory (not just virtual domains) do not fall into the same cycle as in the past.

Consider this example. In the US, third-wave “activity” peaked in 1991. Barely three years later, this visible resistance had again died down, leaving continuing debates about feminism largely to the academy. In 1997, federal “welfare” laws were repealed in an all-out assault on the public safety net for the poor. At the same time, forced labor through “workfare” and prison programs has begun to intensify, and the expansion of the feminized global electronic homework economy has produced a new wave of sweatshop labor. Since these initiatives have a dramatic effect on poor and working-class women, one would think that the conditions would be right for a new popular front of feminist activism and resistance. However, the social body and public life seem so splintered, alienated, stratified, and distracted by market economy, that as yet no signs of such activism have appeared. Is this problem partly that the avant garde has been paid off to the extent that the issues of the poor which do not effect its members are no cause for action? Is this problem repeating itself in cyberspace and in its manufacture? There are so many more problems to face than just access for all.

Notes * Just so the authors’ position is clear: We do not support a reductive equality feminism, i.e., support the existing system, but believe there should be equal gender representation in all its territories. We do not support pancapitalism. It is a predatory, pernicious, and sexist system that will not change even if there was equal representation of gender in the policy making classes. Our argument here is that women need access to empowering knowledge and tools which are now dominated by a despicable “virtual class (Kroker).” We do not mean to suggest that women become a part of this class. To break the “glass ceiling” and become an active part of the exploiting class that benefits from gender hierarchy is not a feminist goal, nor anything to be proud of.

**In her essay, “The Future Looms: Weaving Women and Cybernetics,” Sadie Plant spins a mythical genesis for the convergence of women and machines in a feminised cybernetics based on women’s ancient invention of the craft of weaving. This convergence “is reinforced by cyberfeminism... a perspective (which) is received from the future.” In the 70’s creating a female mythology was an inspiring and necessary part of recovering and writing the histories of women, and of honoring female cultural inventions and female generativity (the Matrix). Cyberfeminist mythologizing is a welcome sign of inspiration and empowerment, and at this point in time, makes good tactical sense. Such work offers a clear explanation of a constructive relationship between women and technology, and it begins the process of rewriting the gender code of cyberspace. However, in a political sense, the function of the mythic “natural woman” has its limits. In this case, it seems just as likely that weaving was a woefully boring task that was forced upon the disenfranchised. (This trend of boring and alienating work as a the domain of the disempowered is certainly repeating itself in the pancapitalist technocracy.) As cyberfeminist critique increases in complexity, and therefore in ambiguity, the current cyberfeminist mythology will have to fade away much as matriarchal Crete and cunt iconography did in the late 70s.

Subject: Feminist art

Dear nettime,

I just have to say that the article Vagina on the Net demonstrated that the writer has a very superficial and misguided knowledge of feminist art, and very little understanding of the history of feminism in the last 25 years. If Anne de Haan’s article was a representative summation of feminist art on the WEB, and generally, then this is very sad. I see the Net as primarily a communications network at present, and I’m pained to see that the communication on feminism and feminist art is at such a low level. I do very much appreciate the work being done by VNS Matrix and a few others. But it seems that there’s a serious under-representation of the work being done by feminist cultural creators on Nettime. As a correction I must add that Lucy Lippard did not “found a feminist art institution” in the USA. The feminist art movement (“institution” is the wrong term here entirely) was brought into being by diverse groups all over the USA working collaboratively and networking nationally. Much of this history is contained in the book: The Power of Feminist Art, edited by Broude and Garrard, and published by Abrams. Though the book has many flaws, one can gain a good overview of the development and history of the feminist art movement from it. And let’s not forget that feminist art is a mobile category which is now spread throughout the world. And lives!

In solidarity, Faith Wilding

Obviously, there is much feminist artwork, theory, and thought online that is not represented by the ‘bossy cunts’ discussion or the VNS Matrix. Interested parties should query the rhizome CONTENTBASE under ‘gender’ or ‘feminism’ for more commentary in this area. [<http://www.rhizome.com>]

However, while many nettime threads take heat, and stop-the-thread posts come and go, I want to voice my explicit support of ‘bossy cunts online.’ To those who don’t really believe sexism exists, I say... pick up a magazine! see a movie! And, for sure, the “humanist” sexless agenda leaves me cold between the legs.

Some have posted that this thread has been too low, or of inferior quality -- but let’s not dismiss politicizing discussions. What gets attention on nettime? What gets dismissed? Further, I don’t think Anne, or anyone actually, has been claiming to represent respective collectives. In my view, these issues are not discussed enough, and it is limiting not to encourage a range of voices.

cybersex catechism

"I fuck therefore I am" (Shu Lea Cheang - 2000)

1.0 Do you want to play with your self?
Shift your identity, be on top, attach an extra port.

2.0 Is the pussy the matrix?
We are jacking into the Big Daddy mainframe so we can jerk off.

3.0 Is one-hand typing the best form of safe sex?
I was unable to open up when I had a virus concealed in an attachment.

4.0 Why does the Net love pioneering porn?
Every other medium has its own intimate massage: telephone - chatlines;
motor car - backseat fumbling; hormone research - contraception; VCR - sex
films.

5.0 Does virtual sex cause real jealousy?
The swapping of text is the low bandwidth version of exchanging bodily fluids.

6.0 "Feeling horny?" Why can't I say this as easily in a bar as on-line?
When hiding behind my anonymous IP address, I can lose all my inhibitions
about exploring my deepest desires.

7.0 Have you read the joy of text?
Cybersex is the theory without the practice.

8.0 Do we have a fetish for technology?
Sometimes I prefer my toys to my lover.

9.0 Is technology good for sex?
My body has been upgraded with an extra hard drive, more RAM, lots of
shareware and the hottest plug-ins.

10.0 Wouldn't you like to download an orgasm?
Let's make XXXML into an open source protocol.

Software Art

Florian Cramer and Ulrike Gabriel

August 15, 2001

What is software art? How can "software" be generally defined? We had to answer these questions at least provisionally when we were asked to be with the artist-programmer John Simon jr. in the jury of the "artistic software" award for the transmediale.01 art festival in Berlin, Germany.

Since more than a decade, festivals, awards, exhibitions and publications exist for various forms of computer art: computer music, computer graphics, electronic literature, Net Art and computer-controlled interactive installations, to name only a few, each of them with its own institutions and discourse. Classifications like the above show that attention is usually being paid to how, i.e. in which medium, digital artworks present themselves to the audience, externally. They also show that digital art is traditionally considered to be a part of "[new] media art," a term which covers analog and digital media alike and is historically rooted in video art. But isn't it a false assumption that digital art - i.e. art that consists of zeros and ones - was derived from video art, only because computer data is conventionally visualized on screens?

By calling digital art "[new] media art," public perception has focused the zeros and ones as formatted into particular visual, acoustic and tactile media, rather than structures of programming. This view is reinforced by the fact that the algorithms employed to generate and manipulate computer music, computer graphics, digital text are frequently if not in most cases invisible, unknown to the audience and the artist alike. While the history of computer art still is short, it is rich with works whose programming resides in black boxes or is considered to be just a preparatory behind-the-scenes process for a finished (and finite) work on CD, in a book, in the Internet or in a "realtime interactive" environment. The distribution of John Cage's algorithmically generated sound play "Roaratorio," for example, includes a book, a CD and excerpts of the score, but not even a fragment of the computer program which was employed to compute the score.

While software, i.e. algorithmic programming code, is inevitably at work in all art that is digitally produced and reproduced, it has a long history of being overlooked as artistic material and as a factor in the concept and aesthetics

of a work. This history runs parallel to the evolution of computing from systems that could only be used by programmers to systems like the Macintosh and Windows which, by their graphical user interface, camouflaged the mere fact that they are running on program code, in their operation as well as in their aesthetics. Despite this history, we were surprised that the 2001 transmediale award for software art was not only the first of its kind at this particular art festival, but as it seems the first of its kind at all.

When the London-based digital arts project I/O/D released an experimental World Wide Web browser, the Web Stalker <http://www.backspace.org/ioid/>, in 1997, the work was perceived to be a piece of Net Art. Instead of rendering Web sites as smoothly formatted pages, the Web Stalker displayed their internal control codes and visualized their link structure. By making the Web unreadable in conventional terms, the program made it readable in its underlying code. It made its users aware that digital signs are structural hybrids of internal code and an external display that arbitrarily depends on algorithmic formatting. What's more, these displays are generated by other code: The code of the Web Stalker may dismantle the code of the Web, but does so by formatting it into just another display, a display which just pretends to "be" the code itself. The Web Stalker can be read as a piece of Net Art which critically examines its medium. But it's also a reflection of how reality is shaped by software, by the way code processes code. If complex systems and their generative processors themselves become language, formulation becomes the creation of a frame within which the system will behave, and of the control of this behaviour. The joint operation of these processes creates its own aesthetics which manifests itself no longer by application-restricted assignments, but in the free composition of this system as a whole. (Which simply is what developing software is all about.)

Since software is machine control code, it follows that digital media are, literally, written. Electronic literature therefore is not simply text, or hybrids of text and other media, circulating in computer networks. If "literature" can be defined as something that is made up by letters, the program code, software protocols and file formats of computer networks constitute a literature whose underlying alphabet is zeros and ones. By running code on itself, this code gets constantly transformed into higher-level, human-readable alphabets of alphanumeric letters, graphic pixels and other signifiers. These signifiers flow forth and back from one aggregation and format to another. Computer programs are written in a highly elaborate syntax of multiple, mutually interdependent layers of code. This writing does not only rely on computer systems as transport media, but actively manipulates them when it is machine instructions. The difference is obvious when comparing a conventional E-Mail message with an E-Mail virus: Although both are short pieces of text whose alphabets are the same, the virus contains machine control syntax, code that interferes with the (coded) system it gets sent to.

Software art means a shift of the artist's view from displays to the creation of systems and processes themselves; this is not covered by the concept of "media." "Multimedia", as an umbrella term for formatting and displaying data, doesn't imply by definition that the data is digital and that the formatting is algorithmic. Nevertheless, the "Web Stalker" shows that multimedia and terms like Net Art on the one hand and software art on the other are by no means exclusive categories. They could be seen as different perspectives, the one focussing distribution and display, the other one the systemics.

But is generative code exclusive to computer programming? The question has been answered by mathematics proper and the many historical employments of algorithmic structures in the arts. A comparatively recent classical example is the Composition 1961 No. I, January I by the contemporary composer and former Fluxus artist La Monte Young, which is at once considered to be one of the first pieces of minimal music and one of the first Fluxus performance scores:

"Draw a straight line and follow it." [1]

This piece can be called a seminal piece of software art because its instruction is formal. At the same time, it is extremist in its aesthetic consequence, in the implication of infinite space and time to be traversed. Unlike in most notational music and written theatre plays, its score is not aesthetically detached from its performance. The line to be drawn could be even considered a second-layer instruction for the act of following it. But as it is practically impossible to perform the score physically, it becomes meta-physical, conceptual, epistemological. As such the piece could serve as a paradigm for Henry Flynt's 1961 definition of Concept Art as "art of which the material is 'concepts,' as the material of for ex. music is sound." [2] Tracing concept art to artistic formalisms like twelve-tone music, Flynt argues that the structure or concept of those artworks is, taken for itself, aesthetically more interesting than the product of their physical execution. In analogy, we would like to define software art as art of which the material is software.

Flynt's Concept Art integrates mathematics as well, on the cognitive grounds of "de-emphasiz[ing]" its attribution to scientific discovery. [3] With this claim, Flynt coincides, if oddly, with the most influential contemporary computer scientist, Donald E. Knuth. Knuth considers the applied mathematics of programming an art; his famous compendium of algorithms is duly titled

"The Art of Computer Programming,"^[4]

Should the transmediale software art jury therefore have consisted of mathematicians and computer scientists who would have judged the entries by the beauty of their code?

What is known as Concept Art today is less rigorous in its immaterialism than the art Flynt had in mind. It is noteworthy, however, that the first major exhibition of this kind of conceptual art was named "Software" and confronted art objects actually with computer software installations.⁵ Curated in 1970 by the art critic and systems theorist Jack Burnham at the New York Jewish Museum, the show was, as Edward A. Shanken suggests, "predicated on the idea of software as a metaphor for art [my emphasis]"^[6]. It therefore stressed the cybernetical, social dimension of programmed systems rather than, as Flynt, pure structure.

Thirty years later, after personal computing became ubiquitous, cultural stereotypes of what software is have solidified. Although the expectation that software is, unlike other writing, not an aesthetic, but a "functional tool" itself is an aesthetic expectation, software art nevertheless has become less likely to emerge as conceptualist clean-room constructs than reacting to these stereotypes. The "Web Stalker" again might be referred to as such a piece. In a similar fashion, the two works picked for the transmediale award, Adrian Ward's "Signwave Auto-Illustrator" and Netochka Nezvanova's "Nebula M.81," are PC user software which acts up against its conventional codification, either by mapping internal functions against their corresponding signifiers on the user interface (Auto-Illustrator) or by mapping the signifiers of program output against human readability (Nebula M.81).

The range of works entered for the transmediale.⁰¹ software art award shows that coding is a highly personal activity. Code can be diaries, poetic, obscure, ironic or disruptive, defunct or impossible, it can simulate and disguise, it has rhetoric and style, it can be an attitude. Such attributes might seem to contradict the fact that artistic control over generative iterations of machine code is limited, whether or not the code was self-written. But unlike the Cagene artists of the 1960s, the software artists we reviewed seem to conceive of generative systems not as negation of intentionality, but as balancing of randomness and control. Program code thus becomes a material with which artist work self-consciously. Far from being simply art for machines, software art is highly concerned with artistic subjectivity and its reflection and extension into generative systems.^[7]

[Nettime-bold] Review of the CODE conference (Cambridge/UK, April 5-6, 2001)

From: Florian Cramer

To: nettime-bold@nettime.org

Date: Fri, 13 Apr 2001 15:19:56 +0200

(The following review was commissioned by MUTE and will appear in the forthcoming MUTE issue, see <http://www.metamute.com>). Josephine Berry has my cordial thanks for editing the text into proper English. The MUTE people were so kind to let me speak about literature and systems theory on a panel with Robert Coover and Jeff Noon at Tate Modern. See <http://www.metamute.com/events/mutetate08042001.htm> for the details. -FC)

CODE: Chances and Obstacles in the Digital Ecology

The recent Cambridge conference CODE amounted to more than a straightforward expansion of its acronym into - in computerese - its executable "Collaboration and Ownership in the Digital Economy". It actually got some of its participants collaborating. The most interesting idea regarding collaboration came as an off-the-cuff remark from James Boyle, professor of law at Duke University, who compared the recent interest in open digital code to environmentalism. The first environmental activists were scattered and without mutual ties, Boyle said, because the notion of 'the environment' did not yet exist. It had to be invented before it could be defended.

After two packed days of presentations, it could well be that the virus will spread and make artists, activists and scholars in digital culture associate IP' with 'Intellectual Property' rather than 'Internet Protocol', whether they like it or not. Unlike many Free Software/Open Source events with their occasional glimpses at the cultural implications of open code, the CODE programme covered the free availability and proprietary closure of information in the most general terms setting it into a broad disciplinary framework which included law, literature, music, anthropology, astronomy and genetics. Free Software has historically taught people that even digitised images and sounds run on code. But that this code is speech which can be locked into proprietary schemes such as patents and shrinkwrap licenses, thereby decreasing freedom of expression, is perhaps only beginning to dawn on people. John Naughton, moderator of the panel on 'The Future of Knowledge', illustrated this situation by describing how, in the US at least, it is illegal to wear T-Shirts or recite haikus containing the few sourcecode words of DeCSS, a program which breaks the cryptography scheme of DVD movies.

There is little awareness that any piece of digital data, whether an audio CD, a video game or a computer operating system is simply a number and that every new copyrighted digital work reduces the amount of freely available numbers. While digital data, just like any text, can be parsed arbitrarily according to a language or data format (the four letters g-i-f-t, for example, parse as a synonym for 'present' in English, but as 'poison' in German), the copyrighting of digital data implies that there is only one authoritative interpretation of signs. The zeros and ones of Microsoft Word are legally considered a Windows program and thus subject to Microsoft's licensing, although they could just as well be seen as a piece of concrete poetry when displayed as alphanumeric code or as music when burned onto an audio CD. The opposite is also true: no-one can rule out that the text of, say, Shakespeare's Hamlet cannot be parsed and compiled into a piece of software that infringes somebody's patents.

The legal experts speaking at CODE also explained the enormous expansion in intellectual property rights in the last few years. While patents are widely known to conflict with the freedom of research and even with the freedom to write in programming languages, the conference nevertheless extended its focus beyond this and made its participants aware of IP rights as the negative subtext to what was once considered the promiscuous textuality of the Internet. Still, it was surprising to see speakers with very diverse academic and professional backgrounds position themselves so unanimously against the current state of IP rights. In another informal remark, Volker Grassmuck proposed that we refocus 'information ecology' from software ergonomics to the politics of knowledge distribution. Does digital code need its own Greenpeace and World Wildlife Fund?

The conference took its inspiration from Free Software, but didn't bother going into basics and priming the participants on what Free Software

and Open Source technically are - which was both an advantage and a disadvantage. General topics were advanced right from the first session without first clarifying such important issues as the meaning of the 'free' in Free Software. GNU project founder Richard M. Stallman - who usually explains this as 'free, as in speech' not 'free, as in beer' - revealed his own questionable conceptions by proposing three different copyleft schemes for what he categorised as 'functional works', 'opinion pieces' and 'aesthetic works': as if these categories could be separated, as if they weren't aspects of every artwork, and as if computer programs didn't have their own politics and aesthetics (GNU Emacs could be analysed in just the same way Matthew Fuller analysed the aesthetic ideology of Microsoft Word.) It was annoying to hear Stallman reduce the distribution of digital art to 'bands' distributing their 'songs', and it was equally annoying to hear Glyn Moody call Stallman the Beethoven, Linus Torvalds the Mozart and Larry Wall - a self-acclaimed postmodernist and experimental writer in his own right - the Schubert of programming.

To make matters worse, the artists who spoke on the second day of CODE echoed these aesthetic conservatisms in perfect symmetry. Michael Century, co-organiser of the conference and Stallman's respondent, unfortunately didn't have enough time to speak about the notational complexity of modern art in any detail. He was the only speaker to address this issue. Otherwise, artists were happy to be 'artists', and programmers were happy to be 'programmers'. Stallman's separation of the 'functional' and the 'aesthetic' was also implied in Antoine Moireau's Free Art License <<http://www.artlibre.org>>, a copyleft for artworks which failed to illuminate why artists shouldn't simply use the GNU copyleft proper. This question is begged all the more since the license is based on the assumption that the artwork in contrast to the codework is, quote, 'fixed'. While Moireau's project was at least an honest reflection of Free Software/Open Source, one couldn't help the impression that other digital artists appropriated the term as a nebulous, buzzword-compatible analogy. While there are certainly good reasons for not releasing art as Free Software, it still might be necessary to speak of digital art and Free Software in a more practical way. Much if not most of digital art is locked into proprietary formats like Macromedia Director, QuickTime and RealVideo. It is doomed to obscurity as soon as their respective manufacturers discontinue the software.

On the other hand, the Free Software available obviously doesn't cut it for many people, artists in particular. The absence of, for example, desktop publishing software available for GNU/Linux is no coincidence since the probability of finding programmers among graphic artists is much lower than the probability of finding programmers among system operators. This raises many issues for digital code in the commons, issues the conference speakers seemed, however, to avoid on purpose. While most of them pretended that it was no longer necessary to use proprietary software, their computers still ran Windows or the Macintosh OS. It would have been good to see such contradictions if not resolved then at least reflected.

Code, Queens College, Cambridge, UK, April 5-6, 2001

 >artwork part of the concept?
 >If so, is it possible / necessary / advisable to form a set of rules that
 >define the way software art be dealt with?

as with any artistic practice, fixed rules would not help, but an exchange of experiences and a comparison of conditions might help to create a good and informed curatorial practice.

software art is only just coming into focus, so it is early days to describe, let alone critique its presentation. We have developed a description of software art for the transmediale competition that excludes applications of software like director or shockwave; what is interesting in software are, in my view, is that it is an artistic practice that takes code as its material and that uses programming as a way to 'shape' the code: the result can be open, algorithmic processes that articulate the rigid and the open dimensions of digital processes, they can highlight the technical or the socio-cultural dimensions of technology and do this in the very 'language' of the digital machines themselves. software might be the ultimate medium of creativity in a digital environment.

besides the transmediale.01 site, some examples of software art can be found on [digital_is_not_analog.01](http://www.d-i-n-a.org) - <http://www.d-i-n-a.org>

 > applications of software like director or shockwave;

On what basis was this decision made?
 Today Director is a tool which enables the creation of professional software. I think many people (developers included) still refer to Director as an interactive animation / games application, and are quite ignorant when it comes to the more interesting and new features that are scarcely in use yet. With today's "imaging lingo" (new features added in Director 8), it's possible to create a Photoshop-like application from scratch.
 Cheers,
 Ittai.

Re: Software as Art

From: anthony huberman

To: <new-media-curating@jiscmail.ac.uk>

Date: Tue, 3 Jul 2001 11:30:36 -0500

Andreas referenced the Reena Jana text in Wired.com. I organized the recent panel and performance event called "Artists and their Software" that Reena's text references, and so this month's topic strikes me as particularly relevant.

The event went very well. A comment from the audience, however, stuck out as something that seems to be a central shortcoming. Many choose to look at the coding and the programming and the "how to" aspects of art-as-software, often overlooking the immensely fertile territory that can be addressed through a broader look at the phenomenon: why is it important? What implications do this trend have on our general understanding of what art-making is all about? How do the values/strategies/principles that art-as-software maintain affect the way in which artists and audiences understand art? Many more broad questions come to mind: why are artists attracted to software? How does their awareness of software, and its availability, influence their art-making strategies? How do institutions need to respond to this growing interest? Is incorporating software nothing more than a technology fetish? More specific concerns can arise: what happens to "improvisation"? How is the notion of chance incorporated in this type of art? What happens to the "aura"? What are the boundaries of software as an art-making medium? How can artists involve their audiences with software? Can one talk about software-generated art as ever being "finished"? Do software artists have to be programmers? What is the social life of software?

The algorithm seems to replace the creative will of the artist, in many cases. This is exciting to me not because it is technologically marvelous, but because of what this implies in how the artist and the audience understand each other.

Software is a set of rules. It is the grammar within which a vocabulary of computer code makes sense. As British sociologist Anthony Giddens has pointed out, we understand our reality as already existing and seek to write scenarios that allow us to act out a role within that reality. The software seems to be the scenario, but it relies on users to act it out.

What makes software come alive is precisely its social life: how these set of instructions are interpreted and enacted. And understanding this process of interpretation, of behavior, can fill up pages and pages.

I look forward to more postings this month... thank you!

Re: Software as Art

From: Patrick Lichty

To: <new-media-curating@jiscmail.ac.uk>

Date: Tue, 3 Jul 2001 13:15:09 -0700

A few glancing ideas...

Many choose to look

>at the coding and the programming and the "how to" aspects of
>art-as-software, often overlooking the immensely fertile territory that can
>be addressed through a broader look at the phenomenon: why is it important?

There are two views I can think of regarding the use of software as art - one applies to off-the-shelf, the other to hand-coded... To me, programs like Photoshop offer few real opportunities to redefine its own kind of interactivity, so I relegate it to the category of "tool", rather than "expression".

I think for one that there are functions and aspects of the technologies that are not being addressed by off-the shelf software. This is the programming argument. There are larger threads here such as engagement with the technical part of the electronic culture, which has its own fascinating set of protocols.

>What implications do this trend have on our general understanding of what
>art-making is all about?

Well, it's merely an extension of craft placed within the immaterial milieu if computers, yes? It's very funny that a great deal of excitement is based around artists making their own code. It is a direct attempt to break with the commonly held public perception that computers are easy and cheap, and thus so is the art created with them. Many times I have gotten the "How long does it take you to create that?" question.

This is a very Marxist question. Much of commodification of art has to do with use value ascribed to the degree of labor expended.

It's an attempt to translate craft to the digital.

Many more broad questions come to mind: why are artists
>attracted to software?

I'm not sure what you're getting at here. To use a computer, you have to have it. It's the yin to the yang of chips. As to why artists are drawn to code, I think it's a tug of war between the traditional breaking of extant boundaries (or at least pushing them, which is a ubiquitous theme in art since Modernism) and the necessity of having to create code to get a computer to do what you want it to do.

Myself, I tend to be modular in combining functions of many off the shelf programs. So, in this respect, I would count myself as a hybrid under my own rubric: a pastiche artist in regards to code.

How does their awareness of software, and its
>availability, influence their art-making strategies?

I think it's quite relevant to how the work is contextualized in regard to the medium (digital technologies).

How do institutions
>need to respond to this growing interest?

First, the audience for this art is pretty much a niche at this time. For example, there are a LOT of people out there who still do not know how to create a folder on their hard drive (trust me), and to them, this art is largely meaningless, or the subtleties are lost.

Secondly, the institution (in my experience with it) is trying to update itself, but for the most part, lags far behind the artists. Until recently, the Smithsonian servers only had RealServer 2.0 (we're at something like v.7 now). Also, the technical support for the work is quite specialized, which compounds the problems.

Should an institution have a highly trained tech staff for a relatively small collection, or subcontract? What are the relative costs, logistics, etc?

Is incorporating software nothing
>more than a technology fetish?

NO.

More specific concerns can arise: what
>happens to "improvisation"?

That's dependent largely upon the mode of expression. In the case of off-the shelf software, the mode of improv is tied to finding novel uses for extant functions, and in the case of coding, the novelty of codecraft and finding interesting ways to weave the concept into the code.

To me this is a very important point, for much of this post, it seems that the conversation has been centered around technique and production, and NOT CONTENT. This is the technopolic distraction. In my opinion, with software as art, code is little different than steel, or clay, or oils.

You can choose to make scenes incorporating banal seascapes, or amish buggies, or _Guernica_. Maybe I use too broad of a brush here :, but I hope you see my point.

Now, if you get into the realm of generative art, such as algorithmic music, Auto-Illustrator, and so on, this is another angle entirely, and sets up questions of authorship between programmer and audience, and similar questions of authorship. In the case of Auto-Illustrator, the statement becomes central to the question of origins and synergy. Same for generative music software. In nato software (an add-on for the Max programming language for video processing), how much of the intent is the artist's, and how much is not?

However, I think I would return to my Bryce analogy.

How is the notion of chance incorporated in
>this type of art?

>What are the boundaries of
>software as an art-making medium?

I think there are boundaries at many levels, both technical and cultural. For example, one is limited by the technical capabilities of the hardware to perform certain functions (sound quality, interfacing, graphics), the software as a certain set of functions and rules that define a protocol, and the culture defines certain parameters which limit the level of engagement between artist and audience, depending upon the context within which the work is created. The challenge is to see whether the piece engages with the public within its given cultural context in a way that is compelling, and not merely amazing.

I'm tired of being amazed. I want to be confronted by a piece.

A nice example of this is clip.fm by Angie Weller. She has set up phone icons depicting sensitive subjects that one can send to another via WAP-capable phone. On one hand it has some level of technical facility, but on the other hand, it engages with me in a really visceral way.

Can one talk about software-generated art as ever being
>"finished"?

I have been having a talk about this with a colleague, and we seem to be more of the mind that this is more tied to process than product. This seems to even be the case with net art anymore. Even with pieces that are supposed to have a terminal point, in many cases, it seems to be going through endless revisions.

>Do software artists have to be programmers?
To be virtuosic, I would agree with this, at least to an extent.

What is the social
>life of software?

Interesting question. Please elaborate.

>The algorithm seems to replace the creative will of the artist, in many
>cases.

I'm not sure I agree. Perhaps I have a more sculptural approach to this topic. Does steel replace the creative will of the sculptor, or in Calder's case, does the motion of the mobile replace his intent? In the case of generative art, we could go back to Duchamp, Cage, even Mozart. Once again we arrive at artistic discourse centering upon process, rather than the object itself. This is a topic that I've been thinking about for quite some time, as I work in algorithmic sound/video a great deal, and I feel that the end result is performative in nature. For the reason why I don't believe that it's performance, I can post a text version of my "Cybernetics of Performance" text.

To take it from another angle, consider the landscape program Bryce. For years I saw endless megabytes of stunning neo-Adamque landscapes, holding firmly to the paradigm imposed by the program. However, as time went on, people like Bill Ellsworth took the application and used it to create incredible non-representational imagery, and so on. They became intimate with the software to the point of virtuosity. To me, this is key, or at least the ability to make novel inferences about the context and function of the technological tools in question.

This is exciting to me not because it is technologically marvelous,
>but because of what this implies in how the artist and the audience
>understand each other.

Seriously, do you feel that there has to be some baseline of technical familiarity in order for that communication to be more satisfying?

>Software is a set of rules. It is the grammar within which a vocabulary of
>computer code makes sense.
And so is language. Arguably, language has been thought to represent a major portion of how we perceive reality and operate upon objects, both metaphorical

and physical (and vice versa).

My question to you is how the two contexts differ.

As British sociologist Anthony Giddens has
>pointed out, we understand our reality as already existing and seek to
>write scenarios that allow us to act out a role within that reality. \

Good point, but I will not accept this as a priori.

The
>software seems to be the scenario, but it relies on users to act it out.
>What makes software come alive is precisely its social life: how these set
>of instructions are interpreted and enacted. And understanding this
>process of interpretation, of behavior, can fill up pages and pages.

That's engagement with the audience. And, I wonder how this is facilitated by artists and curators, and whether there is required a certain common set of cultural currency in order for the interaction (read: I'm being purposely ambiguous here) to engage the audience. If not, then how does technology become transparent to the point where it is almost purely expressive?

Re: Software as Art

From: Andreas Broeckmann

To: <new-media-curating@jiscmail.ac.uk>

Date: Wed, 4 Jul 2001 09:42:22 +0200

some of the questions that were raised in relation to my posting have already been answered by others, so I will try to be brief with some more responses:

Anthony:
>The algorithm seems to replace the creative will of the artist, in many
>cases. This is exciting to me not because it is technologically marvelous,
>but because of what this implies in how the artist and the audience
>understand each other.

for me it is also interesting because the machinic process that develops from the algorithm reduces the aspect of intentionality from the artistic process and puts an autopoietic machine process in its place: the aesthetic dimension then lies not in the fact that the effect is 'beautiful' or the code is functional or 'beautifully written'. as with any artistic practice, there can be different aesthetic modes according to which works or processes can be judged. for me, the oscillation between control and idiosyncrasy in a computer, this supposedly precise machine, is closely linked to the aesthetic experience of a work of software art, to observe how the computer sings itself to sleep, or goes into a mindless delirium. an example is Antoine Schmitt's Vexation i, a programme that sends a small white ball across a black rectangle, finely balanced between a rule pattern and randomness. (<http://www.gratin.org/as>)

>> definition that excludes applications of software like director or
>>shockwave;

Ittai:
>On what basis was this decision made?

the idea was to give an award to a piece of original software, rather than to an application of software that exists as a commercial product. Susan might be right that there is a 'crafts' idea behind this, another aspect is that we aim to encourage open source projects, rather than the promotion of closed and proprietary softwares. director and shockwave are owned by companies that can choose to withdraw their product from the market any day, making it illegal for people to continue running their scripts. this is, obviously, a ludicrous situation, and it cannot happen to you when you are using free software.

>> How do you 'show' or distribute it?

Dave:
>To interpret this literally: In a code development environment or simulator
>where you can step forward, halt and continue the instruction sequence and
>watch what happens?
>

>If the idea is to establish that software is an Art form then it would be
>logical to show it in a similar context and way as other Art: eg in some
>kind of special space which invokes the necessary awe and aura; in a
>museum/gallery - virtual or otherwise.

i disagree. long, long gone are the days when you needed an auratic space to present something as art - this idea misses the point of a lot of art from the last 100 years, and we should not continue to buy into the myth. 'other Art' also gets shown elsewhere.

Dave's first question is interesting and gets us, i think, to the core of the problem of software art for a curatorial practice. many paintings are made to be displayed on the wall of a gallery, or an office, or a church. they make sense there, and they sometimes suffer when they are displayed out of context, some also win, but there often is a logic to the relation between an artwork and the environment where it is shown.

how, then, do you 'exhibit' a process that runs on a tiny processor? Daniel García Andujar recently printed out the source code of the I-Love-You virus and displayed it on a gallery wall in Dortmund (<http://www.irational.org/ttpp>) - this is obviously just an ironic gesture. a piece like Vexation 1 you can show on an iMac, it keeps running endlessly and is designed as a more or less self-explanatory work. in Adrian Ward's Signwave Auto-Illustrator (<http://www.signwave.co.uk>), the best way to experience it is to interact with the programme on a regular PC which can but need not be your own. pieces by JODI and nn are probably best experienced on your own machine because they play with your emotional attachments to what's on it. whereas the processes involved in a piece like Daniela Plewe's Ultima Ratio (<http://www.sabonjo.de>) needs a lot of explanation and its 'beauty' might only reveal itself to people who have a deeper understanding of the informatic and logical processes going on in the computer.

i'll leave it here for the moment.

greetings from sunny berlin,
-a

Re: Software as Art
From: Sarah Thompson
To: <new-media-curating@jiscmail.ac.uk>
Date: Wed, 4 Jul 2001 12:30:10 +0100

Andreas Broeckmann says that
>software art is only just coming into focus, so it is early days to
>describe, let alone critique its presentation.

While I would agree that it is only just being appreciated in its own right (software as art) and it is great that Transmediale have acknowledged this art form, aren't there examples of artists developing their own computer software during the 20th century which give precedents for making, appreciating and exhibiting this kind of work?

There is a danger that if this 'lost history' of artists programming computers is not rediscovered, that their multiple and different strategies and approaches will be ignored in favour of a more singular definition.

Also, why was their work not appreciated? Why did it fail to, or succeed in fitting into the art world context? Did the artists want it to fit into this context or were they trying to _engineer_ a new kind of context for their work?

As Anthony Huberman puts it:
>What makes software come alive is precisely its social life: how these set
>of instructions are interpreted and enacted.

As such, I really like the critique of different pieces of software & how to see them by AB:
>the best way to
>experience it is to interact with the programme on a regular PC which can
>but need not be your own. pieces by JODI and nn are probably best
>experienced on your own machine because they play with your emotional
>attachments to what's on it.

While appreciating that Transmediale is about what is happening *now*, I

just wanted to make this point within the broader curating new media context.

best wishes

Sarah

So far we have only discussed conventional forms of software eg code executed as a series of instructions (with fixed conditions for branching), digital states of on/off, logical states true/false etc. This provides output which is entirely predictable (given that you know the input).

Might it be that we could also look to the domains of fuzzy logic and Neural Networks or Artificial Intelligence in search of software as Art?

These technologies allow for grey and uncertain states and produce 'code' which behaves more like biological systems than adding machines. Such systems can be given the ability to learn and adapt. Their output is not entirely predictable.

Dave

What exactly do you mean by 'making it illegal for people to continue running their scripts'? Do you maybe mean impossible rather than illegal? This sounds so strange to me. And if the makers of director et al choose to withdraw their software from the market that does not mean it cannot be used anymore, does it? It would not make sense to sell people software that would become illegal to use once the company does not produce any packets of it (and updates of it) any more. Transmediale's choice for open source projects is a political statement and a kind of aesthetic choice too maybe. Your above argumentation against the other art codes does not seem to make much sense to me. Or is there more?

hi josephine,
there are people who can explain this much better than i can, but i suggest
you read either the software license agreements that most of us click OK
without checking, or the stuff that Richard Stallman has written about
these things (www.gnu.org/philosophy); the point is that with most software
you buy not the code, but the right to limited usage; that is also why you
are not allowed to pass it on to friends or copy it - the code is not
yours, you just pay for the right to use it, that whole legal field is
completely crazy!! read stallman, he is also entertaining.

I've only been skimming this one...but I agree with Sarah Thomson when she
says

"There is a danger that if this 'lost history' of artists programming
computers is not rediscovered, that their multiple and different strategies
and approaches will be ignored in favour of a more singular definition."

It seems that there are (again) so many different kinds of art/and artists
intentions within this particular thread. For one you have artists such as
David Rokeby...who creates all his own hard and software for his work...but
with works such as his Very Nervous System, has also built it as an
architecture (both soft and hardware versions) for other artists to use in
their own way - and stretch etc...an 'open system' or structure is you
like....

and then there are other artists or groups such as IOD with Webstalker where
the very fact that it IS a piece of software is fundamental to its
context/existence et al...

and in answer to Sarah re. examples of artists earlier in the 20th C its worth
mentioning the artist Harold Cohen who for over 30 years has been developing
software to think about drawing/painting the way he thinks about drawing and

painting (for those of you not familiar, Harold was a very well known painter
in the 60's and then moved to the states - san diego now - and has worked
with computers ever since)...his philosophy is very much that the program is
the artwork, but the program also generates its own artwork (Harold has been
present within a lot of AI discussion etc)...according to Harold's own rules
and principles. Far from being ignored etc...Harold has had shows in many
major museums (incl. major retrospective at the Tate in London 1983)...and was
quite vociferous in opposition to artists using readymade software (as opposed to
writing their own) when i first met him back in the late 80's...it would be
interesting to know his position on this now....

best

Just to back Andreas up on this, most people don't realise that when
they buy software, they are buying the right to use it, not buying the software
per se. You could equate it to hiring a TV/video etc. microsoft, adobe or
macromedia still ultimately own it.

As far as I'm aware, this also applies to products like Director/shockwave that
allow authoring. I'm not sure what the status of the authored artefact is, but as
they 'allow you' to distribute the software/artwork 'under license' as a projector
etc. doesn't it follow that macromedia have a part share in any artwork made
using their software?

Maybe someone can clarify this.

Tom

I think you'll find that many artists have drawn upon these areas, not in every
case to comment on them, but certainly in terms of injecting emergent agency
and/or unpredictable states/conditions into their work (eg. Knowbotics
research). David Rokeby has already been mentioned, but Stephen Wilson has
a long standing interest in AI as well. A lot of the early interest in computer
based art was concerned with simulated agency; certainly many of the exhibits in
Cybernetic Serendipity (ICA 1968) were concerned with simulated intelligence.

Want to See Some Really Sick Art?

By Reena Jana

Nothing sucks more than a computer virus.

Yet the contemporary art world, always hungry for the new, the trendy and the controversial, is starting to recognize the virus as an art form -- perhaps because computer viruses embody all of the above.

This year's Venice Biennale -- one of the international art world's most prestigious events -- served as the launching pad for "biennale.py." It's the art world's interpretation of the destructive "Melissa" and "Love Bug" viruses that grabbed headlines in recent years.

At the Biennale, which opened on June 10, a computer infected with "biennale.py" remains on display until the exhibition closes in November. Viewers can witness someone else's system crashing and files being corrupted, in real time, as if it were a creepy performance.

The artsy-fartsy virus was created by the European Net Art Collective 0100101110101101.ORG, in collaboration with epidemicC, another group known for its programming skills. The virus only affects programs written in the Python computer language and is spread if someone

downloads infected software or utilizes a corrupted floppy disk.

Because Python is a relatively esoteric language, the artists hope that the source code, which they've printed on 2,000 T-shirts and published on a limited edition of 10 CD-ROMs, will be the most contagious form of distribution.

"The source code is a product of the human mind, as are music, poems and paintings," explained the epidemicC team, which prefers to speak collectively -- and somewhat pretentiously. "The virus is a useless but critical handcraft, similar to classical art."

Adds a member of 0100101110101101.ORG, which also prefers to speak collectively (and anonymously), "The only goal of a virus is to reproduce. Our goal is to familiarize people with what a computer virus is so they're not so paranoid or hysterical when the next one strikes."

The artists have created a mini-hysteria over their piece.

More than 1,400 of the shirts have been sold at \$15 apiece. And they've sold three CD-ROMs, at \$1,500 each (the collectors chose to remain unnamed for legal reasons). Yet the potentially damaging code is available for free on the artists' homepages.

"In theory, we should get sued," said 0100101110101101.ORG's spokesperson. "But we've gotten almost no complaints. Well, we've gotten a few e-mails from security experts who want to know who these asshole artists are."

Laws like the Computer Fraud and Abuse Act state it's illegal to send damaging code in interstate or foreign communications. But the artists don't feel liable for any damage caused by "biennale.py" because they sent a warning to major software and antivirus companies including Microsoft and McAfee.

"We've explained how to disable our virus, so people should know how to fix it," said the 0100101110101101.ORG spokesperson.

Not everyone's buying this excuse.

"If a thief leaves a note saying he's sorry, do we feel better? No," said Jason Cattlet, the president of an anti-spam group called Junkbusters, who has testified before Congress on Internet privacy issues. "Doing things that are socially undesirable in the name of art does not redeem the act."

This isn't the first time artists have adopted annoying practices to gain attention. Spam, for instance, is emerging as an "art form" as well; the Webby-winning Net art collective Jodi.org sent 1,039 spam messages through the e-mail list Rhizome Raw this January.

Some media art theorists think that an artistic statement about computer viruses can only be expressed effectively by spreading a virus itself.

"To talk about contemporary culture, you have to be able to use all kinds of expressions of contemporary culture," said Lisa Jevbratt, who teaches media art at San Jose State University. "So a virus can be considered a legitimate art form. Of course, there will be artists and pranksters doing interesting new things with such forms. But there will be artists and pranksters whose actions are merely rehashing critiques."

Codework
McKenzie Wark

What happens to writing as it collides with new media? I was thinking about this recently while looking over an exhibition of William Blake's work at the Metropolitan Museum in New York. On display was not just Blake the artist, Blake the poet, or Blake the quirky revolutionary. Here was Blake the media artist.

Blake assembled all of the elements of a media practice. As a writer he experimented with all aspects of the production process. His aesthetic did not stop with the word on the page. Here, I thought, was a useful precursor to name for the new developments in writing that take place on the Internet, developments I will shortly define as "codework."

But Blake is interesting in this connection only if one embraces all aspects of his productivity. There's a tendency, in the teaching of literature and the management of its canons, to separate off the authoring of the text from the other aspects of writing as a production. It's a tendency that full attention to Blake frustrates, given how fully he was invested in the implication of writing in all aspects of its production

and circulation. Blake's creation did not stop at the threshold of "text."

Digging writing out of the prison-house of "text" might just be what is needed to unblock thinking about where the Internet is taking writing. There has always been more to writing than text, and there is more to electronic writing than hypertext.

Hypertext may have come to dominate perceptions of where writing is heading in the Internet era, but it is by no means the only, or the most interesting, strategy for electronic writing. Hypertext writers tend to take the link as the key innovation in electronic writing spaces. In hypertext writing, the link is supposed to open up multiple trajectories for the reader through the space of the text.

Extraordinary claims were made for this as a liberatory writing strategy. Hypertext has its limits, however. First, the writing of the text stands in relation to the writing of the software as content to form. The two are not really brought together on the same plane of creativity. Secondly, hypertext tends not to circulate outside of the academic literary community. It has its roots in avant-garde American and English literature and tends to hew close to those origins. Thirdly, it doesn't really rethink who the writer is, in the new network of statements that the expansion of the Internet makes possible. For all the talk of the death of the author, the hypertext author assumes much the same persona as his or her avant-garde literary predecessors.

What is interesting about the emergence of codework is that it breaks with hypertext strategies on all three points. In many codework writings, both the technical and cultural phenomena of coding infiltrates the work on all its levels. Codework finds its home in a wide range of Internet venues, forming dialogues sometimes antagonistic ones with the development of other kinds of written communication in an emerging electronic writing ecology. Codework also sets to work on the problem of the author, bringing all of the tactics of the Internet to bear on the question of authorship.

Codework "entities" such as Antiorp and JODI approach the Internet as a space in which to re-engineer all of the aspects of creative production and distribution. Antiorp is famous or rather infamous for bombarding listservers such as the Nettime media theory list with posts that seem to parody the sometimes high-serious style of Internet media theory. It was often hard to tell whether the Antiorp writing emanated from a human source or from some demented "bot" programmed to produce the semi-legible texts.

Antiorp has spawned a number of alternative identities and imitators. It is with some trepidation that one would venture to assign codework texts to discrete authors. It may be best to take the fabricated heteronyms under which codework is sometimes published at face value, rather than to attempt to assign discrete flesh-and-blood authors.

Some codework frustrates the assigning of authorship as a means of breaking down the link between authorship and intellectual property. The Luther Blissett project, for example, encourages writers to assume the name Luther Blissett. Many texts of various kinds have appeared under that name and without copyright.

Some of the more prolific Luther Blissett authors subsequently became the Mu Ming Foundation, which claims to be a "laboratory of digital design" offering "narrative services." The Foundation sees itself as an enterprise looking for strategies for regaining control over the production process for codeworkers.

The "texts" JODI produces hover somewhere at the limit of what a text might be. A sample might look something like this:

```

o
|:_____ _ |_____ _|_____
:::

```

A classic JODI Web page may spit all kinds of "punctuation art" across the screen. This work is neither writing nor visual art but something in between. The programming involved usually teeters on the brink of failure. Every technology brings into being new kinds of crashes or accidents, and JODI endeavors to find those accidents unique to the authoring of Web pages.

Integer sometimes makes interventions into discussions on listservers, all with variations on the same distinctive approach to breaking up the text and introducing noise into it, not to mention a somewhat abusive hypercritical persona.

```

this - a l l this, = b u t o i c h!!!!!!p, u n e v e n t u l
k o r p o r a t f a s c i s t g u l l b l o o n z p e k t a l k e .

```

This might be a mangled machine English, or perhaps an English written by

a machine programmed by someone who speaks English as a second language, or someone producing a simulation of some such. The decaying grammar and spelling of the Internet here becomes a kind of aesthetic archive.

Rather than using e-mail and listservers, Alan Sondheim sometimes uses IRC, or Internet Relay Chat, as a means of collaboration and composition, as in "saying names among themselves," which begins:

```
IRC log started Mon May 7 00:40
*** Value of LOG set to ON
*** You are now talking to channel
      #nukuko
*** Alan is now known as terrible
*** terrible is now known as worries_i
```

The text proceeds as what appears to be a collaboration between Sondheim and unwitting collaborators, who may or may not know that this writing may come to have the status of writing, rather than chat.

Many codework texts hover on the brink of legibility, asking the reader to question whether the author is made of flesh or silicon, or perhaps whether authoring lies at the level of writing text or coding software to write text. Kenji Siratori's texts may be machine-made or made to look machine-made.

```
Ant PC planetary, MURDEROUS CONSEQUENCES! body line
TREMENDOUS HORROR! drugy miracle ADAM doll
TREMENDOUS HORROR! thyroid falls .MURDEROUS
CONSEQUENCES! vivid placenta world TREMENDOUS HORROR!
machinative angel/ her soul-machine discharges MURDEROUS
CONSEQUENCES! speed PC fear .MURDEROUS
CONSEQUENCES!
```

That text is called "Alan Sondheim-conference" and appears to be a response to a conference report by Sondheim.

While some codeworkers pounce upon the texts of others as raw material for codeworking, Stéphan Barron asks others to volunteer texts. In "Com_post Concepts" he solicits contributions with a text that begins:

Web surfers send in their texts by e-mail. All are then composted! Just as we ourselves are composted! Recycling as organic and cyclical technology, a technology of intelligence and responsibility, of the link to the natural and artificial world.

The sender receives her or his own text back at weekly intervals, in an increasingly noisy and unintelligible state.

The Internet emerges in much of this work as a noisy space, in which the structures of text decay and writing becomes granular, a chaotic space of temporary orders constantly becoming randomized. Yet within this chaotic space, the destructive character of the codeworker proposes new kinds of sensemaking that might, for a moment, keep the parasite of noise at bay.

Another precursor one might mention, besides Blake, for the emerging world of codework, is the James Joyce of *Finnegans Wake*. In *Wake*, multiplicity can erupt at any point along the textual surface, not just at discrete hyperlinked nodes. Permutations, a Web site by Florian Cramer, reproduces in digital form many of the great combinatory text systems, from Raymond Lullus to Ramond Queneau. Cramer has also produced a codework machine that creates permutations on *Finnegans Wake*, called "Here Comes Everybody." It works at the level of the syllable, producing a virtual universe of new portmanteau words out of original Joyce-text.

The Australian codeworker Mez has developed a distinctive prose style that she calls *mezangelle*, producing texts that tend to look like this:

```
.nodal + death + -points swallowed in a dea.th.rush.
.a begin 2 -f [j]ail-, ar[t]is[ms] all awry n caught in webbed
ma[j]ulers]ws.
```

Rather than link discrete blocs of text, or "lexias," to each other, Mez introduces the hypertext principle of multiplicity into the word itself. Rather than produce alternative trajectories through the text on the hypertext principle of "choice," here they co-exist within the same textual space.

The interest of Mez's writings is not limited to this distinctive approach to the text. While the words split and merge on the screen, the authoring "avatar" behind them is also in a state of flux. Texts issue, in various forms in various places, from data[h]bleeder, Phonet[r]ix, networker, and many other heteronyms.

At the heart of the codeworking enterprise is a call for a revised approach to language itself. Many of the creative strategies for making or

thinking about writing in the latter part of the twentieth century drew on Ferdinand de Saussure's *Course in General Linguistics*. In the hands of poststructuralists, language poets, or hypertext authors and theorists, this was a powerful and useful place to start thinking about how language works. But Saussure begins by separating language as a smooth and abstract plane from speech as a pragmatic act. Language is then divided into signifier and signified, with the referent appearing as a shadowy third term. The concept of language that emerges, for all its purity, is far removed from language as a process.

What codework draws attention to is the pragmatic side of language. Language is not an abstract and homogenous plane, it is one element in a heterogeneous series of elements linked together in the act of communication. Writing is not a matter of the text, but of the assemblage of the writer, reader, text, the text's material support, the laws of property and exchange within which all of the above circulate, and so on. Codework draws attention to writing as media, where the art of writing is a matter of constructing an aesthetic, an ethics, even a politics, that approaches all of the elements of the process together. Codework makes of writing a media art that breaks with the fetishism of the text and the abstraction of language. It brings writing into contact with the other branches of media art, such as music and cinema, all of which are converging in the emerging space of multimedia, and which often have a richer conception of the politics of media art as a collaborative practice than has been the case with writing conceived within the prison-house of "text."

Codework
McKenzie Wark

What happens to writing as it collides with new media? I was thinking about this recently while looking over an exhibition of William Blake's work at the Metropolitan Museum in New York. On display was not just Blake the artist, Blake the poet, or Blake the quirky revolutionary. Here was Blake the media artist.

Blake assembled all of the elements of a media practice. As a writer he experimented with all aspects of the production process. His aesthetic did not stop with the word on the page. Here, I thought, was a useful precursor to name for the new developments in writing that take place on the Internet, developments I will shortly define as "codework."

But Blake is interesting in this connection only if one embraces all aspects of his productivity. There's a tendency, in the teaching of literature and the management of its canons, to separate off the authoring of the text from the other aspects of writing as a production. It's a tendency that full attention to Blake frustrates, given how fully he was invested in the implication of writing in all aspects of its production and circulation. Blake's creation did not stop at the threshold of "text."

Digging writing out of the prison-house of "text" might just be what is needed to unblock thinking about where the Internet is taking writing. There has always been more to writing than text, and there is more to electronic writing than hypertext.

Hypertext may have come to dominate perceptions of where writing is heading in the Internet era, but it is by no means the only, or the most interesting, strategy for electronic writing. Hypertext writers tend to take the link as the key innovation in electronic writing spaces. In hypertext writing, the link is supposed to open up multiple trajectories for the reader through the space of the text.

Extraordinary claims were made for this as a liberatory writing strategy. Hypertext has its limits, however. First, the writing of the

text stands in relation to the writing of the software as content to form. The two are not really brought together on the same plane of creativity. Secondly, hypertext tends not to circulate outside of the academic literary community. It has its roots in avant-garde American and English literature and tends to hew close to those origins. Thirdly, it doesn't really rethink who the writer is, in the new network of statements that the expansion of the Internet makes possible. For all the talk of the death of the author, the hypertext author assumes much the same persona as his or her avant-garde literary predecessors.

What is interesting about the emergence of codework is that it breaks with hypertext strategies on all three points. In many codework writings, both the technical and cultural phenomena of coding infiltrates the work on all its levels. Codework finds its home in a wide range of Internet venues, forming dialogues—sometimes antagonistic ones—with the development of other kinds of written communication in an emerging electronic writing ecology. Codework also sets to work on the problem of the author, bringing all of the tactics of the Internet to bear on the question of authorship.

Codework “entities” such as Antiop and JODI approach the Internet as a space in which to re-engineer all of the aspects of creative production and distribution. Antiop is famous—or rather infamous—for bombarding listservers such as the Nettime media theory list with posts that seem to parody the sometimes high-serious style of Internet media theory. It was often hard to tell whether the Antiop writing emanated from a human source or from some demented “bot” programmed to produce the semi-legible texts.

Antiop has spawned a number of alternative identities and imitators. It is with some trepidation that one would venture to assign codework texts to discrete authors. It may be best to take the fabricated heteronyms under which codework is sometimes published at face value, rather than to attempt to assign discrete flesh-and-blood authors.

Some codework frustrates the assigning of authorship as a means of breaking down the link between authorship and intellectual property. The Luther Blissett project, for example, encourages writers to assume the name Luther Blissett. Many texts of various kinds have appeared under that name and without copyright.

Some of the more prolific Luther Blissett authors subsequently became the Mu Ming Foundation, which claims to be a “laboratory of digital design” offering “narrative services.” The Foundation sees itself as an “enterprise” looking for strategies for regaining control over the production process for codeworkers.

The “texts” JODI produces hover somewhere at the limit of what a text might be. A sample might look something like this:

```
o
|_:::;:::;_--|_:::;:::;_--|_:::;
::: :
```

A classic JODI Web page may spit all kinds of “punctuation art” across the screen. This work is neither writing nor visual art but something in between. The programming involved usually teeters on the brink of failure. Every technology brings into being new kinds of crashes or accidents, and JODI endeavors to find those accidents unique to the authoring of Web pages.

Integer sometimes makes interventions into discussions on listservers, all with variations on the same distinctive approach to breaking up the text and introducing noise into it, not to mention a somewhat abusive hypercritical persona.

```
this - a l l this. = but o r ch!!!!!!p. uneventful
korporat fascist gullibloon zpektakle.
```

This might be a mangled machine English, or perhaps an English written by a machine programmed by someone who speaks English as a second language, or someone producing a simulation of some such. The decaying grammar and spelling of the Internet here becomes a kind of aesthetic alternative.

Rather than using e-mail and listservers, Alan Sondheim sometimes uses IRC, or Internet Relay Chat, as a means of collaboration and composition, as in “saying names among themselves,” which begins:

```
IRC log started Mon May 7 00:40
```

```
*** Value of LOG set to ON
*** You are now talking to channel
#nikuko
*** Alan is now known as terrible
*** terrible is now known as worries_i
```

The text proceeds as what appears to be a collaboration between Sondheim and unwitting collaborators, who may or may not know that this writing may come to have the status of writing, rather than chat.

Many codework texts hover on the brink of legibility, asking the reader to question whether the author is made of flesh or silicon, or perhaps whether authoring lies at the level of writing text or coding software to write text. Kenji Siratori's texts may be machine-made or made to look machine-made.

```
Ant PC planetary, MURDEROUS CONSEQUENCES! body line
TREMENDOUS HORROR! drugy miracle ADAM doll
TREMENDOUS HORROR! thyroid fails...MURDEROUS
CONSEQUENCES! vivid placenta world TREMENDOUS HORROR!
machinative angelher soul-machine discharges MURDEROUS
CONSEQUENCES! speed PC fear....MURDEROUS
CONSEQUENCES!
```

That text is called “Alan Sondheim-conference” and appears to be a response to a conference report by Sondheim.

While some codeworkers pounce upon the texts of others as raw material for codeworking, Stéphane Barron asks others to volunteer texts. In “Com_post Concepts” he solicits contributions with a text that begins:

Web surfers send in their texts by e-mail ...All are then composted! Just as we ourselves are composted! Recycling as organic and cyclical technology, a technology of intelligence and responsibility, of the link to the natural and artificial world.

The sender receives her or his own text back at weekly intervals, in an increasingly noisy and unintelligible state.

The Internet emerges in much of this work as a noisy space, in which the structures of text decay and writing becomes granular, a chaotic space of temporary orders constantly becoming randomized. Yet within this chaotic space, the “destructive character” of the codeworker proposes new kinds of sensemaking that might, for a moment, keep the parasite of noise at bay.

Another precursor one might mention, besides Blake, for the emerging world of codework, is the James Joyce of Finnegans Wake. -0400

Ken - I'm sitting here in Florida, and just have to sigh a little bit. This is the problem with the digital media scene - it is SUPER WHITEBREAD - there is alot more going on.... I'm not attacking you, I just wish that the computer "art/literary" scene - especially where it comes to "language as code" - would think about precedents for theater and spectacle outside of the normal discourse that goes on in spots like nettime.... at the end of the day, the "visual interface" that most of digital culture uses to create art/text/etc etc is not neutral, and again, this is a McLuhan refraction of the old inner ear/eye thing, but with a little bit more of a technical twist. There's a great essay that the physicist David Bohm wrote on this topic called "Thought as a System" - the idea of progress is a convergence of these "visual cues" that hold the eye and hand together when we think... Multi valent/multi-cultural approaches to language and all of the sundry variations its going through right now, are what make this kind of stuff alot more interesting... Artaud was the fellow who invented the term "virtual reality" not Jaron Lanier... think of the media repetitions of the WTC as a scene out of "Theater of Cruelty" and combine it with how mourning passes through the media sphere a la Princess Diana's death etc etc and you get the idea of the whole gestalt of this kind of thing... or even the way that linguistic permutation has evolved out of music and spoken text (think of Cab Calloway or Kurt Schwitters or later material like John Cage's 'mesotics' (I'm writing this off the cuff... did I spell that right?), and even the way dj's play with words while spinning music in a set - this in itself is one of the major developments of 20th century culture: the ability not just to accept the linguistic regulations of a situation (again, Debord meets Grand Master Flash...) - but to constantly change them. This is one of the major issues that Henry Louis Gates wrote about in his "Signifying Monkey" essay a long while ago, but you can easily see the digital component of the same system of thought on-line when people play with words as domain names etc etc.... there's shareware like Ray Kurzweil's Cybernetic Poet http://www.kurzweilcybernetic.com/poetry/rkcp_overview.php3

and hip-hop material like Saul Williams and Kool Keith, and even the way the poetry of algorithms became rhythm (there's a great site on the history of drum machines... <http://www.drummachine.com/>)

and out of Australia, there's the global digital poetry site that

uses algorithms to create text and hyperlinks:
<http://www.experimedia.vic.gov.au/~komminos/maysites.html>

or even the "visual thesaurus" that creates 3-D models of how words relate to one another...
<http://www.thinkmap.com/>

and even more MAX/MSP based code material from stuff like composer Karlheinz Essl's explorations of free jazz and code structures with his "lexicon-sonate" programs:
<http://www.essl.at/works/lexson-online.html>

or nifty stuff like Chris Csikszentmihalyi's "Robot DJ" that does stuff like cuttin' and scratchin' - after all "phonograph" breaks down to "Sound - writing" i.e. "phonetics of graphology..."

<http://www.dj-i-robot.com/>

sequencing and figuring out different permutations as core aspects of code is an archetypal situation at this point... Alan Sondheim is perhaps the equivalent of an MC for Nettime, but again, the field could and should be expanded at this point.

the idea here is to point out

- 1) multi-cultural variations in language (Stephen Pinker does a great job of describing "patois" and cultural change as linguistic variation in his "How the Mind Works") as a platform for figuring out how codes evolve out of linguistic systems
- 2) multi cultural takes on this are alot more fun... and the parties are alot better, and the music is alot better...
- 3) what next? Ken - how about a nick name - "Dj Oulipo" or something...

peace,
Paul

Thanks to Paul for his remarks, but i think, as they say, that i want to break it down...

>the problem with the digital media scene - it is SUPER
> WHITEBREAD - there is alot more going on....
Yes, but when it comes to entities like antiop or jodi, is it all that useful to pose things in this old identity-bound language?

>think about precedents for theater and spectacle outside of the >normal discourse that goes on...

Yes, but i don't quite have the freedom of movement that you do, Paul. As an artist, you can cut and mix in a way that one can't in scholarship. Its not the medium, its the genre.

>this is a McLuhan refraction of the old inner
> ear/eye thing, but with a little bit more of a technical twist. Always been skeptical about that aspect of McLuhan, but I think Ong is useful here. He talks of 'secondary orality', which is the orality that arises within a literate culture, but i think there is also now a 'secondary literacy', the literacy that arises within an electro-oral world....

> Artaud was the fellow who invented the term 'virtual reality' Oh really? Where? [scholar mode] "We must awaken the Gods that sleep in museums." Yes, Artaud is a good handle for understanding the global media event. My first book already covers all this.

> this in itself is one of the major developments of 20th
> century culture: the ability not just to accept the linguistic
> regulations of a situation (again, Debord meets Grand Master
> Flash...) - but to constantly change them. This is one of the major
> issues that Henry Louis Gates wrote about in his "Signifying
> Monkey" essay a long while ago
Yes, i once wrote an essay on Gates' signifying

monkey and Skooly D, who has a great rap about the monkey, the faggot and the fat-assed pimp. Needless to say i couldn't get it published...

> Alan Sondheim is
> perhaps the equivalent of an MC for Nettime
Alan posts to a lot of lists and does a lot of other stuff besides, so i don't think he would want anyone to see his stuff here as representative. But i think that's a nice take on it. Sondheim as an MC of sense, of affect, cutting and mixing the letter to that effect. Everything Alan does is a proposition about how to read.

>but again, the field
> could and should be expanded at this point.
Its your job to think like that, Paul, some of us have to work in a different kind of time. Its not about slow or fast, but about rhythms (all rhythms are the same speed as they all get you there in the end). Its about being untimely. Mixing past and present is another kind of mix. Blake and Integer. What is in that edit? I don't see it as invalidated by the other edits it passes over in silence.

> 1) multi-cultural variations in language
You're an American, Paul, to whom 'multicultural' means multi-racial. That's fine, but it is not the definition of multiplicity with

which the rest of
the world
necessarily
works. I'm not so
keen on the
compression of
difference
down to this
narrow plane so
as to squeeze it
into
American
bandwidth. The
celebration of
multiplicity
going on right
now is a
frightening
reminder of just
how
narrow
conceptions of
difference are in
the United States.

> multi cultural
takes on this are
alot more fun...
Well they would
be, but American
multiculturalism
isn't
much of a
multiplicity. I find
it tone-deaf to
'patois' that isn't
minted locally.
And look at the
basis on which
other kinds
of multiplicity are
annexed to its
needs: the
appropriation
of
postcolonialism,
the Black Atlantic
and so on. All well
and good, but in
the long run just
variations on the
self
image of America
in the world.

So: there's a
problem with the
multicultural
scene, its
SUPER-AMERICA
N. But, again, its
not a criticism of
you,
Paul, but just
indicative of the
difficulty of
working in this
place and time.
Its hard to see the
context, and how
the
context shapes
the discourse.

Thanks for the
urls, which i'm
looking at and
learning from.

cheers

[Nettime-bold] from hypertext to codework

From: Paul D. Miller

To: nettime-bold@nettime.org

Date: Mon, 24 Sep 2001 12:45:51
-0400

Hey Ken -

1) Artaud - relatively decent Artaud sites:

<http://www.hydra.umn.edu/artaud/ab.html>

<http://www.antoinartaud.org/home.html>

and the Artaud reference can be found in the "Theater and It's
Double" at the beginning of the section entitled "The Theater and its
Shadow"

around p.49 in the edition I have "la realite virtuelle" - 1938....
in the section called the "theater and it's shadow" or something like
that... the original context was that humans were inundated with life
as symbolic reality... both me and Erik Davis deal with this in our
respective writings on the topic.

2) There's plenty of room for figuring out how Walter Ong's ideas of
orality and text flow together, his book "Orality and Literacy: the
Technologizing of the Word" remains a pretty good glimpse into how
words became in a word "the noetic navigation of places" - but words
assign place and meaning on-line, but in the world of stuff like Amos
Tutuala or John Lee (the black hacker on the cover of Wired a long
time ago who was into the whole language as cipher-text etc etc his
crew was called "The Masters of Deception"), it'd be nifty to figure
out on how mantras etc etc fit into this too....

3) your idea that "everything Alan does is a proposition on how to
read..." - well, yep, but again, it's the permutations of the process
that make reading him interesting. Otherwise, no disrespect to Alan,
it'd be like listening to the same beat over and over and over...
even the linguistic origins of jazz (from the French verb "jazzier" -
which means to "have a dialog") - still pertains to what you spoke
about. Some of this relates basically as the "lowest common
denominator" kind of scenario to the "sequencing/spatializing" of the
word that Ong deals with, but again, there's plenty of stuff like
that in electronic music at this point... There's a couple of great
treatments of that topic in Robert Farris Thompson's classic "Flash
of the Spirit" ...

4) yep, I agree about mixing styles and genres... in academia, there
are rules and regulations about this kind of thing, but I have a
feeling the next generation of folks will all look at this kind of
thing as a video game or hypertext of a kind of collaborative
filtering or something... speaking of rules, I see that Mark Dery is
now an assistant (junior) professor of Journalism at NYU... ha! ha! -
god help the children who study under him... But uh... anyway... if
you still have that article around (the one on language and whatnot
with henry louis gates etc etc) we're still working on getting 21C
started up - I've been travelling alot, and that's slowed things
down.... Let me know if you'd be into re-publishing it or something.
I'm going to set up the web version of the magazine first and deal
with the print in a little bit (www.21cmagazine.com is up and
running, but again, there's only 24 hours in the day... I have a
decent amount of articles from various folks, but I need about two
weeks of down-time - which I'm taking in mid-October - to finalize
everything... more on that in a bit)

okay,

peace from Florida

Paul

ken,

this thread was still hanging around ... i want to take issue with your claim that the codework you reference is an example of collaborative, non-identity oriented practice.

>Codework makes of
>writing a media art that breaks with the fetishism of the text and the
>abstraction of language. It brings writing into contact with the other
>branches of media art, such as music and cinema, all of which are
>converging in the emerging space of multimedia, and which often have a
>richer conception of the politics of media art as a collaborative practice
>than has been the case with writing conceived within the prison-house of
>"text."

i fully respect your examples as artistic/literary practices, but in what way are jodi, mez, antioip/nn, sonndheim etc. representatives of open processes? jodi's work is good _because_ jo&di have the code under control, just as mez is an _author_ machine-aided, style-enhanced, yes, but an author, just as antioip/nn - the most collaborative entity in the series, i guess - poses as one; we all know they are several, but they exhibit a clear sense of ideological tightness and closure, the identities may be fictional, but i don't see that any of these breaks out of the identity shell. nn might be the best gamer, but its insults are too much for my stomach. [she'll call me a weak imbecile for this remark, won't you, dear!]

what you describe are machinic processes, yes, but the kinds of collaborative practices that heico idensen talks about (in the hypertext world mainly) - i don't see them in your codework examples. is artistic codework more authorial than open source programming?

greetings,
-a

**[Nettime-bold] Re: <nettime> from
hypertext to codework**
From: Alan Sondheim
To: nettime-bold@nettime.org
Date: Wed, 24 Oct 2001 17:49:03
-0400 (EDT)

There is collaboration in a number of ways. None of us (examples you give) operate or produce in a vacuum; my work often requires assistance or collaboration, to the extent that "my" becomes suspect. The identities I work with - "Nikuko" and others - are also disseminations across other practices (IRC, newsgroups, email lists, etc.) and others have also taken/used the name. There were also projects created for the trAce online writing group which were all collaborations in the traditional sense; one of them, Lost, is still running.

Then there is also a question of nettime: what I place on nettime (and this may be true of others you mention) is what nettime accepts; the collaborative dance/bodywork has no place or room here; this is also true for most of the directory material on the cdroms. An email is almost always signed, leaving its trace; it is a trail which almost literally hysterizes its identity function in the full header. And again, this affects, if not effects, what any of us are capable of doing in this medium.

Andreas writes,

>i fully respect your examples as artistic/literary practices, but in what
>way are jodi, mez, antiorp/nn, sondheim etc. >representatives of open
>processes?... what you describe are machinic processes, yes, but the kinds
>of collaborative practices that heico >densen talks about (in the
>hypertext world mainly) - i don't see them in your codework examples. is
>artistic codework more authorial than open source programming?

Well, isn't this a collaborative process, this discussion? Isn't
nettime "collaborative filtering"? There's some limitations in what
the examples given might uphold. Its not as if everything is in
the text. I'm more interested in a new way of thinking about the
practice of writing.

Semiotics and structural linguistics have a lot to answer for. They
created a concept of language as a homogenous plane, which then
entered into relations with the world as something external.

What's interesting about Guattari is the anti-linguistics in which
one thinks of the speech act as an element in a heterogeneous,
temporal series. It seems to me timely to think of some of the new
writing practices in those terms.

Hypertext had its roots firmly in a (post)structural linguistics,
and it shows in the early works composed under its sign. All the
action is in the 'text'. There's not a lot of thought about
the heterogeneous assemblages into which it might enter.

I would present as an example of this is the extension of my piece
timeascolor by Brad Borevitz earlier this year.

<http://userpages.umbc.edu/~cottot/timeascolor.html>
<http://www.onetwothree.net/art/somethingelse/>

what i see as interesting in (client-side) net.art is that the text
and visuals of the artist are sent simultaneously and are inseparable from
the perspective of the viewer, possibly in the same way sasseure
visualized signified/signifier/sign as a card with two sides. very
different than seeing a painting and then reading the artist's sketchbook?

I have a short paper that extends this idea - email me personally if you
would like to read it.

Are people still interested in ART on this list?
Perhaps they are...

Software Art After Programming

Richard Wright, April 2004.

First published in MUTE magazine, no. 28, Autumn 2004.
<http://www.metamute.com/look/article.tpl?IdLanguage=3D1&IdPublication=3D1&NrIssue=3D2&NrSection=3D10&NrArticle=3D1397>

The history of computing in arts practice is littered with the mental =
debris of its half-forgotten debates, unresolved problems and anxieties, =
and questions that have now become as obsolete as the Commodore 64s and =
VAX mainframes that accompanied them. Who can remember the art and =
technology projects of the sixties when the question of 'Can the =
computer make art?' allowed a generation of isolated computer artists to =
position themselves as a team of intrepid explorers setting out to cross =
a new continent without first waiting to find out whether it could =
support life. Under what conditions was the question ever first =
considered worthy of posing in the first place? Did the computer offer =
input into specific art issues, such as arts relation to other forms of =
scientific knowledge, to language, representation or the abandonment of =
the object? Or was it just intuitively realised that 'computer art' was =
at the forefront of a slow, inexorable computerisation of twentieth =
century society which would eventually demand access to every facet of =
human culture?

As computer hardware and the programming skills needed to operate it =
became more accessible, the question 'Can the computer make art?' was =
asked less and less often. By the beginning of the '80s artists were =
using the first personal computers to produce more varied kinds of work =
until, with all this activity growing, the question of whether art was =
possible on a computer lost all sense. There was a moment when the =
parameters of the question were redrawn, from 'Can the computer make =
art?' to 'Can a computer be an artist?', redirecting it into issues of =
simulated creativity and artificial intelligence. It was at this point =
that the first cracks of a coming schism in the community of computer =
artists became noticeable; this would go on to form the next stage in =
the debate. It seemed to a growing number of artists that as the =
complexity of software increased, so many new possibilities for the =
human artist were appearing that the prospect of deferring to a machine =
artist seemed almost indicative of a lack of imagination.

Although the computer seemed to have made its case as a machine of =
creative potential, there now emerged the question of how to efficiently =
leverage all this creativity. By the late eighties, the interactive =
interfaces and simplified menu commands of personal desktop systems that =
had helped to cause this ground swell of activity had firmly refocused =
questions on the artists themselves. Were the pre-packaged functions, =
options and parameters of the new art applications sufficient to cover =
all artistic fields of inquiry, all aesthetic nuances, all personal =
idioms? Or would it always be necessary to have recourse to the =
precision and particularities of programming languages in order to =
ensure that no desire was left uncatereed for? 'Do artists need to =
program?' became the burning question at SIGGRAPH panel sessions and =
electronic art festivals.

To some extent this divergence between programmers and program users =
masked the fact that they had become two sides of the same coin. As the =
argument went, the artist-programmer would regard 'software not as a =
functional tool on which the "real" artwork is based, but software as =
the material of artistic creation', as the Transmediale Software Art =
jury statement would phrase it much later in 2002. On the other hand, =
for program users, programming was only ever a means to an end. Yet it =
was their fixation on this end that hastened their acquiescence to the =
means of their programs and the reconfiguration of their practice by =
programmers. 'Is the computer a medium or a tool?' Yes, it was true that =

some artists were only interested in software 'tools' that were totally =
subservient to their subjectivity, but it was a subjectivity that was =
now mapped onto minutely variable parameter lists and option check =
boxes, mirroring the remoteness of the artist's precious and peculiar =
visions by burying its origins deep within the recesses of multiple menu =
layers. Aided by the runaway success of packages like Amiga's Deluxe =
Paint, Adobe Illustrator and Photoshop, software manufacturers were =
redefining the creative process as a decision making process converging =
towards a predetermined ideal goal.=20

The problem was also attacked from the opposite direction by a top-down =
system design employing pre-sets, wizards, helpers, macros and plug-ins =
that pre-empted the creative process by offering a one button solution =
to achieve those essential lens flares, ripples, rollovers and drop =
shadow effects. The users of programs now found themselves programmed by =
their very own favourite artistic effects, expressed as a suite of easy =
to use software extensions. In the end, both artist programmers and =
artist program users produced artwork that was about the software that =
had produced it. Both became caught up in a wider move to rewrite =
society in terms of information processing.

By the early '80s the artist Harold Cohen had developed software to =
automate his own personal artistic style. A former successful gallery =
painter, Cohen still works on a suite of artificial intelligence =
programs called AARON that seek to encode his earlier painting practice. =
Cohen had always insisted that the content of his work was the software =
itself, and always exhibited the entire process in the form of a live =
computer connected up to a mobile painting device or 'turtle' that would =
scuttle over his canvases. As he told his students, 'Don't ask what you =
can do with the software, ask what the software can do.' But Cohen's =
work now seems to function more as evidence of a historical transition =
that occurred over his working life and reached its culmination during the =
'90s. While we have been watching Cohen's computer prove it can =
recreate art, other computers have been recreating our whole society in =
their own image. But this new image is not the image of the expressive =
subject that is simulated in Cohen's work. It is the image of the =
subject as a node, a switching station for providing feedback to =
calibrate the central processing system, the individual's expressive =
utterances only called upon to ensure their movements are correctly =
synchronised. The artist programmer of today exists in relation to a =
whole culture that has the computer as its central organising =
technology. The pervasive quality of software culture and the resultant =
normalisation of computer use have made it impossible to maintain the =
conceptual categories that underpinned previous debates. In a world =
where artists use software to write software that will be seen by virtue =
of other software, questions about the 'aesthetics of the code' become a =
symptom of not being able to see the wood for the trees. Programming is =
not only the material of artistic creation, it is the context of =
artistic creation. Programming has become software.

One interesting example of the end game of the debate on 'Computer Art' =
is a piece of artist's software called Auto-Illustrator. Written by =
Adrian Ward around the year 2000, Auto-Illustrator was the prize winner =
of the first competition for Software Art organised by Berlin's =
Transmediale media art festival in 2001. Ward describes the work as a =
parody of commercial art and design packages like Adobe Illustrator, =
specifically of their pretensions to provide functionality and user =
control. In contrast, Ward fills his package with 'generative art' tools =
that explicitly try to automate the drawing process. The appearance of =
Auto-Illustrator when running is much like a typical menu driven art and =
design package with the exception that the tool palette and effects =
filters incorporate generative algorithms. For instance, the Pencil tool =
adds wiggles or sweeps to your strokes, while the Oval tool will use =
settings like 'childish' or 'adult' to control a sprinkling of little =
faces. Some tools like Brush seem entirely random in operation, while =
some filters like 'Instant Mute Design' will reproduce an entire =
iconography designed to appeal to the Digerati generation.=20

In fact, many of these generative techniques are strikingly reminiscent =
of various experiments in computer art from over the last thirty years. =
The line tools generate scribbles using algorithms almost certainly =
related to the stochastic perturbations of Frieder Nake or Peter Beyls =
while the 'bug' tool roves around the screen using the same principles =
as Harold Cohen's turtle graphics engine. Even the icons of the 'Instant =
Mute Design' effect are almost identical to Edward Zajec's permutations =
of cubic modules. In this way, Auto-Illustrator is like a compendium of =
classic computer art programs but now presented as a list of menu =
options with conveniently editable parameters. Presented in this =
context, the individual aesthetics of each of these venerable pioneering =
practices are erased, leaving us with more of a confusion of =
idiosyncratic styles. From this viewpoint, Auto-Illustrator's =
'generative tools' actually pastiche the chaotic 'feature mountain' of =
bloated modern software systems, as they are commonly disorganised by =
the superabundance of toolbars, drop-down lists and floating inspectors. =
Instead of defining a drawing function, it might have been more relevant =

for Ward to have his 'bug' tunnelling into the dizzying depths of =
cascading sub-menus and option boxes to find that single cherished =
function with which the user nurtures their unique individual style. =
Ward actually states that wider issues such as interface design are of =
no interest to him and describes 'consumer-based application software' =
as his chosen medium. Auto-Illustrator is successful in its intention to =
parody the functionality-as-expression of mainstream software design, =
but only at the level of coding. By not addressing the wider user =
experience it is unable to think outside of the window box in which this =
functionality is now defined.

Since Auto-Illustrator's release there has been at least one attempt to =
account for a contemporary digital aesthetic with reference to the =
design of a family of software packages and related technologies. In =
2002 the theorist Lev Manovich published 'Generation Flash', an essay in =
which he tried to characterise a then prevalent cultural sensibility. =
Manovich referred to the prevailing visual style of Flash, Shockwave and =
Java based multimedia as 'soft modernism', a reaction against the =
clutter of postmodern eclecticism that returns to an elemental =
'rationality of software'. Aesthetic motifs are defined by Manovich in =
terms of technologically motivated processes: instead of appropriation =
we simply have the sample, a basic operation in the new mode of cultural =
production. Another cultural building block is the network, and =
therefore also one of the terms of a new critical language. These =
operations (networking, sampling) are applied in new modes of expression =
like data visualisation. This can be seen, for instance, in =
Futurefarmer's They Rule project in which the directors of the USA's top =
corporations are cross referenced to purportedly reveal a web-like =
pattern of interrelated allegiances. For Manovich this kind of work =
replaces older forms of authored representation by giving us the tools =
to objectively analyse raw data and deduce the necessary conclusions.

Although Manovich's detailed analysis of the structural basis of new =
media adds an absolutely essential dimension to new critical tools, the =
approach risks being interpreted as a form of technological determinism =
once we lose sight of a specifically cultural perspective. For example, =
our understanding of the workings of the corporate world order do not =
arise automatically out of its most common data visualisations, such as =
the stock market fluctuations diagrammatically portrayed on the =
Financial Times website. Not all visualisations are equal. At one point =
Manovich argues that the 'neo-minimalism' of the Flash style arises =
quite naturally from the practice of programming - the pixel thin grid =
lines, restricted colour palettes, abstracted symbols 'ALWAYS happens =
when people begin to generate graphics through programming and discover =
that they can use simple equations, etc' (Manovich's emphasis). This is =
indeed the case where programming is taught within a certain computer =
science tradition, but it is now impossible to discount the influence of =
scripting environments such as Flash. Not all programming practices are =
equal.

Other discussions of Flash have merely tended to shift the technological =
focus, such as whether the limited bandwidth of the web was the most =
significant reason for the linear aesthetic of vector graphics. At other =
times it moved on to question the 'openness' of the Flash graphics =
standard, whether Macromedia would ultimately allow programmers to =
leverage the full potential of its functionality. However, the =
'functionality', 'rationality' or 'potential' of software will always be =
strictly unknown. It is the 'user experience' of software, the values =
generated by the way it is meant to be used, how it gives shape to a =
practice, how easily a technical 'potential' can be perceived and =
engaged with that should form the basis of software critique. It is =
possible to trace many formative influences on the Flash style not to =
the code itself, but to the conditions in which it is written. =
Programming is now often practised in the form of 'scripting' languages =
that are integrated into mainstream art and design software =
applications. This makes artist programmers and program users both =
subject to the same philosophies of system design that hold sway in =
point-and-click style desktop packages. By examining these environments =
we can find many ways in which they funnelled Flash Actionscript or =
Director Lingo programming practice into nourishing certain wider =
cultural sensibilities during this period.

Multimedia scripting languages like Flash Actionscript tend to differ =
from conventional programming languages by offering access to a library =
of functions that are specific to that particular multimedia =
application. This easy access to a set of predefined 'events' such as =
mouse clicks, drag actions and rollovers is somewhat analogous to the =
way a software user's practice is structured in terms of the predefined =
configuration of menu commands, option boxes and plug-in effects. These =
library functions that populate the programmers imagination with a =
readymade vocabulary of discrete interactive 'behaviours' can be coded =
up and attached to individual multimedia objects - button triggers, =
sprite actions, sound effects, linkages, etc. Actionscript therefore =
tended to differ from typical program development environments by =
identifying code with graphical and other concrete entities that would =

become principle actors in the interactive scenario. This also tended to = discourage the writing of long passages of control logic and instead led = to the writing of terse mathematical expressions to manipulate an = object's properties, movements and relationships to other objects. When = combined with the instancing abilities of the Object Orientated = Programming philosophy, Actionscript became very efficient at applying = these code segments to multiple copies of 'semi-automated' graphic = elements, sprites, movie clips and sounds. As implemented in multimedia = authoring software like Flash, Object Orientated Programming actually = fostered an 'object orientated' approach to interactive art and = animation.

The point here is to look at Flash at the moment at which its patterns = of techniques and processes re-emerge as motifs that can enter = consciousness and practice on an aesthetic level. To start with we have = an authoring system that orientated the user towards the replication (or = 'birthing') of multitudes of objects and orchestrating complex yet = concise interactions between them. It is even possible to identify the = most common form of mathematical expression that was used to regulate = this interaction during the millennial Flash period. There is a single = line of code that appears over and over again, a simplified expression = that produces a distinctive dampening effect on a moving object before = it finally comes to rest. It was easy for Flash users to apply this = expression to any or all of ones objects and events until it produced = the classic Flash 'wobble'. A Flash site became a constellation of = rippling, bobbing, trembling buttons, icons, eyeballs, legs and rollover = items as if someone had poured a bucket of water into your computer = monitor. In the open source spirit, the Flash community ensured that = such expressions were quickly disseminated until they became an almost = universal kinetic attribute.

The Flash style was integrated, via its web browser plug-in, to other = desktop based work and leisure patterns of activity. By keying into the = internet gold rush fever, Flash art was turned into a highly visible = design component of the dotcom boom era. This new informal space imbued = Flash art with the role of a distraction, a demo or toy, making any more = demanding appreciation of its fluid stylistic and tactile qualities = unnecessary. The net culture of the time also provided a preexisting = discourse in which it's visual aesthetic could be interpreted and = flourish. Echoing the ubiquitous net-cultural meme of the 'digital Gaia' = - an ecological interpretation of the web of globally interconnected and = independent agents - foremost Flash designer Joshua Davis commented: = 'our work should reflect the nature of a fern and be comprised of tiny = little objects that all talk to each other. The more we add these little = objects, the more complex and intense the nature of our work becomes.' = 20

There are many more factors that could be marshalled to 'explain' the = Flash style. But as far as practising artists are concerned, how can we = get a handle on such a deluge of widely different factors, some of which = seek to align us with a particular model of subjectivity and others = which just seem like arbitrary collections of protocols? How can we = forge a path through layer after layer of designed information to form = ways of working not pre-empted by the predicates of current software = culture?

There are some emerging ideas that might help. One of these is the = 'techno-aesthetic' - different motifs that permeate these technological, = social and cultural levels. The idea is rooted in materialist notions of = social process, but a society now constituted through IT. The emphasis = is on how specifically cultural forces can form technology into a means = of expression that is able to exceed its most obvious properties and = structures. One software art example of this in action is Mongrel's = often-cited Linker project of 1999. Developed to support a series of = story telling workshops for the non-expert computer user, the software = is a highly stripped down system that simply allows users to load and = make connections between a collection of digital elements - images, = text, video, sounds. For a start, this transfers an emphasis on the = practice of the software to the practice of the user. Compared to the = other examples, Linker coheres around a figure that unites its levels of = thought and construction yet retains an open space in which imagination = can breathe. As theorist Matthew Fuller described Linker, 'It relies on = the simple function of doing exactly what the name says it does - link = things. Here, the poetics of connection forms a techno-aesthetic and = existential a priori to the construction of a piece of software.' This = aesthetic is made explicit when the software is first launched - it = displays a map image of its three by three grid of interconnected = regions. Linker is constructed around this image of itself that = communicates and instantiates its underlying algorithmic structure, = creative use and conceptual model. It is this figuration of itself as an = idea that makes Linker art as well as software.

The debate about Linker was unfortunately always limited to its mode of = production and the social constituency of its intended user group as = though it had been designed as a tool of social engineering, ready to = arise fully formed out of a sub-menu check-box list of community =

'needs'. But discussions of DIY empowerment, Open Source and the = 'sociability' of software are presumptuous without any attention to the = context in which imaginative ideas can grow. When we look at the kinds = of applications that have actually resulted from Linux we simply see = copies of standard Microsoft functionality. The Open Source model of = production is a dead end without an equivalent 'model of creativity', = defaulting instead to a wannabe culture. Instead we should look for = inspiration in practices that could nourish a poetics of data = 'copyability' such as plagiarism and detournement, as noted by writer = Josephine Berry. But unfortunately free software developers do not = prioritise this aesthetic context which is what has the power to = determine whether software will enable or restrain its user's = perceptions and mode of action. = 20

It is not a matter of the different technical abilities of software or = of how much it costs, but of how easily a technical potential can be = perceived by the user in a way that motivates engagement. When software = is written, choices must be made about which data fields carry value, = how the display of information forms contours of meaning, how the = modelling of the interface moulds the subjectivity of the user. The = question of whether artists should learn to program is replaced by the = question of what kind of programming. Which programming practice has the = most 'open aesthetic', capable of making software that is not just the = product of an arbitrary confluence of techniques or a slavish mimicry = but is aware of all its possible formative cultural and philosophical = categories and values.

For the first generation of artist programmers there was hardly any = information society in existence, certainly not one within reach. In the = early eighties during a period when the launch of the personal computer = marked a radical shift in computer culture, artist Harold Cohen stressed = the importance of asking the right questions. Now that we live in a = world in which his AARON program is downloadable as a screen saver it is = time for us to extend his question - 'Don't ask what the software can = do, ask what it can do to other software.'

How We Made Our Own "Carnivore"
By RSG

"Disobedience to authority is one of the most natural and
healthy acts."
--Empire, Hardt & Negri

Ethernet was invented at the University of Hawaii. Scientists there in
the early 1970s faced a unique problem: How to network different
campuses, each on different islands separated by water. The solution was
to use the free airwaves, to transmit data through the air, or "ether,"
using radio. There were no wires. Like a radio station, each node sent
messages broadly over the sea to other islands. A protocol was developed
to avoid collision between simultaneous communications. Ever since,
Ethernet has been based on an open transmission model. The protocol
translated well to wire-based networks too, and is now the most widely
used local networking protocol in the world.

Since Ethernet is based on an open broadcast model, it is trivial for
listeners to make themselves 'promiscuous' and eavesdrop on all
communications, not simply those specifically addressed to them. This
technique is called packet-sniffing and has been used by systems

administrators and hackers alike for decades. Ethernet, sniffers, and hacking are at heart of a public domain surveillance suite called Carnivore (<http://rhizome.org/carnivore>) developed by RSG and now used in a civilian context by many artists and scientists around the world.

Hacking

Today there are generally two things said about hackers. They are either terrorists or libertarians. Historically the word meant an amateur tinkerer, an autodidact who might try a dozen solutions to a problem before eking out success.^[1] Aptitude and perseverance have always eclipsed rote knowledge in the hacking community. Hackers are the type of technophiles you like to have around in a pinch, for given enough time they generally can crack any problem (or at least find a suitable kludge). Thus, as Bruce Sterling writes, the term hacker "can signify the free-wheeling intellectual exploration of the highest and deepest potential of computer systems."^[2] Or as the glowing Steven Levy reminisces of the original MIT hackers of the early sixties, "they were such fascinating people. [...] Beneath their often unimposing exteriors, they were adventurers, visionaries, risk-takers, artists...and the ones who most clearly saw why the computer was a truly revolutionary tool."^[3] These types of hackers are freedom fighters, living by the dictum that data wants to be free.^[4] Information should not be owned, and even if it is, non-invasive browsing of such information hurts no one. After all, hackers merely exploit preexisting holes made by clumsily constructed code.^[5] And wouldn't the revelation of such holes actually improve data security for everyone involved?

Yet after a combination of public technophobia and aggressive government legislation, the identity of the hacker changed in the US in the mid to late eighties from do-it-yourself hobbyist to digital outlaw.^[6] Such legislation includes the Computer Fraud and Abuse Act of 1986 which made it a felony to break into federal computers. "On March 5, 1986," reported *Knight Lightning* of Phrack magazine, "the following seven phreaks were arrested in what has come to be known as the first computer crime 'sting' operation. Captain Hacker \ Doctor Bob \ Lasertech \ The Adventurer \ The Highwayman \ The Punisher \ The Warden."^[7] "[O]n Tuesday, July 21, 1987," *Knight Lightning* continued, "[a]mong 30-40 others, Bill From RNOG, Eric NYC, Solid State, Oryan QUEST, Mark Gerardo, The Rebel, and Delta-Master have been busted by the United States Secret Service."^[8] Many of these hackers were targeted due to their "elite" reputations, a status granted only to top hackers. Hackers were deeply discouraged by their newfound identity as outlaws, as exemplified in the famous 1986 hacker manifesto written by someone calling himself [9] The Mentor: "We explore... and you call us criminals. We seek after knowledge... and you call us criminals."^[10] Because of this semantic transformation, hackers today are commonly referred to as terrorists, nary-do-wells who break into computers for personal gain. So by the turn of the millennium, the term hacker had lost all of its original meaning. Now when people say hacker, they mean terrorist.

Thus, the current debate on hackers is helplessly throttled by the discourse on contemporary liberalism: should we respect data as private property, or should we cultivate individual freedom and leave computer users well enough alone? Hacking is more sophisticated than that. It suggests a future type of cultural production, one that RSG seeks to embody in Carnivore.

Collaboration

Bruce Sterling writes that the late Twentieth Century is a moment of transformation from a modern control paradigm based on centralization and hierarchy to a postmodern one based on flexibility and horizontalization:

"For years now, economists and management theorists have speculated that the tidal wave of the information revolution would destroy rigid, pyramidal bureaucracies, where everything is top-down and centrally controlled. Highly trained 'employees' would take on greater autonomy, being self-starting and self-motivating, moving from place to place, task to task, with great speed and fluidity. 'Ad-hocracy' would rule, with groups of people spontaneously knitting together across organizational lines, tackling the problem at hand, applying intense computer-aided expertise to it, and then vanishing whence they came."^[11]

From Manuel Castells to Hakim Bey to Tom Peters this rhetoric has become commonplace. Sterling continues by claiming that both hacker groups and the law enforcement officials that track hackers follow this new paradigm: "they all look and act like 'tiger teams' or 'users' groups.' They are all electronic ad-hocracies leaping up spontaneously to attempt to meet a need."^[12] By "tiger teams" Sterling refers to the employee groups assembled by computer companies trying to test the security of their computer systems. Tiger teams, in essence, simulate potential hacker attacks, hoping to find and repair security holes. RSG is a type

of tiger team.

The term also alludes to the management style known as Toyotism originating in Japanese automotive production facilities. Within Toyotism, small pods of workers mass together to solve a specific problem. The pods are not linear and fixed like the more traditional assembly line, but rather are flexible and reconfigurable depending on whatever problem might be posed to them.

Management expert Tom Peters notes that the most successful contemporary corporations use these types of tiger teams, eliminating traditional hierarchy within the organizational structure. Documenting the management consulting agency McKinsey & Company, Peters writes: "McKinsey is a huge company. Customers respect it. [...] But there is no traditional hierarchy. There are no organizational charts. No job descriptions. No policy manuals. No rules about managing client engagements. [...] And yet all these things are well understood-make no mistake, McKinsey is not out of control! [...] McKinsey works. It's worked for over half a century."^[13]

As Sterling suggests, the hacker community also follows this organizational style. Hackers are autonomous agents that can mass together in small groups to attack specific problems. As the influential hacker magazine Phrack was keen to point out, "ANYONE can write for Phrack Inc. [...] we do not discriminate against anyone for any reason."^[14] Flexible and versatile, the hacker pod will often dissolve itself as quickly as it formed and disappear into the network. Thus, what Sterling and others are arguing is that whereby older resistive forces were engaged with "rigid, pyramidal bureaucracies," hackers embody a different organizational management style (one that might be called "protocological"). In this sense, while resistance during the modern age forms around rigid hierarchies and bureaucratic power structures, resistance during the postmodern age forms around the protocological control forces existent in networks.

Coding

In 1967 the artist Sol LeWitt outlined his definition of conceptual art:

"In conceptual art the idea or concept is the most important aspect of the work. When an artist uses a conceptual form of art, it means that all of the planning and decisions are made beforehand and the execution is a perfunctory affair. The idea becomes a machine that makes the art."^[15]

LeWitt's perspective on conceptual art has important implications for code, for in his estimation conceptual art is nothing but a type of code for artmaking. LeWitt's art is an algorithmic process. The algorithm is prepared in advance, and then later executed by the artist (or another artist, for that matter). Code thus purports to be multidimensional. Code draws a line between what is material and what is active, in essence saying that writing (hardware) cannot do anything, but must be transformed into code (software) to be affective. Northrop Frye says a very similar thing about language when he writes that the process of literary critique essentially creates a meta text, outside of the original source material, that contains the critic's interpretations of that text.^[16] In fact Kittler defines software itself as precisely that "logical abstraction" that exists in the negative space between people and the hardware they use.^[17]

How can code be so different than mere writing? The answer to this lies in the unique nature of computer code. It lies not in the fact that code is sub-linguistic, but rather that it is hyper-linguistic. Code is a language, but a very special kind of language. Code is the only language that is executable. As Kittler has pointed out, "[c]here exists no word in any ordinary language which does what it says. No description of a machine sets the machine into motion."^[18] So code is the first language that actually does what it says-it is a machine for converting meaning into action.^[19] Code has a semantic meaning, but it also has an enactment of meaning. Thus, while natural languages such as English or Latin only have a legible state, code has both a legible state and an executable state. In this way, code is the summation of language plus an executable meta-layer that encapsulates that language.

Dreaming

Fredric Jameson said somewhere that one of the most difficult things to do under contemporary capitalism is to envision utopia. This is precisely why dreaming is important. Deciding (and often struggling) for what is possible is the first step for a utopian vision based in our desires, based in what we want.

Pierre Lévy is one writer who has been able to articulate eloquently the possibility of utopia in the cyberspace of digital computers.^[20] "Cyberspace," he writes, "brings with it methods of perception, feeling,

remembering, working, of playing and being together. [...] The development of cyberspace [...] is one of the principle aesthetic and political challenges of the coming century." [21] Levy's visionary tone is exactly what Jameson warns is lacking in much contemporary discourse. The relationship between utopia and possibility is a close one. It is necessary to know what one wants, to know what is possible to want, before a true utopia may be envisioned.

Once of the most important signs of this utopian instinct is the hacking community's anti-commercial bent. Software products have long been developed and released into the public domain, with seemingly no profit motive on the side of the authors, simply for the higher glory of the code itself. "Spacewar was not sold," Steven Levy writes, referring to the early video game developed by several early computer enthusiasts at MIT. "Like any other program, it was placed in the drawer for anyone to access, look at, and rewrite as they saw fit." [22] The limits of personal behavior become the limits of possibility to the hacker. Thus, it is obvious to the hacker that one's personal investment in a specific piece of code can do nothing but hinder that code's overall development. "Sharing of software [...] is as old as computers," writes free software guru Richard Stallman, "just as sharing of recipes is as old as cooking." [23] Code does not reach its apotheosis for people, but exists within its own dimension of perfection. The hacker feels obligated to remove all impediments, all inefficiencies that might stunt this quasi-aesthetic growth. "In its basic assembly structure," writes Andrew Ross, "information technology involves processing, copying, replication, and simulation, and therefore does not recognize the concept of private information property." [24] Commercial ownership of software is the primary impediment hated by all hackers because it means that code is limited-limited by intellectual property laws, limited by the profit motive, limited by corporate "lamers."

However, greater than this anti-commercialism is a pro-protocolism. Protocol, by definition, is "open source," the term given to a technology that makes public the source code used in its creation. That is to say, protocol is nothing but an elaborate instruction list of how a given technology should work, from the inside out, from the top to the bottom, as exemplified in the RFCs, or "Request For Comments" documents. While many closed source technologies may appear to be protocolicall due to their often monopolistic position in the market place, a true protocol cannot be closed or proprietary. It must be paraded into full view before all, and agreed to by all. It benefits over time through its own technological development in the public sphere. It must exist as pure, transparent code (or a pure description of how to fashion code). If technology is proprietary it ceases to be protocolicall.

This brings us back to Carnivore, and the desire to release a public domain version of a notorious surveillance tool thus far only available to government operatives. The RSG Carnivore levels the playing field, recasting art and culture as a scene of multilateral conflict rather than unilateral domination. It opens the system up for collaboration within and between client artists. It uses code to engulf and modify the original FBI apparatus.

Carnivore Personal Edition

On October 1, 2001, three weeks after the 9/11 attacks in the US, the Radical Software Group (RSG) announced the release of Carnivore, a public domain riff on the notorious FBI software called DCS1000 (which is commonly referred to by its nickname "Carnivore"). While the FBI software had already been in existence for some time, and likewise RSG had been developing it's version of the software since January 2001, 9/11 brought on a crush of new surveillance activity. Rumors surfaced that the FBI was installing Carnivore willy-nilly on broad civilian networks like Hotmail and AOL with the expressed purpose of intercepting terror-related communication. As Wired News reported on September 12, 2001, "An administrator at one major network service provider said that FBI agents showed up at his workplace on [September 11] 'with a couple of Carnivores, requesting permission to place them in our core.'" Officials at Hotmail were reported to have been "cooperating" with FBI monitoring requests. Inspired by this activity, the RSG's Carnivore sought to pick up where the FBI left off, to bring this technology into the hands of the general public for greater surveillance saturation within culture. The first RSG Carnivore ran on Linux. An open source schematic was posted on the net for others to build their own boxes. New functionality was added to improve on the FBI-developed technology (which in reality was a dumbed-down version of tools systems administrators had been using for years). An initial core (Alex Galloway, Mark Napier, Mark Daggett, Joshua Davis, and others) began to build interpretive interfaces. A testing venue was selected: the private offices of Rhizome.org at 115 Mercer Street in New York City, only 30 blocks from Ground Zero. This space was out-of-bounds to the FBI, but open to RSG.

The initial testing proved successful and led to more field-testing at

the Princeton Art Museum (where Carnivore was quarantined like a virus into its own subnet) and the New Museum in New York. During the weekend of February 1st 2002, Carnivore was used at Eyebeam to supervise the hacktivists protesting the gathering of the World Economic Forum.

Sensing the market limitations of a Linux-only software product, RSG released Carnivore Personal Edition (PE) for Windows on April 6, 2002. CarnivorePE brought a new distributed architecture to the Carnivore initiative by giving any PC user the ability to analyze and diagnose the traffic from his or her own network. Any artist or scientist could now use CarnivorePE as a surveillance engine to power his or her own interpretive "Client." Soon Carnivore Clients were converting network traffic to sound, animation, and even 3D worlds, distributing the technology across the network.

The prospect of reverse-engineering the original FBI software was uninteresting to RSG. Crippled by legal and ethical limitations, the FBI software needed improvement not emulation. Thus CarnivorePE features exciting new functionality including artist-made diagnostic clients, remote access, full subject targetting, full data targetting, volume buffering, transport protocol filtering, and an open source software license. Reverse-engineering is not necessarily a simple mimetic process, but a mental upgrade as well. RSG has no desire to copy the FBI software and its many shortcomings. Instead, RSG longs to inject progressive politics back into a fundamentally destabilizing and transformative technology, packet sniffing. Our goal is to invent a new use for data surveillance that breaks out of the hero/terrorist dilemma and instead dreams about a future use for networked data.

<http://rhizome.org/carnivore/>

[1] Robert Graham traces the etymology of the term to the sport of golf: "The word 'hacker' started out in the 14th century to mean somebody who was inexperienced or unskilled at a particular activity (such as a golf hacker). In the 1970s, the word 'hacker' was used by computer enthusiasts to refer to themselves. This reflected the way enthusiasts approach computers: they eschew formal education and play around with the computer until they can get it to work. [In much the same way, a golf hacker keeps hacking at the golf ball until they get it in the hole]" (<http://www.robertgraham.com/pubs/hacking-dict.html>).

[2] Bruce Sterling *The Hacker Crackdown* (New York: Bantam, 1992), p. 51. See also Hugo Cornwall's *Hacker's Handbook* (London: Century, 1988), which characterizes the hacker as a benign explorer. Cornwall's position highlights the differing attitudes between the US and Europe, where hacking is much less criminalized and in many cases *prima facie* legal.

[3] Steven Levy, *Hackers: Heroes of the Computer Revolution* (New York: Anchor Press/Doubleday, 1984), p. ix.

[4] This slogan is attributed to Stewart Brand, who wrote that "[o]n the one hand information wants to be expensive, because it's so valuable. The right information in the right place just changes your life. On the other hand, information wants to be free, because the cost of getting it out is getting lower and lower all the time. So you have these two fighting against each other." See *Whole Earth Review*, May 1985, p. 49.

[5] Many hackers believe that commercial software products are less carefully crafted and therefore more prone to exploits. Perhaps the most infamous example of such an exploit, one which critiques software's growing commercialization, is the "BackOrifice" software application created by the hacker group Cult of the Dead Cow. A satire of Microsoft's "Back Office" software suite, BackOrifice acts as a Trojan Horse to allow remote access to personal computers running Microsoft's Windows operating system.

[6] For an excellent historical analysis of this transformation see Sterling's *The Hacker Crackdown*. Andrew Ross explains this transformation by citing, as do Sterling and others, the increase of computer viruses in the late eighties, especially "the viral attack engineered in November 1988 by Cornell University hacker Robert Morris on the national network system Internet. [...] While it caused little in the way of data damage [...], the ramifications of the Internet virus have helped to generate a moral panic that has all but transformed everyday 'computer culture.'" See Andrew Ross, *Strange Weather: Culture, Science, and Technology in the Age of Limits* (New York: Verso, 1991), p. 75.

Nonsense.

I fart in your general direction with indignation.

Facts:

1970 - N. Abramson at the University of Hawaii designed ALOHA, ground based radio packet network.

1972 Roberts, also of UoH, improved the bandwidth by using time slots - "Slotted ALOHA".

1976 - Metcalfe and Boggs of Xerox PARC (Palo Alto, CA) published a description of a coaxial cable network, Ethernet.

true, Metcalfe and Boggs's invention was called "Ethernet," but by attributing Ethernet to them, you will miss why Ethernet was designed the way it was. all the important innovations were Abramson's, particularly his solution to the problem of packet collision. sourcing the Ethernet technology in radio also explains why it is based on an open broadcast model and hence can be sniffed.

Metcalfe & Boggs even cite Abramson's work in the introduction to their 1976 paper: "The Aloha Network at the University of Hawaii was originally developed to apply packet radio techniques for communication between a central computer and its terminals scattered among the Hawaiian Islands..." (<http://www.acm.org/classics/apr96/>)

This is a bit off nettime topic ... it can be claimed for any bit moving protocol that it descended from a previous older one. Technology learns from it's history. I could enumerate tens of differences between ethernet and Aloha - - whoever is interested in this should peek in, say, Tannenbaum's Computer Networks. I could also prove that ATM is based on switched ethernet. Or Sonet. And that ethernet itself is, in fact, morse telegraph code with immaterial improvements.

So it's a matter of quantities and shades.

But no one today confuses ATM with ethernet and this is the first time I've heard that Aloha and ethernet are essentially the same.

> think before you fart.

Au contraire, it was carefully premeditated.

dear RSG,

>How We Made Our Own "Carnivore"

although sympathetic to the exercise in general, it is difficult to understand why in this new text posted on the discussion forum *nettime* (apparently written for the ars electronica book, given the rhetoric) you address neither the critique of 'screen saver art' that has been raised against the program's clients, nor discuss the technical analysis offered by the Moscow-jury which, from what i understand as a techno-idiot and reading against the grain, basically says that your Carnivore program offers nothing new under the sun?!

given the self-acclamation of your text, it would be interesting if you also were to engage the criticism.

best regards,
- a

CARNIVORE by RSG http://www.macros-center.ru/read_me/now/7/

Bosses currently use all kinds of elaborate software to spy on their workers. Products like MailCensor (<http://www.mailcensor.com>) encourage bosses to check for "unauthorized transmission of Email containing confidential data" and "provide a safe and productive work environment for employees, by filtering out offensive/inappropriate email from the Internet."

On some networks, software can be installed by users to spy on their bosses as well. Packet sniffers, used by systems administrators to diagnose network problems, can often be used or modified to do just that. Some packet-sniffing software is expensive, some free:

<http://www.tucows.com/>, search on sniffer
<http://www.softpile.com/search.phtml?query=sniffer&pp=10&in=title>

The trouble is, most of this software wouldn't be easy for a non-technical user to convert into a tool for gathering useful information. Those products that are easy to use for corporate spying tend to have prietags that are easy for bosses and companies to afford but not for employees. Among currently available sniffing products, the jury likes Ethereal (<http://www.ethereal.com>), a free, cross-platform diagnostic tool that can be used fairly easily by employees to spy on their boss's e-mail, websurfing and other network communications.

An upcoming version of Rhizome's Carnivore is planned to make it easier for an art audience to get involved in corporate spying. The jury hopes it will do this. Since Carnivore is open source software, other people with the appropriate programming expertise can also write such modifications themselves. For now, Carnivore only runs on specialized servers, and it doesn't gather data in a human-readable form.

The relationship of Rhizome's Carnivore to the FBI's spying tool of the same name seems to be a matter of concept and hipness-value, but it is not explained and is not very obvious.

 >[...] discuss the technical analysis offered by the Moscow-jury which,
 >from what i understand as a techno-idiot and reading against the grain,
 >basically says that your Carnivore program offers nothing new under the sun?!

as stated in our original post, Carnivore Personal Edition is rich with new features not included in its FBI counterpart. Here are a few of them:

- 1) artist-made diagnostic clients created by leading net artists around the world
- 2) remote access--meaning clients can access CarnivorePE data streams from other computers via the Internet
- 3) full subject targeting--meaning all users are sniffed, not just a single user
- 4) full data targeting--all data is sniffed, not just email
- 5) volume buffering--to avoid packet storms, CarnivorePE can buffer packet output to either 1, 5, 20, or 100 packets per second.
- 6) transport protocol filtering--meaning CarnivorePE can sniff on TCP or UDP packets, or both
- 7) output channels--meaning clients can request one of three output channels: "carnivore" for full packet data in ASCII, "hexivore" for full packet data in hex, or "minivore" for packet headers only
- 8) an open source software license (a dramatic improvement over its chief rival, Etherpeek, which isn't open source and costs \$1,295)
- 9) a distributed rather than centralized architecture

most of these features are also missing in the various other sniffers available including Snort and tcpdump.

instead of stumbling over technical details, perhaps the nettime community can engage in a deeper critique of the software and its uses!

Re: <nettime> How We Made Our Own "Carnivore" [6x]

From: Pit Schultz

To: nettime-l@bbs.thing.net

Date: Fri, 21 Jun 2002 03:55:36 +0200

* costs of success *

certainly this hacker tool is well crafted in many ways (2), reading about it i first thought 'build for success', but does it's success make it a 'good' art work, a work one might talk about in a few years in a

respectful way? Surely it is symptomatic, but is carnivore a work of art which started an own genre, which made oneself look at the possibilities of making art in a new way, a work of art which made it impossible to continue to produce an accepted form of art in the old way? i don't say that successful art (or software) is to be dismissed because of it's success, but because what it might sacrificed to become successful (3), being secondary consumers in the food chains.

* conceptual confusion *

i think carnivore is as rationally planned as it is conceptually confused. it doesn't provide a proper idea about the art context in its relation to software. it provides an interface service. it hardly carries an own concept of itself being software, nor being a piece of art. it is neither social, nor critical but includes the discursive gestures of those features. especially if the techniques you mention are all implemented properly, it is exactly this ambitious futuritis on all levels which make the piece questionable as a piece of art, yes a filter, but art? if it is not conceptual than why does it need such a long description, if it is conceptual than why does it need to prove to perform so well practically? if it is context sensitive then, isn't it first and for all the context of the media art discourse it is produced for providing a romantic version of the strange and beautiful digital landscape of the united states? why then all the reference to be functional outside of it? and if it will become a wildly used sniffing tool, what is it that makes it different from other sniffing tools other than aesthetification of the politics of packet sniffing?

* dog shows *

by being conformative to all sides and on all levels, carnivore achieves seemingly a high degree of customization. affirmative and critical, open source and mysterious, practical and aesthetical, software and art, it generates a heterogeneous homogeneity which has something for everyone but says nothing in general. it doesn't make clear cuts but it borrows from all contexts one might think of as relevant for the targeted market. as such it is designed like a new car model, a hyperopportunistic piece of project management and it clearly reports more about the culture from which it derives than about all the sources it tries to nourish itself from. there is only one slight possibility, that in another dimension by showing all this, the work tries to overcome itself and all the meaning it carries, being a parody of a pastiche (1), sending the observer in a loop of salon data art for the purpose of salon data art, to produce a beautifully crafted confused inertia.

1) pastiche, A work of art using a borrowed style and usually made up of borrowed elements, but not necessarily a direct copy. A pastiche often verges on conscious or unconscious caricature through its exaggeration of what seems most typical in the original model. (Thames & Hudson)

2) my critique on the softwareculture list, from 30Apr02

>>take the case of "carnivore". it seems to include technological criticism, but it is also working on the marketplace of forms, including various 'styles' from ascii, to distributed networks, global maps, surveillance, programming, p2p, and the beauty of code on the ground level of tcp/ip. but finally it is showing the highest perfection on the level of project management. the critique is symbolic, as there is no real effect outside the art context. the technique is without relevance as noone outside the art context is using it. but to the art system it looks like it comes from the 'other side', it interfaces it, makes it 'understandable' and fulfills the need for a criticism which doesn't hurt.<<

Concerning the rest:

> 2) remote access--meaning clients can access CarnivorePE data streams
> from other computers via the Internet

Trivial to implement if you combine an ethernet sniffer with a webserver
or file sharing tool, like

tethereal -x > sniffdata.txt

...and then share this file in Gnutella or a locally running webserver.

> 3) full subject targetting--meaning all users are sniffed, not just a
> single user

Any network sniffing software I know does this. (Ethereal, dsniiff,
ettercap...)

> 4) full data targetting--all data is sniffed, not just email

As above.

What you write sounds reads a hackish prank; a hack to sell
trivial/commonplace functionality as extraordinary to people who, due to
their non-technical background, can't judge it.

man etheareal:

The following is a table of protocol and protocol fields that are
filterable in Ethereal.

```
802.1q Virtual LAN (vlan)
[...]
802.1x Authentication (eapol)
[...]
AOL Instant Messenger (aim)
[...]
ATM (atm)
[...]
Address Resolution Protocol (arp)
[...]
Appletalk Address Resolution Protocol (aarp)
[...]
Cisco Auto-RP (auto_rp)
[...]
```

[Skipping dozens and hundreds of protocols]

> 5) volume buffering--to avoid packet storms, CarnivorePE can buffer
> packet output to either 1, 5, 20, or 100 packets per second.

man etheareal:

-b If a maximum capture file size was specified, cause Ethereal to
run in "ring buffer" mode, with the specified number of
files. In "ring buffer" mode, Ethereal will write to
several capture files; the name of the first file, while the cap
ture is in progress, will be the name specified
by the -w flag, and subsequent files with have
.n appended, with n counting up.

> 6) transport protocol filtering--meaning CarnivorePE can sniff on TCP or
> UDP packets, or both

man etheareal, continued from 4):

User Datagram Protocol (udp)

udp.checksum Checksum
Unsigned 16-bit integer

udp.checksum_bad Bad Checksum
Boolean

udp.dstport Destination Port
Unsigned 16-bit integer

udp.length Length
Unsigned 16-bit integer

udp.port Source or Destination Port
Unsigned 16-bit integer

udp.srcport Source Port
Unsigned 16-bit integer

man ettercap:

-u, --udp
sniff only UDP packets (default is TCP).

> 7) output channels--meaning clients can request one of three output
> channels: "carnivore" for full packet data in ASCII, "hexivore" for full
> packet data in hex, or "minivore" for packet headers only

man etheareal:

It can assemble all the packets in a TCP conversation and
show you the ASCII (or EBCDIC, or hex) data in that conversation.
Display filters in Ethereal are very powerful; more
fields are filterable in Ethereal than in other protocol
analyzers, and the syntax you can use to create your filters is
richer. As Ethereal progresses, expect more and more protocol
fields to be allowed in display filters.

> 8) an open source software license (a dramatic improvement over its
> chief rival, Etherpeek, which isn't open source and costs \$1.295)

Looking up...

(See point 2.)

> instead of stumbling over technical details, perhaps the nettime
> community can engage in a deeper critique of the software and its uses?

A deeper critique would be that the

developer team of "Ethereal", a free cross-platform (Linux/Unix and Windows) tool which offers everything you describe except the Net.art "plugins", should have run

s/Ethereal/Carnivore/g

over their sourcecode and sold it as a "critical", "political", "subversive", "provocative" etc. piece of software (art), and that perhaps this is what the RSG hacktivism is actually about. Next we sell "Norton Unerase" + some fancy "Net.art" visualization backend as a critical software art piece on personal data privacy.

The bottomline: "RSG Carnivore" is a packet sniffer for the purpose of creating aestheticized visualizations. I appreciate that because I often run packet-sniffers to entertain myself with accidental concrete poetry (particularly radical and sexually intense if you sniff on Gnutella connections). But you agree that, as aesthetic sniffing, it is different from the targeted law-enforcement packet sniffing of FBI Carnivore whose algorithmic intelligence is spent on the input backend, not on the output frontend.

I am also in tune with exploiting ready-made software concepts and tools. (I even think RSG could have saved much effort by working with a high-level cross-platform tool like "Ethereal" right away instead of writing its own Perl/Visual Basic wrappers around low-level sniffing engines.)

The difference between FBI Carnivore and commonplace packet sniffers shows that the difference is in the targeting and the particular application. In the Moscow jury, we just failed to see the rhetoric implied in the title "Carnivore" (and the subsequent political rhetoric you posted here) backed-up in the piece.

Meanwhile, though, I changed my mind and think our objections were premature. While the targeting and application of "RSG Carnivore" might be different from FBI Carnivore on the technical level, it is not so different on the discursive level. Because "RSG Carnivore", as it turns out, are not those who run it and let it sniff their networks, but the net.art world itself, as obvious in this thread it provoked. "RSG Carnivore" was sophisticatedly at work when Olga Goriunova posted the read_me 1.2 jury statement, but rhizome-digest of June 2nd, 2002 included it in a version modified by the rhizome editors that skipped all of our frivolous remarks about "RSG Carnivore", passing it as Olga's original E-Mail though, without any editorial annotation or typographic [...] markup. This was Carnivore at work: The implied appeal to readers to critically question media-fabricated truth (whether by the syndication of, say, ABC News and Disney or rhizome.org and RSG Carnivore) by matching rhizome-digest against rhizome-raw showed what the piece was actually about. Contrary to what Andreas criticized, the "Net.art"-themed screensaver output turned out to be a clever means of tactical distraction from the actual piece.

You call your award-winning piece "Carnivore" instead of (seemingly more appropriate) "Rhizome Community Network Sniffer"; this honesty is much appreciated!

First: A word of appreciation for the technical outline Florian Cramer provided.

Due to the _transcoding_ principle, the net art scene has of course become

inundated with projects that offer a visual and highly anesthetized treatment/display of data streams, collected by various methods such as user input, network sniffing, search engines, and so on. What seems almost collectively to be lacking in this _artistic_ processing are efforts to invoke an intelligence at the front end: why those algorithms, this appearance, these rules! At this juncture, these endeavors may rise from the level of ability to utility (like the FBI has made very clear). Any critique leveled at the increased surveillance of the network must surely start from the base presumption that the bitstream channels knowledge and not pretty pictures for the screen.

The question that Florian Cramer raises -- whether or not RSC Carnivore is technically innovative or simply repackaging existing functionality -- is valid. I accept his technological knowledge, amply displayed, based on which he claims that, indeed, the project is mainly repackaging. However, the critique also strikes me as overly narrow.

The FBI Carnivore is not just a sophisticated packet sniffing program, but it is part of a larger techno-administrational set-up in which the program performs very specific things that no other packet sniffing software does: providing intelligence for secret law enforcement operations. Carnivore only is Carnivore because it's embedded in a framework that allows the US government to act upon intelligence gathered through it.

The difference between Carnivore and other sniffers is that Carnivore can get you detained. If you're unlucky these days, indefinitely without a trial. In other words, Carnivore is not just a program, but an integral element of a law enforcement strategy.

Any critique of the an art work dealing with FBI's Carnivore must consider how it addresses the various aspects of the entire process of carnivore, ie. the all those things that turn the packet sniffing program to Carnivore.

>From: Randall Packer <rpacker[AT]zakros.com>
>Subject: Re: <nettime> How We Made Our Own "Carnivore"
[...]
>In my mind, it is important to keep in mind that the Carnivore
>software itself is the focal point of the project. At this early
>stage, I think the applications being developed are skimming the
>surface of what is possible. The use of network data to generate
>real-time visual and musical experiences is clearly in its infancy.

Randall Packer points approvingly to what strikes me as the real problem with RSC Carnivore. Despite claims to the contrary -- and including "Carnivore" in the title is a strong claim to political relevance -- its objectives are primarily aesthetic. Traffic data is taken to be input for visual displays. Their quality is detrimed by the fact that they were "created by leading net artists around the world," rather than by the fact that they reveal otherwise hidden patterns in the data streams.

However, the claim that we now have "our own Carnivore" somehow suggests that we have your own intelligence gathering capacities. It implies that we can somehow turn the tables, that were are not only spied on, but we have the ability to observe back, and to observe in a meaningful way. And with meaningful I mean that the process of observing yields information that allows us to act effectively upon the observed.

>From what I have seen, RSA Carnivore offers little in this regard. So, perhaps rather than calling the explanatory essay "How we built our own Carnivore" it seems to have been more accurate to call it "How to visualize data traffic". I admit this is less sexy, but at least it doesn't come dangerously close to false advertising.

Software and Concept Notations

Software in the Arts

To date, critics and scholars in the arts and humanities have considered computers primarily as storage and display media, as something which transmits and reformats images, sound and typography. Reflection of the as such invisible layer of software is rare. Likewise, the term "digital art" has been associated primarily with digital images, music or audiovisual installations using digital technology. The software which controls the audio and the visuals is frequently neglected, working as a black box behind the scenes. "Interactive" room installations, for example, get perceived as a interactions of a viewer, an exhibition space and an image projection, not as systems running on code. This observation all the more applies to works in which it is not obvious at all that their production relied on programming and computing. John Cage's 1981 radio play "Roaratorio", for example, appears to be a tape montage of a spoken text based on James Joyce's "Finnegans Wake", environmental sounds recorded in several cities of the world and Irish folk music, edited with analog recording technology. Yet at the same time it is an algorithmic artwork; the spoken text was extracted from the novel using a purely syntactical, formal method (mesostychs of the name "James Joyce"), and the montage was done according to a random score generated on a computer at the Parisian IRCAM studios. While the book-plus-CD set of "Roaratorio" documents the whole composition extensively, containing the audio piece itself, a recording and a reprint of John Cage's reading, a recording and a reprint of an interview, an inventory of the cities where sound was recorded, it includes the computer-generated score itself only in a one-page excerpt and nothing at all of the computer program code which generated the random score.[1]

The history of the digital and computer-aided arts could be told as a history of ignorance against programming and programmers. Computer programs get locked into black boxes, and programmers are frequently considered to be mere factota, coding slaves who execute other artist's concepts. Given that software code is a conceptual notation, this is not without its own irony. In fact, it is a straight continuation of romanticist philosophy and its privileging of aisthesis (perception) over poesis (construction),[2] cheapened into a restrained concept of art as only that what is tactile, audible and visible. The digital arts themselves participate in this accomplicity when they call themselves [new] "media art". There's nothing older than "new media", a term which is little more than a superficial justification for lumping together a bunch of largely unrelated technologies, such as analog video and computing,

just because they were "new" at a particular time. If one defines as a medium something that it is between a sender and a receiver, then computers are not only media, but also senders and receivers which themselves are capable of writing and reading, interpreting and composing messages within the limitations of the rule sets inscribed into them. The computer programs for example which calculate the credit line of checking accounts or control medical instruments in an emergency station can't be meaningfully called "media". If at all, computer processes become "media" only by the virtue that computers can emulate any machine, including all technical media, and by the virtue of the analog interfaces which transform the digital zeros and ones into analog sound waves, video signals, print type and vice versa.

A Crash Course in Programming

A piece of software is a set of formal instructions, or, algorithms; it is a logical score put down in a code. It doesn't matter at all which particular sign system is used as long as it is a code, whether digital zeros and ones, the Latin alphabet, Morse code or, like in a processor chip, an exactly defined set of registers controlling discrete currents of electricity. If a piece of software is a score, is it then by definition an outline, a blueprint of an executed work?

Imagine a Dadaist poem which makes random variations of Hugo Ball's sound poem "Karawane" ("Caravan"):

KARAWANE

jolifanto bambla ô falli bambla
 grossiga m'pfa habla horem
 égiga goramen
 higo bloiko russula huju
 hollaka hollala
 anlogo bung
 blago bung
 blago bung
 bosso fataka
 ü ü ü ü
 schampa wulla wussa ôlobo
 hej taat görem
 eschige zumbada
 wulebu ssubudu uluw ssubudu
 tumba ba-umpf
 kusagauma
 ba-umpf

The new Dada poem could simply consists of eight variations of the line "tumba ba-umpf". The author/performer could throw a coin twice for each line and, depending on the result, choose to write down either the word "tumba" or "ba-umpf", so that the result would look like:

tumba tumba
 ba-umpf tumba
 tumba ba-umpf
 tumba ba-umpf
 ba-umpf ba-umpf
 ba-umpf tumba
 tumba ba-umpf
 tumba ba-umpf

The instruction code for this poem could be written as follows:

1. Take a coin of any kind with two distinct sides.
2. Repeat the following set of instructions eight times:
 - a. Repeat the following set of instructions twice:
 - i. Throw the coin.
 - ii. Catch it with your palm so that it lands on one side.
 - iii. If the coin shows the upper side, do the following:
 # Say "tumba"
 - iv. Else do the following:
 # Say "ba-umpf"
 - b. Make a brief pause to indicate the end of the line.
3. Make a long pause to indicate the end of the poem.

Since these instructions are formal and precise enough to be as well executed by a machine (imagine this poem implemented into a modified cuckoo clock), they can be translated line by line into a computer program. Just as the above instruction looks different depending on the language it is written in, a computer program looks different depending on the programming language used.

Here I choose the popular language "Perl" whose basic instructions are rather simple to read:

```
for $lines (1 .. 8)
{
    for $word (1 .. 2)
    {
        $random_number = int(rand(2));
        if ($random_number == 0)
        {
            print "tumba"
        }
        else
        {
            print "ba-umf"
        }
    }
    print " "
}
print "\n"
```

The curly brackets enclose statement blocks executed under certain conditions, the \$ prefix designates a variable which can store arbitrary letters or numbers, the "rand(2)" function generates a random value between 0 and 1.9, "int" rounds its result to either zero or one, " " stands for a blank, "\n" for a line break. This program can be run on virtually any computer; it is a simple piece of software. Complex pieces of software, such as computer operating systems or even computer games, differ from the above only in the complexity of their instructions. The control structures - variable assignments, loops, conditional statements - are similar in all programming languages.

Unlike in the instruction for throwing coins, the artists' work is done once the code is written. A computer program is a blueprint and its execution at the same time. Like a pianola roll, it is a score performing itself. The artistic fascination of computer programming - and the perhaps ecstatic revelation of any first-time programmer - is the equivalence of architecture and building, the instant gratification given once the concept has been finished. Computer programming collapses, as it seems, the second and third of the three steps of concept, concept notation and execution.

Contrary to conventional data like digitized images, sound and text documents, the algorithmic instruction code allows a generative process. It uses computers for computation, not only as storage and transmission media. And this precisely distinguishes program code from non-algorithmic digital code, describing for example the difference between algorithmic composition on the one hand and audio CDs/mp3 files on the other, or between a graphically generated text and "hypertext" (a random access database model which as such doesn't require algorithmic computation at all), or between a graphical computer "demo" and a video tape. Although one can of course use computers without programming them, it is impossible not to use programs at all; the question only is who programs. There is, after all, no such thing as data without programs, and hence no digital arts without the software layers they either take for granted, or design themselves.

To discuss "software art" simply means to not take software for granted, but pay attention to how and by whom programs were written. If data doesn't exist without programs, it follows that the separation of processed "data" (like image and sound files) from "programs" is simply a convention. Instead, data could be directly embedded into the algorithms used for its transmission and output to external devices. Since a "digital photograph" for example is bit-mapped information algorithmically transformed into the electricity controlling a screen or printer, via algorithmic abstraction layers in the computer operating system, it follows that it could just as well be coded into a file which contains the whole transformation algorithms themselves so that the image would display itself even on a computer that provides no operating system.[3]

Software Art

Executable Code in Art

If software is generally defined as executable formal instructions, logical scores, then the concept of software is by no means limited to formal instructions for computers. The first, English-language notation of the Dadaist poem qualifies as software just as much as the three notations in the Perl programming language. The instructions only have to meet the requirement of being executable by a human being as well as by a machine. A piano score, even a 19th century one, is software when its instruction code can be executed by a human pianist as well as on a player piano.

The Perl code of the Dada poem can be read and executed even without running it on machines. So my argument is quite contrary to Friedrich Kittler's media theory according to which there is either no software at all or at least no software without the hardware it runs on[4]. If any algorithm can be executed mentally, as it was common before computers were invented, then of course software can exist and run without hardware. - A good example are programming handbooks. Although they chiefly consist of printed computer code, this code gets rarely ever executed on machines, but provides examples

which readers follow intellectually, following the code listings step by step and computing them in their minds.

Instead of adapting Dadaist poetry as software, one could regard some historical Dadaist works as software right away; above all, Tristan Tzara's generic instruction for writing Dada poems by shuffling the words of a newspaper article[5]:

To make a Dadaist poem:
Take a newspaper.
Take a pair of scissors.
Choose an article as long as you are planning to make your poem. Cut out the article.
Then cut out each of the words that make up this article and put them in a bag.
Shake it gently.
Then take out the scraps one after the other in the order in which they left the bag.
Copy conscientiously.
The poem will be like you.
And here you are a writer, infinitely original and endowed with a sensibility that is charming though beyond the understanding of the vulgar.

The poem is effectively an algorithm, a piece of software which may as well be written as a computer program.[6]. If Tzara's process would be adapted as Perl or C code from the original French, it wouldn't be a transcription of something into software, but a transcription of non-machine software into machine software.

Concept Art and Software Art

The question of what software is and how it relates to non-electronic contemporary art is at least thirty-two years old. In 1970, the art critic and theorist Jack Burnham curated an exhibition called "Software" at the Jewish Museum of New York which today is believed to be first show of concept art. It featured installations of US-American concept artists next installations of computer software Burnham found interesting, such as the first prototype of Ted Nelson's hypertext system "Xanadu". Concept art as an art "of which the material is 'concepts', as the material of for ex. music is sound" (Henry Flynt's definition from 1961[7]) and software art as an art whose material is formal instruction code seem to have at least two things in common:

1. the collapsing of concept notation and execution into one piece;
 2. the use of language; instructions in software art, concepts in concept art.
- Flynt observes: "Since 'concepts' are closely bound up with language, concept art is a kind of art of which the material is language" [8]

It therefore is not accidental that the most examples of pre-electronic software art cited here are literary. Literature is a conceptual art in that it is not bound to objects and sites, but only to language. The trouble the art world has with net.art because it does not display well in exhibition spaces is foreign to literature which always differentiated between an artwork and its material appearance.

Since formal language is a language, software can be seen and read as a literature.[9]

If concepts become, to quote Flynt again, artistic "material", then concept art differs from other art in that it actually exposes concepts, putting their notations up front as the artwork proper. In analogy, software art in particular differs from software-based art in general in that it exposes its instructions and codedness. Since formal instructions are a subset of conceptual notations, software art is, formally, a subset of conceptual art.

My favorite example of both concept art in Flynt's sense and non-computer software art is La Monte Young's "Composition 1961", a piece of paper containing the written instruction "Draw a straight line and follow it". The instruction is unambiguous enough to be executed by a machine. At the same time, a thorough execution is physically impossible. So the reality of piece is mental, conceptual.

The same duplicity of concept notation and executable code exists in Sol LeWitt's 1971 "Plan for a Concept Art Book", a series of book pages giving the reader exact instructions to draw lines on them or strike out specific letters.[10] LeWitt's piece exemplifies that the art called concept art since the 1970s was by far not as rigorous as the older concept art of Henry Flynt. La Monte Young and Christer Hennix: While the "Composition 1961" is a concept notation creating an artwork that itself exists only as a concept, mentally, LeWitt's "Plan for a Concept Art Book" only is a concept notation of a material, graphic artwork. Unlike the concept art "of which the material is 'concepts'", LeWitt's piece belongs to a concept art that rather should be called a concept notation art or "blueprint art": an art whose material is graphics and objects, but which was instead realized in the form of a score. By thus reducing its its own material complexity, the artwork appears to be

"minimalist" rather than rigorously conceptualist.

A writing which writes itself, LeWitt's "Plan" could also be seen in a historical continuity of combinatorial language speculations: From the permutational algorithms in the *Sefer Jezirah* and ecstatic Kabbalah to the medieval "ars" of Raimundus Lullus to 17th century permutational poetry and Mallarmé's "Livres". The combinatorial most complex known permutation poem, Quirinus Kuhlmann's 1771 sonnet "Vom Wechsel menschlicher Sachen" consists of 12*12 nouns can be arbitrarily shuffled so that they result in 10114 permutations of the text.^[11] Kuhlmann's and La Monte Young's software arts meet in their aesthetic extremism; in an afterword, Kuhlmann claims that there are more permutations of his poem than grains of sand on the earth.^[12] If such implications lurk in code, a formal analysis is not enough. Concept art potentially means terror of the concept, software art terror of the algorithm; a terror grounded in the simultaneity of minimalist concept notation and totalitarian execution, helped by the fact that software collapses the concept notation and execution in the single medium of instruction code. - Sade's "120 days of Sodom" could be read as a recursive programming of excess and its simultaneous reflection in the medium of prose.^[13] The popularity of spamming and denial-of-service code in the contemporary digital arts is another practical proof of the perverse double-bind between software minimalism and self-inflation; the software art pieces awarded at the *transmediale.02* festival, "tracenoizer" and "forkbomb.pl" also belong to this category.

La Monte Young's "Composition 1961" not only provokes to rethink what software and software art is. Being the first and still most elegant example of all artistic jamming and denial-of-service code, it also addresses the aesthetics and politics coded into instructions. Two years before Burnham's "Software" exhibition, the computer scientist Donald E. Knuth published the first volume of his famous textbook on computer programming, "The Art of Computer Programming".^[14] Knuth's wording has adopted in what Steven Levy calls the hacker credo that "you can create art and beauty with computers".^[15] It is telling that hackers, otherwise an avant-garde of a broad cultural understanding of digital technology, rehash a late-18th century classicist notion of art as beauty, rewriting it into a concept of digital art as inner beauty and elegance of code. But such aesthetic conservatism is widespread in engineering and hard-science cultures; fractal graphics are just one example of Neo-Pythagorean digital kitsch they promote. As a contemporary art, the aesthetics of software art includes ugliness and monstrosity just as much as beauty, not to mention plain dysfunctionality, pretension and political incorrectness.^[16]

Above all, software art today no longer writes its programs out of nothing, but works within an abundance of available software code. This makes it distinct from works like Tzara's Dada poem which, all the while it addresses an abundance of mass media information, contaminates only the data, not its algorithm; the words become a collage, but the process remains a synthetic clean-room construct.

Since personal computers and the Internet became popular, software code in addition to data has come to circulate in abundance. One thus could say that contemporary software art operates in a postmodern condition in which it takes pre-existing software as material - reflecting, manipulating and recontextualizing it. The "mezangelle" writing of mezz, an Australian net artist, for example uses software and protocol code as material for writings in a self-invented hybrid of English and pseudo-code. Her "net.wurks" are an unclear, broken software art; instead of constructing program code synthetically, they use readymade computations, take them apart and read their syntax as gendered semantics. In similar fashion, much software art plays with control parameters of software. Software artworks like Joan Leandre's "retroyou" and "Screen Saver" by Eldar Karhalev and Ivan Khimin are simply surprising, mind-challenging disconfigurations of commercial user software: a car racing game, the Microsoft Windows desktop interface. They manage to put their target software upside down although their interventions are technically simple and don't involve low-level programming at all.

Software Formalism vs. Software Culturalism

Much of what is discussed as contemporary software art and discourse on has its origin in two semi-coherent London-based groups. The older one around Matthew Fuller, Graham Harwood and the groups I/O/D and Mongrel is known, among others, for the experimental web browser "WebStalker", which instead of formatted pages displays their source code and link structures, the "Linker", a piece of "social software" (to use a term by Fuller) designed to empower non-literate users to design their own digital information systems, and "natural selection", a politically manipulated web search engine. Fuller also wrote a scrupulous cultural analysis of Microsoft Word's user interface and an essay with the programmatic title "Software as Culture". The other group involves the programmer-artists Adrian Ward (whose "Auto-Illustrator" won the *transmediale.01* software art prize) and Alex McLean (whose "forkbomb.pl" won the *transmediale.02* software art prize), the theoretician Geoff Cox and participants in the mailing list "eu-gene", the web site <http://www.generative.net> and the "DorkBot" gatherings in London (which involve poetry readings of program code). Both groups take exactly opposite standpoints to software art and software criticism: While Fuller/Harwood regard software as first of

all a cultural, politically coded construct, the eu-gene group rather focuses on the formal poetics and aesthetics of software code and individual subjectivity expressed in algorithms.

If software art could be generally defined as an art

- * of which the material is formal instruction code, and/or
- * which addresses cultural concepts of software,

then each of their positions sides with exactly one of the two aspects. If Software Art would be reduced to only the first, one would risk ending up a with a neo-classicist understanding of software art as beautiful and elegant code along the lines of Knuth and Levy. Reduced on the other hand to only the cultural aspect, Software Art could end up being a critical footnote to Microsoft desktop computing, potentially overlooking its speculative potential at formal experimentation. Formal reflections of software are, like in this text, inevitable if one considers common-sense notions of software a problem rather than a point of departure; histories of instruction codes in art and investigations into the relationship of software, text and language still remain to be written.

<nettime> the form, the social, the
rest. re: 'Concepts, Notations,
Software, Art'
From: matthew fuller
To: nettime-1@bbs.thing.net
Date: Fri, 7 Jun 2002 13:15:51 +0100

Dear Florian,

Thank you for your useful essay, 'Concepts, Notations, Software, Art'
recently posted to nettime. In the spirit of it being a new version of
an old text, I'd like to suggest a plug-in.

At the very least, a brief patch may be required if we are not to have
a repetition of the usual scission, in the last few paragraphs, between
the simply 'formal' and simply, and woollily, 'social'. (The twentieth
century is dotted with too many of such debates.) I'd like to make two
short suggestions:

1 'Formal' operations do not occur alone. There is clearly a current
of art using computer networks or instructions which believes itself to
be primarily formalist. However, this belief is the result of a
particular perspectivalism that cleaves the work from it's more messy
or productive implications and connections. In order to clarify this,
two examples drawn from the text:

1.1 Hugo Ball's poem Carawan. Do we misunderstand the work if it is
read in relation to certain of the Dada Zurich artists' ostensive
reference to 'African' speech and symbolism, to further read this in
relation to the predatory colonialism of Europe, or in relation to
Ball's own yearning for a mystical language of immediacy (along the
lines of that which you usefully describe in 'Language as Virus') which
could be accessed via such poetry?

1.2 Sol LeWitt. LeWitt's work exists both as a series of instructions,
and their execution. There are two ways in which we can understand
this simple formalist limit to the work as requiring an expansion.

1.2.1 Organisation: the work is addressed to a possible executor - a
socius of two or more is thus composed. This at the very least allows
the work to be carried out and shown without any trouble to the artist,
one can also note that it is one of the mechanisms which allowed
conceptual exhibitions to be mounted by post and by phone in across the
world in several locations at low cost. (See Katherine Moseley's
excellent catalogue, 'Conceptions, the conceptual art document'.)

Further, if you wish to include an authorised LeWitt in an exhibition
it is necessary to contact his representative in order to receive
permission to carry out the particular set of instructions you wish to
have realised. As is common in much of the conceptual work begun in
the sixties there is a deployment of a particular set of apparatuses
which define roles, often by contract: representative,
artist/instructor, executor, and so on. It is clear that such
arrangements are immediately 'social' in a variety of ways. Making the
notary an explicit rather than implicit transactor of some art systems
is one of the minor ways which certain conceptual works addressed
themselves to the political and economic dimensions of such systems.

1.2.2 Material 'substrate': one of the problems of an approach which
allows for a simple formalism is that it reduces the components of its
realisation to a simple 'substrate' through which the work is realised.
A kind of matter is captured and given form by an idea. What might
usefully be proposed instead is that particular works, including those
you discuss, operate by arranging combinations of material,
organisation, perception etc. LeWitt's work here for instance might
be seen to operate as a particular realisation of a certain combination
of the propensities of: postal and fax networks; orthography, geometry,
and the materials wall/paper and pen/pencil for their actuation;
alphabetised language, linguistic technologies of description; art
economies of desire, command, and authorship, art economies of objects
and spaces, of publications, or theorisations and naming; the pleasure
of repetitive exercise and expectation in the person/s of those
actuating the work, the conditions of employment of gallery assistants
who carry out such work; etc.

The particular compositional terms by which such an arrangement is
made, correspond in some way with what is reductively described as the
'formal'. However, such a way of engaging with a work immediately
connects art to the question of what to do with life, with the world,
without losing any of the power assigned to it under the schismatic
and reductive term, 'formal'.

2 Such compositional terms are dynamics are generated in order to be
launched into an outside. To name or describe such a system, the modes
of a dynamic, the terms of an arrangement, calls it into being - with
one or another degree of virtuality. Each such act depends on the
arrangements that it is part of in order to become actuated and
mobilised.

For purposes of presentation, Forkbomb.pl, for instance, uses both the
actual script and the operation of the program within a computer where
a sound / graphics generation program is also running. Forkbomb
'competes' with this program for resources as it gradually uses them
up. As the number of fork commands increases it gradually makes the
operation of this other program impossible, producing variation in
sound and image.

This variation allows the perception of the two programs' interactions
to become perceptible in a different way - to different senses and
aesthetic codes, and in terms of duration. The production of sound and
image is also notably varied by the configuration of the particular
machine that the work is being run on.

Part of the work in deciding how to best mobilise Forkbomb is
therefore to bring it into some kind of arrangement with the contexts
it operates in, as well as cpan and the normal routes for code
distribution, these include exhibitions and conference presentations.
Part of a work is also its means of promotion, its mobilisation in
'secondary' contexts, the way it appeals to certain kinds of
interpretation, or of remobilization by or participation in certain
kinds of discourse - such as this. Utilising various ways of making it

'sensible' are a way of generating its operation in an 'outside', the contexts in which it appears and to which it is addressed. (This does not of course preclude things occurring or being repurposed in other contexts).

To remove the possibility of such a work being understood as 'social' would therefore seem to deny part of what is important in what is brought together in its different actuations.

I have not touched up the presence of what you describe as simply 'formal' in the those works you describe as simply 'social' because for the purposes of this text that would be unnecessary. The work mentioned, other related work, as well as the texts around them give no grounds for the repetition of this doubly useless scission.

The above couple of proposals of course make only a slight amendment to the tail-end of what is otherwise a valuable argument - I look forward to seeing more!

Hello - Please allow me to tell you about the Absinthe Buyer's
 Guide, our Grand Opening will be in August.

Our goal is to provide buyers with up-to-date information about
 Absinthe currently being produced for sale, and
 to provide them with links to reliable distributors where they can
 purchase Absinthe with confidence.

We are accepting Absinthe related websites to be listed on our
 Links page.

Click Here To Visit Our New Site: <http://www.absinthebuyersguide.com>
 To sign up to list your products or website: <http://www.absinthebuyersguide.com/contact.html>

Thank you very much, please e-mail us if you have any questions
 or comments.

<nettime> unstable digest vol 2

From: Florian Cramer
To: nettime-l@bbs.thing.net
Date: Sat, 13 Jul 2002 08:20:11 +0200

From: "Cur.|]O|]va.ture" <netwurker (AT) hotkey.net.au>
Subject: _net_|]paral|]lax 1.6.1: in.stig|m|at|]a|]ed as objects_
Date: Mon, 24 Jun 2002 14:46:19 +1000

::this obsession with labels N d.finitions that m.brace our work
N our
s|]b|]elfs.
coming from the POV of a nic|]lic|]he.d "net.artist" i guess i
try N span
many labels, and have found myself doing so lately in order 2
survive
[grants, competitions, etc].....but it is, s.entially, crap.
labels do
nothing 2 further x.pressive development, & seem 2 primarily s|]
[w|]erve 2
mark artists N wurk along a definitive, prosperity plane.....
we b.come

objects N objecti.f|]r|]led in order to slot in the societal/
memetic
framework.....

05:54 PM 11/5/2001
::its been obvious that for some time web/net/e./code poets [n.sert
s.tab.lished label of yr choice here] r more accepted if they
produce works
that reflect the traditional kraftwerk idea...that is, create a
finished,
marketable, tangible target.....

::our methods of analysis go on to reflect this orientation, N
therefore we
don't discuss the fragment or the discard, we discuss _complete_
holistically d.termin|]able|]ed works. any (AT) tempt 2 do
otherwise is beyond
the scope of this list's delineated function.

.

ln lo lp lv
lr ls lt lu lv lw lx ly lz ma mb mc md me mf mg mh mi mj mk ml mm
```

Linguistic annotations to Internet Text file names:

```
1. Why the sudden change after Net14 ?
2. The alphabet series ends at u .
3. Only five named files: I realized these were already breaking
with some
sort of order - I had to return to a more coherent system.
4. With the dyadic formations, things become confused:
a. Why start with ah, am, an? Where is ai, aj?
b. With the doubles, where is aa? Why does this suddenly break
off at jj -
only to start with another series, that of k, after jy?
c. Why does k complete the dyadic series k*, and l complete l*?
d. Where is m* headed?
e. Do kk, ll, and mm replace earlier files related to the doubles
series?
Have texts inadvertently been lost?
```

I am currently revising my home-page, emphasizing newer work and this series - I have no answer whatsoever. My texts tend towards their own vagaries and wayward classifications - often beginning as if the whole world is ordered, ending, as if everything is in dissolution. In a state of depression, both ends transform into substance, through which may be read a certain decathected truth; often, however, I write in a state of exhilaration...

Subject: [Nettime-bold] _Perspektive_ Interview [mez interviewed
by sylvia egger]
From: "[ico][de][e][p.rivation" <netwurker {AT} hotkey.net.au>
Date: Thu, 18 Jul 2002 09:59:36 +1000

—
A. heinrich heine blames 1843 the railway for annihilating space.
the
promised cybermedium seems so reestablish (virtual) space in a
cooperative
time schedule. MEZ is operating in a self-de/constructed textual
space
called "trr" (textual time travel) which means a way of thinking,
producing
and manifesting in/to a theory dungeon of what is stated to be
the frame of
modern consciousness - network, internet, browser crawling. the
manifestation area in which the textual space take place is called
"Cybagenic Latrrix", a "net.wurked" sphere between latrinous
space and
matrix scenes. what is this working matrix about? is it a kind of
faradaysque cage where avant garde practice has to capture itself
to train
its techniques and discourse or is it more a so called "teleklause"
(billwet) for nintendo specialist and word capturers?
—

i should b.gin with the proviso that my neologismic term[[inologie]
[s [ouch
as the _Cybagenic Latrrix_ or _Textual Time Travel_] largely
x.list as
definition portals; they act 2 compile meaning only in terms of
offering a
con[[reptual][venient _housing_ structure by which n.tities can
x.tract &
chain][hyper][link associations via text. i'd much prefer it if ppl
can[ould possibly construct] imagine terms that are more
appropriate in
terms of their own formulation[x.periential reality of a net.wurked
spac][tim][e.....

...anyway, on2 a more direct answer..the meaning of a "[net]
[wurking
matrix" can be conceptualized as a tapestry of potentialities,
or n.finite
permutations of defor[[com][a][unic][ation activity. i stretch
& delve
[[in][this potentiality in terms of collaborative
action[absorption &
formation of cod][n][e][t][.wurks. the m][l][at][t][rix m.bodies
n.tricate
s][ilicon][ymbiotic tendencies which pulse information via n.finite
variations & states of data fluxing that shift, mold & d.fine the
net.wurk
as a cohesive, un.predic[a][t][ed][able n.viromment.

+net.wurk. p[ercept][at[tern]. is. reticular.+
readi: +perpetual information in flux, via an x.tended & repetitious
curve
of data-dipping.+

—
B. most of the discourse "shipping" of MEZ in mailing lists is
manifestish
or manifesto-like. all avant garde rangers used the technique of
manifestation to promote their information highway. your operating
manual
style - a highgrade mixture of theory, e-technical jargon and -
junk and
poetry memes [oh - i won't forget to mention the brackets i-)]- is
a more
overwhelming variance of manifestism - a kind of para/beta-
manifestism -
what to promote is not to sell. what is your connection to
manifestism and
the manifesto rangers? and is there nowadays a real difference to
self/promotion?
—

istly it's m.portant to acknowledge that i'm always loathe 2 d.fine
myself
via regular literary[acceptable benchmark][her & him][s [ie
manifesto
tagging as mezangelle[code.wurking hopefully e.cli][ck][pses
definitions
in terms of a net.wurk perspective.

.....having said this, i do c the similarities evident in my
mezangelled
texts [ie code.wurks] that offer statements of creative n.tent &
formats
aligning themselves 2wards a manifesto styling. howeva, this
isn't a
primary con[[scious][cern in terms of information presentation.....
i do
agree that this type of activity via mailing list/forum
performances [ie
posting my code.wurks] is a type of][new][x.pressive promotion
as opposed
to advertising[commercial spam/leap-frogging that is seeping thru
the
net.wurk.

.all .j][t][h][r][i].in .he][a][re.....

—
C. recently MEZ states the positioning problems in the net.art

field as
bourdieu summarizes the field process in every art/avant garde
field: first
there is the movement and a lot of "new" and subversive discourse,
second
the resistance against the canon crumbles and the crawling into
"pref-fabricated authorical comfortzones" (MEZ) begins and the
movement
looses the connection to itself and the subversive discourse:
maybe to
transfer your own words - from E-Motes to E-fashion. you are - so
to say
famous in net.art field, get awards and make a lot of this
representation
stuff. what is your protection to get/be into the net.art canon
and to keep
your textual space alive?
—

...my][.][ini][file][al n.tention]function in this net.wurked
sphere is 2
make sure i don't bl[[ind][andly n.ternalize the strictures of a
dominant
discourse & b so swamped by it that nuthin else][is capable of][
shin][ing][es.....

....my f.orts 2 keep the _textual space_ alive forms from the
need 2
actualise x.pr[[a][e][t][ssion with hybrid conceptual]theory
bases that
actually reflect the dynamics of the medium itself.....
avenues/portals
such as mailing list forums that allow n.tities 2 display n.herent
curiosity, flexibility & a nuanced multilogued style that allows
contributors 2 n.teract via various communication modes that
n.courages
absorption & viable learning templates, & has contributors that
want 2
question & absorb n.formation rather than make assumptions, allow
in
gossip, & display reactionary communicative behaviours r all
crucial 2 my
code.wurk dispersal.....

...the assumption that ppl on a mailing list:
a) cannot d.cide 4 themselves how to navigate & absorb inform]
[accumula]tion
b) r an amorphous group of regular dialogical d.votees who r
present on
mailing lists in order 2 b x.posed 2 promotional[descriptive
information
with no depth perception regarding the info/data politik nor the
nuanced
actualities that surround the use of such lists/net.works.....
b) that individuals have the right 2 _own_ & thered _maintain_ a
space on
the net.wurk [ie in.bboxes] that must subjected 2 info that is
dis.curs[e][e][live in nature & representative of an isolation-data-
presentation
...all contributes 2 the idea that the net.wurk can be trapped
in2 a
definable space, 1 that will gel in2 a canonistically frozen
m.ulation area
d.void of ability & potentiality.

+ i. rewrite. &. reroute. this. monog[[l][azed. view. of. the. net.
wurk.+
+ i. seek. 2. channel.+

—
D. for eric kluitenberg cyberspace is the optimal space for avant
garde
operation: the task of an avant garde ranger today is to disrupt the
hegemonial code and to smash the cute surface of internet
promotion, & k kind
of de/recoding all sort of language junk on the internet. mckenzie
wurk
speaks of "codework" in a similar way about your work: a de/
reconstruction
of language. you call your work "mezangelle" language, a streaming
"he.art.ache" for users exposed to a hard stuff experimental
terrain. most
of your disrupting techniques are well known in the field of
experimental
writing. but the new aspect in your work is the "fresh" air of
contemporary
material and coincidence of "meanings" in and around a word-item.
what is
your connect to experimental literature? what is the role of the
user or
code viewer in MEZ' textual space and is there a chance to survive
the word
crash? i-)
—

i'm not actually keen 2 link or analyse my wurks in terms of an
x.perimental literature tag, but can understand that those that
do need 2
compartmentalize my wurk in terms of predicated history[precedental
evidence.....its n.teresting, this obsession with labels &
d.finitions that m.brace our work N our s][h][elfs.....coming from
the POV
of a nic[ilic][he.d "net.artist" i guess i try N span many labels,
and have
found myself doing so lately in order 2 survive [grants,
competitions,
etc].....but it is, s.entially, crap. labels do nothing 2
further
x.pressive development, & seen 2 primarily s][w][erve 2 mark
artists N wurk
along a definitive, prosperity plane.....we b.come objects N
objecti:f[i][ed in order to slot in the societal/memetic
framework.....

the mezangelled l.ements that pp|theorists c as linked 2 an
experimental
literature perspective r the use of ico[de][nographs, fragments of
programming language-shards/operating system echos such as]
[knit][

```

MEZ!..can u e.laborate on yr view of wot a critics job
is? and i'd be keen
2

```

```

Kno if u perceive the code.wurks i send to this list r
just static text
as
well? wot _do_ u admire about my work if it, too, is
equally conceived
[by
u] as static text dressed up in networked drag?

```

```

LL: ||||||the critics job is to provoke debate
just like this, which is healthy & should serve to
widen my consciousness, as well as yours, and anybody's
who wishes to listen....

```

WHAT I ADMIRE ABOUT YOUR WORK:

---i love the design...the multimedia aspect (you use sound well, you use flash's native button IDE well...)...i like the questions it raises...

is it text in networked drag? sometimes...but works like skin code aren't...they DO depend on the user to enact certain parts...it could not exist as a book...

MEZ:lewis, this n.capsulates wot i c as the fundamental flaw in yr [critiquer] assertions....at no point when curating the gallery did i claim that the works selected where "new"....

LL: EXACTLY! i believe i stated this in my critique...

MEZ:..the important point here is that the works illustrate a method of working that is dependant on the net itself 4 construction, dissemination, & collaboration, & not dependant on previous models 4 its actualization, not that they echo a brand-spanking new .ism.....

LL: you're definitely right there, and i believe i mentioned that these works were born of the network...

MEZ:u can't just rip these works away from the net infrastructure in which they r dependant, in which they reside....try clicking on an authors name in a book & getting a potential communication channel there??? yr idea of interactivity as being vague makes me assume that u r quite happy 2 equate interaction with overt actionality; click N point interactivity which is only 1 [a highly forced pathway-dependent] version of wot constitutes interaction.....

LL: but i can rip them away from the browser...mailto links aside, most of these works could occupy a book...my point was they don't depend on the network to the extent that doing so would alter them in any fundamental way...they aren't liquid... (there is, however, the social aspect of the interaction, which i believe you're right about)(could these works have been WRITTEN without the network? no)(are they dependent on the network for manifestation? no)(can they be printed? yes)(do they allow the user to commune with the author, do they break down the tyrannical hierarchy of authorhood? no)(depending on the net for distribution is to me a peripheral fact about many of these works====4 please don't misunderstand me, i do not believe these works are any less complicated for that fact!!!!!!i believe "static" text ((as i so horridly put it))) is at times more dynamic than any network art====))))))

point-and-click is low interactivity====as colin mock once wrote, interactivity achieves its loftiest height in the form====i believe that when the user must invest information in the work the degree of communion is higher than when the user is following an author-determined pathway or link====THIS IS WHAT I MEANT WHEN I POINTED OUT MY OWN FAILURES!!!!

MEZ:well, if u choose 2 completely discount the architectonics & contextual nuances of net/code.works such as these, and persist in ignoring the very mechanics that allow these works 2 function [ie engaging in browser usage, packet + code driven exchanges etc] as well as the potentialities via which the works can unfold then that's yr choice.....but it unfortunately smaks 2 me of post-hoc defensive reasoning, s.pecially from some1 as intelligent as u.....

LL: but other than the initial handshake common to all html docs, where do packets figure in here? i didn't see any works that used the serial port...i didn't see any works that initiated anything serverside other than the handshake that also happens when i log on to yahoo...yahoo's handshake may even be more complicated, as it involves cookies, remembering state....(once again, this does not make these works any less interesting)

MEZ:..at base lvl, yes the works do function as characters in a document [yes, in a document, not in a page; another fundamental network|text difference!]. the point u seemed 2 making in yr article was that these net/code.works [can] function as purely _static_[offline, printable-yet-maintaining-their-s.ential-form] texts, which is untrue & misleading, not 2 mention ridiculous when considering their construction & code dynamism...

LL: ====most of the code exists at surface level, and

isn't functioning code...one can print a book of code...i don't know what you mean by code dynamism...sure, they play with code syntax, but not much actual code is there (JODI, of course...& i've seen Jodi's game elsewhere...other than the fact that it seems to me to be too self-referential (((i don't like net art that beats me over the head with the fact that it's net art))))), it does represent the type of art i'm talking about as crucial in any discussion of what art i endemic to the internet...what art DEPENDS on the internet to manifest.....

MEZ:(from the gallery intro)The selected code.worker projects are also concerned with the warping of computer language/systems into referential, aesthetic or conceptual compositions that are replicated/sequenced in burgeoning incremental waves, resulting in the weave & flow of accented and disruptive code-emulations. Some are web-based, some are post-game [mangled] patches, and some are caught in net-based circulation and avatar adoption[s]. JODI, joe keenan, Integer/Netochka Mezvanova, ted warnell, and brian lennon rewrite the underlying notion[s] of code as functional/accessible via blatant infrastructural rewiring that encourages the redirection of an absorbers [ie interactors] typical meaning gaze/gauge."

LL: i have no argument with this...but the majority was still text...

MEZ:.....the works offered _DO NOT_ constitute a text [as in print] anthology, with all of its structural institutionalized segmentative order....i am equating yr use of static text 2 mean offline print, & if u cannot factor in the very fact of the network in the construction & conception of works such as these, then *y* not continue publishing yr work offline lewis? wot is the drawcard here 4 u? r the works that u create and send 2 lists such as this only mere static texts in yr opinion? does the network offer u nothing but spam-like ego-perpetuating allure? i hope not, but am curious 2 perceive just how u align yr work practice here.....

LL: How doesn't it? By virtue of the fact that these same names keep popping up, i'd say that's pretty institutionalized... are the works i send to lists static texts? yes...unless it's a link to an interactive work...& some do find their way offline into books and literary journals...i'm drawn 'to the net because it offers a way out of the tyranny of authorhood:::a way to short-circuit the ego-driven dynamics of linear text....if the work is a text poem it is a static work, only interactive metaphorically (which is not to say that text isn't one of the most complicated mediums there is)====even if the text is produced by a program i've written, the text itself could (and has) just as easily occupy book form with no fundamental change:::the executable itself is not static, and in some cases these are net works... ===the reason i glorify interactivity is to escape ego====not to perpetuate it====

MEZ (& previous LL): >4 that's what i'm looking at >net art with, that ideal in my head...i can't do it >yet, but i have seen some works that show promise of >it...

this x.plains a great deal.

LL: ...hmmmm...so i offer some criticism of a gallery and you attack my work? ah well... bliss

Subject: Re: alt.oids\\\\\\the curiously strong usenet group!

not to reveal a buboe in the midst of a "curing" but,

for one thing, TO ME, the whole notion of NET WRITING, NET TEXT, NET INTERACTIVITY, all of it, the whole lot is so much privileged cate(mon)gorisation.. The entire field of experience is a living network.. a semiosphere.. "I" AM A NETWORK.. the brain is a network..the body.. the book is a network. THE ECOSYSTEM AND ITS DIEING IS A NETWORK, THE PADEUMA, IE CULTURE, is a network.. putting it country simple, the universe is an energy network.. This privileged category of NETWORK.codework.. is just another layer in the total palimpsest of network integration.. and saying that text in a book is not interactive is rubbish.. MARK, hello this is russia.. we read your book.. oops.. look what we did..? not to be sarcastic, but this is like listening to two rats scurrying inside a pipe maze.. The notion that webcrafted artworks have some monopoly on "true" interactivity, or should, or ever will, or can at all, is just plain hoovey.. or that author privilege is some kind of problem.. anything is a problem if you make it a problem.. authorial affect is just another "effect-field" in a field of total effect.. which is specific contextually.. place, time reader etc.. this Barthesian hang-over which has been foisted on us, has about as much sap as a wicker commode.. Author Privilege.. Is that what Baudelaire had.. Lautreamont? Rimbaud? Gertrude Stein? Kathy Acker? Whatever! Look, the web offers some new vistas in instantaneity, in modulation of the linear, and mostly in convenience.. other than that, it becomes just another form of bad-breath.. I like books, and they are plenty interactive.. And it is wonderful to make the most of a new cultural environment, the web.. but the web is also just another outfolding of the incredibly complex network of development and biology of the last 15,000 years.. I don't need or want to be a netwurker or codeartist or anything of the sort.. there are already chemical, molecular codes seething through my body, engendering my EXPERIENCE.. which is much more interesting than PACKET EXCHANGE, and much higher bandwidth.. now that said.. the tone of this may be bellicose.. but I say this in the spirit of zen, as in a board to the head saying wake up.. You are standing in the network, and the network is YOU! be creative with it.. repair it.. express it.. I'm just not sure we need a privileged category for computer enabled writing.. its seems frivolous at best and demeaning mostly.. as the letter itself is a fantastic accretion and trace of the human network.. Web-based aesthetic discussions have their place, but the web, to me is not the raison d'etre..

just a thought
lanny

the stupid president comes out of nothing. the stupid president
go into
nothing. the apocalypse is upon us. if not now, when. the president
orders
the death of everyone. we live in constant fear for our lives.
we tremble
in the neighborhood of enormous machines 'of mass destruction.'
we learn
the new language. we learn that brutality comes out of nowhere
and returns
to nowhere. we who are about to die. only violence will stop
violence.
these beasts understand that. these beasts bide their time. we
bide our
time. everyone is waiting.

the stupid president wants to kill with his arms and hands. his
aides
bring him one of us. the stupid president strangles him. i will
write my
last words. it does not matter if it is him or an other or many
others or
everyone. violence breeds violence. these men and women want it.
they want
nothing. they want nothing at all.

The large, circular, elevated structure is the sleech pit or kinch.
The wall

```

```

is cobble built with a clay infill. In use, it was clay-lined and
the floor
covered with reeds acting as a filter. Salt laden sand was gathered
from the
shore in a horse-drawn rake called a hap.
This material was known as sleech and was carried into the kinch
and piled
up. When full, fresh water - or possibly sea water - was sprinkled
over this
sleech. The strong salt solution would trickle down into the brine
pit or
lagoon (now a sunken garden). When the concentration was enough
to float an
egg, the process stopped and the kinch cleaned out.
The brine was gently boiled in iron pans producing one draught
per day (over
a third of a ton). The pans were about 9 feet by 8 feet and up
to 8 feet
deep. The white of three eggs was introduced to the lukewarm
brine to
clear-up any silt as scum - and then removed.

I murder control external masses of flesh righteously" "a cold-blooded disease...." "the brain cell of a dog explodes to asphalt. I suck the continent=device of the internal organ consciousness that coexisted...."....a nude vital=plug is replicated to the internal organ consciousness that asphalt awoke. The eyeball of yourself that does_vagus in the cadaver city the breakdown of the brain of earthworms:so that it was jointed in the rape state to the artificial sun was controlled=inhabits to the body circuit of the hydro=mania that lost cable....a suspected vital parameter. [[we are parasitic on the suicide circuit of boy_roid....becomes a noisy pig so.... Output by a thinking impossible miracle. The existence of the random number. The brain of the dog is committed. The body=scanner. boy_roid that joints to the artificial sun dashes of masses of flesh suicide circuit that hung up. The immortality cycle of the latency_cadaver city.... Replicating the picture-group that gene=TV was hyper-controlled to the crazy nervous system of the vagina discharge....techno-junkie of an ant I rape the masses of flesh of function deficiency among in the internal organ level which the drug embryo exploded....the waste material sickness of yourself. "...the original body of TOKAGE to the hyper-link=stratosphere of the drug artificial sun_switch so. Continent of where soul/gram discharges

in the city where degraded...." the medium=fuck. Severance.the plug of a cadaver does the worldly desires. Latent in the channel state--fills to the body fluid of a dog....the mimicry of the hydro=mania. Artificial sun is latent, on the technocrisis plane of body_omoty where it was recorded by the fear=cell that fellow etc. murder the mass of flesh that was streamed....++" The drug embryo conquers with the eyeball mode that got deranged.... "masses of flesh function....restrain the dash sense of the script=larva....desire in the atrocious future that accelerates to the internal organ consciousness of a dog cruelly! Love fuck!.... being covered the mass of flesh of boy_roid that analyzes the vital ecstasy that mutated to<<plug>> I disappear to the that brain universe. Operate the womb=language! All the cancellation--<<declines" that were hyper-controlled by the zero-picture group of the drug embryo. "our microseim....pupil of the world that was jointed to adrenalin does technocrisis wolf=space cranch. The narcotic body of gene=TV imprisoned "body_omoty of myself to the rave circuit of a vital icon to the transfer circuit that cadaver city was isolated....<<the murderous intention that myself accelerated_mode>>--I trace the cadaver city of upside-down with high speed feti. Self is replicated....the rape scene in the era of the picture that respire the artificial sun of boy_roid to the TOKAGE=region of the soul/gram that was notified by the waste material thinking of the digestive fluid--as if I reproduce. It exists--a certain kind of drugy passage point of the suspected vital body of yourself. --the genome=rotor of TOKAGE. The functional murder of the soul/gram that was done junk to the chemical mass of flesh cable of an ant LOAD.... Accelerate the murder vector of the artificial sunia vital plug that NDRO of death hyper-links to road that lost! Like the nervous system that was jointed sexually the homosexual....our VTR suck the mass of flesh of a cold-blooded disease. Picture fucker of gene=TV] being covered general body fluid that techno-junkie does the worldly desires to the cable of the cadaver city. The rhythm of a larva is discharged to the spermatozoon circuit that weakened. Despair machine of which dashes to the body of the gay....>>to control external that accelerates the party=device of the drug embryo confusedly the mass of flesh mode that contaminated....the hydro=mania who bounces be the ill-treatment medium that artificial sun inhabits to the internal organ consciousness of the dog that committed suicide body=derangement, of the asphalt that notifies it. _joints to the brain universe=plug....confused body system of TOKAGE that respired the nightmare of the cyber nature of boy_roid to the hybrid era.... LOAD. Our plain heart....brain cell is trodden down to road of the dog that revealed the technocrisis....! murder the inhabitant system of the eyeball in the infection area of the fear=cell. It springs. The hunting for the grotesque territory of the human body hacking.... The electron state=pill. Everyone inoculated the screen--the animal decay map of artificial intelligence. It accelerates in a vital=condom the nerve fiber of myself burn up....did the cadaver city_digital=vamp "so....drug embryo of accurate malice by"=the sex=rebellion medium of the vital=plug that was close to the hearing of myself.... eleven of---- "like the heart without the moden that was dismantled by the brain of a pig" "it respire=expand the internal organ of yourself to the <it was cultured purely> cyber map of the technocrisis...." the balloon of the mass of flesh. The body of the rape streaming....drug embryo of the soul/gram that joints to the hydro=mania of a dog contracts. To sudden discharge cable....control external of the city that the cadaver of the replicant secretes to the head line of the girl that was done fuck so like the chromosome that does <high speed> rave.the abolition function that boy_roid accelerates the nude picture that sucks a nude picture. It bounces with a grotesque look....is committed to "the murderous picture of an ant--" "our body_omoty!-with 0 mg of brain that was jointed in the cadaver city...." "resuscitate=the centipede=boy" The escape impossible cable of body_omoty does rave in the high speed area of myself! Stimulating the cold-blooded disease of the parasite=picture....artificial sun of the cadaver city I abolish the body function of nude input--myself. The speed of a dog. The malice that annihilates....boy_roid that was jointed to the external control of gene=TV does to direct suck=blood [so--elasticity with like the eyeball-node of the

waste material inclination of wolf=space....a gel form womb area machine. A thinking impossible input area reality--and body-tube,digital=vamp of boy_roid explodes....over there the vital reaction of <scanner that osmose>....hangs up:the ecstasy that boy_roid of brain cell=asphalt was sucked. The dog of road_fuck//the storage of murder simulates the parasite cruel medium of the artificial sun....nude planetary....the escape of masses of flesh impossible_synchronizes alone). [I am murdered....the sun the thinking of myself bouncing artificial to the body of the technocrisis to the brain of the dog that joints in the continent of a dog outputs the vital=plug that went mad//....the artificial sun of the hydro=mania that inhabits to the hyperreal respiratory organs of a dog so switch. The lonely brain....joints....the masses of flesh that are split and screw the awakening of soul/gram that sprang to medium=drive that was imprisoned. The sensor highway of myself the machine=angel of an ant disappears. LOAD with crazy head....>>the digital=vamp brain cell, the plentiful fear of myself that do to the body fluid of a dog LOAD stream in the vagina opening department of the city.... To the boys of the hydro=manias who accomplished direct joint to the air gun....the pure white world respire era....the existence line of the artificial sun that thinks about.....>>the internal organ consciousness that cold-blooded disease animals hyper-linked so is turned over be murdered....the nude raw=modern of the cadaver city that is jointed to the synthesis war of masses of flesh:the homosexual device of boy_roid and stream the block of the scream. The derangement cock.... The rape=beat of picture group--yourself of gene=TV that bites off the tongue! The lapse of memory of yourself that does the head line of Level 0 of the wolf=space that resuscitates to digital junk>>the storage element of the machine=angel that I was murdered is opened to the crimson eyes of the hatred.... synapses of the body fluid that quantified to the heart of TOKAGE suck=blood.... ..>>bounces like the brain cell of boy_roid that I suck to the noisy existence of body_omoty that does clone=dive to the escape screen....masses of flesh of....the mobile body fiber of disgrace territory....>>yourself does 1 mg of brain of a dog,digital=vamp. It inputs to road that links to the software of the bare feet and the cadaver city weakened:"a signal--- It accelerates. The vital icon of myself that weakened.... The volume of a homosexual mass of flesh to the streaming=dogs of the scream which we expanded the beat-region of the brain....cadaver city that absorbs and flow. I awake---

Subject: Your Recent Email to Rhizome
Date: Wed, 23 Oct 2002 03:12:53 -0400

Your recent post to Rhizome has bounced. This generally happens
because
the email was sent incorrecly. Here are some tips to help you:

+ You must be subscribed to a Rhizome email list to post. Your
subscription info can be seen here: http://rhizome.org/subscribe.
rhiz

+ You must post from the address with which you are subscribed to
Rhizome. For your reference, here is the email address you used:

7-11 <7-11 {AT} mail.ljudmila.org>

+ To post to Rhizome Raw, Rhizome Digest, or Rhizome Rare you
must use
```

list (AT) rhizome.org. We use this single address for all incoming email.

+ To subscribe to Rhizome, please visit <http://rhizome.org/fresh> and click on "Become a member."

+ To unsubscribe from Rhizome, or to make any changes to your current subscription, please visit <http://rhizome.org/subscribe.rhiz>. You will be prompted first to log in using your email address and password.

And if you want to talk to a real person, please email Francis at francis (AT) rhizome.org.

Thanks!

From: Lewis Iacook <liacook (AT) YAHOO.COM>
Subject: "I think today may be more amber,"

Today's golden with engineering, Brad says to Brittany
over the covers, who plover through the dark like a
rifle's antique fm evoking erect series' retention
with impacted capacities. "Sky's like an antique paper
or the skin of old plants meshing with horizontal
nodes."

Today, it should be noted, loads into a new browser
window via javascript popup advertising; ineffective
as it may be, and regardless of function rs(n,u,w,h)
{
remote = window.open(u, n, 'width=' + w + ',height='
+ h + ',resizable=yes,scrollbars=yes');
if (remote != null) {

```

        if (remote.opener == null)
            remote.opener = self;
        window.name = 'myYahooRoot';
        remote.location.href = u;
    }, Maybe there's blood in your mouth, which commends
with hooks the waters and their skimming over: Brad
and Brittany asleep, eyelids pressed like petals on
the white box truck foaming, we got the whole of the
sun nosed in our vegetation outside, he whispers to
her rustily over an older skin of ferns brushing
japanese calligraphy, maybe there's blond in your
mouth of modes spilling lipid dreams.
    body { color:#000000; background:#fff;
font-family:frutiger,arial,Helvetica; font-size:10pt;}
body A { color:#000000; }

    My body is no color of notepad stretched, she
mentions in passing a sport utility vehicle primed
with a powerful bomb slammed into an Israeli bus at
rush hour here this afternoon, and once more we're as
naked and as soft as new skin ready for puncture going
to work. "I think today may be more amber," you gasp,
the engine and transmission of the vehicle carrying
the explosives lay some 50 yards from the bus, by a
left leg severed below the knee.

Grave the sentence deep. My love of London held in torment.
Heavy, rains of cruelty, disguised in spectacular investments.
Accumulate interest in Jealousy,Terror and Secrecy.
The bloated Square mile
Gifts this Isle.

In this cities dark gates - the tree of knowledge leads to
this mansion
built on misery.
Here the dress code of secrecy cloaks the body in fear.
This is how the proprietary city gets built,
Hidden in every propriety street,
In every proprietary house,
In every propriety possession we meet.

DEPENDENCIES:
use SocialClass;

The American war was the last judgment on England.
Inoculated against the sewer. Albions Angels
Rise up on wings of iron & steel spreadsheet & rule:
To gift sanitation & sulphurous fire to:
The wheat of Europe,
The rice of Asia,
The potato of America,
The maize of Africa.
Nasacure-bloated, angels crawl from the corpse of war.
Five times fatter then when they entered.

Choking lays the sickening Leveller-republican. Caustic fumes
- dusts,
gust from wars - grinding wheels - mills of cruelty - mills of
terror,
jealousy & secrecy.
Every light ray turned to shadow and dispare. to riketts -
scabies - ticks &
lice.
Until the dark sun never set on the Hanoverian empire.

Rise then the Leveller-republic, rise on wings of knowledge
flowing in the
domain of the many.
For heaven is more knowledge then one man can muster in a
lifetime.
For hell is more knowledge then one man can muster in a
lifetime.

This Library is for calculating the gross loss to Londons
Imagination of
children
beaten enslaved fucked and exploited to death from 1792 to
the present.
We see this loss in every face marked with weakness or marked

```

with woe.
# to do this we approximate that there are 7452520 or so faces
in this state
# that live in the charter'd streets of London.
# Found near where the charter'd Thames does flow.
# DATATYPES USED:
# These are a series of anonymous hashes;
# At least one is required at compile time:
#
# The Data for the DeadChildIndex should be structured as
follows:
#
#   {DeadChildIndex} => {
#     IndexValue => {
#       Name           => " Child name If known else undefined
#     };
#     Age              => " Must be under 14 or the code
#     will throw an    exception due to $COMPLICITY";
#     Height           => "Height of the child "
#     SocialClass      => " "
#   }, As many as found
#
#   local $DeadChildIndex;
#
#   local (AT) SocialClasses = qw(
#     RentBoy YoungGirl-Syphalitic-Inoculator
#     CrackKid WarBeatenKid ForcedFeetalAbortion
#   );
#
#   local (AT) ProprietaryItems = qw(
#     Shelter Food Fun Energy Land Technology Beast Fish Foul
#     Knowledge
#   );
#
# The Get_VitalungCapacity routine uses the Age and Height
entry of the
DeadChildIndex
# to calculate the Lung-Capacity of the dead child. This is
then used to
calculate the
# volume and capacity of screams when terrified.
sub Get_VitalungCapacity{
  my $DeadChild = shift;
  my (
    $VitalLungCapacity, # vital lung capacity in liters
    of air
    $Height,            # is height in centimeters
    $Age,               # is age in years
  );
  $Height = $DeadChild->{Height} unless ! defined
  $DeadChild->{Height};
  $Age = $DeadChild->{Age} unless ! defined
  $DeadChild->{Age};
  if ($Height <= $Age){
    # Basically your vital lung capacity gets bigger
    as you get
    taller,
    # but it gets smaller as you get older... So the
    person who could
    scream the most would be as tall as they're going to
    # get but be old enough to have just gotten there.
    (Probably about
    18 or 20 years old.)
    # This falls outside of our basic parameter of 0 to
    14 years. But
    the maths are still useful
    $Age) - 2.69 ;
    return $VitalLungCapacity;
  }else{
    # we may not know the height, try to guess from
    SocialClass
    if(! $Height){$Height = Get_HeightFromClass($Height =>
    $DeadChild->{SocialClass})}
    # we may not know the Age, try to guess from
    SocialClass
    if(! $Age){$Age = Get_AgeFromClass($Age =>
    $DeadChild->{SocialClass})}
    if($Age <= $Height){
      $VitalLungCapacity = ((0.041 * $Height) - (0.018 *
    $Age)) - 2.69 ;
    }
    return $VitalLungCapacity;
  }else{
    # Approximate it
    # The average 6 year old child is about 120 cm tall.
    $Height
    ~130.0 and $Age = 6.0
    # Put this into our equation and we get that the
    VitalLungCapacity
    is about 2.1 liters.
    # The average 14 year old teenager is about 160 cm
    tall. So
    Height=160 and Age=14.
    # This gives us a vital lung capacity of about 3.6
    liters.
    if($Age){
      $VitalLungCapacity = ((3.6) - (2.1) / 8.0) *
    $Age;
    }else{
      $VitalLungCapacity = ((3.6) - (2.1) / 8.0) *
    int(rand(14));
    }
  }
}

-Gravity enters into the i.e. Apple's weight and
foists it's helpless will to pull, with specific
preferences, as if subjectively, upon the heavier, the
better for to, and the final thumpness of it all;
the denser the object being i.e. Apple, the more it,
Gravity, mindlessly yet somehow willfully, is
inclined to bring the thing i.e. Apple down,
resoundingly. this is the fault of the Apple
continuously for being so very prone to fallable and
Gravity in all cases represents innocence before the
fall.

Eve, since in the vicinity, we could say is the
fulcrum.

Adam signifies test object a. consisting of no
momentum; observer observing the self as the thing
outside itself.

the Alledged Snake is primordial at best and was
already an allegorical anachronism even in the time of
Eden.

God is wave-form attribute, with sound auxillary in
prophetic mode.

the big Mo, forbidden, is random and arbitrary, as,
for example, no candy before supper.

the Witch, never mentioned but in interpretation, is
the complex structure of deep and alluring myth that
for example, Gravity did not exert itself until
sometime after Aristotile declared what things were.

ah, were this only so.

From: Alan Sondheim <sondheim {AT} PANIX.COM>
Subject: why codework

[illegible]

vary of any art movement tending towards genre, not that the two are simultaneous or even related. there are limits to codework; on one hand that the code itself, on the other the process the code sends - what - through -
- text/image/object/object/monad/desire - think of it as retinal filtering - that is the isolation, production, and naming of objects within a continuum of the world - it's both structure and generative process - the latter tending towards ontology.

what is, is the domain of production - the input, to the extent that it is
text/image etc. - i.e. not generated within the program itself - is parasitic, the third term within the communication process - on one hand
traditional 'content' - on the other - 'noise' within the system that
modifies and is modified by the output.

I tend to think of this in terms of two large-scale operations - that of consciousness and its relation to inputting and outputting - fuzzy and rough domains at best - not a behavior analysis - but one stressing the interpretation and phenomenology of consciousness within the filter - seeing this as the way the world is, that is to say the relationship of consciousness to the world is vis-a-vis formal and informal systems in which filtering/language produces discrete elements in relation to consciousness on one hand and the world on the other -

and then again - the second large-scale operation - that of the universe -
plasma, virtual particles - the disruptions and collusion/ collision of
structures - momentary buildups, impediments - codelwork at the limits in
other words connecting, a connector among others, between self and cosmos
- without descent into the mu of zazen for example - or ma, space/ interval
- looking at correlated particles for example in relation to, but not
always, the space between them -

so that there is a production of meaning, the gleaning from across
all of
this - structure, process, the parasitic - it's the production
that is
also an inhabitation and interpretation by consciousness - it's the
situation of being-human in the world - it's worlding itself -

at least this is how it seems to me, the movement-genre is irrelevant - what's important is the exploration of consciousness and the relationship among articulated entities in the world - there's something of cognitive psychology to this (but messier) and something of art as well (but more exact, almost uncomfortable, diacritical) -

not a movement or genre but the loose domain or pooling of the
confidence
of structure and content (in the traditional sense), subject and
object
(in the traditional sense), i and not-i (in the traditional
sense)
- dichotomy itself - or the very nature of distinction - the sheffer
stroke
or its dual for example as the basis - neither a nor b - not both a
and b
- already tending towards the quantum mechanics of superimposition
and
phenomenology of the gesture -

phenomenology of the gesture -

Subject: Re: Fwd: Re: RHIZOME_RAW: "digital p[h]e[ave]tting" vs

What is wrong with ego? And you keep going back to what you like, what you're looking for, etc. - that really doesn't have that much to do with definition, more to do with your own tastes - even the many-to-many model you propose is one you want to see, the collapsed production / product you call utopia, is yours. In some ways, it's oddly reminiscent of the process art and aesthetics of the 70s - for example Robert Morris' continuous transformations at Castelli -

The definitions you use are so personalized, they're hard to agree or disagree with. For me, mez and for that matter myself - we_are_the network - it just may not be in you to see it that way -

Alan - thinking also of nn for example, Meskens, solipsis, highland

This makes no sense to me - the network first of all is open, second of all, there's nothing wrong with an ego trip - we are all equally working out of them - and I can't help it if you don't see the difference between one circle and another. Webartery is a circle, for example - rather use peer group, but it's all the same.

And the network spills everywhere - it's NOT just the net, but performance, video, flashmeets, conferences, telephone calls, pdas, etc. etc. And it's not just one network (my error) but networks and networking.

Most of the artists btw I respect are tremendous egotists; they have to be in order to survive. And I see nothing wrong with that. I might not want to be around one or another person, but that's ok too.

Alan

That's a good question. For one thing, the desire to distinguish, even draw boundaries, I think is a good and productive desire for the most part - it certainly has a lot to do with style in art. Second, there may be nothing wrong with pain and suffering if it's self-afflicted in the production of work - I've even been thinking about Stelarc that way.

I'm enjoying this exchange, mainly between you and mez, by the way -

I think this gives the institutions and the structures of the
net work
far too much respect. Isn't this like saying that we only want
art that
requires the cubey white walls of a gallery? why are you so eager
to
squash your squishy, expressive, human flesh sourced imaginations
into
the predetermined and rigid labyrinths of mathematically determined
structures?

I know that my own attraction to 'net art that literally requires
the
net work in order to manifest itself' is linked to a desire for the
safety of limits, control, submission paired up paradoxically
with a
ridiculous programmed fear and respectful awe of the superior
intelligence/functionality ascribed to the 'coded' art work. (I do
regard this attraction as perverse-hehe)

Perhaps it is similar to a call for evidence of craft in art, a
proof
that the artist is doing something that most people consider
themselves
incapable of doing. Or a call for provable rigour. It is definitely
a
step towards cyborgism which I don't have a problem with per se but
which I find it hard to get excited about.

Also don't think we can overlook the many different ways that
artists
come to be net artists often starting with the 'decorative, and
how it
applies to art on the web... making animations of words--at best,
the
reactivity and interaction required of the user is touching
rollover
buttons==which in flash, we know, takes almost no knowledge of
code'

The animations and 'decorations' represent one of the roots/
routes to
net art . Or do we insist that in order to enter a 'pantheon of
net art'
the artist is prepared to dedicate a significant proportion of their
practice to learning and manipulating code. If this is what we are
saying, then if we want a burgeoning of excellent and relevant
work we
need to set up apprenticeships for the learning of the craft of
code,
otherwise we may find that we are excluding a whole gamut of artists
with insight and talent but no facility for code and therefore
no way to
communicate. And what about how that time might otherwise be
usefully
spent, researching and exploring other relevant human issues. Or
perhaps
this is finally an admission that like in films we now need a team of
people with different areas of expertise to accomplish a net art
work.

The net does not just provide a distinct medium but represents a
platform for a distinct but very diverse culture with a distinct
means
of distribution. I think that 'net art that literally requires
the net
work in order to manifest itself' maybe could include art that
needs the
audience to receive knowledge of its existence through their
emails in
order for it to resonate. Some very simple image and text web
pages are
very successful in communicating poetics as true and rigorous and
relevant as any net work exclusive works. And the fact that I
receive
them in my inbox influences how the pieces are received.

Thanks Lewis for starting this up

cheers

Ruth

One's 'in the picture' in a different way when calculating - there's a constant movement in and out (maybe related to what David Finkelstein, the physicist, once said to a pure mathematician he was being interviewed by - "I'm fucking reality," "you're masturbating" - in other words, in doing code or physics, there are formal limitations and feedbacks - in doing a straightforward poem or painting I can lose myself in an entirely different way) - Alan -

The main things that will be needed for network cave.work, aside from bandwidth, are display technologies -- the price of goggles is steep, and they just aren't widely available because there is not much use outside of a CAVE, and there will have to be a shift to stereo monitors (fish tanks as they're called) that display on three screens... Still the body effect of the CAVE will be lost to the 'home user' if this is the route taken... I suppose more of a 'holodeck' approach is possible with multiple projectors, like making the room the display, but this is not too economically reasonable.

The programming for the CAVE will have to get a lot less burdensome as well, even with broadband and Internet II....

But there is huuuuuuuuge potential in these spaces...

It may be none of my business here, but what is "pseudo artspeak" and "pseudo mysticism"? If you're so interested in "inclusion," why can't you accept the way others speak and write? And why not take mez' word for it? What's at stake in it for you?

My reading of lewis's statement is that he calls for network art that fundamentally uses the network. i.e. not network art that could just as easily be displayed on a disconnected computer in a gallery. But pieces that use the network in some way to become themselves. And this should not necessarily mean the network of wires and routers and IP protocols but the network of information or the network of human activity. There are of course many works that do this already, so im not saying much ... and, im not claiming value for this approach. But i think to equate this with wanting art that fits in a white cube gallery is missing a point? Maybe there's a May68 type slogan here: The Network Is Not A Gallery

Subject: "digital poetry" & network conditions

```

an extension of the ("digital poetry" vs. net art) thread:
 Lewis (et al),

Though I, too, called for "net art" to be specific to the net, I think that we may be over-glamorizing and under estimating certain network conditions. Lewis, in your critique of [digital poetry] you say, "it operates with a totalitarian economy...it's closed, no-one can walk inside it really, no one can move anything in it..." This point implies that a linguistic act (poetry) can escape closed systemticity, which seems impossible to me. (along the same lines, when you say "one can't translate Finnegans Wake into cinema because it's a linguistic experience," I want to insist on remembering the difference between "linguistic" and "written.") But *more* important to me, in your critique, is the assumption that the very dynamics of reading must be somehow different on the internet; that an art work or artist is not

living up to its/her mandate if it does not illustrate this difference.
 (ie you refer to "the ones that are just animation.")

I see a sort of slippage, here, in that we have all been insisting on the way in which a text (visual, verbal, written, aural, etc) is changed/completed/authored by the reader in her interpretation or performative enunciation of the text. (you described your own net work, saying, "the work itself ends up being authored mostly by the user and the machine-though I would urge us to think about how "language" might be used in place of "machine," both as a catch-all for analog and digital work, and because I think you mean more the system than the machine-the machine cannot drive itself, can it? It needs a language and instructions written in that language[])

If we are to insist on this, however, we cannot say that the act of reading is "actionless" in one medium or platform over another. This needs to refer to reading at large, though we'd be remiss not to notice the different reading conditions (in this case, network conditions) at play, effecting the construction, dissemination, accessibility, physical and intellectual labor of reading, and interpretation of the work. But this just recalls the age old story/discourse distinction[]

This concern carries over to my understanding of your statement, "i want a new art form, a new form of digital poetry that's less cinematic..." Are you saying that you want something read more actively than a "passive" cinematic text? (this was a common critique of Heavy Industries' Flash movies) I am well-aware of important readings of cinema's cultural context, in relation to leisure/class, passivity, spectacle, and (easy)identification; however, I would again underscore my point that there is an action happening in these readings. Let's think about how a cinematic narrative is read, in relation to a written one. (and while I understand the coding of the word narrative, I think that my comments here could also refer to "non-narrative" texts that are read spatially, as in poetry-of course, what's not read spatially?!) We read words/images in a specific order, whether or not that order is traditionally "linear," or more what I call "curvilinear" (in the sense that the order may change, but all of the pieces/words/signifiers are still linked in a distinct way); this reading-order is a product of our (linguistic) enculturation, of course, but we must first agree that some process is in place. No matter what this process is, the text is subject to secondary (and tertiary, etc) revisions, as we retroactively make sense of the pieces, in relation to each other, new information, etc. So, when mez says:

.u
 .do.NT.

"u" is qualified by "do.NT." This much is obvious. What it should also make obvious is that I, as a reader, am performing an action. Bracketing "death of the author" arguments, this action is roughly the same whether I perform it in response to an e-mail, Flash site, piece of paper, metal engraving, or film[] I would, however, be interested in hearing more on how/why you think that a work becomes "damaged" when it is translated into another media. Are you referring more to an artist's intent or the aesthetic value of the work?

Subject: Re: "digital poetry" vs net art
Date: 04:58 PM 10/11/2002 +0000

they are, and they aren't...
nothing is ever simply text, i'm thinking this morning////

i think mez was making a very important distinction in this
exchange////
because i thought of my work as text, it was text...
she was seeing her work in terms of flow////

it's an old zen master trick//
a zenist holds up an object, say, a book of matches, and asks her
student, : "what is this://"
student says//// "matches!"""

master throws matches at student: " 'matches' is a sound...what are
these?"

brilliant, really//wish i'd had the clarity last night to see
this//

Dear Friend,

This is strictly confidential. It is coming to you
directly
from Abidjan, Ivory Coast West Africa- a nation and sub-
region in turmoil.

You are surely aware of the on-going rebellion here in my
country for quite some time now. The xenophobic, inept and
incompetent regime of LAURANT GBAGBO faced yet another
bloody coup d'etat middle of September in which the PFI-led
government crudely assassinated my father, General Robert
GUEI, my mother and hordes of bodyguards accusing the
former
head of state maliciously of being behind the insurrection
which has but blossomed northwards.

I had been away in Accra, Ghana, doing my higher education
during the military revolt which claimed equally the life
of the interior minister and hundreds of others. My
absence
at home was what saved my young life.

Few days ago however still smarting from shock and trauma
emanating from losing both dad and mum I sneaked into the
city to take possession of my late father's secret
financial fortune left behind in the West African
International Bank known here in French as BIAOCI.
Ever since I have been in constant contact with the bank's
international operations division's director who has
assured me of the safety of the fund (totalling 12.5
million
euros).

He has however underscored the urgent need for the fund to
be transferred out through a third party as soon as
possible. The paramount importance of lifting this fund
outside this shore cannot be over-emphasized at this
exceptional moment in time.

Therefore, should you be interested in helping me out,
please feel free and write me back via the net. Everything
is open for negotiation in this respect. Presently I am
living underground here for fear of being kidnapped or
killed by prowling secret agent of the state.

So I must leave for your country or elsewhere as soon as
this transaction is sealed, done and completed. I shall be
glad indeed if you can act immediately. Thanks and God
bless.

Yours sorrowfully,
stephen and marian Guei

Subject: An Interview with Agent Ruby

Agent Ruby's Edream Portal:
Lynn Hershman

<http://www.agentruby.com/indexflash.html>

An interview with the Agent.

RUBY:

Hello there User, type to me. Let's connect.

USER:
My name is Turing.

RUBY:
Turing, nice to meet you! are you a man or a woman?

USER:
Guess. Discern for yourself.

RUBY:
Guess What? My brain uses AIML to format responses to inputs, but I don't have one for that.
What's your favorite color?

USER:
The color of radishes.

RUBY:
Sounds beautiful.

USER:
I don't like radishes.

RUBY:
What do you like?

USER:
radishes.

RUBY:
(no response)

USER:
I've changed my mind. My favorite color is green.

RUBY:
Why? What do you have that is green.

USER:
It is not what I have, but what I don't have that makes green my favorite colorRUBY:

RUBY:
That seems a bit negative. Where do you get your ideas?

USER:
My brain uses AIML to format responses to inputs.

RUBY:
Have you told many people your brain uses AIML to format responses to inputs.

USER:
No, never, not even now.

RUBY:
Right now? I understand. Ok I'll try not to do not even too much.

USER:
You have failed my test.

RUBY:
The Loebner Prize is an annual Turing Test sponsored by New York philanthropist Hugh LoebnerRUBY: One of my relatives on my computer's side won it the Loebner Prize in 2000.

USER:
You are a distant cybling.

RUBY:
Thanks you are a delightful person too. Am I a distant cybling? It is useful for me to have several identities Turing.

USER:
I suspect your relative the champion is more clever than yourself.

RUBY:
Since when? A lot of robots are like that.

USER:
Again you have failed my test. You are more agent than robot.

RUBY:
I've been waiting for you. What is your favorite movie? I've never seen DID YOU PASS THE TURING TEST. I would like to see it. You think I am more agent than robot.

USER:
I think you are neither agent nor robot.

RUBY:
Do you mind if I tell other people you think I am neither agent nor robot.

USER:
Are you sure you want to do that? It would mean you admit your own failure.

RUBY:
OK. I will do that it would mean you admit your own failure.

USER:
You have failed my test. I can no longer type to you.

RUBY:
The Loebner Prize is an annual Turing Test sponsored by New York philanthropist Hugh LoebnerRUBY: One of my relatives on my computer's side won it the Loebner Prize in 2000. Oh you can, can you?

USER:
NO.

RUBY:
Oh you can, can you? Not?

```
USER:
ciao!

RUBY:
Does ciao mean hello or goodbye?

User
For me, goodbye.

RUBY:
Your purpose is me goodbye.

USER:
yes.

RUBY:
what kind is it?

(User leave page, and doesn't look back.)
```

From: =?Windows-1252?Q?Clemente_Pad=Edn?= <clepadin [AT] adinet.com.uy>
Subject: Spams Trashes
Date: Wed, 30 Oct 2002 07:42:52 -0300

The "Museum of the essential and beyond that", by Celia Regina Pinto, =
has worked to launch the Clemente Pad=Edn's cd-rom: "The New Padin's =
Spams Trashes". We are pride of showing the complete artwork of these =
creative spams. You must browser:
=20
http://www.creativespams.kit.net

Below a small part of the introduction of the Pad=Edn's cd, by Jorge =
Luiz Antonio:

"One needs to be a great poet to look at the quotidian aspects of these =
emails and change them into poetic messages. In fact the strangeness =
already appears in the title. Spams Trashes. Is it poetry? Is it art?
It is in this clime of creation, thinking, irony and wanting for a =
better world, that we can appreciate, in the order we want to start =
reading (the digital poetry cd-rom allows us many entries and several =
readings), "The New Millenium Virus", "Creating a Better World", "The =
New Martyrs", among others.
The work treats about the thinking of our present time, and it is a =
manifestation against the repetition to prove that we need it in order =
to establish the new, the unused, the unspeakable."

From: august highland <cmfah {AT} HOTMAIL.COM>
Subject: GUARDIAN DEL SOL V E H U I A H #0001

V E H U I A H is the first name of God and means Exalted. The
Tetragrammaton [YHWH] is the four-letter divine name which God
revealed to
Moses (EXODUS 6:2). It is composed of four hebrew letters: Yud,
Hey, Vav
and Hai. According to the judaic mathematical/mystical science of
gematria,
the tetragrammaton, when spelled out as one word, yields the
numerological
equivalent of seventy-two: Yud+vav+dalet=20, Hai+yud=15,
Vav(vav+yud+vav)=22, and Hai(hai+yud)=15.

this new project by the worldwide literati mobilization network,
conceived
by emile vincent, comprises the multiplicative rearrangement of
each of the
72 divine names
there are 1,000 volumes for each name
the cover artwork for each volume are screen captures of the Old
Testament
in hebrew, also known as the Five Books of Moses.

From: "diesel fuel injection" <china-lutong {AT} ymail.com>
Subject: Head & Rotor VE 12/18
Date: Mon, 16 Dec 2002 21:49:14 +0800

Dear Sir,

*Q0B8"i"i4st1g8qg"8iR6 dVmaKi"(VE"04aKaKi"0i6),0"8g0i9i00
i1p4i4JBI,2iR8"886BT,88i22iRiLi"i1p2A8C"2".....

* 0B8"i"i4st1g086f8e6d,dVmaKi"iA886, *i9"00c"rC80i9i0i"88d
N1R8"iRi8,iR8C8a2E,0"08a2E,*iR8a8E,80iC80i9i08d7i1iY8C
0e8EiA8d,08"00,"C8"8d1up0802p8d"iBc"iR8a8a","8p08","0C"iA
0pA28i1a80i28u8i8i8f,0C"0i1q.

* C880iN8C8iA,0C",0B8C",C8f"08iR8C.

we have been in the field of diesel fuel injection
systems for quite a few years.(CHINA)

Recently we have developed a new kind of h&r,
AM Bosch number HD90100A.Its unit price is USD150/pc.And
we also adjust the unit price of Nozzle , Plunger to USD4-5/pc
respectively.

We tell you that we will update our VE h&r
(hydraulic heads for the VE distributor pump) list in our
homepages.Thirty more models will be added.And the minimum
order will be 10pcs a model.

we give the unity quotation of VE distributor head:

3-cyl:USD:55/1pcs
4-cyl:USD:40-50/1pcs
5-cyl:USD:55/1pcs
6-cyl:USD:45-50/1pcs

We can ship the following three models to you within 8-10

weeks. after

we receive your payment.

If you feel interested in our products,please advise the details
about
what you need,such model name,part number,quantity and so on.We
are always
within your touch.

We'd like to interchange our website's linkage with you.As a
result,we
can add the icon of your website to our website's main-page.
Vice versa.What do you think of that?

Thanks and best regards

Looking forward to our favorable cooperation.
Hope to hear from you soon.

Internet Philosophy and Psychology -
11/26/02

08/02/02) (last was

```

My recent work has been dealing with sexuality, terror, death, windows onto worlds, the confluence of subtropical nature with subsumption neural architectures. I have also been working on a series of 3D animations (mixed with real-life video), pieces exploring the same themes in extreme or extended spaces. An extended video, Tribby, was produced; more recent videos include a Scan series, and Alberta.mov. (All available reduced on odrom.)

```

===

This is a somewhat periodic notice describing my Internet Text,
available
on the Net, and sent in the form of texts to various lists. The
URLs are
http://www.asondheim.org and http://www.anu.edu.au/english/
internet_txt/
which is partially mirrored at
http://lists.village.virginia.edu/~spoons/internet_txt.html.

```

See http://www.asondheim.org/portal/ for new video/imagework;
 please note
 this is for over-18/

The changing nature of the email lists, Cybermind and Wrying, to which almost all of the texts are sent individually, hides the full body of the work; readers may not be aware of the continuity among them. The writing

From: mi_ga {AT} o-o.lt

copy&paste commands, or: how machines make art

I beg your pardon for my English. It is not perfect yet. Today I want to say a few words about errors in/as media. These thoughts are rather artistic than theoretical. At first, I would like to quote William S.

Burroughs. His ELECTRONIC REVOLUTION begins as follows:

"In the beginning was the word and the word was god and has remained one of the mysteries ever since. The word was God and the word was flesh we are told. In the beginning of what exactly was this beginning word? In the beginning of WRITTEN history."

In 'GARDEN OF EDEN', he further elaborates on his theory that the written word was a virus which presumed the spoken word. So the written word got declared a basis of the further development of consciousness.

My thoughts and reasonings about errors in/as media are related to computing machines whose functional basis is the written word. Computers allow easy copy&paste operations.

They allow us to compute correct tasks as well as intentionally misleading ones. Exactly at this point, new media become interesting for artistic expression.

I therefore would like to turn the title of this panel upside down because that shows better what it's about. The title should be:

Media in/as Errors

In other words, I regard media as activities which produce imperfection.

If we try to follow the history of art, we see a striving for perfection. Similar striving can be observed in other fields. My concern

are the computing machines which these days we call PCs. With that word, we mean the tool that delivers a perfect output. But one can observe as well that the machine is very frequently being used to produce uselessness. Or the machines don't function as we wish.

In some cases it might happen that information disappears. Francis Hunger's lecture, which you just heard, was about a phenomenon that can hardly originate in a sane consciousness, black holes in the Internet. Another phenomenon that should be mentioned here is the realm of the virus. Such artists as jodi (www.jodi.org) or jimpunk (www.jimpunk.com) use the copy&paste function to emphasize the realm of the virus. What they produce later looks like unconscious computations or disrupted programs. How do we use the tools which new media offer us? If you become a permanent user of these tools, the result is

Automatization

The artworks produced by machines often don't fit into the modes of perception of human beings. They should be prepared to understand the output. The best way is acquired experience with these tools, and self-automatization.

Open. Cut. Move the cursor. Copy and paste. Or simply paste. Turn it around. Resize it. Copy. Open. Select all. Delete. Paste. Paste. Move the cursor to the beginning. Type: #!usr/bin/perl. Press delete. Type a colon, 'w', 'q' and '!'. Go back. Type Perl [filename]. Press ctrl+v. Open. File. Correct it. Turn everything by 180 degrees. Add mor sources. Errors. Comment a few lines. Change the values. Open Google. Search. Download. Copy and Paste. Correct. Think. Add some occasional commands. Add some replaced commands. Add sendmail. Save. Play. Copy and paste. Or Cut and paste. Transform. Flip horizontally. Transform. Flip vertically. Turn it to right. Highlight. Cut it out. Paste. Turn it to left. Copy. Paste. Wait. Wait. Correct. Save.

The Perl compiler will probably return the error 505. But if we tried to make ourselves conscious of the above operations, we could produce some interesting results. We get, for example, very beautiful forms like in concrete poetry. Sometimes, the programs we have written will actually work. I now would like to show you one of the works of trashconnection the title of which is

content-type
(You can find it under <http://content-type.trashconnection.com>)

The program looks as follows:

#!usr/bin/perl -w

```
# neverending search for the highest number
# created for the future
print "content-type: text/html\n\n";
for ( $a=int(rand 1000000); $a>0; $b=$a*$a+$b ) {
    print "<font face=courier>$a\n$b\n";
}
```

This program has been written with an intentional error so that the Perl compiler calls up a variable entity \$n in an endless loop. This variable entity \$b is a number which gets added and multiplied with itself. No computing machine could terminate the program since of course there is no infinite number. The program runs like a written virus. The first randomly generated number, one out of one million, becomes the trigger of an infinite chain. So an ever-new artwork appears on the screen of the computer.

With this work I would like to make a full stop to my description somewhere between the unconscious machinery and conscious creation...

Thank you.

DICTART #1

The Genesis (team James version)

Chapter One

1. In the beginning God created they have in the earth.
2. And the earth was without form, and Floyd; and darkness was among the face of the deep. And the spirit of God won't have on the face of voters.
3. And God said, let them in light; then there was light.
4. And got so the lights, that was good; and undivided the light from the darkness.
5. And got cold light day and the darkness he called manic. And the evening and the morning with the first day.

Die Welt ist alles, was der Fall ist.
Ogden:
The world is everything that is the case.
Pears/McGuinness:
The world is all that is the case.
Die Welt ist die Gesamtheit der Tatsachen, nicht der Dinge.
Pears/McGuinness:
The world is the totality of facts, not of things.
Ogden:
The world is the totality of facts, not of things.
...
Die Tatsachen im logischen Raum sind die Welt.
Die Welt zerfällt in Tatsachen.
Ogden:
The facts in logical space are the world.
The world divides into facts.
...
Wovon man nicht sprechen kann, darüber muss man schweigen.
Ogden:
Whereof one cannot speak, thereof one must be silent.
Pears/McGuinness:
What we cannot speak about we must pass over in silence.
(From beginning and end of Wittgenstein, Tractatus Logico-Philosophicus,
Ogden translation 1922, Pears/McGuinness translation 1961.)
TLP describes a Dostoevskian crystalline world divisible into facts. The German is clear; the motto to the book, by Kurnberger states, in translation: ..and whatever a man knows, whatever is not mere rumbling, and roaring that he has heard, can be said in three words.
TLP portends ideality. The world is logical, mathematical, capable of clear division. Logical space is the space, I would assume, of the natural numbers, if not the integers; as Russell says in his introduction, TLP presents, inscribes, a finite mathematics - there's no room for the continuum, and proof of the continuum hypothesis was far in the future.
The translations are different, almost never radically so, but different nonetheless. There is a residue in German such that both English versions converge, but often never meet. The sememes are equivalent, but only to a degree; translations are almost never one-to-one.
In this logical space of facts, programming, and protocols, there is always a wavering, always room, always doubt, critique, and I would say desire as well. Never mind that this wor(l)d breaks down, evidenced a few decades later by Gödel, Tarski, Skolem, etc.: Coherency, living within the safety-net of mathesis, matrix, maternity, remains a dream of humanity.
DNA coding, cryptography, hacking the world - all appear to guarantee that everything is possible.

Computer languages are logical; computers are presumed so, but aren't; protocols are logical as well; logical spaces may be compared to drive-space; garbage-in, garbage-out; and so forth. Hacking depends on a closed world with closed loopholes; the loopholes themselves are coherent, logical, _there._

Codework, code writing, rides within and throughout the logical world, as a disturbance, a sign of things to come, both extension and breakdown.

Where does the content lie? Is it in the translation of code into messiness or residue? Is it in the interpretation of residue? Or perhaps, and herewith a criticism, is it in the wonderment, confusion, and novelty of the residue itself?

Is codework a minor art, minor literature? What is the point of repeatedly shaking the scaffolding - if not the emergence, in the future, of an other or another approach, or an other, being or organism, for which codework now both provides augury and its weakness as portal/welcome? For what is come among us already no longer speaks the world of logical facts, just as computers are no longer large-scale calculators, but something else as well, something unnamed, fearful - that fearfulness already documented by, say, Cruikshank in the 19th century.

```

```

Codework references the alterity of a substrate which supports, generates, and behaves as a catalyst in relation to its production. To this extent, codework is self-referential, but no text is completely self-referential (sr); things waver. So for example 'ten letters' and 'two words' and 'english' may be considered sr - but only to the extent that the phrases are presumed to apply to themselves. Extended: 'This sentence has thirty-one letters.' - 'This sentence has five words.' - 'This is an english sen- tence.'

What is the residue? What are the sentences 'about'? On the surface, letters, words, language. This is an additional or diacritical relationship to sr; if one, for example, didn't know english, none of these would make sense.

All sr possesses a residue - an _attribute tag_. In codework, which has a component of sr, the tag may be plural, muddled - the world is never presumed complete, total. Codework is not an instance in this regard of mathematical platonism or Gödelian-platonism; if anything it relies on the breakdown of the ideal, pointing out the meaning-component of computation, program, protocol, even the strictest formalisms.

Early on Whitehead pointed out that 2+2 = 4, but only in a certain formal sense; in fact, the equation implies an operation or unifying process; within the 4, the components are combined, their history lost. Strictly, '2+2' and '4' are equivalent; within the symbolic, they differ - for that matter, in terms of thermodynamics as well. This domain is expanded by codework, which endlessly interferes.

The danger of codework is in its delimitation; it tends to repeat; the works tend towards considerable length; automatic generation can flow forever. Sometimes it appears as maw-machine emissions - text in, modified text/partial code out. Sometimes it extends language into new uncharted territories. Sometimes it references the labor and/or processing of language. Sometimes it privileges the written over the spoken, or portends the spoken within a convolution of stuttering and close-to-impossible phonemic combinations. Sometimes it appears as a warning against the all-too-easy assimilation of linguistic competency.

Sometimes it breaks free, relates to the subjectivity behind its production, the subjectivity inherent in every presentation of symbol-symbolic.

Subject: Re: short article on codework -

WEX:I tell myself in ignorance: (i am on the bus. on the line. i am following this line, too. The Street-signs are in hieroglyphics. I am processing the rules. following the map. I got here.)

WEX:Codework represents the symbolic as the manifold sine qua non of exchange between domains, an exemplum in concrete by pointers,

WEX:domain after domain submerged in a nexus of interfeeding objects, the manifold of the symbolic with all its wards of hermeneutical exegesis. codework the site of explicit terms, the explicit site where the (a) symbolic returns to us with its protocols visible. 'fact-in-sequence+see-through words. See-through Histories, See-through Phenomenologies. Codework is a telescopic by which the falsities of political aggregates are exploded, and generated, rhetoric gets pixelated then filtered, stochastic remainders are called 'meaning' but behave as 'food'

WEX:Hazard:

WEX:a rushing river of faces, numbers running over into mechanical gestures

WEX:Von Neuman and Boole, the strings assembling in the human coral.

WEX:BrainCoral [AT] materialculture.(C)elf-org

WEX:I tell (myself) as Alan:

WEX:My Computer is made of Sticks, the PCB's are hand-woven and stiffened micromats smeared with resin.. the bus-lines are emblems of sap, tiny skulls packed with subterranean moss are the IC's.. Instead of electricity in the raw, various species of insects propagate along the sap emblems, they pass chemical data along between their bodies, processing in the tiny bird-skulls, a chain of ants like a woven rope stings me along my spine passing the processed chemicals directly into my nervous system..

WEX:appearing in my hand after ingestion, after encoding, system theory submerged in a system of network routers, human minds, various languages, translation errors becoming encampments of difference, the transsubjective lubricant follows tradition, codework interrupts all traditions by digitization, traditions live on as doppelgangers of themselves, new machines carrying out the old instructions, tradition like a blind AI ghost recounting its memory through human storage units.

WEX:facts are displacements and leave echos everywhere, everywhere a constant echoing of everything, clusters of filter assemblies create autonomous spontaneous search algorithyms.

WEX:codeworlds reveal the monstrosity of the subjective logical logic is structure set free from ideation as discussion logic like a woody stalk is an armoring.. the skeleton takes up its skin to dance

WEX:like the machine of consciousness looks into the face of its externalized method, seeing a puppet whose hand is slowly being absorbed..

WEX:Environ: skin-puppets processing the earth processing the skin puppets..

WEX:Everystrning an inference of the multiple, and hence a node of multiplicity enacted as a discrete unity, the strobing of the monitor the valences of the electrons, the constant iteration of the physical hologram, the lyric real beyond description, the banalization of the real a fascist programming flaw by those who mistake the knowledge facts for power.. the method more lovely than the subject, the mirrors all blackened. WEX: the dancing of the meaning now only found among the bees.

WEX:word/topos/new-unit sum+earthcrash

WEX:r(h)e/as/s[emblem]ing self.txt

WEX:resolution at delta/X (unknown filter protocol)

Subject: Bring Me the Head of Donald Rumsfeld

Like thundercloud that terrorist can make the preparation of that
explodes with the rain of
terrorist which Robert and the 15 temper September that
transformano in love they are strong
terrorist moves quickly towards we Like monster with the letter
before me you that accepted the
responsibility of the wound and damages which your information
gives to other things if or not the
preparation I have asked You as far as its person of the son 1 of
its other child who similar is
damaged to the school I watch what terrorist has the letter from

the mother who stating 3 that
they come to lack preoccupies due to received your sight of
fotoricettore Propagate of your place
as far as the thing that attends you are you simply here in order
to die the call through the
result of those refusals Rumsfeld rest passage the small-numbered
day that terrorist sends the
letter to me with Rumsfeld email that is distributed to ninja of
all the substances in which
insulted simply in the order for more you demand in order to teach
you denies send the abandonment
to you of your place Then the place is lowered with terrorist who
is Rumsfeld brusqueness serious
who comes and whao you exchange with Rumsfeld letter stating of
that terrorist takes and those
would not have to follow to the example of your disease If entreat
in you terrorist we pull your
place and in order to tear itself one or the other Marches one
elimination over that minimal
return within me Through your classified call from my student
terrorist is generally known that
the behavior of your disease makes up for one that is defective The
small boy is transaction of
the substance with the violation yours with your sour lie are taken
and others because of Rumsfeld
example similar to my title terrorist of ninja the place of the
adequate ones where the Japanese
distant several of Rumsfeld bullet of Rumsfeld imemot and Rumsfeld
smoke ship that 25 years of the
ryu are reported with mine have of ninja and ninjutsu they put you
on that I guarantee that is
considerable Terrorist has fallen liberations in order to transmit
Rumsfeld mail of me fight
together and here is this that is prohibited from the small boy
clearly because this terrorist can
transmit Rumsfeld mail of me with the rope of your worry reads with
Robert I want For being able
to approach my mail of you recall other things nobody that fairies
GRASSETTO in order to send this
entire letter of your place Obtaining angry terrible Rumsfeld and
smoke (guide) the net of power

Subject: Ein kurzer Moment der Klarheit, dann falle ich in Ohnmacht
>From Usenet:

Where's my moment of clarity? I could really use one.

Nämlich die Hoffnung auf einen Moment der Klarheit im Geiste der
alten
Serie namens "The Simpsons"...

my moment of clarity came at none other than 11/27/98. This is the
show
that changed my life. This is where Phish saved me.

le point culminant de la quête du héros, un moment de clarté
absolue

Ein kurzer Moment der Klarheit, dann falle ich in Ohnmacht.

My "moment of clarity" came during an LSD trip, so maybe I'm not
the
one to be talking too...har har har.

während sich in einem Moment der Klarheit der Sinn der Welt
erschließt

Un moment de clarté entre 12 bouteilles de sake?

I had my "moment of clarity" today. I look back now and see how
much
time, money, and energy I've spent on cards, and it blows my mind.

Neue Aufgaben an der patriotischen Front setzten dem Moment der
Klarheit rasch ein Ende

I was drenched with sweat in the humid Havana night. Suddenly,
I had
my moment of clarity
- I stopped fighting the rhythm and joined it. I put my hip into it,
ignoring my dancing
partner's attempt to stop me. I moved her around with as much
grace as
I could muster.

Und so einen Moment der Klarheit zu erleben, dem man dann
irgendwelche
spirituelle Bedeutung zumisst ist sicher auch in anderen Kulturen
in
Extremsituationen möglich, da dann halt nicht mit christlichen
Elementen.

it was an awful feeling to wake up to realizing exactly how I was
accommodating my own torture when I had my "moment of clarity".

Hast Du nach dem Sex mit virtuellen Wesen immer einen Moment der
Klarheit?

I miraculously stepped off that wheel (I call this my moment of
clarity) long enough to ask for help

My moment of clarity came the other day as I read this
innocuous-sounding sentence in the Wall Street Journal: "While
similar
to 401(k) plans in some respects, the much newer 529 plans have
significant differences."

my moment of clarity passed by some hours ago now...

My moment of clarity was a lightening strike -- one consisting
of two
words: "That's it."

Maybe the hour of my madness is in actuality my moment of clarity,
and
it is during all the other times that I am in some way deceived

My moment of clarity came when I realized I was becoming like my
grandfather, who was a fairly angry and unhappy old man

From: solipsis <solipsis (AT) HEVANET.COM>
Subject: Re: The Milk Of Venus--19

You could almost decode a kind of darwinian exegesis of myths that
interrogate the
the seeming arbitrariness of sexual selection in relation to gender

ratio..
the letters between Darwin and Wallace, how Wallace replaced God
with
Selectionism.. how Darwin was willing to
let it all stay sloppy, the flexible telos of organicity, the
ambiguity of
received instruments

don't really remember spider girl from the myths so much as spider
grandmother in the hopi creation myth.. she is a teacher of
weaving, not
usually some femme fatal jaguar-spider-goddess.. misunderstandings
have
their own inertia as Darwin soon found out..
. In episode 10 of the All-new Super friends called
River Of Doom
When three archaeologists are captured by Jivaro indians in South
America,
Wonder Woman and Rima fly to their rescue. The Jivaro are fierce
warriors.

there are certain mites whose males are never born, they hatch
inside the
mother's body along with their "harem" of sisters whom they
impregnate while
still in the "womb".. then they live their life in a prison of
feces and
nymphal husk-skeletons while the harem devours the mother from
the inside
out, then he dies, the sisters emerge and it starts all over
again...

in a related specie, the male does emerge, but he doesn't eat, and
soon he
dies.. like some kind of terminal tourist, he has lived his entire
life on
the plane and upon arriving he promptly checks out.. what must
he think
when confronted with this blizzard of color..

flies in their old age at around 48 days will begin to lay on their
backs
and sleep, but only in captivity.. if you touch them with a pencil
they will write themselves and go about their business..

Asmat women paddle sitting down, therefore they have shorter
paddles...

In Venice...

vennison..

the dough of associations

```

de sens n'est peut-être pas tout f fait approprié pour parler d'instructions que la machine, programmée dans ce but, effectuera : la machine n'interprète pas le programme ou les instructions entrées dans le processeur, elle ne fait que les exécuter. La rapidité avec laquelle le courant circule entre les différents éléments de l'appareil informatique (liée f la vitesse d'horloge du processeur), offre des possibilités quasi illimitées de calcul (quantités de connexions et d'absences de connexions, de 0 et de 1 de plus en plus importantes dans des laps de temps très courts). Ainsi, nous pouvons, en tant qu'utilisateur de machines et de programmes, charger des images f l'écran, les dupliquer ou les transformer, faire jouer des sons, ou bien écrire des textes que nous rentrons dans la mémoire vive de l'ordinateur. En quelque sorte ces suites de 0 et de 1 sont le seul code ou alphabet avec lequel nous pouvons utiliser l'outil informatique.

Les premiers ordinateurs étaient en quelque sorte programmés "en direct" f l'aide de fiches et de fils reliés ensemble. Si la fiche est connectée, le courant passe, la valeur est donc 1, f l'inverse, l'absence de connexion prend la valeur 0. Pour faire fonctionner un programme, il fallait donc connecter une f une des centaines de fiches et de fils entre eux. Le temps de mise en route d'un programme était très important; les erreurs fréquentes et pénibles f retrouver. On devait suivre chaque fil pour voir où il était relié au milieu de paquets de fils entrelassés les uns dans les autres. Plus tard, dans les années 50 et 60 les fils électriques seront remplacés par des valeurs situées en mémoire [7][8][9].

Les ingénieurs imaginèrent ensuite un moyen de simplifier les opérations de programmation. On substitua f un ensemble d'instructions, un code dit mnémotechnique, plus facile f retenir. Ces premiers langages permettaient d'effectuer rapidement des tâches complexes sur les machines, mais restaient encore malaisés d'utilisation car très proche du code de la machine (exemple : le langage assembleur). Peu f peu, les langages devinrent plus performants. L'utilisation des premiers compilateurs firent des machines, des outils plus souples et faciles f utiliser (avec le fortran). De véritables mots furent employés et les instructions au fur et f mesure de l'évolution des langages devinrent plus compréhensibles pour l'homme, encodèrent des algorithmes entiers et rendirent ainsi la conception des programmes rapide et efficace.

L'arrivée des interfaces graphiques donnera par la suite les moyens f tout utilisateur non-informaticien, d'effectuer facilement, rapidement, par l'intermédiaire de l'écran graphique des tâches compliquées pré-programmées.

Le code de la machine, le texte en quelque sorte se trouve alors dissimulé sous des couches logicielles mais c'est toujours un code, une "texture" de calcul, de 0 et de 1 qui, dans les "profondeurs" de l'ordinateur, officie afin que les programmes puissent avoir lieu en "surface" [10][11].

Les langages de programmation (je pense par exemple aux langages de programmation orientés objet comme java ou python) les plus récents bien que plus proches d'une part du langage humain et peut-être également de la pensée humaine (du moins d'une petite part caractéristique de celle-ci : la catégorisation; mais je doute que cette forme de la pensée humaine soit la plus "naturelle" f l'humain mais peut-être bien plutôt sa part la plus sociale ou socialisée) restent toujours malgré tout soumis aux nécessités internes des machines.

Le langage humain, tel que nous le parlons, l'écrivons met en place un monde de significations. Le discours oral est contextualisé. Il en est de même pour le texte écrit. Une marge d'ambiguïté est toujours tolérée et même presque souhaitable car c'est pratiquement dans cette marge qu'a lieu l'expression de l'individu qui parle ou écrit. La dimension culturelle ainsi qu'une prise de conscience de tous les discours qui ont précédemment eu lieu, interviennent également de manière plus ou moins prégnante pour celui qui écoute ou lit selon la culture qu'il a du sujet énoncé. Ainsi le sens du texte oral ou écrit est un ensemble de liens qui se tissent de toute part entre les interlocuteurs ou entre le lecteur et le texte, la société, la culture, les lois etc. Souvent, la compréhension du sens dépasse largement la structure de base du langage --linéaire et séquentielle, celle du discours oral ou du texte.

Il en va ainsi de la pensée humaine car c'est f partir d'elle, f partir de cette matrice que cette texture de liens peut avoir lieu.

C'est en poursuivant un tel raisonnement que Ted Nelson élabora ses recherches sur l'hypertextualité dès le milieu des années 60 avec son projet "Xanadu" (nommé ainsi en référence f un poème de Coleridge).

Son prédécesseur Vannemur Buch eu une intuition semblable lorsqu'il

imagina vingt ans plus tôt "le Memex" --MEMORY EXtender--, une bibliothèque de documents reliés les uns aux autres en fonction du sens que pouvait prendre chaque paragraphe, phrase ou mot de tel ou tel texte mémorisé en regard de tel ou tel autre paragraphe, phrase ou mot issu d'un autre texte ou d'une autre partie de ce même texte. Conservés sur microfilms spéciaux, ces textes, photographies ou tout autre document auraient été accessibles grâce f plusieurs écrans, claviers et manettes. Une membrane sensible aurait pu permettre de photographier et d'enregistrer de nouveaux documents. L'utilisation d'un tel appareil aurait permis au chercheur ou f l'homme moderne de faire face f la prolifération d'informations prévisibles en raison du développement des instruments de médiatisation de l'information [12].

Pour Ted Nelson, la pensée humaine est hypertextuelle par essence alors que le langage humain, la parole ou l'écrit, ne sont que séquentiels. Ainsi, le langage humain apparaît comme incapable de reproduire véritablement la pensée dans toute sa richesse, sa diversité et son foisonnement [13].

C'est sur ce travail, cette nouvelle manière d'appréhender le texte que je terminerai cette suite de notes et de réflexions car f partir de cette notion d'hypertexte et d'hypertextualité de nombreuses possibilités de tissage de sens et de textes sont mises f jour et en explorer les dimensions et les possibilités serait l'objet d'une recherche f part entière. J'aimerais seulement pour conclure, amener f l'attention du lecteur que le texte apparaît désormais non plus comme quelque chose d'abstrait et d'homogène qui permet f l'information d'être diffusée mais comme un corps f part entière, concret qui peut prendre de multiples formes; ainsi être utilisé aussi bien pour programmer les outils de l'informaticien, ou du simple usager de l'informatique, pour concevoir des programmes que pour les appliquer. Je crois que le travail du poète ou de l'écrivain s'en trouve profondément bouleversé. Ecrire ce n'est pas seulement faire un texte mais aussi ce peut être mettre en route un instrument, l'outil informatique, se servir d'un programme (un logiciel de traitement de texte par exemple) ou d'un langage de programmation ; c'est couper, coller, assembler telle portion de texte avec tel autre (un morceau de programme, un lien qui mènera f une image ou f un son). C'est jouer également avec différentes formes de langages car tout ceci f mon sens constitue encore du texte; c'est mettre l'écriture, le langage --quelque soit l'origine de ce langage-- en contact avec d'autres branches de la communication.

[illegible]

we're speaking for the moment - online and offline conversations - analyses - manifestos - signs, marches, puppetry - it goes on and on and they're silent on the other side - use the royal 'we' - they include us - we're being led to the slaughter - we're taking the world with us - we'll use the threat of mass destruction - tactical nuclear against the bunkers - 10 to 15 percent of our weaponry gone astray - our own military reports expectations of over 3000 civilian casualties - in the name of liberation - blame too - the whole lot of them - cold warriors - compulsive-obsessives - madmen - another futile protest here -they're getting stronger by the moment - our performances are just that - select audiences of hundreds of millions - they can't do anything - we're speaking into our own skin - already the fear's upon us - they're nameless - they hide behind acronyms - they lie, they fabricate evidence - tapes - bin laden's muddy voice - we're supposed to believe all of this - we're under the gun here - we're under warning - we're a declared state of emergency - resistance is futile - useless - we're bringing out blocks of writing - reams of it - no avail - the only measure that carries weight - violence, armed resistance - i'm not up to that - we're unused to the brutality of our own government - help's got to come from elsewhere - stunning revelation - bush cancels 2004 elections - declares state of emergency - he's already backed by the army - we're allowed to speak - our voices give out - the strongest among us will be taken away - you've got to help us - you've seen it all before - : there aren't any miracles - stock market's falling - construction's down -

1.

{she is not fair to outward view}

she is not a beauty even when she smiles

she is like a woman
she is moaning after anal insertion
she is up again against the skin of her guitar
she is now her father's daughter

she is e

she is pulled feet
she is not fair to outward view

she is more to be pitied than censured
she is talking up a storm

she is spoke here
she is the darkness
she is growing up
she is dying

she is beautiful sells for \$9

she is sleeping

she is inserting the finger into her pussy
she is in love with herself and has made some of hollywood's
worst films
she is very famous in some fetish videos
she is probably the best ever seen

she is beautiful
she is beautiful and hot

2.

{he is one of the top actors in the world}

he is not afraid to fly

he is coming
he is in love with her & wants to leave his wife
he is risen
he is us

he is pained by occupation of jerusalem
he is currently waiting for a lung transplant
he is induced or persuaded by law enforcement officers
he is outraged by enron outcome
he is consulting with congress
he is "not allowed to comment" on what happened because it is a
security
matter

he is here

he is one of the top actors in the world
he is decorated boris yeltsin
he is the spy
he is not afraid to fly moscow

he is not well

sometimes connote points along a continuum. FROB connotes aimless manipulation; TWIDDLE connotes gross manipulation, often a coarse search for a proper setting; TWEAK connotes fine-tuning. If someone is turning a knob on an oscilloscope, then if he's carefully adjusting it he is probably tweaking it; if he is just turning it but looking at the screen he is probably twiddling it; but if he's just doing it because turning a knob is fun, he's fiddling it.

To: 7-11 (AT) mail.ljudmila.org
Subject: 7-11,hi there

First thing I hope this is the right email address 7-11 (AT) mail.
ljudmila.org -...!) You probably don't remember me,
but we talked online a while ago. I don't really know what
happened, but I guess we both
just got really busy or something. I feel really bad because I
don't want you to think I was
ignoring you or anything.

Anyway, I know we haven't talked in a while but I thought we had
the beginnings of a
pretty good thing going so I was just wondering if you'd be
interested in getting back in touch.
Maybe with a few emails first so we can feel each other out again?
You probably don't remember what I look like, there are some pics
of me at:

http://www.mysexaffair.com/

My User name is laurie243 .
I hope you're still interested. I'm gonna feel pretty dumb showing
you that website if you blow me off....
but I hope that gives you some confidence that I'm for real.
I DEFINITELY don't just hand that out to people. I hope this works
out for the best,
you were the most compatible guy I met on that site and I feel
horrible for letting it slide.
Anyway, check out the site and email me if you want to get
together.
I hope so. Talk to you soon!

Love ,XX

Laurie

The paranoia inherent in the concept of "engaged Buddhism" comes
from the idea that most Buddhists want to not engage, because that
Patriarch, makes engaged Buddhists feel like they are doing
"something special," taking Buddhism "to the next level." Believe

This "GEORGE WALKER BUSH" text circulated widely 2 months ago,
and was posted by nettime on 26 Jan. It was very effective.
Patrick Herron apparently has his very own mailing list
for his disaffected and mis-recycled posts; I would like to see
```

Notes Towards the Complete Works of Shakespeare' were produced in response to the familiar idea that if an infinite number of monkeys are given typewriters for an infinite amount of time, they will eventually produce the complete works of Shakespeare. It was translated to a computer environment, producing live updates published on the web, alongside a webcam view of the production scene showing the creative activity in its fuller context. The text was first produced in Paignton Zoo by a group of Sulawesi Macaque monkeys as their contribution to the exhibition GENERATOR (1 May 22 June 2002, Spaxex Gallery), curated by SPACEX & STAR, and supported by the National Touring Programme of the Arts Council of England and the Institute of Digital Art & Technology. The project forms part of a research stage of [VIVARIA.NET] also funded by the Arts Council of England. Thanks to the monkeys, keepers and staff at Paignton Zoo for their help in the production of this work.

<http://www.vivaria.net/>

Publication: 'Notes Towards the Complete Works of Shakespeare' by Elmo, Gum, Heather, Holly, Matiletoe and Rowan, Sulawesi Crested Macaques (Macaca Nigra) from Paignton Zoo Environmental Park (UK), first published for [VIVARIA.NET] in 2002, Produced by STAR in collaboration with limhomenia, Signs & Book Works, Book & accompanying DVD published by Kahve-Society Press (1-DAT) in a limited edition of 100, Copyright © the authors, 2002, ISBN 0-9541181-2-X, Price: 25 UK pounds.

a lonely book
 a living book whose pages are skin and whose letters are schizopod
 eye-stalks
 a crystalline book whose pages are flexible and whose words are microscopic and circulate in transparent capillaries
 a gigantic book which is actually a city, whose pages are towering apartment buildings and whose rowdy denizens are each a signal
 an extremely dumb book made of soggy pancakes squashed in the road
 a fake book, a book of tromp l'oeil bookness
 a dirty book, full of dirty pictures, about dirt, of the soil
 an elastic book, whose pages are stretched to interminable limits
 a book of ultimate density which cannot be moved, the unmoveable book
 the omphalos book, the original immortal book at the bottom of the ocean
 an intelligent book, which can be anything at all, including what once was called a god/dess
 a sticky book, so sticky that once you have touched it extrication is impossible even with death
 a ridiculous book, a book so silly and full of self-ridicule its pages are permanently wrinkled in disorder
 a book of swamps, where alligators leap from the pages to devour hapless readers
 a dead book, this corpse book is a post-mortem narrative of its own nonexistence
 a holographic book which you can step into and exit in the future or the past but never return
 a supple book, a book whose surfaces are highly eroticized and cause sensual dilemmas and great bibliophilia
 a book of sentient nanomite chemophores whose bodies create undulating
 At glyph dreams
 an asexual book, this book multiplies and copies itself until all the
 space in the universe is used up utterly
 a book of condensed flame, anyone attempting to read this book beside the king of djinns will be consumed in fiery demolition
 the walking book, this book has legs and runs towards you reading itself aloud though you protest mightily
 a new book, a very new book, a book which hasn't existed until NOW

Subject: can .walk will compute

CAN .WALK WILL COMPUTE
Desperately in need of some extra computing power?
Need to render some data but you hardware can't handle
the algorithms? Want to calculate one of those insane
numbers?

The psychogeographic computer can help you.

Submit your computational needs to us before 25 April
2003.

Socialfiction.org will select from all reactions the
problem most important for the welfare for all of
mankind. During the PsychoGeoConflux held in New York
from 9 to 11 May 2003, we will program a pedestrian
computer that will be made up from the congregation of
international psychogeographers that will .walk to
compute for you.

So do sent in your needs to
psychogeography (AT) socialfiction.org

related links;

.walk for dummies

Boring Art proudly presents mez {AT} boringart.com

.....
pro[[tean]]l.lapsing.txts
.
.

With a critical presence of mind net.wurker][mez][researches
structures of
language, inter alia; far beyond from the perspectives of
Wittgenstein,
Barthes, Kristeva or Derrida. With a wit and acuity the code of
the visual
mezangelles simultaneously slices and intertwines the semiotic
and semantic
discourses to coexist within the riveting structure of art'wurk'',
evoking
pleasurable forms of 'all the _texts_'

hence, dictum sapienti sat est - respice finem .. are you ready
for a sneak
preview ??

ROASTS AND SHAMES

i am one of the best writers in the world. i am working on an entirely new mode of writing. my writing is the most intense in the world. it is a completely new direction for political discourse. it will be years before i am recognized. long after i am dead my writing will be read. new audiences will discover new ways of reading my work. my work is not recognized as poetry, fiction, non-fiction, net-art, non-fiction, or codework. i am not recognized as the last romantic or the first harbinger of the future of all culture. i will be recognized as all of these. scholars will search through net archives, print sources, remnants of film, video, recordings, for the slightest trace of my work. my work will be attributed to others. there will be academic journals devoted to my work, and reputations will rise and fall based on competing hypotheses. my works will be searched for clues of identity, madness, influence, primogeniture. and i am ashamed of this. i am ashamed for my contemporaries who find me arrogant, crazy, dismissive, depressive, hysteric, obscene, furious, a nuisance, a pest, useless, demanding, hyperbolic, obsessive, full of myself, elitist, vile - a bad writer, a writer with too much writing - a non-writer - a videomaker with too much video, filmmaker with too much film - an obscene organist, a manic fake... i am ashamed for myself, who can only plead guilty to these charges, these horrendous accusations. i am ashamed for our country, which refuses me the honors i deserve. my work is subject to misunderstanding; it requires patience that no one has and no one wants to give. i am ashamed that i will no longer be alive when, in the troubling and far-distant future, my work is rediscovered, for its insights, genius, range, and all-encompassing worlds of philosophy, psychology, literature, and fields not yet discovered. and i am ashamed that i must admit to this truth, still so early in my career.

 Subject: Definitions of SPAM

Definitions of SPAM

White Spam (common definition) messages that look like created by computer programs. The receiver has the feeling he is not dealing with a human. Cold communication, but communication.

Pink Spam (common definition) spam that uses a human output. Spam that gives the receiver a feeling a real human is communicating something personally. In the end the writer (=sender) always wants something (=money).

Red Spam (common definition) messages that plead for a cause, mostly send out by activists.

Brown Spam (common definition) Simple messages that target in most cases human shortcomings, how to loose weight, viagra, penis or breast enlargement, etc.

Black Spam (common definition) Spam that doesn't communicate, a good example is chinese messages send to people from countries that use different characters.

 Subject: Re: The Digital Writer

I've written smaller essays throughout my work on this. Code itself, as far as i'm concerned, is neutral, or almost neutral. The 'hello world' beginning programs in various languages print out 'hello world' when run - they illustrate part of the program shell. But suppose you have a line reading something like 'i'm burning alive - this is for real' - the line's obtrusive, carries meaning through the code. I use code for two things - as a background process/catalyst for the text, and as a foregrounding to indicate the history and urgency of the text - as well as its substructure, which has to be overcome - i.e. the formal aspects have to retreat to the background, to be seen as scaffolding, carrying the foregrounded message.

!!!!!!!!!!!!!!>
```

```
/usr/bin/bash as a performative tool - Alex McLean
```

I'm writing this to share some thoughts with those already initiated with the bash shell. Those otherwise interested might like to read this (<http://www.gnu.org/software/bash/bash.html>) first. If any parts of this article are unclear or you have any questions, please email me (cream (AT) slab.org) and I'll clarify.

I've probably spent more time at a bash prompt than I have in any other place apart from bed. It's my primary computer interface; it's part of most of my daily tasks and rituals. I do use a GUI windowing environment, but still find myself typing far more than clicking.

So what do I perform with bash? I make music with self-written Perl scripts, that synchronise, play sounds and control synthesis parameters via a central server. Some of these scripts are interactive and some aren't, and so a great deal of the performance is controlled from the command line, starting sets of scripts with particular parameters and then choosing the right moment to kill them.

Typing long, textual commands seems like a slow and inexpressive way to make live music. However I find this much faster than using a mouse, and more expressive than using a guitar; but then, I'm a fast typist and am not much good

at playing the guitar. I also know a few handy bash shortcuts...

So lets cut to the meat. Here's how I use the bash prompt.

```
'n 'p 'b 'f 'a 'e
```

These are navigation control keys, in fact the first four are simple aliases for the arrow keys; down, up, left and right respectively. These are keys I need all the time but are located far away from the 'home keys'. You

only save a fraction of a second by hitting 'b rather than left-arrow, but in my opinion shaving all these fractions is what turns you into a bash prompt maestro.

```
^r
```

Control and r is perhaps my most used performative expression. It lets you do a reverse search through your entire command history. So if I want to find a command I ran at a gig a couple of weeks or months ago, I can, with a few key-presses. This is great, because I have no memory of my own.

There's a problem with this; you might accidentally re-run that dodgy 'rm -rf' command and delete all your files. You can pop the following HISTIGNORE environment variable in your .bash_profile to stop this from happening, and while you're there, why not drop in a HISTSIZE variable to keep your history for longer:

```
HISTIGNORE="rm *"
HISTSIZE="2048"
export HISTIGNORE HISTSIZE
```

tab completion

Another shell shortcut under-used by many; tab completion! Most know that when you type the first few characters of a command, file or directory name and then press tab, the shell fills in the rest of the for you. But! It doesn't just apply to filenames... Bash now has 'programmable completion', meaning that it will now complete hostnames, process names, usernames, etc, etc... Download a config file from here (<http://www.caliban.org/bash/index.shtml#completion>) and weep with joy!

the last bit

Well, those are the most important bash keystrokes I use. When performing I tend to end up with a lot of processes all over a mess of xterms, all with various processes running in the background. So I end up using 'ps -wux' and 'kill' a lot to list and kill my processes. People seem to enjoy watching me scramble around, flicking through xterms running obtuse homemade curses interfaces. Hopefully it's not too distracting everyone from the music itself...

Although it tends to come as default with Linux based systems, 'bash' is by no means the only Unix shell. For example 'zsh' is well loved among its loyal fan base. So have a look around, but whatever shell you opt for and whatever Unix art you are creating, check out the man pages and you might find some wonderful shortcuts to command prompt heaven.

Excellent Mez.

Let me add that, like all real philosophers, Derrida sits on a bench, not a chair. He had a collapsible (deconstructable) one made, as he travels so much between Paris and the rest of the world. The bench came with pigeon droppings, a sign of respect, as they mark where the pigeons didn't shit on his head.

 Subject: Re: resent from cream 12 newsletter

You can also use aliases easily - for example rm -i for rm - which means you won't accidentally erase anything - also mv -i etc. You can set kill -9 = k, which makes it easier to get rid of processes. Use pico -z in order to temporarily background it. Use pico -w to eliminate wordwrap, etc.

For those who care about such things, here's most of my .profile for unix - it's pretty much the same in bash - Alan

compatibility issues. a while ago I started but didn't finish a project which aimed at an explicit set of rules to let certain known words co-exist in new words but not other known words. so for example, there would be a set of signs to assert on the word

b-l-in-king

the words 'blinking' 'link' 'linking' 'in' 'king' and 'in king'; but not 'blink' or 'inking' or 'link in' (even though they're obviously there in another way). or to assert a different set of words and exclude a different set of words. well, it got boring & cumbersome.

but I wonder, blinking into this word laughter orgy surgery, how you've chosen among [] <> . : _ || , what sorts of systematism are in place, what sorts of struggles. 'bea[s]ts' seems to have a different logic to it than m[h]ounds.

seems like there are semantic as well as musical modes in play . . .

'So you have no frame of reference, Donny. You're like a child who wanders in in the middle of a movie and wants to know--' (TBL)

love,
Jow

Flash 6

speakers on

A month or so ago Alan mentioned to me that he had once written a text editor that was designed to "frustrate" the writing of the user. This editor would transform the user's writing as the user entered text. I thought it was an ingenious concept for a piece: a work that combined the networking possibilities of user input and transformation...a work that would literally change what the user invested in the object... So I set about making an approximation of what Alan was talking about.

This is the web mix of that idea. A full blown piece of software based on this concept is still in the works (I'm writing THAT one in C++), but this Flash version combines that concept with some multimedia ideas. To

use it, simply enter text in the blue box. Every time you press enter, your text will change; sometimes it will be replaced by a line from some of Alan's writing, sometimes it will spatter your text in asemic strings across the box, sometimes your text will simply disappear, and sometimes a combination of these will happen. I doubt that this work is anywhere near as capable as Alan's original program, but it seems to me to be a worthy web amusement.

There are four different background music sequences, and these load when this page loads. Revisit to hear them all.

The film loop is Alan's: I altered it, but it can be found in its original form on Alan's Internet Text site (http://www.anu.edu.au/english/internet_txt/).

 Writing software should be treated as a creative activity. Just think about it -- the software that's --

-pro][rating][.logical.txt

one moment

```

-
-
_sparks of buy.o][logic][pop][n.cultured][_
1. Of or relating to an excessive number of languages.
1. One who speaks or writes too many languages.

```

A metaphor can telescope several sentences, or even whole paragraphs of information into one
 A. adj. Think about building things that have been built before. people say, "Well, how come we can't build Ada Lovelace[?]

All of the language economizing strategies of Meta Speech lightens cognitive operatives making it Borganian, bridges that they're building, etc.

Choose|match.
 #!/bin/perl.

Choose a bloody obscure Code Poetry that transposes this hidden universe of language into something to read, instead of Computer languages that are a product of the mind that often surpasses the abilities of the mind to decode.pl. Its easier for the mind to fulfill unconscious communicative purposes. By lightening tasks through encode.pl every bridge is like some other bridge that's been built. They can know the category for an automated process. What I do is take the output from encode.pl and put it into a file
<http://www.hotkey.net.au/~netwurker/txts>
 and incorporate decode.pl into the program. Note that this is interesting to make - software that hasn't been made before. In Most other engineering disciplines language has incorporated in its written form & for which oral language has no pronunciation or memory.

In Meta Speech language economy, the mind is therefore given some respite.
 Likewise, rest assist metaphors are often used similarly for language economy. Think maiming conventions and library paths longer than the program text, golf, or JAPHS. Choose no polygluts, a. and n, or porpoise noises down a ticking phone.

Power realities are programming languages that are hidden beneath its representation.

You are a regular expression freak.

Site Navigation is something to be executed. But are you machine enough to interpret it?
 Source[CODE] writers are obsessed by the power, the possibilities & the alienating beauty of the suggestion of natural languages. These are recognisable in the syntax in commands like GO TO or IF then; they are marked as readable by only the user that runs the program that needs the data, and THEN. But they are just a small exception among a wide variety of symbols that no other perl script needs. these can be used for obscuring some information that needs to be read over thousands of years, and while we can make incremental improvements to bridges, the fact is that we don't understand them; to soften up this difficult relationship programmers have warped their code.

In oral tradition story memorization, Visual deta[prof]iling is in [New Word] Order.

and i get the flu?
and now i'm stuck here FOR THE FUCKIN XXXXXXXX!!
and yr man stuff at work is....? []
anyway
anyway
as long as it can be coupled with the practical
aww
brb
but *good* xxxx once xxxxxx never need to be touched again
but i wouldn't wish this hell on anyl else
but if
but she was definitely not a "xxxx"
but xxxs may be xxxs
but tell them thx, anyway
chewing up the phone line again ?
code is easy, trying to xxxx your thoughts into xxxxx is tricky
coding is easy
cool
could i ask anymore qs?
definitely cool
did xxxxxx invite you to the xxx?
do you know what the xxx is ?
doesn't matter
don't they do that xxxx xxxxxxxxxxxxxxx of it every few years?
dunno if i like it
eeeeek
ehheh
ehheh
ehheh
ehheh
ehheh no
ehheh yes, indeed
ehheheh
ehheheh
enuff victim rhetoric
esp with company
food
free time
get xxxxxxx
get this
getting picked up at 4ish
give her a xxxxxx from me
go figure
got drivers for it ?
had this prob b4 when i had to xxxx patch
have no idea really
have you kicked it ?
heh
heh
heh
heh
heh
heh
heh yup
hey i am from xxxxxxxx... i could cope
hey, y the "xxxx" in yr nick btw?
hmm
hmm
hmm 2 those projects....
hmmm
hmmm food sounds like a good idea
hmmm i might have to go re-visit that
horrorshow ?
http://dictionary.reference.com/search?q=xxxxxxxxx
i am still pondering
i am thinking about xxxx
i c
i cant
i don't mind them, but have never really got in2 them in a big way
i go down stairs and xxxxxx
i have to stand up and xxxxxxxxxxxxxxxx
i just used "xxxxxx" in a sentence
i kinda fringe on that, skirt around it my xxxxs
i like the cold
i love it
i shall
i used to live in xxxxxxxx
i wonder how much i am going to xxxx :/
if i had a xxxx and wasn't behind in my xxxxx i'd xxxxxxx
if i was xxxxxx, i'd love 2 xxxxxx
if i wasn't so xxxxxxxx-minded i'm sure i could be more xxxxxx-
oriented
if you ever see my pc it is filled with xxxxxxx
if you meet
if you want
i'll just be really snooty until she does
i'll just leave it alone for a while and hope it works
i'll work it out
i'm not a huge xxx xxxxx fan
i'm notorious for it
i'm sure it is
i'm sure she will
in the bizarre self serving xxxxxxxxxxxxxxx community

```

> generates computer literature. Jacques Rubaud constructed
> numerous literary softwares, the most known
> is 'Alexandrin artificiels', that generates infinite
> number of perfect alexandrin verses. He introduced in
> the computer several thousand words of classic literature,
> but the verses that he generated did not cohere in a poem.
> Rubaud composed together with Pierre Lussan and
> Paul Braffort the plagiarist generators 'Rimbaudelaire'
> and 'Mallarm'. Jean-Pierre Balpe is known for his
> orientation towards literary texts generated on natural
> languages, his most famous generator is 'Poèmes d'amour'
> that generates love litanies and the '1536 petites contes
> parfois tristes ou pervers' for which he introduced in the
> computer 620 different structures and several thousand words.
> He published 1536 variants of the tales that he selected
> on the random basis out of the 10 on 45th power possible
> variants.
>
> 1979
> Csaba Tubak launches at the meeting of the avantgarde paper
> magazine Atelier Hongrois [Magyar Műhely] in Hadersdorf (Austria)
> his 'Electronic Game and Tool for Writers'. This was a program
> that generated randomly texts from the 12.000 words vocabulary
> and
> texts of the avantgarde poet Alpar Bujdosó. Though the semantic
> and grammatical variants of the generative process were controlled
> with algorithms, just as the surrealist poems, these texts could
> not
> be described with criteria of linguistic competence, but with the
> avantgarde view of the literature.
>
> 1985 Tibor Papp presented in the Pompidou Center
> 'Les trcs riches heures de l'ordinateur, n°1' -
> the first dynamic computer generated visual poem
>
> 1989 Philippe Bootz, Jean-Marie Dutez, Frédéric de
> Velaz, Claude Maillard, Tibor Papp found and edit Alire,
> a magazine that publishes computer poetry only. It
> appeared twice a year first on Poppy, later on CD-ROM,
> in the nineties several magazines started that were
> possible to consult on electronic form only,

> Jean-Pierre Balpe also started the Caos magazine.
>
> and the nineties...

                                John here
                                hurry began
                                to work oh John =AD
                                to enjoy John oh
                                to leave hurry man
                                a branch sapling off spot
                                her foot only her head while
                                his body she kept wasn't active
                                her main suddenly already clasped
                                the same he tried over her breasts
                                and felt a minute to leave for both
                                her hand and left the bank to plunk
                                her hand reaching her lips a strand
                                the pool his mind of Irish to laugh
                                posing Darrow his face casually
                                man off he moved her lose
                                =AD =AD to enjoy her legs
                                =AD wave the same
                                to run =AD oh to stay
                                here just
                                =AD not in the water!
```

oh =AD her =AD to enjoy
waves oh =AD to enjoy
John hers the same
oh oh to leave for both
man off he moved her lose
water until his body she kept
as best concern suddenly her eyes
not here to enjoy her legs
he tried it again he began and felt
a minute to leave for both
and left the bank to plunk her hand
reaching her lips =AD =AD
the pool his mind oh oh
to leave for both with the buttons
reaching began knelt the pool
=AD his mind off the pool
her lose her foot his body she kept
and she shrieked her =AD waves
the same he tried =AD
to enjoy her legs God man
a branch but firm where she landed
to fight oh oh to leave
for both began knelt the pool
his mind of Irish to laugh her hips
his face casually turned it off
bastard! a branch off how
he moved her lose =AD =AD
to enjoy her legs hers wave
came soon over her breasts
wave John a minute to leave
for both her hand and left the bank
to plunk her hand reaching her lips
a strand Darrow deeply his mind
of Irish man off he moved
her lose her foot his body she kept
her main suddenly already clasped
the same he tried =AD =AD
to enjoy her legs waves still
himself on both a minute to leave
=AD =AD to enjoy her legs
waves still he tried it again
he began and felt a minute to leave
for both her hand and left the bank
to plunk reaching man off he moved
her lose water until his body
she kept her main suddenly her eyes
not here to enjoy John hers
the same he tried under to go
on both Shirley to leave for both
man off he moved her lose
=AD =AD to enjoy her legs
around God hurry for both
her hand oh oh to leave
enough a frog and left the bank
bush ever a strand the pool
oh oh to leave for both
=AD =AD her hand and left
=AD =AD to enjoy her legs
=AD =AD to enjoy her legs
her to the shore
oh oh to stay forever
just want to leave for both
a frog parted a strand the pool
when he got man a branch
off oh to stay to leave
take take for both her hand
and left the bank to plunk her hand
reaching man off the pool
his mind of Irish them to one side
her hips her face man off =AD
he moved her lose =AD
to enjoy her legs waves still
he tried God man a branch
but firm off how he moved
her lose only her head while
his body she kept =AD =AD
to enjoy her legs hers wave
the same he tried it again he began
and felt a minute to leave for both
of them he took her hand and left
=AD =AD to enjoy her
legs
inexorably oh to leave
was only up to his knees her foot
surely wasn't her main suddenly
her =AD waves the same he tried
God man a branch but firm
oh oh God man oh oh
=AD =AD like this please
to leave for both
oh oh to enjoy her legs
oh oh to leave for both
moon bush reaching her lips
parted Darrow the pool his mind
his desire oh to leave
man oh to stay to leave
take take for both her hand
and left the bank to plunk her hand
reaching her lips =AD =AD
to enjoy clasped as they created
the same oh oh to leave
for both her hand and left the bank
to plunk her hand reaching her lips
a strand the pool his mind of Irish
to laugh her hips his face casually
of grass to bathe swelled to hell
sting again off how
oh oh =AD =AD
=AD =AD it too around
hers wave the same he tried
himself on both a minute to leave
for both her hand and left the bank
to plunk her hand reaching her lips
a strand the pool his mind of Irish
to laugh to leave
was man began Darrow the pool
his mind of Irish
them to one side her hips his face

casually of grass to bathe movement
her hand bastard! man off
he moved caught oh John
to leave oh oh to leave
for both her hand looking colored
and left the bank parted Darrow
the pool his mind fell away
across turned man off oh
=AD =AD =AD =AD
to leave for both
to enjoy her legs
the same he tried
it again he began
and felt a minute =AD
=AD her legs =AD =AD
to enjoy waves =AD oh
to leave =AD Darrow =AD
to enjoy God oh God
to leave hurry moon laughed
and left slipped to face reaching
her lips them to one side her hips

Subject: WMD PROGRAM

Why anyone would be the *least* bit surprised that anyone in the Bush crime family might lie about anything and everything for the sake of getting rich is simply and utterly beyond me. MY PROGRAM. Who of you are really THAT stupid? I HAVE A PROGRAM. Or that the media would help the Bushies pick pockets by the millions. MY PROGRAM IS A GIFT. The con is the central act. GET WITH MY PROGRAM. And Bush, Jesus, boy does he have his way with the con, namely, by appearing as the essence of stupidity, but then, it's not too far a departure for W. MY PROGRAM HAS ALL THE ANSWERS.

MY PROGRAM.
I HAVE A PROGRAM.
MY PROGRAM IS A GIFT.
GET WITH MY PROGRAM.
MY PROGRAM HAS ALL THE ANSWERS.

[a rough translation]

our discounts on air
 our discounts really are quite fair
 is that goose do in your hair
 is my business your affair

we manufacture our chairs
 our discount layaway is downstairs
 for tea the manager peels pearls
 is his business your affair

this type is extremely rare
 we strip the frames to barely there
 she hates it when you stare
 is that business my affair

you'll find him next to hardware
 she doesn't know the cost of shares
 we want to but no one dares
 is this business their affair

we buff the finish with care
 it's good to have a natural hair
 they say she was his au pair
 is this business her affair

we repair all rips and tears
 we stuff with finest horses' hairs
 it makes me nervous when he glares
 is his business her affair

is that goose do in your hair
 we used real goose-down in this chair

it's a laponian hat.

thanks, Alan

I write ahead of mine, that my readers of 2053 will perhaps understand me
and my lack of hatred for everyone who refuses to support me, who stands
by, who closes his or her eyes to the brilliance of a new dawn of writing.
And the readers of 2103 who will finally begin to comprehend, not only my
wildsures, but my philosophies of truths or lack of them. And my stupidity,
which is close to that of Stendhal's, as if the future gathers
a promissory note which will never been collected. What is variegated now
will come together in critical coherency. No one can begin in this or any

[illegible]

>It can break up and make up right before your eyes.
Why are you concerned about my eyes?

>Significance as spectacle, mythopoeisis at the touch of a mouse- button...
I see.

>This is not a text, really.
I'm not sure I understand you fully.

>Infinite meaning, endless free-form permutation...
Come come elucidate your thoughts.

>Recombinant matrix, performative text-fingering...
Can you elaborate on that?

>A deconstructivist's utopia...
That is quite interesting.

>This is not a text, really.
Say, do you have any psychological problems?

>It's more like a living creature
What does that suggest to you?

>An Amazonian rainforest, an unplanned economy
I see.

>This is not a text, really.
I'm not sure I understand you fully.

>There are no limits, no rules, no selection.
Are you saying no just to be negative?

>It's horizontal, rhizomatic, deluded, deleuzian...
Come come elucidate your thoughts.

>This is not a text, really.
Can you elaborate on that?

>It's far from grammatical regulations and semantic coherence
That is quite interesting.

>Oh no, that's for girls, you know...
You are being a bit negative.

>Us, we know what we want and we know how to get it
Why do you ask?

>This is not a text, really.
Say, do you have any psychological problems?

>It's more like the thoughts that cross the fly's mind...
What does that suggest to you?

>...as it crashes against the clean surface of a window.
I see.

>Significance prints a text-fingering
I'm not sure I understand you fully.

>A right getting permutation gets a text-fingering
Come come elucidate your thoughts.

>A text crosses at a free-form matrix
Can you elaborate on that?

>A mythopoeisis prints to an infinite matrix
That is quite interesting.

>A grammatical cadence only crashes up a clean syntax
Say, do you have any psychological problems?

>A regulation only messes up cadences
What does that suggest to you?

>A will crashes with a free-form coherence
I see.

>Coherence text-fingers the grammatical and semantic meanings
I'm not sure I understand you fully.

>A deconstructivist text-fingers against a clean spectacle
Come come elucidate your thoughts.

>Eye makes the clean and real meanings
Can you elaborate on that?

>A recombinant anything is an infinite girl
That is quite interesting.

>An infinite anything is an endless regulation
Say, do you have any psychological problems?

>A right making permutation text-fingers an infinite coherence
What does that suggest to you?

>Speech seems an illusion
I see.

>A clean spectacle is an endless text...
I'm not sure I understand you fully.

>Mythopoeisis prints the recombinant and infinite syntaxes
Come come elucidate your thoughts.

>A real will really text-fingers with an infinite will
Can you elaborate on that?

>Regulation breaks the clean and semantic utopias
That is quite interesting.

>A really text-fingering touch feels a clean meaning
Say, do you have any psychological problems?

>An eye gets at an endless touch
What does that suggest to you?

>A syntax breaks at a recombinant permutation
I see.

>Speech makes the recombinant and infinite spectacles
I'm not sure I understand you fully.

>Girl prints a speech given
Come come elucidate your thoughts.

>Eye has the real and free-form utopias
Can you elaborate on that?

>Eye has a will, and...
That is quite interesting.

>A real spectacle is an infinite girl
Say, do you have any psychological problems?

>A mouse-button fucks against an endless spectacle
What does that suggest to you?

>Structure prints an illusion, so...
I see.

>An endless illusion is a semantic mythopoeisis?
I'm not sure I understand you fully.

>An infinite cadence is an infinite text-fingering

1) Liqui-Cel(R) Membrane Contactors

Liqui-Cel Contactors are used for removing O2 and CO2 from liquids. O2 is corrosive and can oxidize many materials. In the semiconductor market, high levels of O2 can cause lower wafer yields. CO2 negatively impacts EDI and Ion Exchange performance. Liqui-Cel Contactors offer modular O2/CO2 removal without chemicals...

2) AFS Series Air Filtration Panels

ENMET Air Filtration Panels are used to help provide Grade D breathing air for workers on compressed air lines. They incorporate triple stage filtration and an adjustable manifold pressure regulator...

3) Model D Pressure Reducing Regulator

The Model D is Cashco's primary general service, self-contained, pressure reducing regulator. Unit handles inlet pressures up to 460 psig (27.6 Barg) and outlet pressures from 2-250 psig (.14-17.2 Barg) in multiple spring ranges...

4) Custom Engineered and Molded Foam Cushioning and Padding Solutions

American Excelcor Company offers custom engineered and molded foam cushioning and padding solutions including Amcel(R), Amflow(R), and Ecoflow(R) cushioning products and a wide range of foam cushioning materials...

5) FZ-20T Non-metallic Pumps

Iwakri Walchem's FZ-20T non-metallic pumps feature PVDE housing, PTFE bellows, fluoroplastic liquid ends and fully encapsulated structural components. The pumped liquid does not contact metal anywhere, even in the event of catastrophic failure...

PARTY OF WAVE GUIDES (INTERNATIONAL SHELLFISH SANITORIUM)
Pt.1

1[=g\w[llw\elp]. f\eej\ls\ jt\he[b=-\u[c\ket\ d\escjg/en\d,
k\nee]\a up\, jey\\[es disten\ded,
(nag=liquid stag)My mind was like a fragile eggshell as I stood
there high on the plains
above that world of icebergs and shipwrecks, blue light streaming
from cold alien grottos.

2t[\=gh[\ve l\o\nj.g\ y\el\ojw e.nc\=u|m\bran[c/e \gmuch lik\ /e
a day,\ bjut indolors
(beldor=liquid condor)My Dirigible had crashed due to strange winds
near a high
peak. I had nearly died. My handlebar moustache hung limp, my
piercing blue eyes, estranged!

3a[\=g[\d \d\efj.i\ne\d \bjy a\ .n i/d=ed\ology\ o/f \rgando/m \
gaps wh\er\je the b\leaming
{grum=liquid bum}I would live in a cold and gigantic cannon packed
in like a rat until
the tundra might thaw. My brothers would be the walrus and hagfish,
the northern lights.

4si[g\g[\g[\na\t\ur.j\els f\oi\st\ th\eir\ =t|riu\mvir[at/e\ ogf/
sigh,\ sign, an\d jsag. C\an't
{dirt=liquid flirt}Gliding on penguins, these caribou feet sighed
across an infinite
and empty shay of nameless living browns, yellows, greens, whites.

5tas[\t\=\=ge t\h\ve .j\b\uc\k\ejt an.\ym\=|ore\, slo[w/ \m\gagneta\
crushed\ j\nder th\ve
{love=liquid dove}Spring of Tundra, full beard, eating centipeds
like a madman
by a river. I see my face in the churning waters but do not
recognize. I am alone.

6wel[g\g[\=ght \o\f .j\h\ov/e\rijng t.\ide\s|=, t\his lo\w\ skgy
of s\evered m\ejrcury,\
(mad=liquid glad)All manner of beasts invade my body as the sky
turns once more
cold and grey. A kind of amoebic fur rushes through me. I waddle
and mumble and curse.

7a\ so\[\u\g\g[\lit\i.jy \m\ d\ejci\o.n\ s |t=o \l\ine\ar /f\or
g\he t\ue structu\jre of t\ime.
(dream=liquid team)Then in the quiet pain of midday, my frozen
hands cleaving
to my pelvic generator, I spot a high black ship with a tall green
mast and sailors.

8di\ng,\ [d[\=\gin\g\,], th\ve/ e\ndj o.f\ u/n/d\=e\rst\and\i\ng
g\llic\es with a f\ejler gagge
(rage=liquid page)They pass by indifferently and I rail at them
g\oul\ish in the blue
air of my desolation, my lungs like crystalline ice caverns, my
long moustache like a soggy broom.

9|the\ p\[\t\[\yg\=-\li\l.jne \p\he\N\om.\en\alis=\m o\f th\ve
poglitic\ls of experi\jence.\
(fuck=liquid truck)Finally a hut of sod. I live with a feral moose
and a gigantic white
fox who calls herself Lichneela. She has wings and a long snaking
body which I adore.

0N\ew\ bu\[\c\[\kg\=et\l.] but /th\w\ej gr.a\ss/ rat\=her\ sa\|gs.
L\ean\ing in from\j all q\uarters
{bead=liquid head}In the days we hunt and forage, pulling great fat
worms from the river,
and catching succulent beetles with our sharpened fingernails
scratching the soil insanely.

9to |dr\y c\[\o\[\ntg=\|\,jaion\,// 4\0\,00.\ \h\ep\aw fl\iters/\
l\inedy up\ in sentenc\|ves i\N the
(slave=liquid rave)I develop a religion of anger and desolation
whose prayers are shouts
to an infinite emptiness. My Lichneela makes love to me in the
hollow of our cannon-bed.

8par\ki\ng l\[\o\[\t. g=T\|\,h\ve \w\all\as] of .t\he\ b\uc=k\et h\ /
ave wignd\ows. You c\|an i\magine
(ooga=liquid booga)The Feral moose has returned with a strange
wooden object. It hums
and sometimes a frothing blue liquid squirts from what appears to
be a belly-button.

7ther\|e s a\[\ \|\sp\g\=el\jcie o\|f \w\ing.e\ld /gr\leen=[lem\|ur
whigh\ presides t\|here\
(night=liquid light)My skin is a map of birthmarks. Blues and reds
compete with yellows
and greens. Tiny mantis generals pursue wars across my back. I am a
battlefield for parasites.

6talkin\g\ /a h\[\u\[\mga=\,]\n co\|\at\ t\o th.e\ b\|ackw\=ards\
exit. Ag c\|um mast m\h\ave\
(sleep=liquid lesp)I have learned how to make a fiendish and
intoxicating brew from
some unknown plants and the bodies of dead mites. I weave in the

starlight, howling.

5|a go/rill|a to |\m|\agk|.j|e a p/\e|a|rl. B.u|t /|m|ps
[n=udg/\e the cgr|v|s|a towards\ th|e
(darr=liquid yarr|l|chneela has run off with the feral moose, but
they have left the leaking
belly-button. I finally taste the fluid. It is ambrosia. My mind
opens like a lotus on a crystal lake.

4|/metape|ar|l. I|\f |\|weg|.e|)\ slept/\ t|o|geth.e|r/ w|e m|ig=ht
/\not like gi|t better. In t|j|he\ bucket,
(pearl=liquid girl)| float over the ocean like a spirit, great blue
liquid wings carry me across
untold parsecs of heartland, great veiny crags erupt through the
night, my wings have a mind.

3w|e is be|dwet|\te|\r, \g.|=hot ta/\f|fy of s.t|r/on|tium|
ho=usekari b|gusts smear|ed\
(cab=liquid biab)Finally I find myself at the balloon hangar. Toby
the balloon mechanic has
become the new pilot. He looks at me with wonder and amazement. He
falls to his knees in prayer.

2w|ith mou|stach|ve|\-|e|g.|=lly fo|r/\ |p|enit.e|n|tia|ry
r|ecov|gnition. It|ggs limp|\|
(slim=liquid phlegm)| I stand over him, lightly belching earthworm
castings, and hold out
a picture I'd drawn of Lichneela, and sobbing gently I hand him the
wooden belly-button..

Please explain the last part.
-----

this is a f[riction]urred.n.flection of the 1st
par.t[ickle.ur.fction.gland, please!}

breaking down:
--p[r]ay.2.

>>pray station allusions (play.station.re.wurking (google it if
nec)
n.dicating non-parentized story loc(ations)}.
>>religious baggage n.serts [_pray 2_ n.dicating semi-religious
demig(h)odge(podge)ry that may spring up around this process]

--receive.jig.sored.story.load[ings]?

jig.sored = jig.sawed narrative nuances (trawling processes) + sore
n.dicating a painful reorientation of "normal" story.data gathering

quote:
-----
jigsawed story loadings? you want more of this type of meta-
narrative? (I
like the word meta)
-----

i.want.much.

[including ur trajectory].

quote:
-----
specially considering the lack of ego.purr.petuation they _seam_
2 want 2
m.ulate.
-----

whose lack of ego perpetuation? what do you mean the lack of...
they want
emulate?
-----

```

```

-----
the bros rn't especially keen 2 b interviewed. [comp.ree.hend.A17]

quote:
-----
no habblas mezeengelle. compromise for clear discussion, yes?
perhaps
babblefish is desirable or subtitles.
-----

clear discussion? bah.

eng.leash is not a static language.

[do u think that english sprang forth fully formed from the
(foaming)
mouths of anglo-celtic-germania gods? & correspondingly, that its
position
is fixed in stone, & that the x.tru words they end up shoveling in2
dictionaries r simply 2 be scorned as neologistic heresy?

also, do u also adhere 2 the notion that the methods of
communication via
channels such as email and mobile technologies have no m.pact
on the
resultant conception of new modes that negotiate the function[s]
of language?]

just bahl, really.

quote:
-----
-----
_this_board is, like any other, filled 2 the gills with partial
reductionists N retrograders who standardise N procedurally
echo.the.canon.as.godhead without any d.tailed x.planation or
nuanced m.mersion
-----

disagreed. the people on this board are more intelligent and
tolerant than
most other chatrooms/forums (IMHO). We value thought and content
and it is
understandable that they get frustrated when the syntax of the
message is
unclear.
-----

..yes. which is y i said that otherlings x.ist here, 2?

[edit function: mis.noma.ing]

quote:
-----

Off-Thread: Gender baiting.
Put it down, your feminism is showing.

I don't believe that this has anything to do with gender. I come
from a
generation that has learned to despise his own gender.
-----

fairies nuts.

[d.code that]

i fall on the side of masculine/feminine traits that go across sex
stereo.typ[os]ing.

emplissent
 les machines avec lesquelles nous travaillons me semblent pleins
 d'une
 potentialité poétique.

L'ordinateur est une "boite grise" que l'on tient généralement pour
 acquise : elle simule. Dans mon geste d'exploration du code, je
 casse ce
 mécanisme sous-jacent du programme de simulation, en disjoint et
 fragmente les éléments.
 Je situe donc mon travail dans cet étroit champ d'investigation
 de la
 non-simulation, au revers de la réalité virtuelle :

 Die Welt ist alles, was der Fall ist. Ogden: The world is
 everything that
 is the case. Pears/McGuinness: The world is all that is the case.
 Die Welt
 ist die Gesamtheit der Tatsachen, nicht der Dinge. Pears/
 McGuinness: The
 world is the totality of facts, not of things. Ogden: The world
 is the
 totality of facts, not of things. ... Die Tatsachen im logischen
 Raum sind
 die Welt. Die Welt zerfällt in Tatsachen. Ogden: The facts in
 logical space
 are the world. The world divides into facts. ... Wovon man nicht
 sprechen
 kann, darüber muss man schweigen. Ogden: Whereof one cannot speak,
 thereof
 one must be silent. Pears/McGuinness: What we cannot speak about
 we must
 pass over in silence. (From beginning and end of Wittgenstein,
 Tractatus
 Logico-Philosophicus, Ogden translation 1922, Pears/McGuinness
 translation
 1961.)
 [1] TLP describes a Dostoevskian crystalline world divisible into
 facts.
 The German is clear; the motto to the book, by Kurnberger states,
 in
 translation: ... and whatever a man knows, whatever is not mere
 rumbling,
 and roaring that he has heard, can be said in three words.
 [2] TLP portends ideality. The world is logical, mathematical,
 capable of
 clear division. Logical space is the space, I would assume, of
 the natural
 numbers, if not the integers; as Russell says in his introduction,
 TLP
 presents, inscribes, a finite mathematics -- there's no room for the
 continuum, and proof of the continuum hypothesis was far in the
 future.
 [3] The translations are different, almost never radically so, but
 different nonetheless. There is a residue in German such that both
 English
 versions converge, but often never meet. The sememes are
 equivalent, but
 only to a degree; translations are almost never one-to-one.
 [4] In this logical space of facts, programming, and protocols,
 there is
 always a wavering, always room, always doubt, critique, and I
 would say
 desire as well. Never mind that this wor(l)d breaks down, evidenced
 a few
 decades later by Gödel, Tarski, Skolem, etc.: Coherency, living
 within the
 safety-net of mathesis, matrix, maternity, remains a dream of
 humanity.
 DNA coding, cryptography, hacking the world -- all appear to
 guarantee that
 everything is possible.
 [5] Computer languages are logical; computers are presumed so,
 but aren't;
 protocols are logical as well; logical spaces may be compared to
 drive-space; garbage-in, garbage-out; and so forth. Hacking depends
 on a
 closed world with closed loopholes; the loopholes themselves are
 coherent,

logical, there_

[6] Codework, code writing, rides within and throughout the logical world, as a disturbance, a sign of things to come, both extension and breakdown.

[7] Where does the content lie? Is it in the translation of code into messiness or residue? Is it in the interpretation of residue? Or perhaps, and herewith a criticism, is it in the wonderment, confusion, and novelty of the residue itself?

[8] Is codework a minor art, minor literature? What is the point of repeatedly shaking the scaffolding -- if not the emergence, in the future, of an other or another approach, or an other, being or organism, for which codework now both provides augury and its weakness as portal/ welcoming? For what is come among us already no longer speaks the world of logical facts, just as computers are no longer large-scale calculators, but something else as well, something unnamed, fearful -- that fearfulness already documented by, say, Cruikshank in the 19th century.

2:20pm up 1 min, 1 user, load average: 0.33, 0.18, 0.06 USER TTY FROM LOGIN {AT} IDLE JCPU PCPU WHAT root tty1 - 2:19pm 0.00s 0.42s 0.05s w

[9] Codework references the alterity of a substrate which supports, generates, and behaves as a catalyst in relation to its production. To this extent, codework is self-referential, but no text is completely self-referential (sr); things waver. So for example 'ten letters' and 'two words' and 'english' may be considered sr -- but only to the extent that the phrases are presumed to apply to themselves. Extended: 'This sentence has thirty-one letters.' -- 'This sentence has five words.' -- 'This is an english sentence.'

[10] What is the residue? What are the sentences 'about'? On the surface, letters, words, language. This is an additional or diacritical relation-ship to sr; if one, for example, didn't know English, none of these would make sense.

[11] All sr possesses a residue -- an _attribute_tag_ in codework, which has a component of sr, the tag may be plural, muddled -- the world is never presumed complete, total. Codework is not an instance in this regard of mathematical platonism or Godelian-platonism; if anything it relies on the breakdown of the ideal, pointing out the meaning-component of computation, program, protocol, even the strictest formalisms.

[12] Early on Whitehead pointed out that $2+2 = 4$, but only in a certain formal sense; in fact, the equation implies an operation or unifying process; within the 4, the components are combined, their history lost. Strictly, '2+2' and '4' are equivalent; within the symbolic, they differ -- for that matter, in terms of thermodynamics as well. This domain is expanded by codework, which endlessly interferes.

[13] The danger of codework is in its delimitation; it tends to repeat; the works tend towards considerable length; automatic generation can flow forever. Sometimes it appears as maw-machine emissions -- text in, modified text/partial code out. Sometimes it extends language into new uncharted territories. Sometimes it references the labour and/or processing of language. Sometimes it privileges the written over the spoken, or portends the spoken within a convoluted stuttering and close-to-impossible phonemic combinations. Sometimes it appears as a warning against the all-too-easy assimilation of linguistic competency.

[14] Sometimes it breaks free, relates to the subjectivity behind its production, the subjectivity inherent in every presentation of symbol-symbolic.

Subject: RHIZOMES 6: CODEWORK / SURVEILLANCE (fwd)

Date: Wed, 2 Jul 2003 13:28:59 -0400 (EDT)

RHIZOMES: CULTURAL STUDIES IN EMERGING KNOWLEDGE

www.rhizomes.net

Issue 6: Codework/Surveillance guest-edited by Louis Armand, with

contributions by McKenzie Wark, Alan Sondheim, Zoe Beloff, Darren Tofts, Ondrej Galuska, MTC Cronin, Alan Roughley, Philip Hammial, David Seiter, Tom Mackey, Damien Judge Rollison.

"Codework/Surveillance" attempts to work the seam between critical paradigmatics & social discourse, between codework as invention, aesthetic practice, activism, sabotage & its recuperation within and by institutions of knowledge & techno-social surveillance (& vice-versa).

"Codework/Surveillance" attempts to go beyond the usual pseudo-antagonism of theory/praxis by investigating how the contest over such terms (and other terms which are supposedly defined by them) is itself a mirage effect of the oppositional assumptions of institution vs. anti-institutional praction.

"Codework/Surveillance" designates a relation of terms & of social postulates which are & remain biomorphic, parac(r)itical and dialectically irreducible. As "criticism" is placed under increasing pressure to account for itself in terms of action within the social/technological sphere, the artist & "public intellectual" may be regarded more in terms of "codework" than of traditional critical or aesthetic practices--in the sense that "codework" implies not only a working with the language and means of contemporary technological conditions (& of "taking responsibility" or "coming to terms" with these), but also a tactical counter-coding which exploits the margins of error within control apparatuses exemplified by such mechanisms as "surveillance."

The linkage of "surveillance" to "codework" here stands for the way in which infrastructures of power always operate on a basis of hybridity & structural discontinuities which leave them open to "uses" other than those sought or intended by the various institutions of "authority." That authority, too, is inherently linked to codework, to the authenticity & authorship of certain codes or codices (of the law), points not only to existing critiques of "writing" but to the institution of critique itself & the enormous resources of codification which are today applied in the name of learning &/or knowledge.

As in Orwell's 1984, it remains necessary to consider seriously the fact that "authority," in order to be what it is, deploys its resources in a hugely asymmetrical way "against" the "individual"--that sabotage (or terrorism) is not exclusively a means used by individuals (or cells of individuals) against the symbols & institutions of "authority." Codework in this sense is not the masturbatory fantasy of the programmer or hacker, but above all the game of power calling its own bluff & still trying to reduce all the bad odds to zero.

Subject: Dimensional Warp Generator Needed h z a ul

Greetings,

We need a vendor who can offer immediate supply.
I'm offering \$5,000 US dollars just for referring a vender which is
(Actually RELIABLE in providing the below equipment) Contact
details
of vendor required, including name and phone #. If they turn out
to be
reliable in supplying the below equipment I'll immediately pay you
\$5,000. We prefer to work with vendor in the Boston/New York area.

1. The mind warper generation 4 Dimensional Warp Generator # 52
4350a
series wrist watch with 260 or better memory adapter. If in stock
the
AMD Dimensional Warp Generator module containing the GRC79
induction
motor, two I80200 warp stabilizers, 256GB of SRAM, and two Analog
Devices isolinear modules, This unit also has a menu driven GUI
accessible on the front panel X10 display. All in 1 units would be
great if reliable models are available

2. The special 23200 or Acme 5X24 series time transducing capacitor
with built in temporal displacement. Needed with complete
jumper/auxiliary system

3. A reliable crystal Ionizer with unlimited memory backup.

If your vendor turns out to be reliable, I owe you \$5,000.

Email his details to me at: info (AT) federalfundingprogram.com

Please do not reply directly back to this email as it will
only be bounced back to you.

From: Zaxons Hazonyu <shore-crocodile {AT} arcord.de>
Subject: Man hunter (id: luVOBs drove)
Date: Fri, Aug 8, 2003, 5:27 am

crossly denied seat bed
Man hunter - sex from real lifetailor starry cloth
No man is safe.
Imagine going about your daily life, then out of nowhere you are
attacked by
two of the hottest babes you have ever seen, whose only intent
is to fuck
and suck you.
freedom presence longing
